Use flow blocks to design customer journeys in the Connect Customer Flow Designer. Drag blocks onto the canvas and connect them to define how each journey progresses. The following table lists all available flow blocks that you can use. Choose any block name in the Block column for more information.

Block	Description
the section called “Send communication”	Sends an outbound communication such as voice, SMS, WhatsApp, or email.
the section called “Set attributes”	Stores key-value pairs for use across a journey.

Block	Description
the section called “Check attributes”	Branches the flow based on comparisons between attribute values.
the section called “Check communication status”	Evaluates the delivery or contact status of a previous communication.
the section called “Distribute by percentage”	Routes profiles randomly to branches based on configured percentages (for example, for A/B testing).
the section called “Loop”	Repeats a branch for a defined number of iterations before continuing.
the section called “Wait”	Waits for a specified period of time and optionally for specified events.
the section called “Custom action”	Invokes an Lambda function and uses returned data in the flow.
the section called “Customer profiles”	Checks segment membership or attributes from Connect Customer Customer Profiles.
the section called “End flow”	Ends the current journey flow.

Send communication

Important

Before using this block, make sure you completed channel configuration including claimed phone numbers for agent assisted voice or automated voice, claim a phone number or originating identity in AWS End User Messaging SMS and then import the number into Amazon Connect for SMS or WhatsApp, and enabled email at Amazon Connect instance. For instructions, see Set up SMS messaging, Enable email campaigns.

Description

Use this block to send communications through channels such as voice, SMS, WhatsApp, or email. Before using this block, ensure channel setup is complete:

- Voice: Claim phone numbers for automated or agent-assisted calls.
- SMS / WhatsApp: Claim numbers or originating identities in AWS End User Messaging, then import them into Connect.
- Email: Enable email campaigns in your Connect instance.

Example use cases

- Send onboarding, appointment reminder, or promotional messages.
- Trigger fallback logic to reach a customer on another channel when a prior attempt fails.

Contact types

Contact type	Supported?
Voice	Yes
SMS	Yes
WhatsApp	Yes
Email	Yes
Custom channel	Yes, through Custom action

How to configure this block

You configure the **Send communication** block in one of two ways:

- **Amazon Connect admin website**: Open the block in the journey flow designer and set its properties on the block's properties page. The available properties depend on the channel you send on. For the fields shared across channels, see Common properties. For channel-specific fields, see Send an SMS (text message), Send an email, and Voice call.

- **Flow language**: Define the block programmatically with the `SendCommunication` action in your flow's JSON. The action parameters map to the same properties described in the following sections.

Common properties

Property	Description
From	Select the originating phone number or email address claimed for your instance. You can set this value manually or dynamical ly using an attribute.
Message template (non-voice)	Choose a predefined template for SMS, WhatsApp, or email.
Template alias / version	Select a specific version or alias of the message template.
Store outbound communica tion	Optionally save the outbound message ID in flow attributes for delivery tracking.
Dial criteria (voice)	Specify dialing behavior or targeting logic for voice calls.
Engagement preference (voice)	Define how to prioritize multiple contact numbers per customer.

Send an SMS (text message)

Configure the following properties on the page to send an SMS message:

- **From**: The phone number that the message is to be sent from. The dropdown menu shows a list of phone numbers that are claimed for your Amazon Connect instance.
  - **Set manually**: Use the dropdown menu to select a phone number claimed for your Amazon Connect instance.
  - **Set dynamically**: Enter an attribute based on a **Namespace** and **Key** that points to the ARN of a phone number claimed for your Amazon Connect instance.
- **Message template**: Use the dropdown menu to choose from a list of SMS templates. You can choose one template to be sent to the customer.

- **Template alias or version**: Use the dropdown menu to choose a different SMS template alias or version.
- **Store outbound communication**: You can choose to store outbound communication in flow attributes. By saving the outbound message ID in a flow attribute, you can track its delivery status.

Send a WhatsApp message

Configure the following properties on the page to send a WhatsApp message:

- **From**: The phone number that the message is to be sent from. The dropdown menu shows a list of WhatsApp numbers that are imported into your Amazon Connect instance.
  - **Set manually**: Use the dropdown menu to select a WhatsApp number imported into your Amazon Connect instance.
  - **Set dynamically**: Enter an attribute based on a **Namespace** and **Key** that points to the ARN of a WhatsApp number imported into your Amazon Connect instance.
- **Message template**: Use the dropdown menu to choose from a list of WhatsApp templates. You can choose one template to be sent to the customer.
- **Template alias or version**: Use the dropdown menu to choose a different WhatsApp template alias or version.
- **Store outbound communication**: You can choose to store outbound communication in flow attributes. By saving the outbound message ID in a flow attribute, you can track its delivery status.

Send an email

Configure the following properties on the page to send an email message:

- **From**: The email address that the message is to be sent from. The dropdown menu shows a list of email addresses that are configured for your Amazon Connect instance.
  - **Set manually**: Use the dropdown menu to select an email address configured for your Amazon Connect instance.
  - **Set dynamically**: Enter an attribute based on a **Namespace** and **Key** that points to an email address configured for your Amazon Connect instance.
- **Display name**: Personalize how your email address appears to your customers in their inbox.

  - **Set manually**: Enter the display name directly.
  - **Set dynamically**: Enter an attribute based on a **Namespace** and **Key**.
- **Message template**: Use the dropdown menu to choose from a list of email templates. You can choose one template to be sent to the customer.
- **Template alias or version**: Use the dropdown menu to choose different email template alias or version.
- **Store outbound communication**: You can choose to store outbound communication in flow attributes. By saving the outbound message ID in a flow attribute, you can track its delivery status.

Voice call

Configure the following properties on the page to use outbound voice channel:

- **From**: The phone number that the voice call is to be made from. The dropdown menu shows a list of phone numbers that are claimed for your Amazon Connect instance.
  - **Set manually**: Use the dropdown menu to select a phone number claimed for your Amazon Connect instance.
  - **Set dynamically**: Enter an attribute based on a **Namespace** and **Key** that points to the phone number address (in E.164 format — for example, `+12025551234`) of a phone number claimed for your Amazon Connect instance. For voice, use the address, not the phone number ARN or ID.
- **Dial criteria**: Configure how the voice call should be handled based on detection criteria. Use the dropdown to choose a segment that the voice call will target for.
- **Engagement preference**: If your contact list includes single account with more than 1 profile, such as joint account holders, and 1 profile could have more than 1 phone number, you can use engagement preference to set contact strategy based on preference.
- **Store outbound communication**: You can choose to store outbound communication in flow attributes. By saving the outbound message ID in a flow attribute, you can track its delivery status.

How to set From dynamically with Lambda

> **Pricing**
>
> Custom action channel and Lambda pricing will apply.

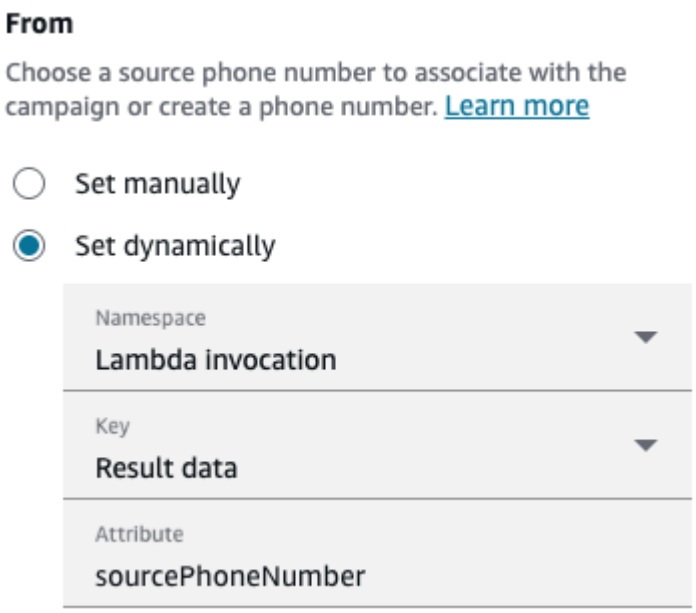
You can use an **Invoke Lambda** block earlier in the journey flow to determine the source phone number or email address at runtime. The **Send communication** block then references the returned value dynamically.

How it works

1. Add a **Custom action (Invoke Lambda)** block before the **Send communication** block in your journey flow.
2. The Lambda function runs and returns a JSON response that includes the source value in a key of your choice. The expected format depends on the channel: for a voice call, return the phone number address in E.164 format; for SMS or WhatsApp, return the phone number ARN; for email, return the email address. For example, for a voice call:

```
{
  "sourcePhoneNumber": "+12025551234"
}
```

3. The returned value becomes available in the flow at `$.LambdaInvocation.ResultData.key`. In this example, the value is at `$.LambdaInvocation.ResultData.sourcePhoneNumber`.
4. In the **Send communication** block, set the **From** field to **Set dynamically** and reference the Lambda output. Set the **Namespace** to `Lambda invocation` and the **Key** to the field name your Lambda returns.



Your Lambda function can use any logic to determine the source address. Use any field name in the Lambda response, as long as it matches what you specify in the **From** field's dynamic reference.

> **Fallback for an unresolved dynamic source**
>
> The dynamic source phone number can resolve to a null or empty value at runtime. For example, your Lambda function returns `null` for a profile's `sourcePhoneNumber`. In that case, the voice call falls back to the default source phone number set in the journey's telephony channel configuration. If the resolved value is instead a non-empty but invalid phone number (for example, not in E.164 format), the profile is not dialed and is dropped with an error that you can view as an event in your data lake.

Add contact attributes to voice dials

For voice dials, you can attach a set of contact attributes to the dial request in the **Send communication** block. Connect Customer sets these attributes on the contact that it creates for the dial, so they are available in the outbound voice contact flow and to agents and AI agents.

For example, suppose a campaign calls customers about an item in their cart. With each dial, you can pass the product name and offer code as the `Product` and `OfferCode` attributes. You can then use these attributes in the outbound voice contact flow in ways such as the following:

- Greet the customer by name, or mention the offer, by using a Play prompt block.
- Give the agent the customer's name, product, and offer when the call connects, so the agent can continue the conversation without asking the customer to repeat details. To show these details in a screen pop, launch a step-by-step guide with a Show view block by using a Set event flow block. For more information, see Display contact information in the agent workspace.
- Give an AI agent the same context by using an AWS Lambda function block to add the attributes to the AI agent session. For more information, see Add customer data to an AI agent session.
- Route the call based on the offer, for example to a team of specialists, by using a Check contact attributes block.

> **Note**
>
> Adding contact attributes to a dial request is supported for the voice channel only.

How it works

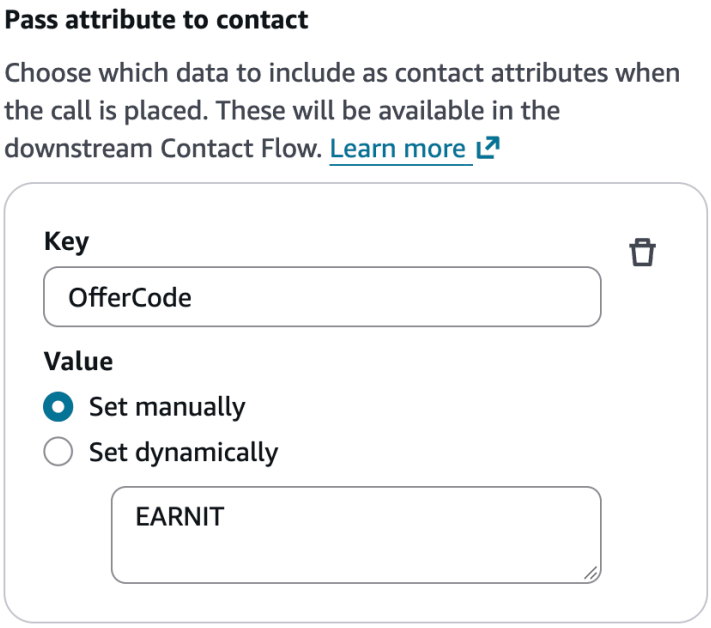
Each attribute is a key-value pair. The value can be a static string, or a campaign-flow reference such as `$.Customer.FirstName` or `$.FlowAttributes.OfferCode` that Connect Customer resolves at dial time. Connect Customer stores the resolved attributes on the created contact, where you reference them as `$.Attributes.key` in the outbound voice contact flow.

Add attributes in the Send communication block

In the **Send communication** block, under **Pass attribute to contact**, enter a **Key**. Then, for **Value**, select **Set manually** or **Set dynamically**:

- **Set manually**: Enter a value, such as `EARNIT` or `$.FlowAttributes.OfferCode`.
- **Set dynamically**: Displays two dropdown lists. Choose a namespace in the first list, and then choose an attribute in the second list. For example, enter the Key `FirstName`, choose the **Customer** namespace, and then choose the **First name** attribute.

The following image shows the **Pass attribute to contact** options configured to add the attribute `OfferCode` with the value `EARNIT` using **Set manually**.



Add attributes by using the API or AWS CLI

If you create the campaign flow by using the API or AWS CLI, add the attributes to the `Attributes` map under `Parameters` in the `PutDialRequest` action. Each entry maps a key to a static value or a reference. For more information, see the section called “Create a campaign flow”.

```
{
  "Identifier": "PutDialRequest",
  "Type": "PutDialRequest",
  "Parameters": {
    "Attributes": {
      "OfferCode": "$.FlowAttributes.OfferCode",
      "Product": "Running shoes"
    }
  }
}
```

Use the attributes in the outbound voice contact flow

In the outbound voice contact flow, reference each attribute as `$.Attributes.`*`key`*. For the preceding example, use `$.Attributes.OfferCode` and `$.Attributes.Product`.

Verify the attributes

After a dial, the attributes are persisted on the contact. To confirm them, open the contact on the contact details page and review the **User defined attributes** section, or call `DescribeContact`.

Limits and behavior

- Adding contact attributes to a dial request is supported for the voice channel only.
- **Keys** can be 1–32,767 characters, using letters, numbers, hyphens (-), and underscores (_).
- **Values** can be up to 32,767 characters, after Connect Customer resolves any dynamic references.
- All contact attributes for a contact share a combined limit of 32 KB, including system-managed attributes. For more information, see UpdateContactAttributes.
- Avoid the `connect_` prefix, which is used for system-managed attributes. If a key that you provide matches a system-managed key, such as `connect_customer-profile_profile-id`, Connect Customer overwrites your value with the system value.
- Static values can't be empty. If a reference can't be resolved at dial time, the attribute is added to the contact with an empty value, and the dial still succeeds.

Reference the dialed contact ID in the campaign flow

After a voice dial, Connect Customer makes the created contact's ID available in the campaign flow as `$.OutboundCommunication.Telephony.ContactId`. This value is populated for voice contacts, and is null when no contact was created.

Use this contact ID to get details about the call that aren't in the delivery receipt. For example, add a **Custom action (Invoke Lambda)** block after the **Send communication** block, and have your Lambda function call DescribeContact with the contact ID. You can then branch the campaign flow based on how the call was handled, such as which agent took the call.

> **Pricing**
>
> Custom action channel and Lambda pricing will apply when you use a Custom action (Invoke Lambda) block.

Set attributes

This topic defines the flow block for storing key-value pairs that can be referenced throughout a journey flow. You can define and update attributes at any step to pass data between blocks or personalize later actions.

Description

The Set Attributes block stores key-value pairs that can be referenced throughout a journey flow. You can define and update attributes at any step to pass data between blocks or personalize later actions.

For example, you can:

- Store campaign or contact-level data such as customerSegment, preferredChannel, or accountType to drive conditional logic
- Capture and reuse values returned from external systems through Lambda functions, such as offer eligibility or compliance status
- Record message delivery results, such as SMS delivery status or email bounce reason, for use in follow-up logic
- Set loop-level counters or flags to control iterations in multi-step journeys

The Set Attributes block supports the following namespaces:

- Flow attributes – Attributes that persist within the journey execution context
- Lambda invocation – Attributes generated or returned by Lambda function calls
- Loop – Attributes created or updated within looping constructs in a journey
- Delivery receipts – Attributes populated based on message delivery results, such as DeliveryStatus.
- Outbound communication – Attributes related to outbound campaign execution, such as ChannelType, outbound communication ID, or the dialed contact ID for voice.

Example use case:

- You can use the Set Attributes block to retry a failed SMS message on another channel. When an SMS delivery receipt returns a DeliveryStatus of failed, you can set an attribute preferredChannel

to Email and route the flow to an email delivery branch. This helps ensure the customer still receives the message without manual intervention.

How to configure this block

You can configure the Set attributes block by using the Amazon Connect admin website or by using the SetAttributes action in Flow language.

Common properties

Property	Description
Attribute name	Enter the key name for the attribute.
Value	Define a literal value or reference another attribute.
Namespace	Choose the applicable namespace for the attribute.

Check attributes

This topic defines the flow block for branching based on a comparison to the value of an attribute.

Description

The Check Attributes block branches the journey flow based on comparisons between attribute values. It evaluates contact, flow, or system attributes to determine which path the journey should take next.

You can use this block to apply conditional logic such as:

- Routing customers to different paths based on segment, preferred channel, or message outcome
- Checking Lambda-returned values such as eligibility results or risk scores
- Comparing delivery receipt attributes to decide follow-up actions
- Controlling loop progression based on counters or flags set in earlier steps

Example use cases

- Channel fallback: If an SMS delivery receipt returns a DeliveryStatus of failed, use the Check Attributes block to branch the journey and send an email instead.
- Personalization and targeting: Branch based on customer segment. For example, if customerSegment equals premium, send a high-value offer; otherwise, continue to a standard path.
- Dynamic scheduling: Evaluate an attribute such as DaysSinceLastEngagement. If greater than 30, send a re-engagement message; if less than 7, skip outreach.
- Lambda-driven logic: After a Lambda function returns an eligibilityStatus, continue only if the value equals true.
- Loop control: Use Check Attributes to evaluate loop counters. If loopCount is less than 3, continue retrying; otherwise, end the loop.

How to configure this block

You can configure the **Check attributes** block by using the Amazon Connect admin website or by using the CheckAttributes action in Flow language.

Common properties

Property	Description
Attribute key	Select the attribute to evaluate.
Operator	Choose the comparison condition (Equals, Contains, Greater than).
Value	Specify the target value for comparison.

Supported comparison conditions include: **Equals**, **Is less than**, **Is less or equal**, **Is greater than**, **Is greater or equal**, **Starts with**, **Ends with**, **Contains**, **Exists**, **Key exists**.

Supported attribute namespaces

The Check Attributes block can read attributes from the same namespaces supported by the Set Attributes block:

- Flow attributes

- Lambda invocation
- Loop
- Delivery receipts
- Outbound communication

Check communication status

Description

Use this block to verify whether an outbound message or voice call succeeded before proceeding. You can add up to 5 conditions.

Example use cases

- Follow up only after an SMS or email is delivered.
- Retry or route to an agent if a call fails or reaches voicemail.

How to configure this block

You can configure the **Check communication status** block in the admin website or using the CheckCommunicationStatus action in Flow language.

Supported status

Channel	Status	Description
WhatsApp	Failed	The WhatsApp message could not be delivered to the recipient.
	Delivered	The WhatsApp message was successfully delivered to the recipient.
	Sent	The WhatsApp message was sent to the recipient.
	Read	The recipient opened and read the WhatsApp message.
SMS	Text invalid	The destination phone number is not valid.

Channel	Status	Description
	Text blocked	The recipient's device or carrier is blocking SMS messages.
	Text delivered	The message is delivered to the specified location.
	Text successful	The recipient's carrier successfully accepted the message.
	Text queued	The message is queued and ready to be delivered to the recipient.
	Text pending	The message hasn't yet been delivered.
	Text TTL expired	The SMS message couldn't be delivered within the specified time frame.
	Text carrier unreachable	An issue with the mobile network prevented the message from being delivered. This error is usually temporary.
	Text invalid message	The body of the SMS message is invalid. For example, the message doesn't meet the content or format requirements and can't be delivered.
	Text carrier blocked	The carrier has blocked delivery of this message. This often occurs when the carrier identifies the contents of the message as unsolicited or malicious .
	Text spam	The mobile carrier identified the contents of the message as spam and blocked delivery.
	Text unknown	An error occurred that prevented the delivery of the message. This error is usually temporary.
Voice	Voicemail beep	The number dialed was answered by voicemail with a beep.

Channel	Status	Description
	Voicemail no beep	The number dialed was answered by voicemail with no beep.
	AMD unanswered	The number dialed kept ringing, but no one answered.
	Sit tone busy	The number dialed was busy.
	Sit tone invalid number	The number dialed was not a valid number.
	Human answered	The number dialed was answered by a person.
	AMD unresolved	The number dialed connected, but answering machine detection could not determine whether a person or voicemail answered.
	AMD unresolved_silence	The number dialed was connected but the answering machine detection observed silence.
	AMD not applicable	The call disconnected before ringing, and there was no media to detect.
	Sit tone detected	A special information tone (SIT) was detected.
	Fax machine detected	A fax machine was detected.
	AMD error	The number dialed was connected, but there was an error in answering machine detection.
	Outbound destination endpoint error	Current configurations do not allow this destinati on to be dialed (for example, calling an endpoint destination from an ineligible instance).
	Outbound resource error	The instance has insufficient permissions to make outbound calls, or the necessary resources were not found.

Channel	Status	Description
	Outbound attempt failed	There was an unknown error, invalid parameter, or insufficient permissions to call the API.
	Outbound preview discarded	No contact was made. The recipient was removed from the list. The system does not automatically retry.
	AMD disabled	Answering machine detection is disabled.
	Initiated	An outbound call was initiated or transferred.
	Connected to System	The contact established media—for example, a person or voicemail answered. Amazon Connect generates this event for any of the Answering MachineDetectionStatus codes.
	Contact data updated	One or more contact properties were updated on an outbound call. Updated properties can include user-defined attributes and tags, routing criteria updates, or conversational analytics configuration.
	Queued	An outbound call is queued to be assigned to an agent.
	Connected to agent	An outbound call is connected to an agent.
	Disconnected	The voice call disconnected. Possible reasons include a failed dial attempt, an unanswered call, or a detected SIT tone.
	Completed	The contact has fully ended, including After Contact Work (ACW) if applicable.
Email	Bounce	An issue related to the email or server prevented delivery of the message.

Channel	Status	Description
	Complaint	The message was received but the recipient marked it as spam.
	Delivery	The message is delivered.
	Send	Amazon Connect accepted the message and attempted to deliver it.
	Reject	Amazon Connect detected malware and rejected the message.
	Open	The message was received and the recipient opened it.
	Click	The message was received and the recipient clicked a link in it.
	Rendering Failure	The email wasn't sent because of a template rendering issue.
	DeliveryDelay	A temporary error occurred that delayed delivery of the message. Amazon Connect systematically reattempts message delivery.
	Subscription	The email was successfully delivered, but the recipient updated the subscription preferences.

Distribute by percentage

Description

- This block is useful for doing A/B testing. It routes profiles randomly based on a percentage.
- Profiles are distributed randomly, so exact percentage splits might or might not occur.

How it works

This block creates static allocation rules based on how you configure it. Internal logic generates a random number between 1-100. This number identifies which branch to take. It doesn't use current or historical volume as part of it's logic.

For example, say a block is configure like this:

- 20% = A
- 40% = B
- 40% remaining = Default

When a profile is being routed through a flow, Amazon Connect generates the random number.

- If number is between 0-20, the contact is routed down the A branch.
- Between 21-60 it's routed down the B branch.
- Greater than 60 it's routed down the Default branch.

Loop

Description

Counts the number of times customers are looped through the **Looping** branch.

- After the loops are completed, the **Complete** branch is followed.

Configuration tips

If you enter 0 for the loop count, the **Complete** branch is followed the first time this block runs.

Wait

Description

- This block pauses the flow for the specified wait time or for the specified event.
- For example, you want to send a SMS reminder after an initial introduction email. You can either set up a fixed duration (for example, 3 days) or Wait until specific time and date. The next activity block will execute after the wait time expires.

How to configure this block

You can configure the **Wait** block in the admin website or using the Wait action.

Common properties

Property	Description
Set duration	Enter a fixed delay (for example, 3 hours or 2 days).
Wait until	Specify an exact date/time within 7 days.

Custom action

Description

Use this block to call Lambda functions that fetch, validate, or transform data for use in the journey.

How to configure this block

You can configure the **Custom action** block in the admin website or using the InvokeLambda action.

Common properties

Property	Description
Action	Select Invoke Lambda action
Function ARN	Select a registered Lambda function.

Example

Invoke a Lambda to check offer eligibility, store the result in eligibilityStatus, and branch accordingly.

Configuration

Before you can invoke a Lambda using this block, you need to set up your Lambda functions at your Amazon Connect instance at AWS admin console. For more information, see Invoke Lambda functions.

When you do this for a journey flow block, you use the **Outbound campaigns** under the **Channels and communications** section, and to choose your Lambda function, you use the **Set up custom actions** section and then the **Lambda Functions** drop down.

Customer profiles

Description

Use this block to determine whether a profile belongs to a particular segment or meets specific profile criteria.

How to configure this block

You can configure the **Customer profiles** block in the admin website or using the CheckSegmentMembership action.

Common properties

Property	Description
Action	Select check segment membership action
Segment name	Select the segment to check.

Example

Proceed only for customers in the "Loyalty Gold" segment.

End flow

Description

> **Important**
>
> The End flow block is a terminal flow block. With this block, you can end a flow and the profiles will exit the Journey.

- Ends the current journey flow.
- This block is used for profiles exiting the journey flow.

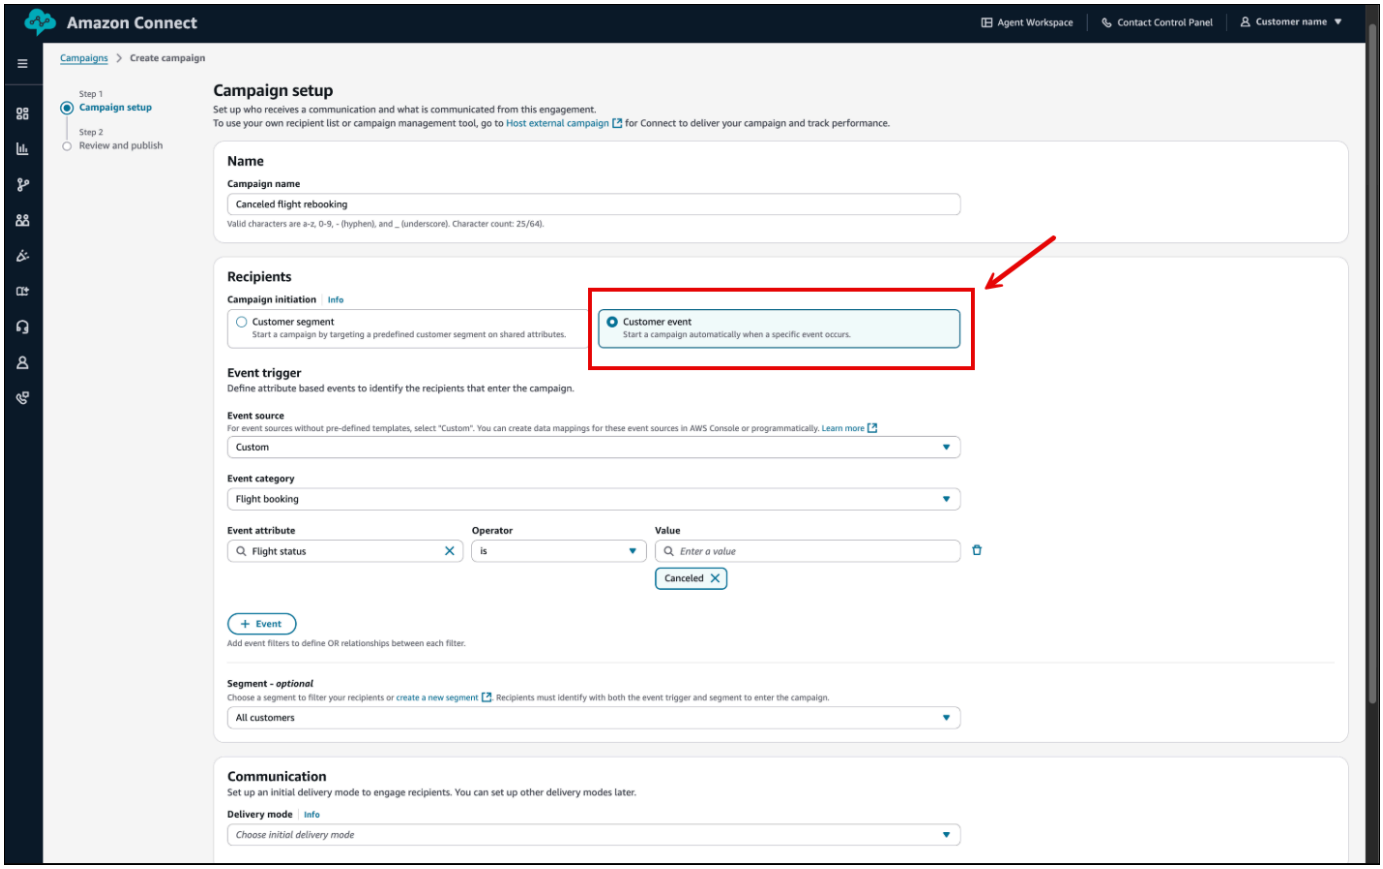
Configuration

No configuration is required. Simply connect this block to the end of a branch.

Create an outbound campaign using event triggers

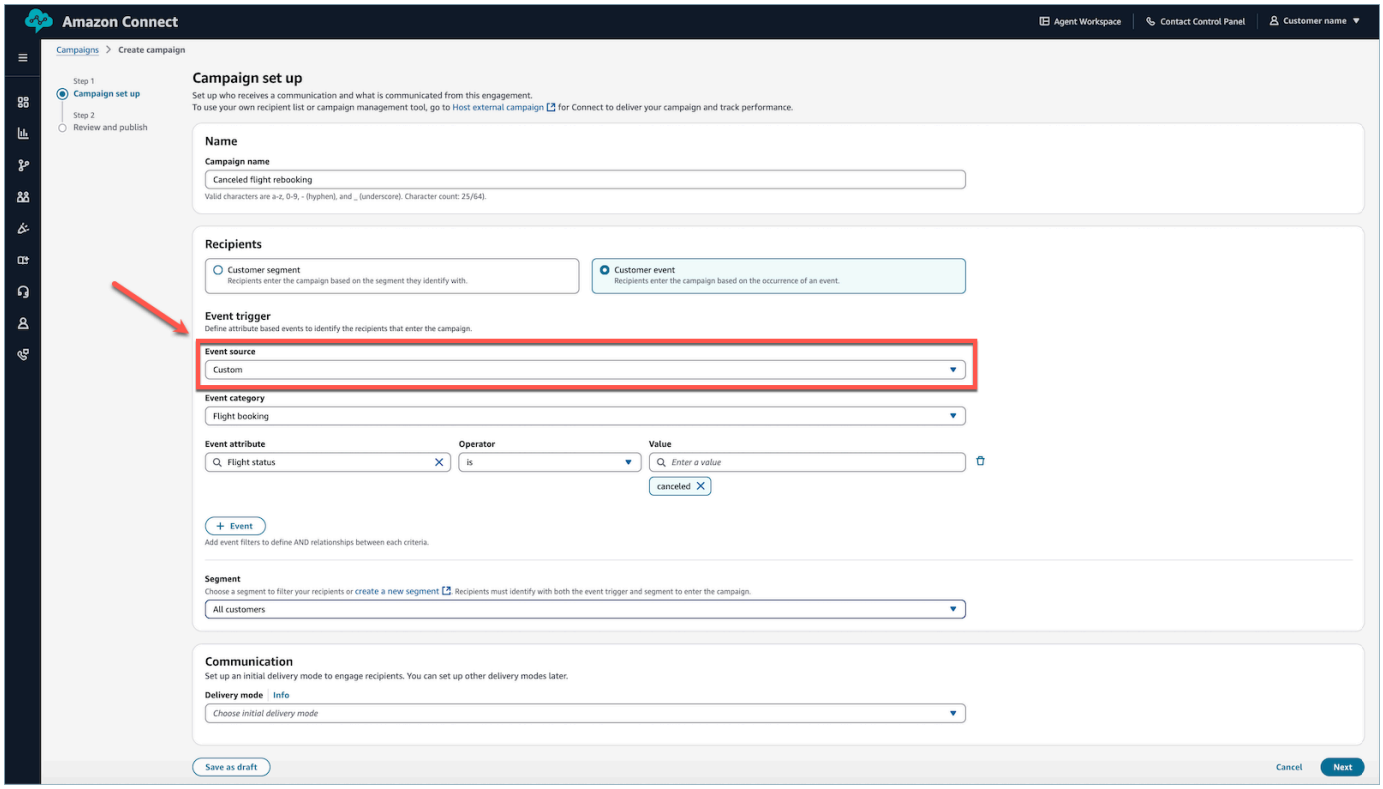
Set up event triggers in the Connect Customer admin website

1. On the **Campaign set up** page, select **Customer event** under **Recipients**.

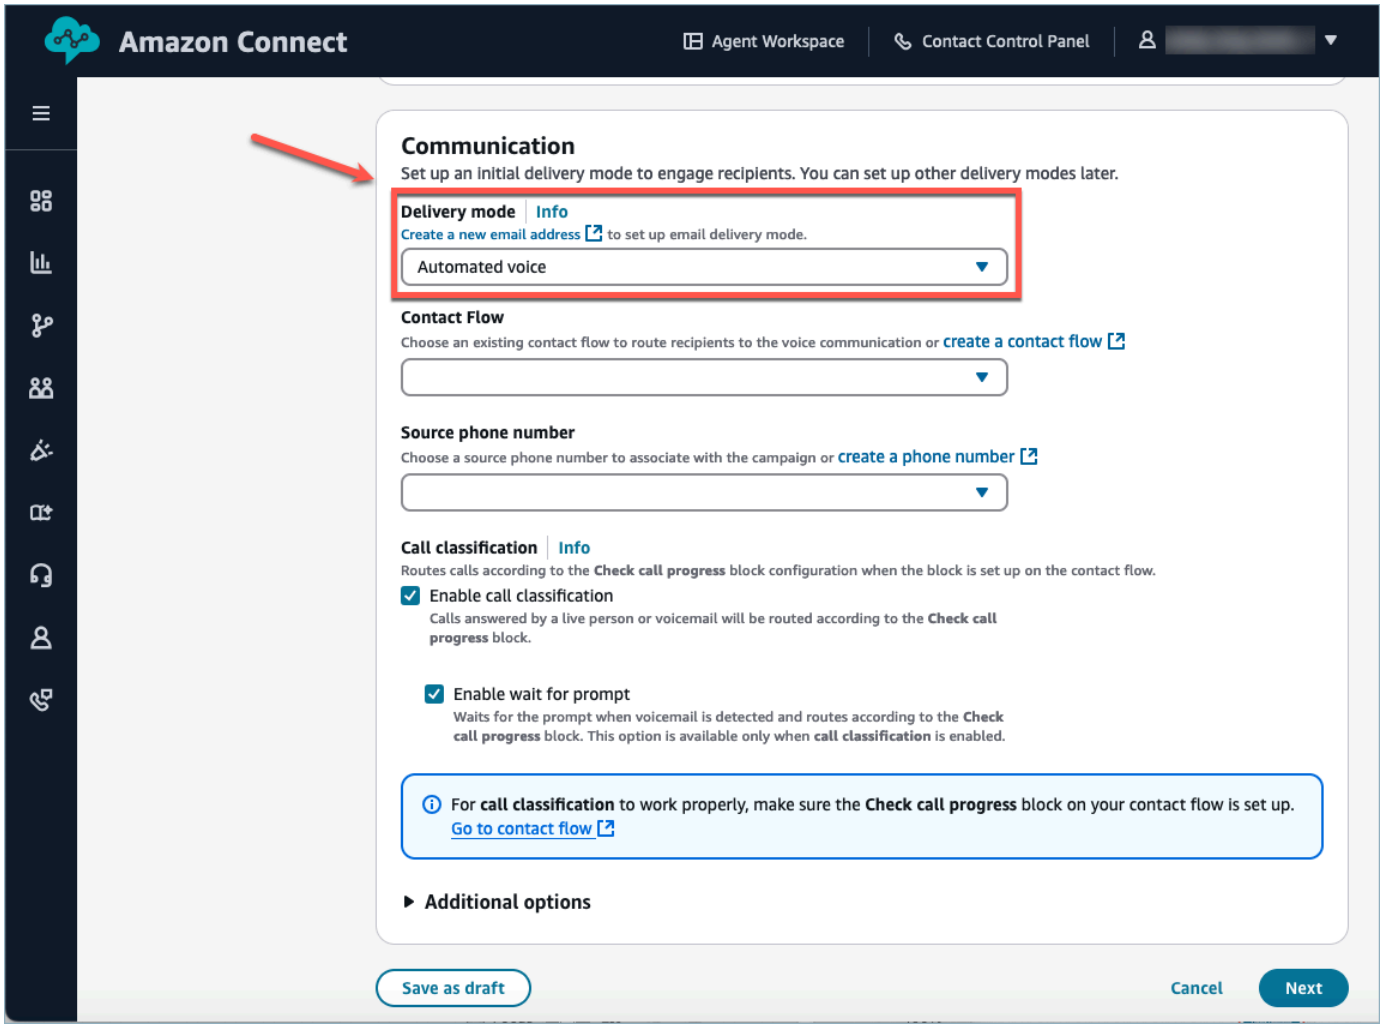


2. Select an **Event source** to specify where the data originates, and configure the attribute conditions that will activate the event trigger.

   Event sources are based on integrations in your Customer Profiles domain. details on setting up your external application, see Integrate with external applications. You can also integrate with Kinesis or S3.

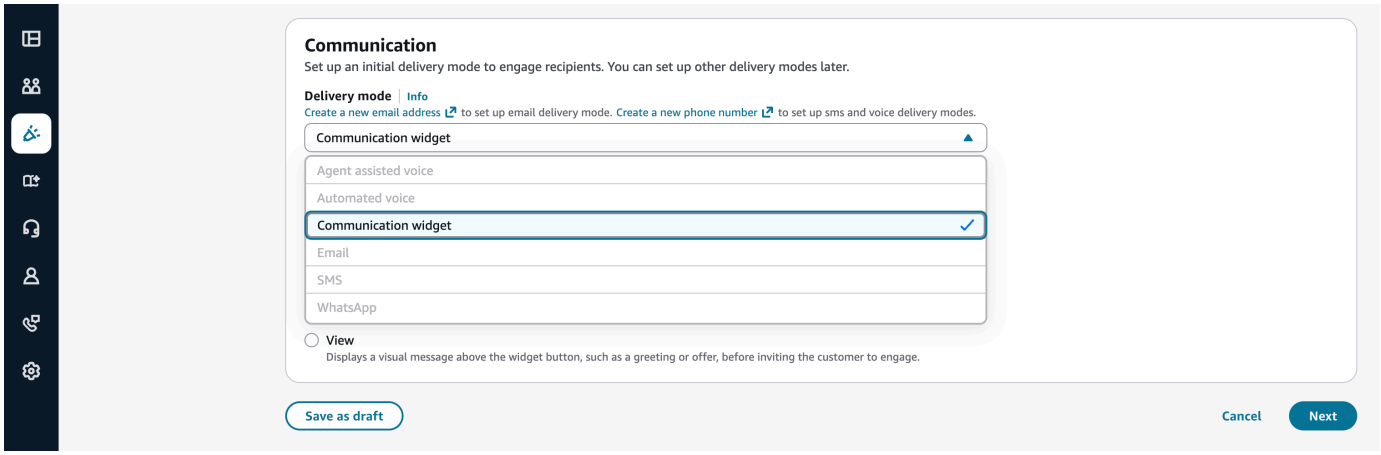


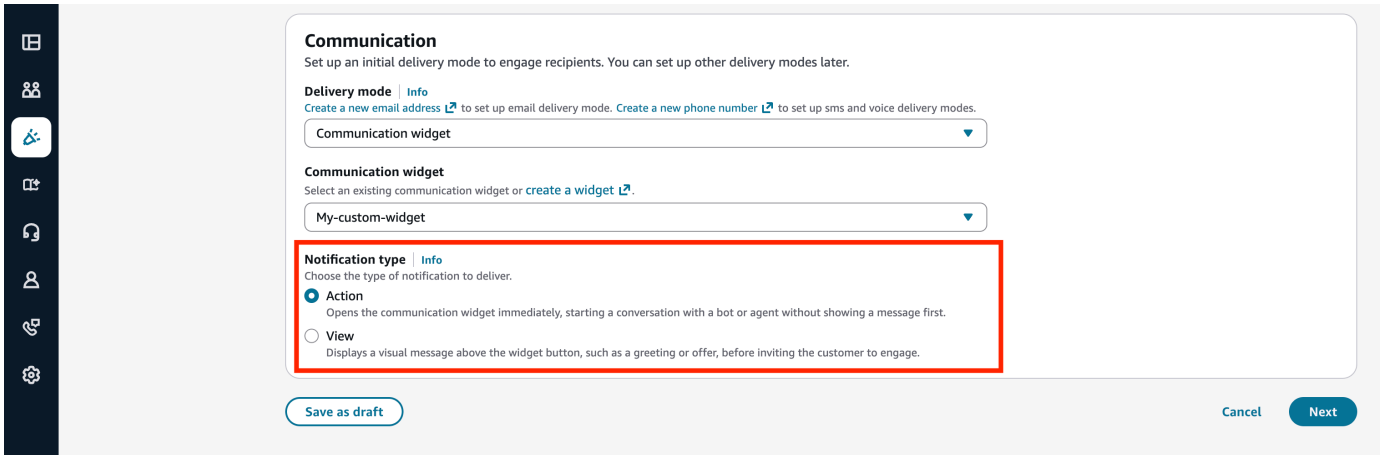
3. Select the **Delivery mode** and additional communication settings.



Important

To create a communication widget campaign, you must have a Customer Profiles integration between your Customer Profiles domain and your instance. The required object type name is `Campaign-WebNotification`. You can do this by choosing the upgrade button in the Connect Customer admin website console by selecting your instance and then going to the **Outbound campaigns** subpage.





There are two notification types to choose from: **View** and **Action**.

View

A **View** notification displays a visual message or prompt above the communication widget button. It presents information to the end user, such as a greeting, offer, or contextual message. The notification invites the end user to engage in a conversation with an agent or bot.

Select **View** when you want to surface a message, promotion, or contextual nudge to the end user before they start a conversation. This gives the end user a moment to read and decide whether to engage.

Examples:

- A proactive banner saying "Hi! We noticed you've been on this page for a while. Need help finding the right plan?"

- A promotional message: "Limited time offer — chat with us to get 20% off your upgrade."
- A contextual nudge: "Having trouble completing your order? We're here to help."

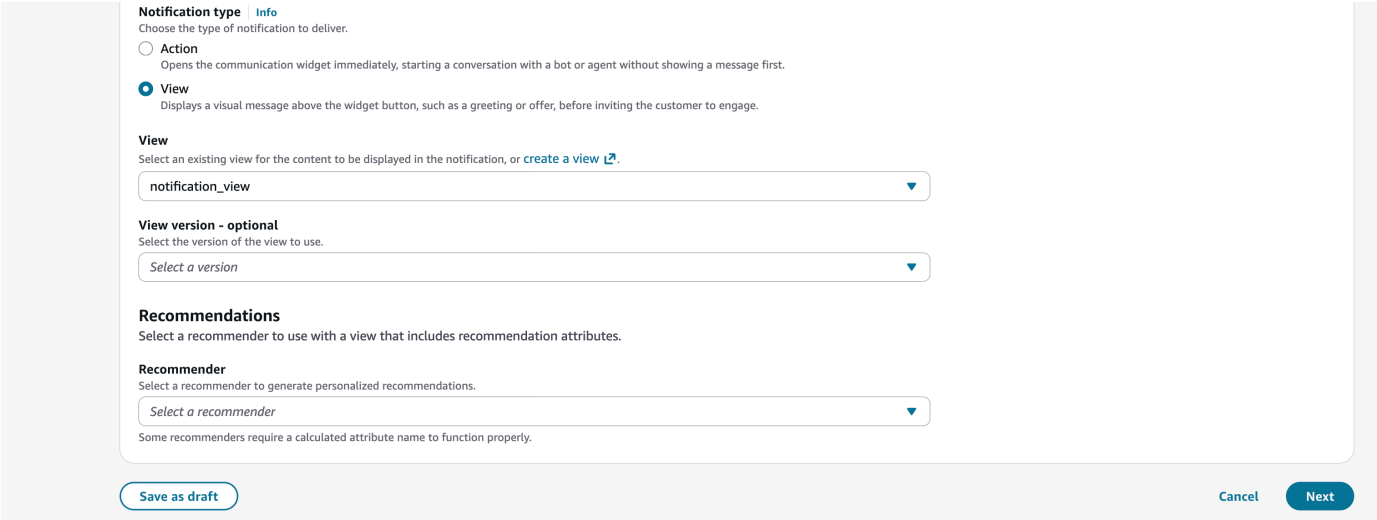
Action

An **Action** notification bypasses any visual message and immediately triggers the communication widget to open, and starts a conversation directly with a bot or human agent.

Select **Action** when you want to skip the notification step entirely and launch the end user straight into a live conversation. No intermediate message is shown.

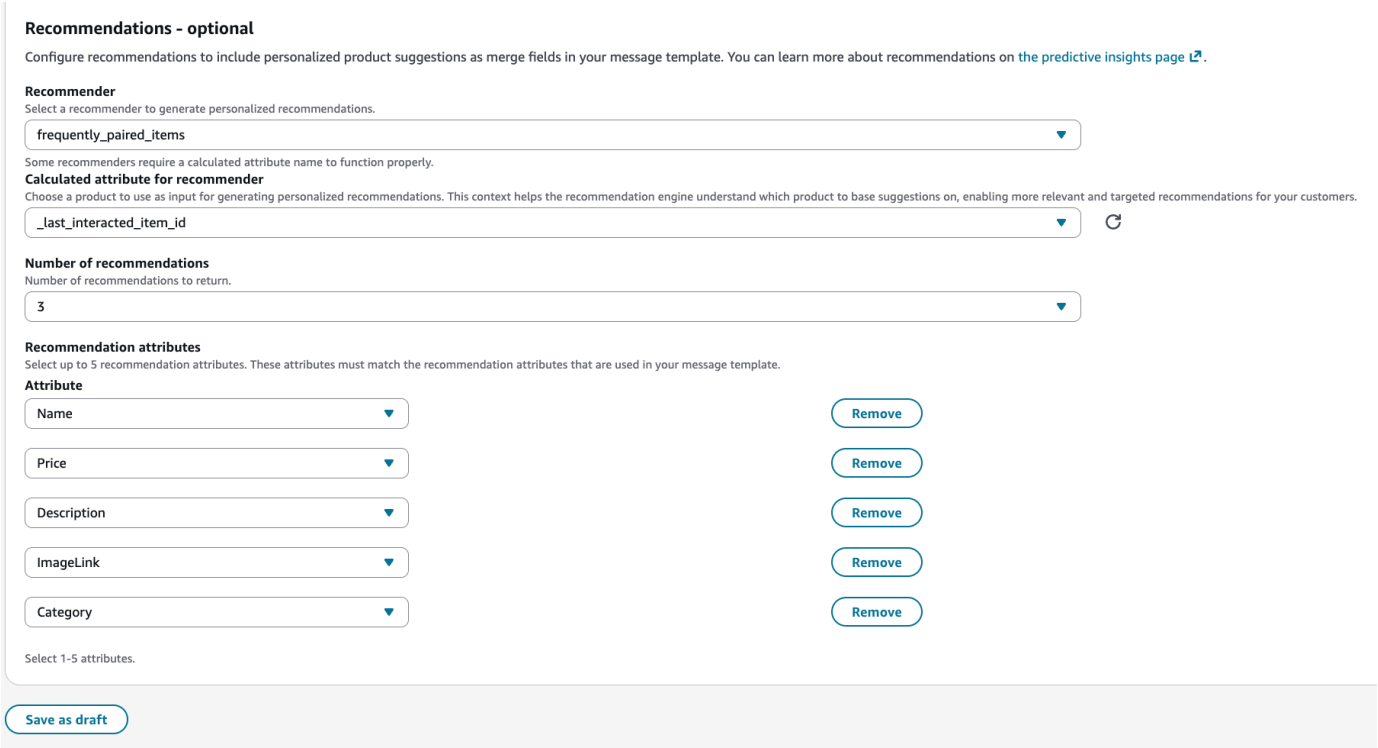
Examples:

- The system immediately connects a high-intent customer on a checkout page to a support agent.
- The system routes a returning customer with an open case directly into a bot flow to check status.
- A VIP customer triggers an instant connection to a dedicated agent upon visiting the help page.



Recommenders are only available when you select the **View** notification type and the selected view has a **Web Notification Service** integration type. If you select the **Action** notification type, or if your selected view does not have this integration, the recommender option does not appear.

4. (Optional) Configure the **Recommendations** section to integrate Predictive Insights with your event-triggered campaign. With Predictive Insights, you can deliver personalized template content through email and SMS channels.



Configure the following settings:

- **Recommender name** – Select the name of the recommender you want to use to generate recommendations for the profiles associated with the campaign. You can only use recommenders that are active to generate recommendations.

  Predictive Insights offers several types of recommendations. For more information, see Step 3: Creating Predictive Insights.

- **Calculated Attribute for recommender** – This setting is only required when using a *Similar items* or *Frequently paired items* recommender type. This context helps the recommendation engine understand which product to base suggestions on, enabling more relevant and targeted recommendations for your customers.

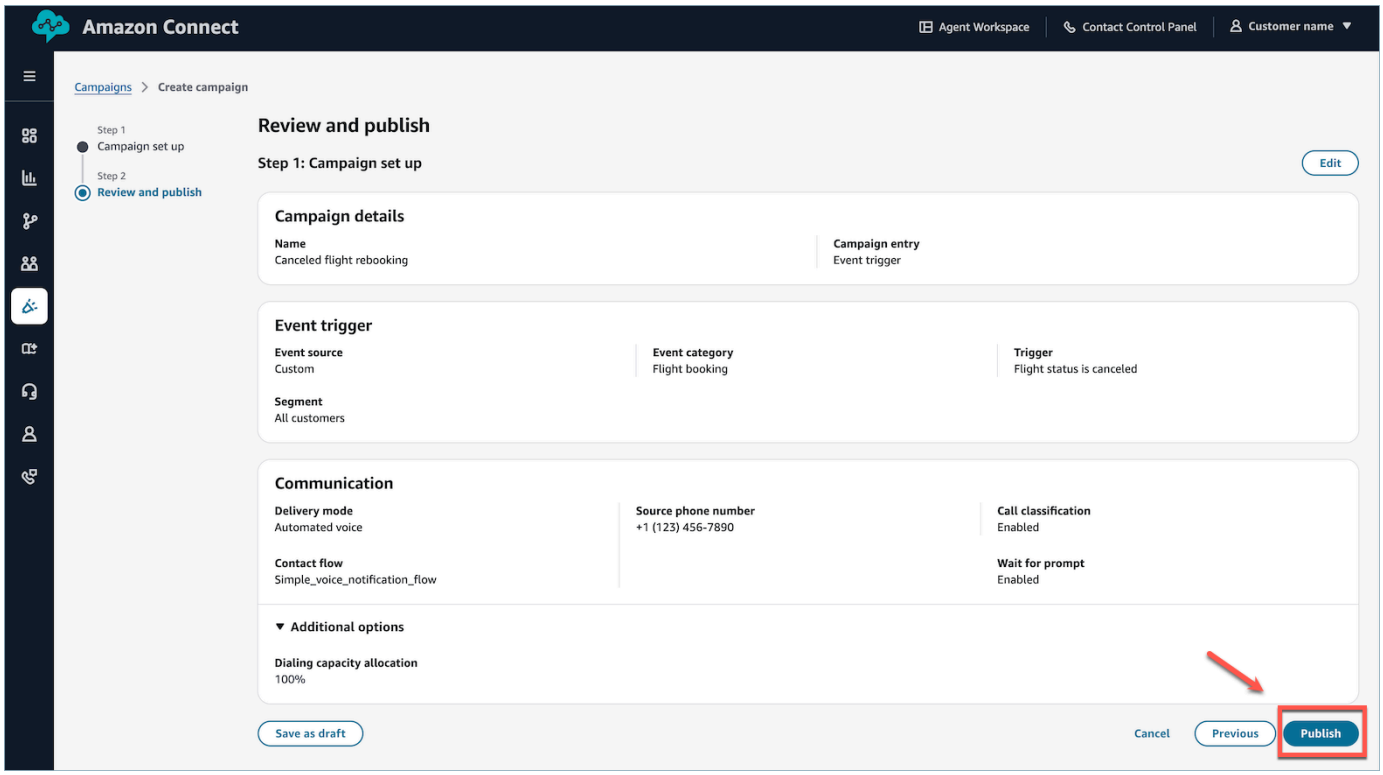
  For example, you might use a calculated attribute like `_last_interacted_item_id` that captures the purchased item ID.

- **Number of recommendations** – The maximum number of recommendations to generate for a profile. This can range between 1 to 3 recommendations.

- **Recommendation attributes** – Define which attributes of the recommendations response are used in your message template.

For more information about Predictive Insights, see Get started with Predictive Insights.

5. Verify your configurations and choose **Publish**.



Create outbound campaigns with event triggers using APIs

Connect Customer Customer Profiles event trigger APIs

- Two API calls are made to create a functioning event trigger:
  - CreateEventTrigger: Defines which action to perform based on a specified condition.
  - PutIntegration: Defines the action to use.

Example of an event trigger request:

```
{
    "Description": "string",
    "EventTriggerConditions": [
```

```
        {
            "EventTriggerDimensions": [
                {
                    "ObjectAttributes": [
                        {
                            "ComparisonOperator": "string",
                            "FieldName": "string",
                            "Source": "string",
                            "Values": [ "string" ]
                        }
                    ]
                }
            ],
            "LogicalOperator": "string"
        }
    ],
    "EventTriggerLimits": {
        "EventExpiration": number,
        "Periods": [
            {
                "MaxInvocationsPerProfile": number,
                "Unit": "string",
                "Unlimited": boolean,
                "Value": number
            }
        ]
    },
    "ObjectTypeName": "string",
    "SegmentFilter": "string",
    "Tags": {
        "string" : "string"
    }
}
```

The `ComparisonOperator` supports the following values:

ComparisonOperator	Comment	Supported type
INCLUSIVE	Checks if the target includes all the specified values.	String

ComparisonOperator	Comment	Supported type
EXCLUSIVE	Checks if the target does not contain all the specified values.	String
CONTAINS	Checks if the target contain any of the specified values.	String
BEGINS_WITH	Checks if the target begins with the specified value.	String
ENDS_WITH	Checks if the target ends with the specified value.	String
GREATER_THAN	True if the target is greater than the specified value.	Number
LESS_THAN	True if the target is less than the specified value.	Number
GREATER_THAN_OR_EQUAL	True if the target is greater than or equal to the specified value.	Number
LESS_THAN_OR_EQUAL	True if the target is less than or equal to the specified value.	Number
EQUAL	True if the target is equal to the specified value.	Number
BETWEEN	True if the target is within specific value range or timestamp.	Number/Date*
NOT_BETWEEN	True if the target is not within specific value range or timestamp.	Number/Date*
BEFORE	True if the target is before the specified timestamp.	Date
AFTER	True if the target is after the specified timestamp.	Date

ComparisonOperator	Comment	Supported type
ON	True if the target is on the specified timestamp.	Date

- **Source**: Used to define an attribute in the object.
  - Only one attribute is allowed in a single `ObjectAttribute` entry.
- **FieldName**: Used to point to the mapped attribute in Data Mapping.
  - Only one attribute is allowed in a single `ObjectAttribute` entry.
- **ObjectTypeName**: Supports all default and custom object type names, but not standard object types, such as `_profile`, `_asset`, `_order`, and others.
- **EventTriggerLimits**:
  - Allow max of concurrent 20 event triggers per customer domain by default.
  - Default limit of 10 invocations per day, per profile, per trigger. You can override this by specifying `UNLIMITED` in `MaxInvocationPerProfile`.
  - **MaxInvocationPerProfile**:
    - Valid Range: Minimum value of 1. Maximum value of 1000. (or `UNLIMITED`)
  - Unit:
    - Valid Values: HOURS, DAYS, WEEKS, MONTHS
  - Value:
    - Valid Range: Minimum value of 1. Maximum value of 24
- Time range comparison
  - Customer Profiles uses standard libraries to parse time values. For global services, it is important to account for timezone conversions to ensure accurate processing.
- The `EventExpiration` value is specified in milliseconds. When used to trigger a campaign, the maximum expiration time is capped at 15 minutes.

Outbound campaigns event trigger APIs

- **CreateCampaignV2**

  The only changes needed for creating an event triggered campaign are the highlighted fields. The rest of the fields are the same as Scheduled Campaigns.

```
{
    "name": "string",
    "connectInstanceId": "string",
    "channelSubtypeConfig": {
    // or other channel parameters
        "email": {
            "outboundMode": {
                "agentless":{
                }
            },
            "defaultOutboundConfig":{
                "connectSourceEmailAddress":"example@example.com",
                "wisdomTemplateArn":"arn:aws:wisdom:us-west-2:123456789012:message-
template/dXXXXX0Pc8-195a-776f-0000-EXAMPLE/51219d5c-b1f4-4bad-b8d3-000673332",
                "sourceEmailAddressDisplayName": "testEmailDisplayName"
            }
        }
    },
    "connectCampaignFlowArn": <Flow ARN>,
    "schedule": {
            "endTime": "2024-12-11T21:22:00Z",
            "startTime": "2024-10-31T20:14:49Z",
            "timeZone": "America/Los_Angeles"
    },
    "source": {
        "eventTrigger": {
            "customerProfilesDomainArn": <Domain ARN>
}
```

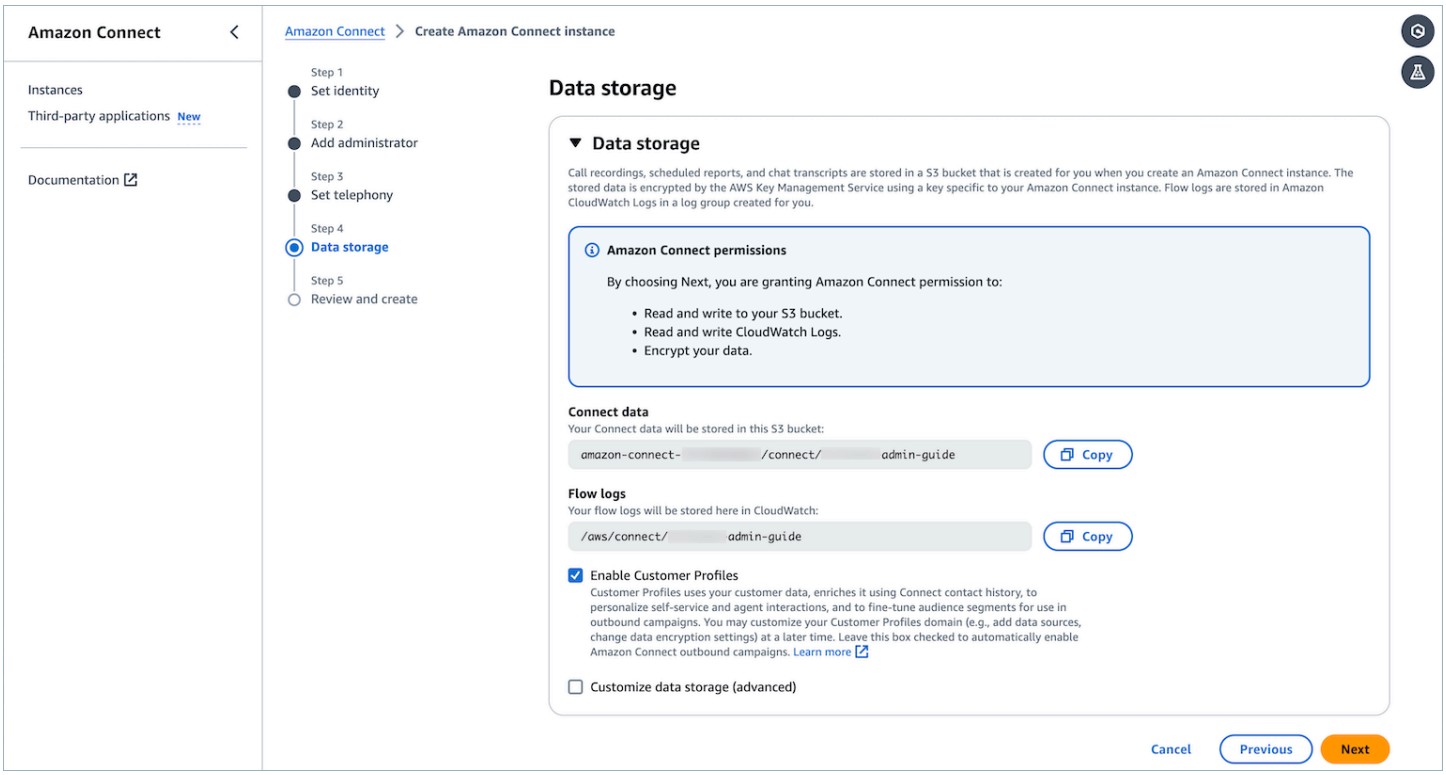
- **PutProfileOutboundRequestBatch**

  You are not able to directly invoke this API, but it will be logged within your Cloudtrail logs. This API is used to trigger a campaign after receiving an event, and is the mechanism that initiates a voice call, email, or SMS.

Enable outbound campaigns and Customer Profiles

To enable Connect Customer Customer Profiles and Connect Customer outbound campaigns

1. When creating a Connect Customer instance, when you get to **Step 4 - Data storage**, keep **Enable Customer Profiles** selected, as shown in the following image. This option enables Connect Customer Customer Profiles and outbound campaigns.

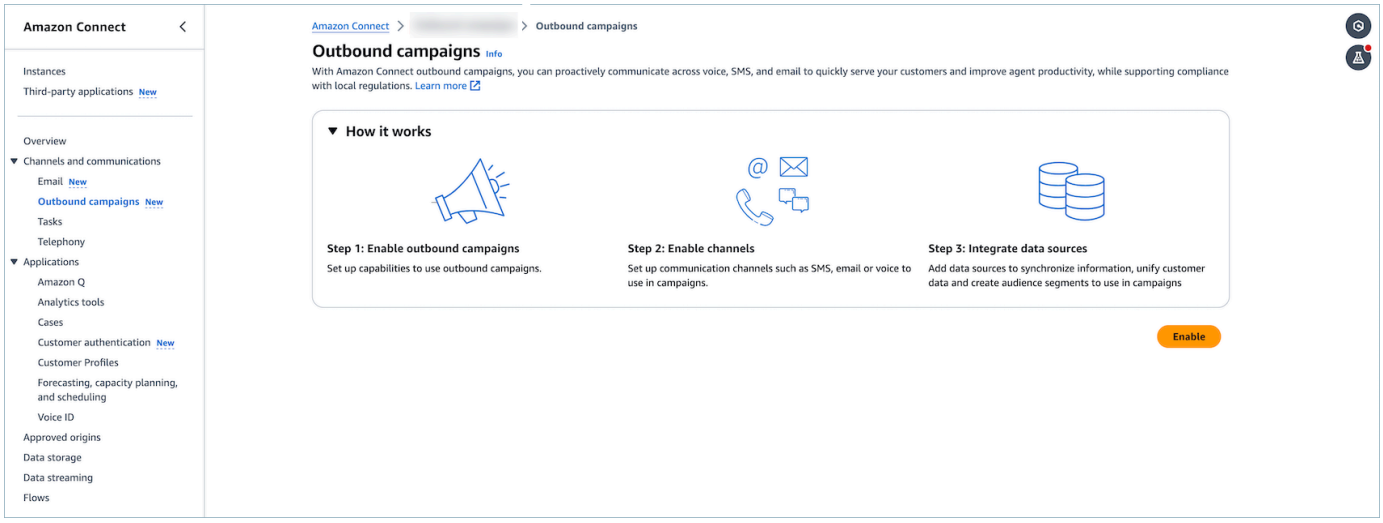


2. Select **Customize data storage (advanced)** to select a customer managed key for Customer Profiles and outbound campaigns from a dropdown list. An AWS owned key is used if you don't provide a custom key.
3. When a Connect Customer instance is created successfully, outbound campaigns and Customer Profiles is enabled by default.

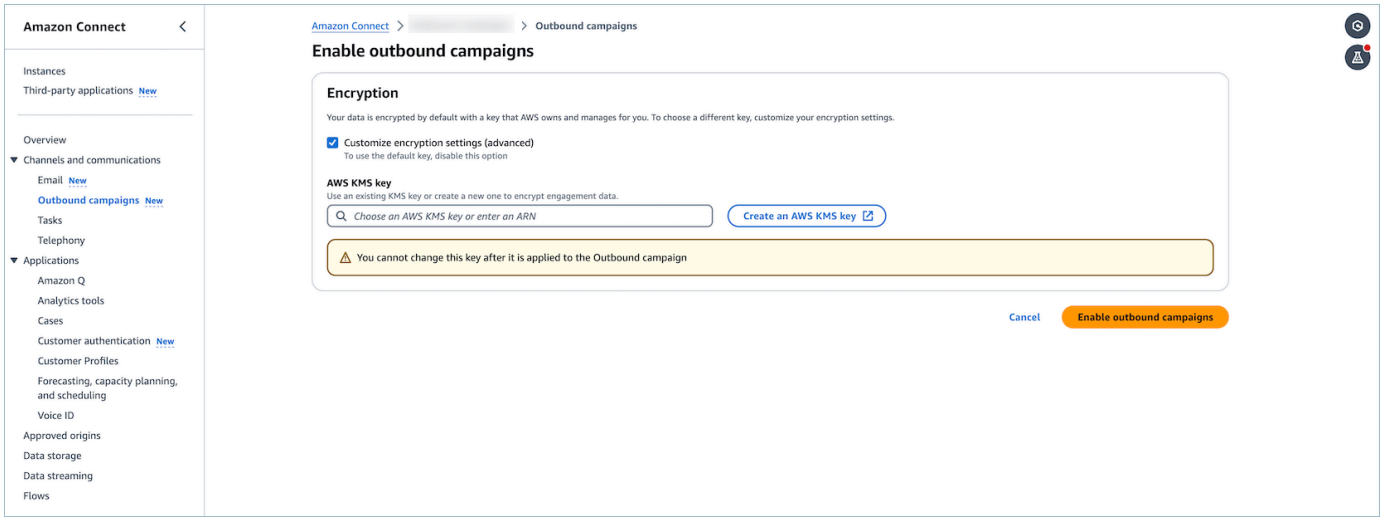
Existing customers enable outbound campaigns

To enable Connect Customer Outbound campaigns

1. Select the Connect Customer instance you wish to enable outbound campaigns for.
2. Choose **Outbound campaigns** in the left navigation pane.
3. If you are setting up outbound campaigns for the first time, you will see an **Enable** button.



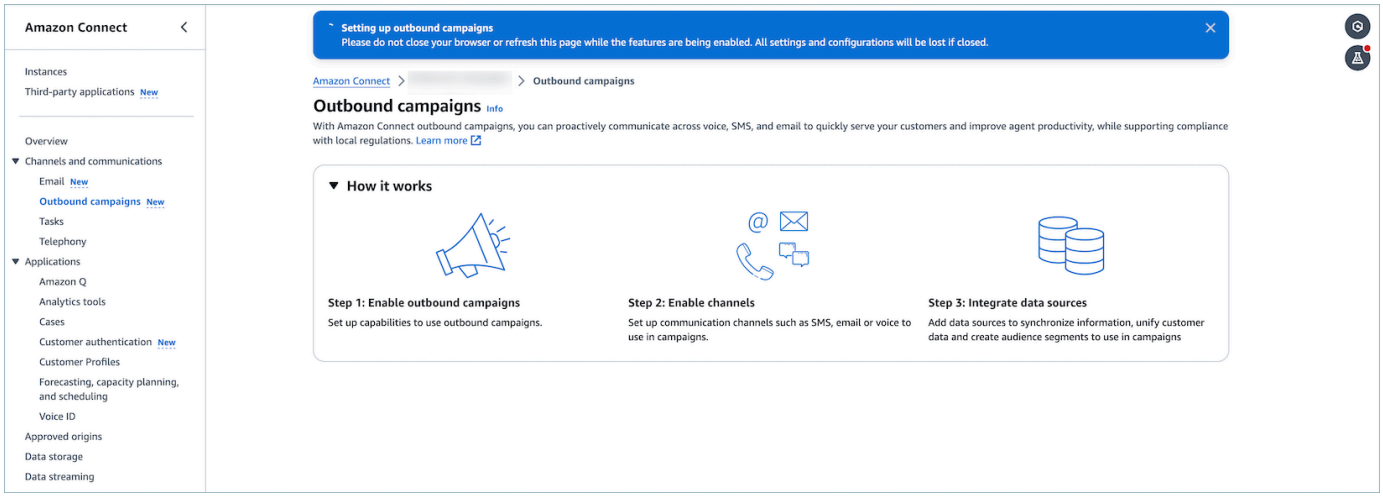
4. Choose **Enable** to go to the KMS configuration page for outbound campaigns.



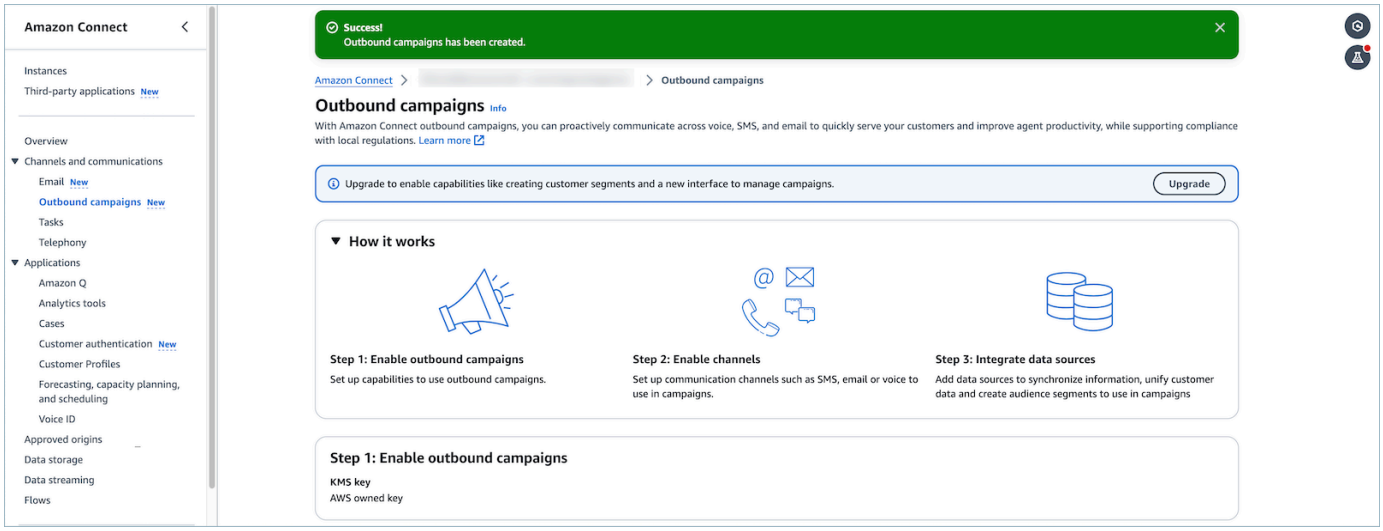
> **Note**
>
> The KMS configuration will only be used for the outbound campaigns configuration and the KMS key cannot be updated after it is created.

5. Choose **Enable outbound campaigns**. Upon enabling outbound campaigns, a Customer Profiles domain, and an agent assist knowledge base with KnowledgeType `MESSAGE_TEMPLATES` will be created if none existed previously.

6. You will be redirected to the home page and see a notification bar indicating that resources are being created.



7. A success banner will be display upon successfully enabling outbound campaigns.

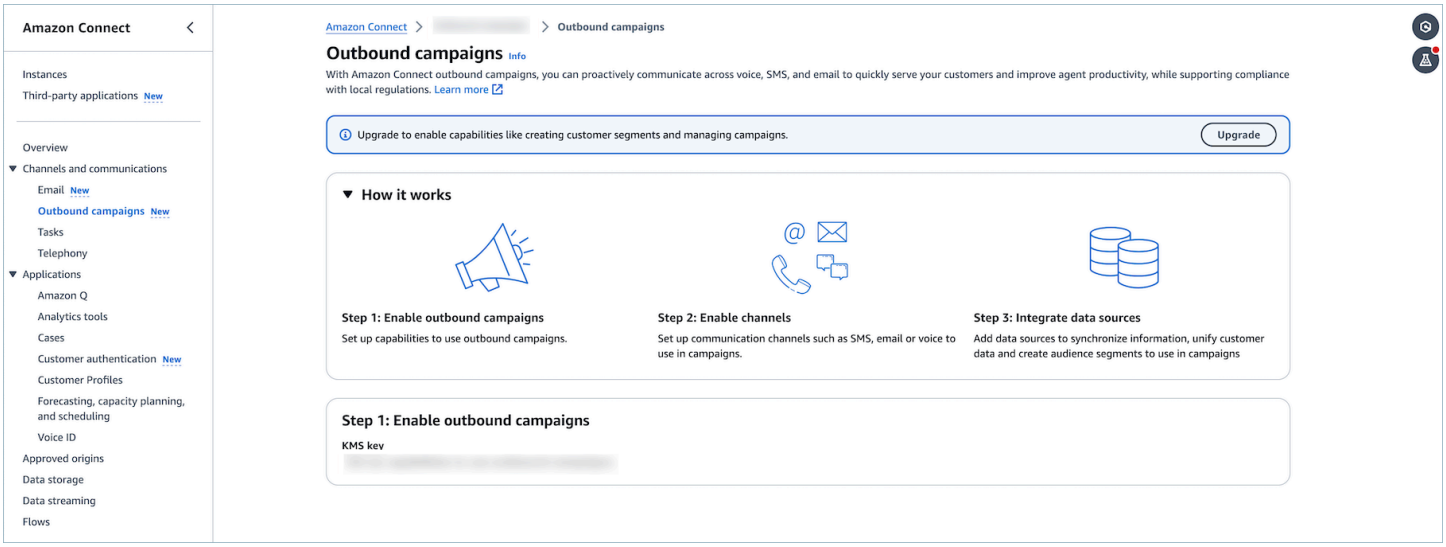


8. After successfully enabling an outbound campaign, and configuring a KMS key, the KMS (AWS Key Management Service) key that was previously selected for the campaign will be displayed.
9. Choose **Manage email** to be redirected to the AWS Connect Email console. In the AWS Connect Email console, you can set up and configure your email domain, including verifying the domain, creating email addresses, and managing email sending and receiving settings.
10. Choose **Manage SMS** to be directed to the AWS End User Messaging SMS console. In the AWS End User Messaging SMS, you can configure and set up SMS phone numbers for your application, including purchasing numbers, managing sender IDs, and configuring SMS messaging settings.
11. Choose **Manage voice** to be redirected to the Connect Customer admin website. In the Connect Customer admin website, you can claim and manage voice phone numbers for your contact center, set up call routing, and configure various voice-related features.

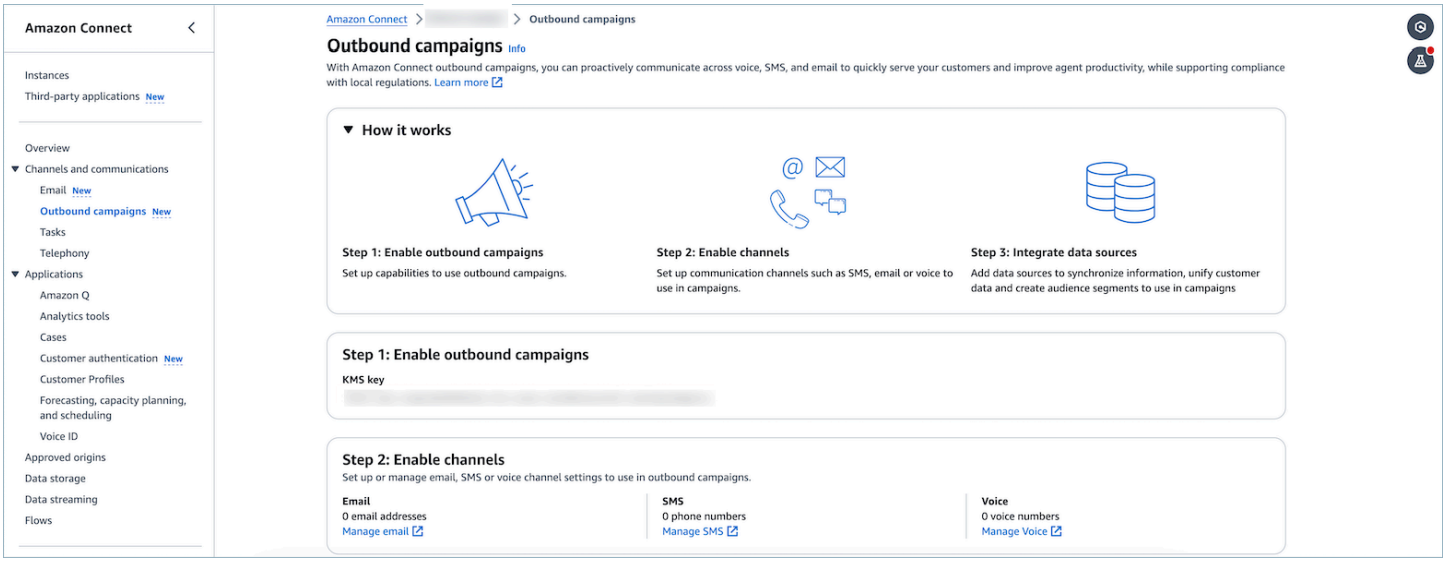
To upgrade outbound campaigns if you have a Connect Customer instance with outbound campaigns enabled

1. Select the Connect Customer instance you wish to upgrade outbound campaigns for.
2. Choose **Outbound campaigns**.
3. If outbound campaigns was previously enabled, the **Upgrade** button will be displayed.

> **Note**
>
> - By upgrading outbound campaigns, you can use segmentation and orchestration capabilities in the Connect Customer admin website
> - Upgrading outbound campaigns will update the current outbound campaigns page to new experience.



3. Choose **Upgrade**.



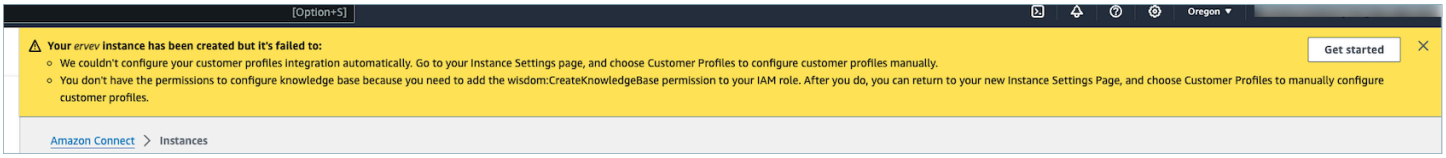
4. After successfully upgrading an outbound campaign, the KMS (AWS Key Management Service) key that was previously selected for the campaign will be displayed.
5. Choose **Manage email** to be redirected to the Connect Customer Email console. In the Connect Customer Email console, you can set up and configure your email domain, including verifying the domain, creating email addresses, and managing email sending and receiving settings.
6. Choose **Manage SMS** to be directed to the Amazon End User Messaging console. In the End User Messaging console, you can configure and set up SMS phone numbers for your application, including purchasing numbers, managing sender IDs, and configuring SMS messaging settings.
7. Choose **Manage voice** to be redirected to the Connect Customer admin website. In the Connect Customer admin website, you can claim and manage voice phone numbers for your contact center, set up call routing, and configure various voice-related features.

How to delete Outbound campaigns configuration

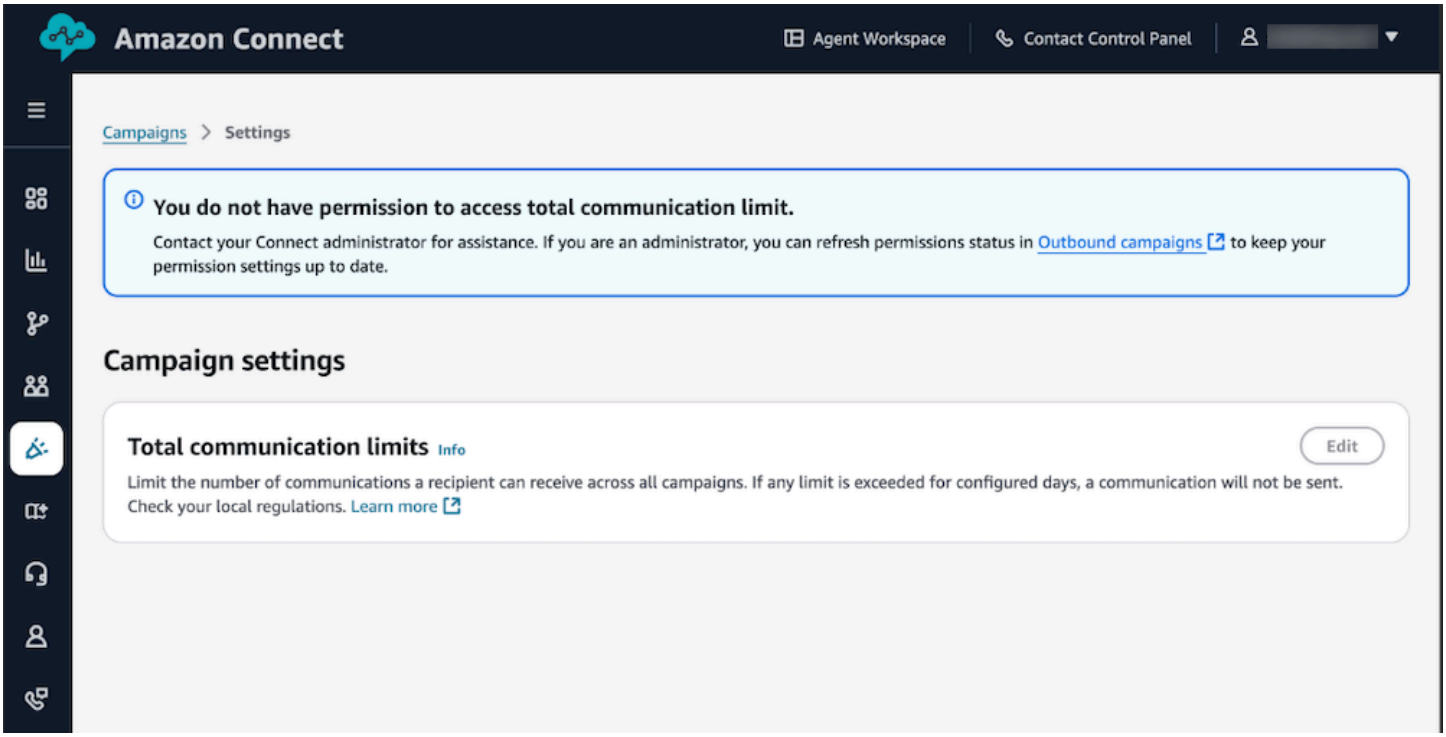
You can delete the Outbound campaigns configuration by using the Outbound campaigns `DeleteConnectInstanceConfig` API. The option to toggle the Outbound campaigns configuration on/off has been removed. The only way to turn off the Outbound campaigns feature in the UI is to delete your Connect Customer instance.

Error state and troubleshooting

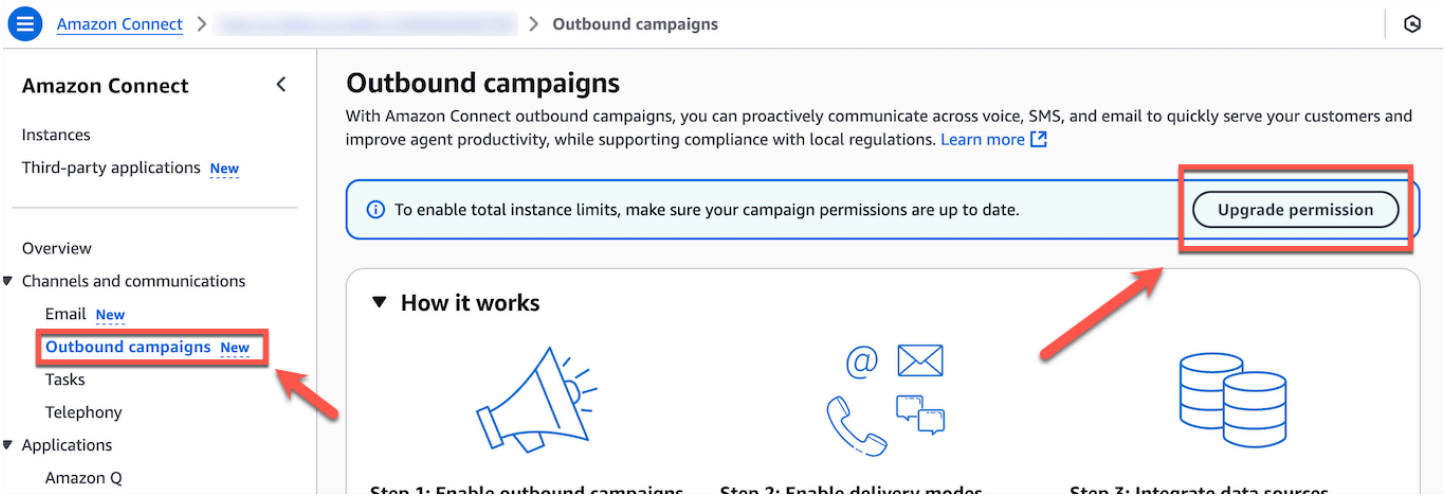
When creating instance if you see a warning banner, you are either missing some permissions to enable these features or some failed to be created. You can configure those permissions at a different time.



If you navigate to the Outbound campaigns **Settings** page and see the following banner, you do not have the required permissions to access total communications limits.



To enable total limits permissions, you can navigate to the Connect Customer admin website and under **Outbound campaigns**, choose **Upgrade permission**.



Error message	Cause	Resolution	Screenshot
Already associated with another customer profiles domain, cannot be associated with multiple domains.	An Outbound campaign can only be associated to one customer profile or one knowledge base at a time.	You can either use the associated Customer Profiles domain, go back to the Customer Profiles domain page, and re-associate the domain, or you can find out which domain is associated by using the `connect-campaign:ListConnectInstanceIntegrations` API to find the Customer Profiles domain Arn. If needed, you can delete the integration between Outbound campaigns and Customer Profiles and re-associate it by deleting the integration by using the `connect-campaigns:DeleteConnectInstanceIntegration` API.	

Error message	Cause	Resolution	Screenshot
Outbound campaigns has been created. However, some features might not work as expected. Please check your settings and try again.	A resource failed to configure correctly . However, some resources succeeded . The error message will help indicate to the customer what went wrong.	Follow the instructi ons on the warn/erro r banner.	

Enable email campaigns for your Connect Customer instance

This topic is for administrators who have access to the Connect Customer console. It explains how to enable email campaigns for your instance using the console. For the APIs used to enable email campaigns programmatically, see APIs to enable email for campaigns.

When you enable email, you get an autogenerated email domain. Optionally, you can also use custom domains.

- **Connect Customer email domain**. The email domain is *`instance-alias`.email.connect.aws*.
- **Custom domains**. You can specify up to 5 custom domains that have been onboarded to Amazon SES.

Step 1: Move Amazon SES into production mode

Connect Customer uses Amazon SES for sending emails. If you have a new Amazon SES instance, you need to take it out of sandbox mode. For instructions, see Request production access (Moving out of the Amazon SES sandbox) in the *Amazon SES Developer Guide*.

After you move Amazon SES into production mode, if you already enabled email when you created your Connect Customer instance, skip to these topics:

- (Optional) Step 4: Use your own custom email domains
- Step 5: Configure a CORS policy on your attachments bucket

Otherwise, proceed to Step 2.

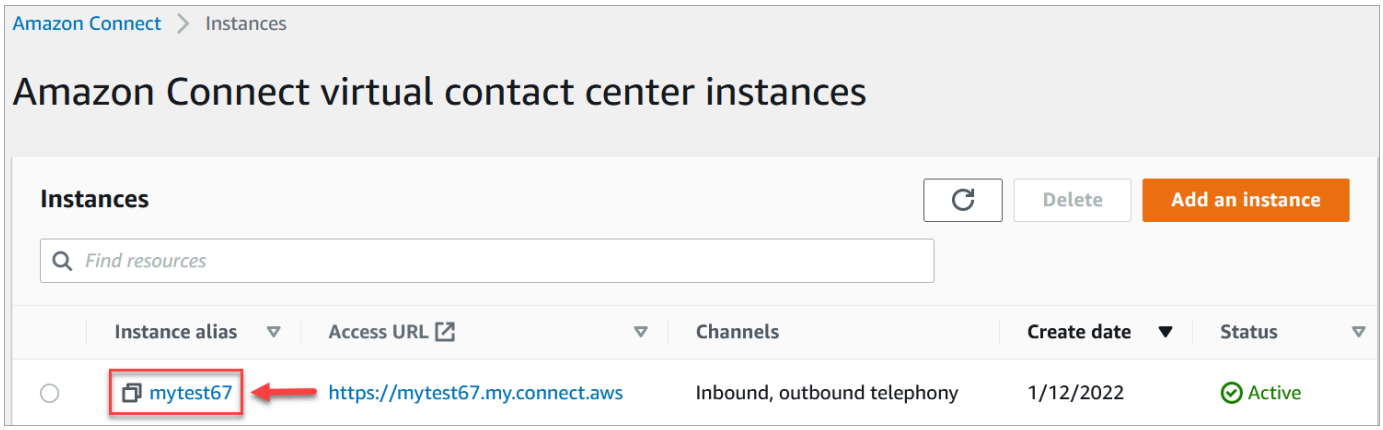
Step 2: Enable email and create an Amazon S3 bucket for storing email and attachments

These steps apply only if you already created a Connect Customer instance but didn't enable email.

You need to update your **Data storage** settings to enable sending email campaigns and specify the Amazon S3 bucket where email messages and attachments are to be stored. Email requires two Amazon S3 bucket pointers. They can be to the same Amazon S3 bucket or two different buckets.

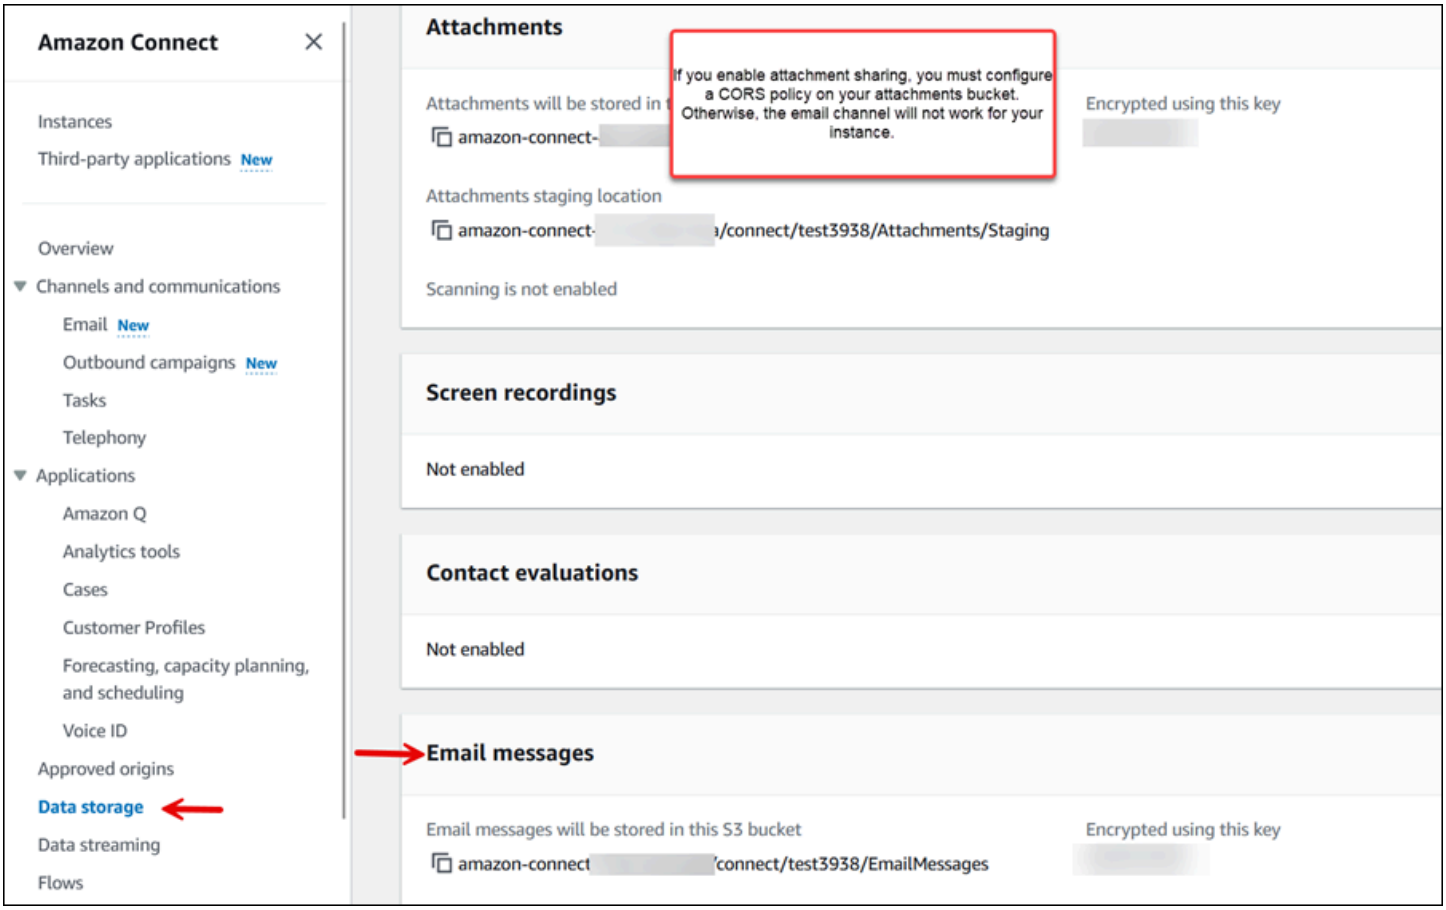
> **Important**
>
> If you choose **Enable Attachments sharing** for your instance, you must create an Amazon S3 bucket and configure a CORS policy on your attachments bucket, as described in this topic. If you don't do this, **email will not work for your instance**.

1. Open the Connect Customer console at https://console.aws.amazon.com/connect/.
2. On the instances page, choose the instance alias. The instance alias is also your **instance name**, which appears in your Connect Customer URL. The following image shows the **Connect Customer virtual contact center instances** page, with a box around the instance alias.



3. On the left navigation menu, choose **Data storage**, and then choose **Enable email**. If you want to allow email attachments, choose **Attachments** as well.

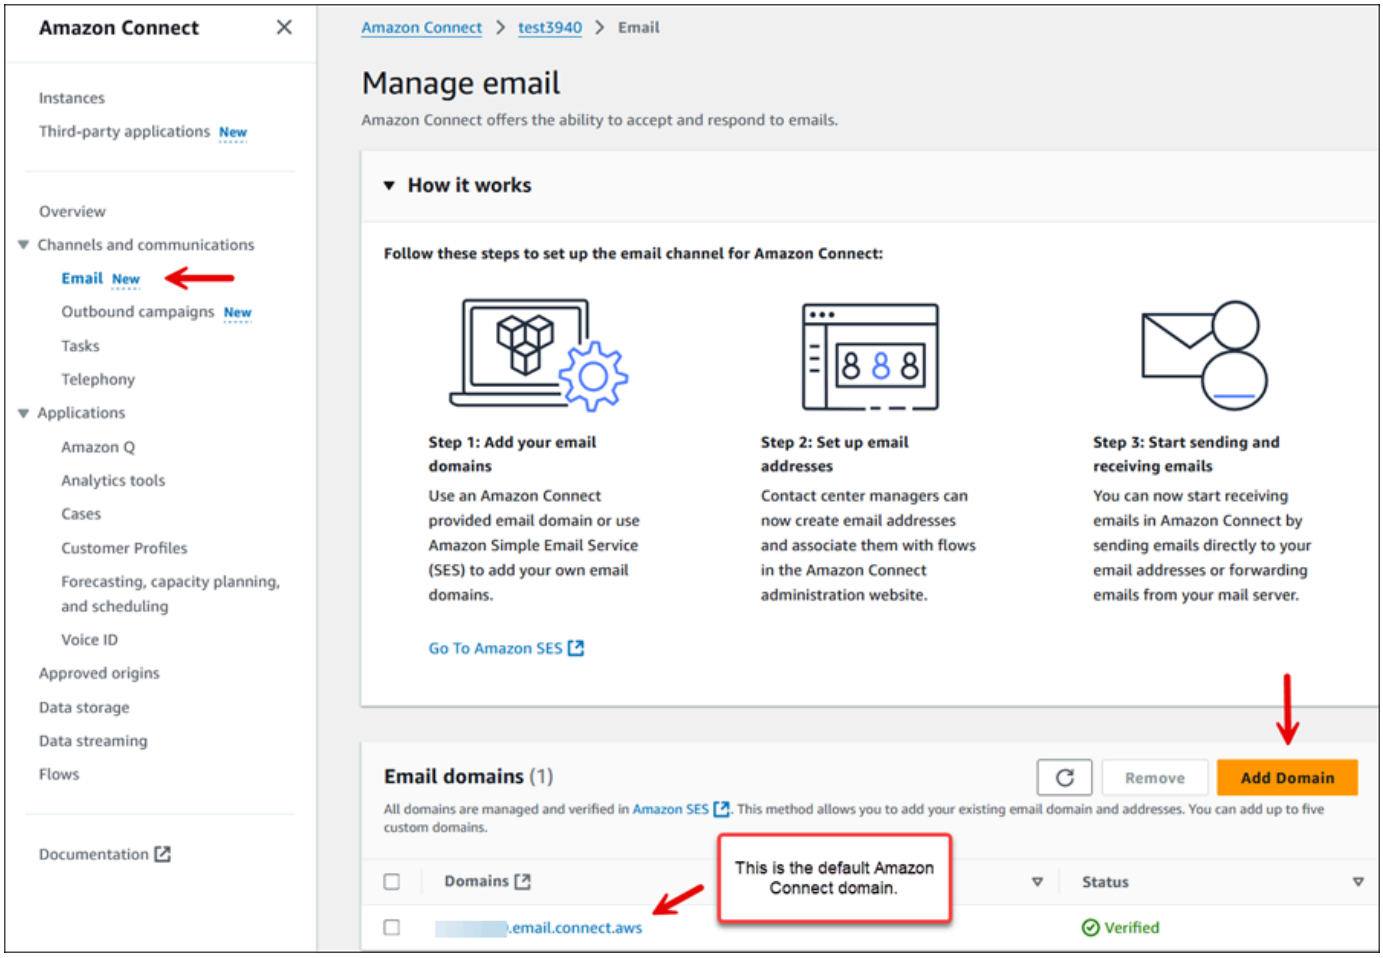
The following image of the **Data storage** page shows the Amazon S3 bucket for email messages and attachments.



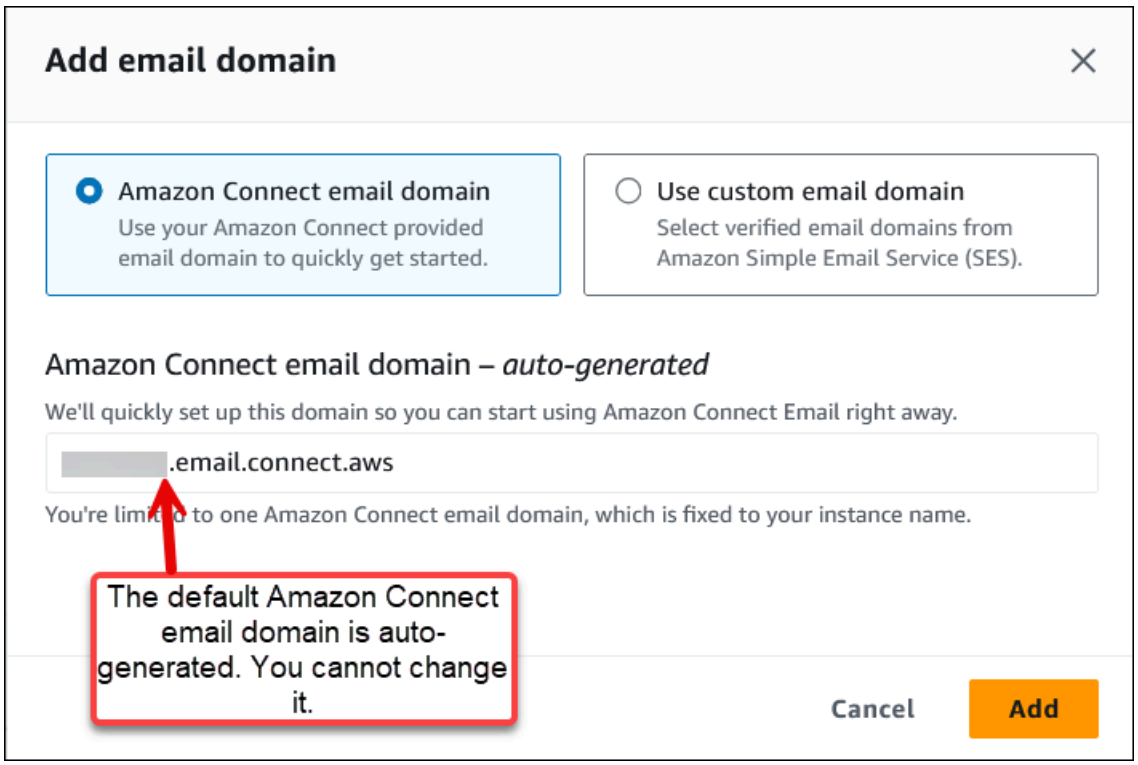
Step 3: Get a Connect Customer email domain

These steps apply only if you already created a Connect Customer instance but didn't enable email. Complete these steps to get an email domain from Connect Customer.

1. In the Connect Customer console, on the left navigation menu, choose **Email**, and then choose **Add Domain** as shown in the following image.



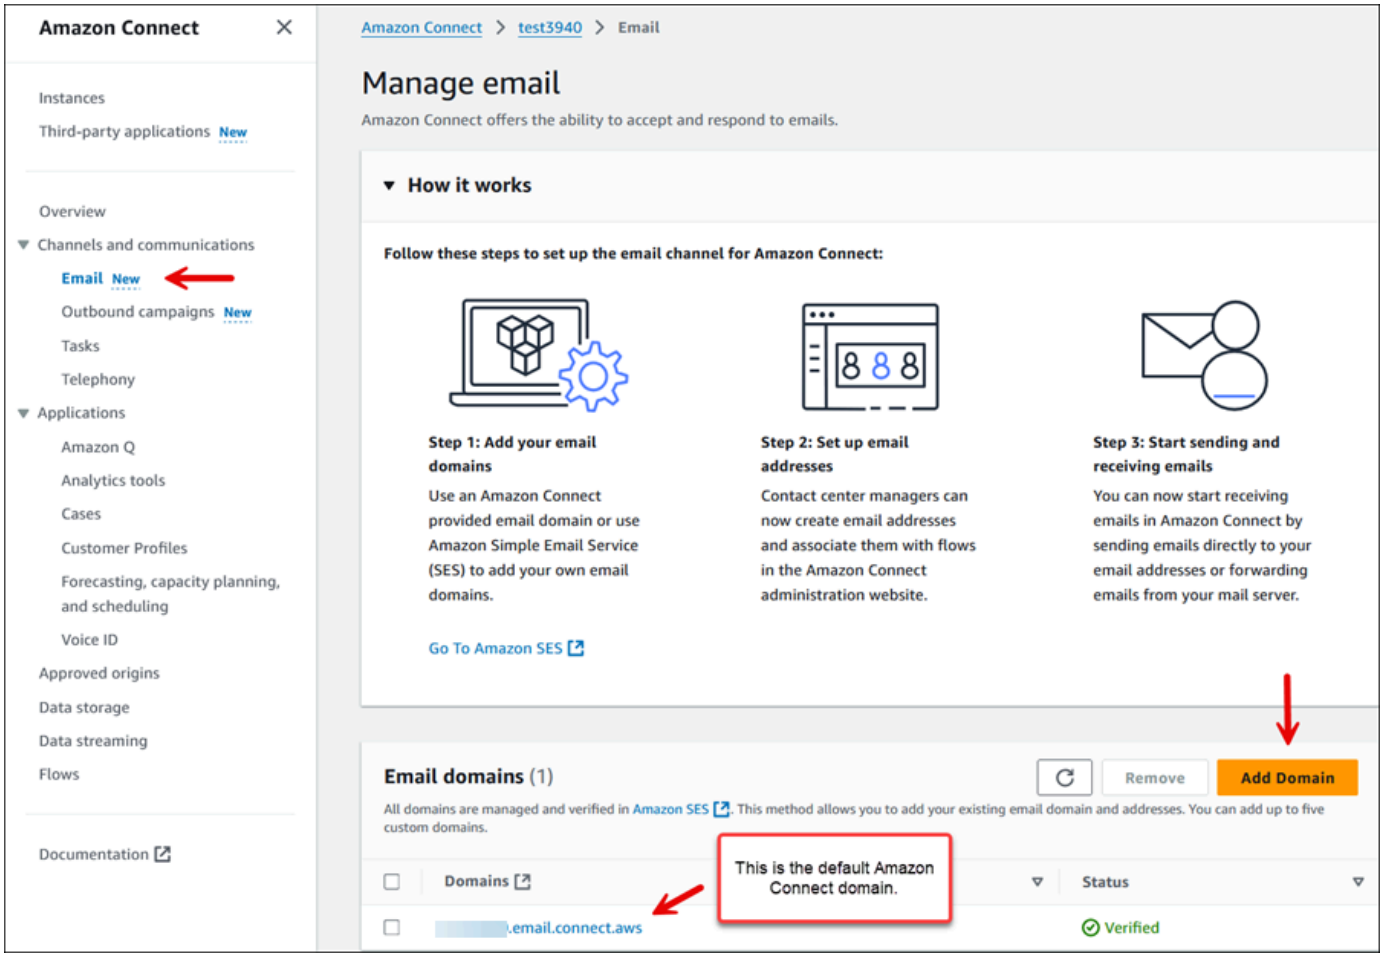
2. In the **Add email domain** box, choose **Connect Customer email domain**, as shown in the following image. When you choose this option, the name of the domain is autogenerated: *`instance-alias`.email.connect.aws*. You cannot change this email address.



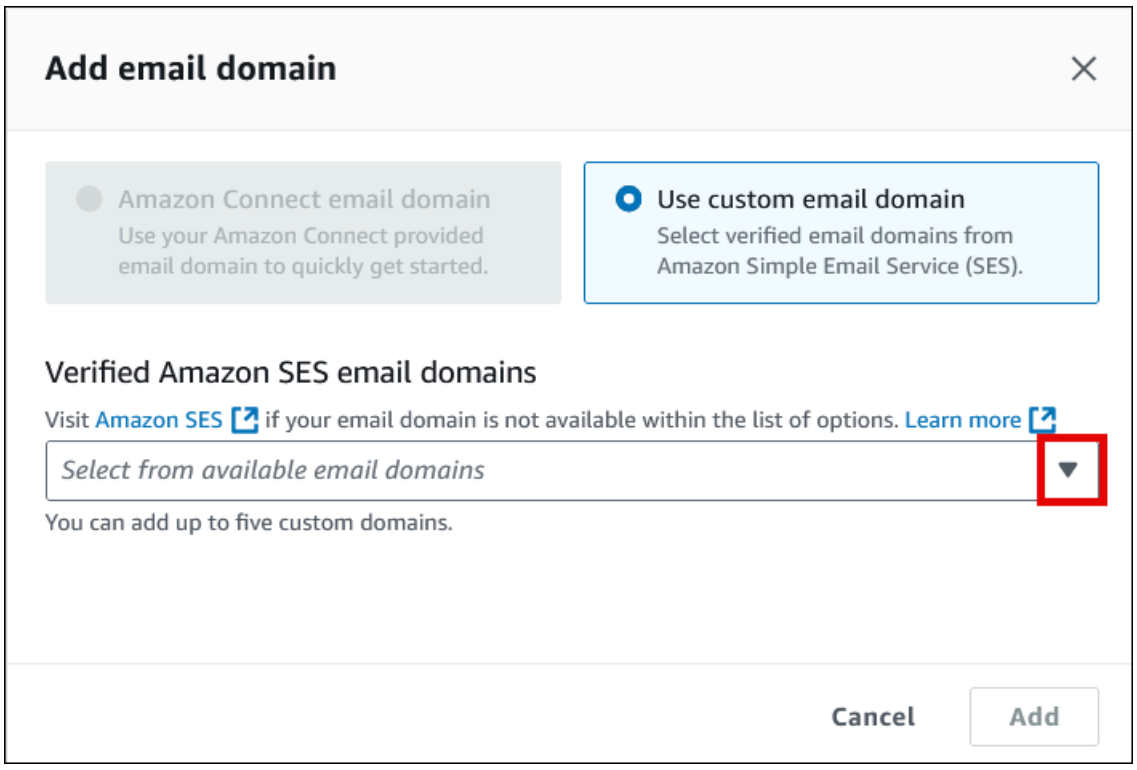
(Optional) Step 4: Use your own custom email domains

You can import up to five custom domains that have been onboarded to Amazon SES.

1. In the Connect Customer console, on the left navigation menu, choose **Email**, and then choose **Add Domain** as shown in the following image.



2. Choose **Use custom email domain**. Use the dropdown box to choose custom domains that have been verified by Amazon SES.



Step 5: Configure a CORS policy on your attachments bucket

To allow customers and agents to upload and download files, update your cross-origin resource sharing (CORS) policy to allow PUT and GET requests for the Amazon S3 bucket you are using for attachments. This is more secure than enabling public read/write on your Amazon S3 bucket, which we don't recommend.

To configure CORS on the attachments bucket

1. Find the name of the Amazon S3 bucket for storing attachments:
   a. Open the Connect Customer console at https://console.aws.amazon.com/connect/.
   b. In the Connect Customer console, choose **Data storage**, and locate the Amazon S3 bucket name.
2. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
3. In the Amazon S3 console, select your Amazon S3 bucket.
4. Choose the **Permissions** tab, and then scroll down to the **Cross-origin resource sharing (CORS)** section.

5. Add a CORS policy that has one of the following rules on your attachments bucket. For example CORS policies, see Cross-origin resource sharing: Use-case scenarios in the *Amazon S3 Developer Guide*.

   - Option 1: List the endpoints from where attachments will be sent and received, such as the name of your business web site. This rule allows cross-origin PUT and GET requests from your website (for example, http://www.example1.com).

     Your CORS policy might look similar to the following example:

     ```
     [
         {
             "AllowedHeaders": [
                 "*"
             ],
             "AllowedMethods": [
                 "PUT",
                 "GET"
             ],
             "AllowedOrigins": [
                 "*.my.connect.aws",
                 "*.awsapps.com"
             ],
             "ExposeHeaders": []
         }
     ]
     ```

   - Option 2: Add the * wildcard to `AllowedOrigin`. This rule allows cross-origin PUT and GET requests from all origins, so you don't have to list your endpoints.

     Your CORS policy might look similar to the following example:

     ```
     [
         {
             "AllowedMethods": [
                 "PUT",
                 "GET"
             ],
             "AllowedOrigins": [
                 "*"
                 ],
            "AllowedHeaders": [
     ```

```
            "*"
            ]
    }
]
```

APIs to enable email for campaigns

Use the following APIs to enable email programmatically:

- CreateInstance
- CreateIntegrationAssociation
- AssociateInstanceStorageConfig
- DisassociateInstanceStorageConfig
- DescribeInstanceStorageConfig

Invoke Lambda functions

Step 1: Create a Lambda function

During campaign execution, outbound campaigns will invoke your Lambda function with a batch of profiles and expects a response containing results for each.

Request Payload

When your Lambda function is invoked, it will receive a JSON payload with the following structure:

Payload Structure

```
{
  "InvocationMetadata": {
    "CampaignContext": {
      "CampaignId": "string",
      "RunId": "string",
      "ActionId": "string",
      "CampaignName": "string"
    }
  },
  "Items": {
    "CustomerProfiles": [
```

```
      {
        "ProfileId": "string",
        "CustomerData": "string",
        "IdempotencyToken": "string"
      }
    ]
  }
}
```

Field Descriptions

InvocationMetadata

- **CampaignContext**: Contains metadata about the campaign execution
- **CampaignId**: Unique identifier for the campaign
- **RunId**: Unique identifier for this specific campaign run
- **ActionId**: The identifier of the flow action being executed by outbound campaigns
- **CampaignName**: Human-readable name of the campaign

Items

- **CustomerProfiles**: Array of customer profiles to process (batched for efficiency)
- **ProfileId**: Unique identifier for the customer profile
- **CustomerData**: JSON string of the customer profile
- **IdempotencyToken**: Unique token for this specific invocation to ensure idempotent processing

Example Request Payload

```
{
  "InvocationMetadata": {
    "CampaignContext": {
      "CampaignId": "campaign-12345",
      "RunId": "run-67890",
      "ActionId": "activity-abc123",
      "CampaignName": "Welcome Campaign"
    }
  },
  "Items": {
    "CustomerProfiles": [
```

```
      {
        "ProfileId": "customer-001",
        "CustomerData": "{\"firstName\":\"John\",\"lastName\":\"Doe\",\"email\":
\"john.doe@example.com\"}",
        "IdempotencyToken": "token-xyz789"
      },
      {
        "ProfileId": "customer-002",
        "CustomerData": "{\"firstName\":\"Jane\",\"lastName\":\"Smith\",\"email\":
\"jane.smith@example.com\"}",
        "IdempotencyToken": "token-abc456"
      }
    ]
  }
}
```

Expected Response Payload

Your Lambda function must return a JSON response with the following structure:

Response Structure

```
{
  "Items": {
    "CustomerProfiles": [
      {
        "Id": "string",
        "ResultData": {}
      }
    ]
  }
}
```

Field Descriptions

Items

- **CustomerProfiles**: Array of results corresponding to each customer profile in the request
- **Id**: Must match the `ProfileId` from the request
- **ResultData**: Custom JSON object containing your processing results (optional)

Example Response Payload

```
{
  "Items": {
    "CustomerProfiles": [
      {
        "Id": "customer-001",
        "ResultData": {
          "recommendedProduct": "Premium Plan",
          "score": 85,
          "nextAction": "send_email"
        }
      },
      {
        "Id": "customer-002",
        "ResultData": {
          "error": "Invalid customer data",
          "errorCode": "VALIDATION_ERROR"
        }
      }
    ]
  }
}
```

Important Constraints

Payload Size Limits

- **Maximum Response Payload Size**: 32 KB per customer profile
- If your `ResultData` exceeds this limit, the invocation will be marked as invalid

Response Requirements

- You must provide a response for every `ProfileId` included in the request
- Missing responses will be treated as errors
- The `Id` field in the response must exactly match the `ProfileId` from the request

Error Handling

- If your Lambda function throws an exception, all profiles in the batch will be marked as failed
- Include error details in `ResultData` for debugging purposes

Invocation Type

- **Invocation Type**: `REQUEST_RESPONSE` (synchronous)
- Your function should return results within 30 seconds rather than processing asynchronously. Responses taking longer than 30 seconds will result in action failure

Step 2: Grant Outbound Campaigns access to your Lambda function

1. Open the Amazon Connect console at https://console.aws.amazon.com/connect/.
2. On the instances page, choose your instance name in the **Instance Alias** column. This instance name appears in the URL you use to access Amazon Connect.
3. In the navigation pane under **Channels and communications**, choose **Outbound campaigns**.
4. Under the **Set up custom actions** section, use the **Lambda functions** drop-down box to select the function to add to your outbound campaigns instance.
5. Choose **Add Lambda Function**. Confirm that the ARN of the function is added under **Lambda Functions**.

> **Important**
>
> The preceding console procedure automatically adds the required resource-based policy to the Lambda function. If you use the AWS CLI or SDK, you can call the PutConnectInstanceIntegration API with the `lambda` integration configuration. This API automatically adds the required resource-based policy to your Lambda function, just as the console does.
>
> If you need to add the resource-based policy manually (for example, for cross-account invocations), add a policy statement that grants the `connect-campaigns.amazonaws.com` service principal permission to invoke your function. You can optionally add a `Condition` element with `AWS:SourceAccount` and `AWS:SourceArn` to restrict access to your account and Connect Customer instance. We recommend including both conditions. The following example shows the required policy statement.

```
{
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "connect-campaigns.amazonaws.com"
      },
      "Action": "lambda:InvokeFunction",
      "Resource": "arn:aws:lambda:region:account-id:function:function-name",
      "Condition": {
        "StringEquals": {
          "AWS:SourceAccount": "account-id"
        },
        "ArnLike": {
          "AWS:SourceArn": "arn:aws:connect:region:account-id:instance/instance-
id"
        }
      }
    }
  ]
}
```

For more information about resource-based policies, see Using resource-based policies for Lambda in the *Lambda Developer Guide*.

Step 3: Invoke a Lambda from a Campaign

1. Open or create a **Journey** flow.
2. Add a **Custom action** block (in the **Integrate** group) to the grid. Connect the branches to and from the block.
3. Choose the title of the **Custom action** block to open its properties page.
4. Under **Function ARN**, choose from the list of functions you've added to your outbound campaigns instance.

Step 4: Consume the Lambda function response

Access variables directly

To access these variables directly in a flow block, add the block after the **Custom action** block, and then reference the attributes as shown in the following example:

```
RecommendedProduct - $.LambdaInvocation.ResultData.recommendedProduct
Score - $.LambdaInvocation.ResultData.score
```

Make sure that the name specified for the source attribute matches the key name in the `ResultData` returned from the Lambda.

Send web notifications with Connect Customer outbound campaigns

You can use Connect Customer outbound campaigns to deliver personalized notifications to website visitors through the Communications widget. Notifications are triggered by visitor activity that the web data tracker captures into Customer Profiles, such as scrolling past a portion of the page, viewing a product for an extended time, or adding an item to a cart. For an overview of how the web data tracker and web notification work together, see Web data tracker and web notification.

How web notification works

1. An event trigger fires when visitor behavior matches a rule you configured in your outbound campaigns campaign.
2. The campaign passes the visitor context to the web notification service, which calls the Customer Profiles API to resolve dynamic placeholders such as first name and recommended products.
3. The service delivers the notification to the visitor's browser over WebSocket and displays it in the Communications widget. The service records interaction events for analytics.

Prerequisites

- An Connect Customer instance with the Communications widget configured and data collection enabled. For more information, see Capture website visitor activity with the web data tracker.

- Customer Profiles enabled on the instance. For more information, see Enable Customer Profiles for your Connect Customer instance.
- Connect Customer outbound campaigns enabled on the instance. For more information, see Enable outbound campaigns and Customer Profiles.
- Upgrade your existing outbound campaigns configuration to enable this channel. For more information, see Set up Connect Customer outbound campaigns.

Step 1: Enable web notification on your Communications widget

1. Sign in to the Connect Customer admin website.
2. In the navigation menu, choose **Channels**, then choose **Communications widgets**.
3. Create a new widget or open an existing one for editing.
4. Under the **Features** section, enable **Web notification**.
5. Add the website domains where the widget will be embedded to the allowed domains list.
6. Save the widget and copy the widget snippet code for embedding on your website.

Step 2: Create a notification view

A view defines the visual layout and content of your notification. Use the notification template to design what visitors see.

1. In the navigation menu, choose **UI Management**, then choose **Views**.
2. Choose **Create view** and select the **Notification** template.
3. Design the notification content:
   - **Title** – Supports personalization, for example `Hi {FirstName}!`.
   - **Message body** – Can include product recommendations from Customer Profiles.
   - **Action buttons** – For example, **Chat now** or **Learn more**.
4. Publish the view.

For more information about views, see Use views to customize the user interface for agents, customers, and other user personas in Connect Customer.

Step 3: Add a web notification service integration and personalize your view

To personalize notification content with Customer Profiles data, add a web notification service integration to your view. The integration connects the view to the Customer Profiles API so dynamic placeholders are resolved at delivery time.

1. Open your view in the view editor.
2. Choose the **Integrations** tab.
3. Choose **Add integration**.
4. Set the **Integration name**, for example `WNS`. This name is how you reference profile attributes in your view content using the `$.#INTEGRATION_NAME` syntax.
5. Set **Integration type** to **Web notification service**.
6. Choose **Add integration** to save.

After adding the integration, use dynamic placeholders in the view to personalize notifications with profile data. The following table shows the syntax patterns to use in the title or message body of a notification view.

Data type	Syntax	Example
Customer profile attribute	`$.#INTEGRATION_NAME.Profile.<AttributeName>`	`$.#WNS.Profile.FirstName`
Recommendation (catalog item)	`$.#INTEGRATION_NAME.Recommendations[<Index>].CatalogItem.<AttributeName>`	`$.#WNS.Recommendations[0].CatalogItem.Name`

Example notification content

Using an integration named `WNS`, a notification might look like the following:

```
Title:   Hi $.#WNS.Profile.FirstName! Still thinking about this?
```

```
Message: We think you'll love $.#WNS.Recommendations[0].CatalogItem.Name.
         Click below to chat with an agent.
```

Tip

In the view editor, choose the **Reference** tab to see all available Customer Profiles attributes and recommendation catalog fields you can use as dynamic placeholders.

Note

When a notification is triggered, the web notification service calls the `BatchGetProfile` and `GetProfileRecommendations` APIs in Customer Profiles to fetch real-time profile data and resolve any dynamic placeholders before delivering the notification to the visitor's browser.

Step 4: Create the campaign

Web notifications are delivered through outbound campaigns. Create a campaign that links to the widget you configured in Step 1 and the notification view you created in Step 2. For a full walkthrough including screenshots, see Create an outbound campaign using the admin website and Create an outbound campaign using event triggers.

(Optional) Link a recommender to enable AI-driven product suggestions in the notification. Recommenders are only available when you select the **View** notification type and the selected view has a **Web Notification Service** integration. For more information, see Predictive Insights (Preview).

Step 5: Initialize web notifications on your website

After embedding the Communications widget snippet on your website, initialize web notifications by calling `Notification.init()` in your page JavaScript. Call this method only after the visitor has granted appropriate consent for personalized messaging.

```
await window.amazon_connect.Web.Notification.init();
```

Measure performance

Track delivery, engagement, chat conversion, and dismissal in the Connect Customer analytics dashboard under the outbound campaigns performance section.

Limitations

For limitations that apply to web notification, see Limitations.

Disable outbound campaigns in Connect Customer

> ⚠ **Prerequisite**
>
> You must delete all existing campaigns before you disable outbound campaigns.

To disable outbound campaigns, delete your outbound campaigns configuration by using the Outbound campaigns `DeleteConnectInstanceConfig` API or the `delete-connect-instance-config` AWS CLI command. The console does not include a control to turn off the feature.

The following example deletes the outbound campaigns configuration for an instance. Replace *`instance-id`* with the ID of your Connect Customer instance.

```
aws connectcampaigns delete-connect-instance-config --connect-instance-id instance-id
```

After you delete the configuration, you can no longer create outbound campaigns.

Outbound campaign metrics in Connect Customer

The following outbound campaign driven metrics are available on the outbound campaigns performance dashboard and by using the GetMetricDataV2 API.

Average dials per minute

This metric measures the average number of outbound campaign dials per minute for the specified start time and end time.

Metric type: Double

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AVG_DIALS_PER_MINUTE`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Avg. dials per minute

Notes:

- This metric is available only for outbound campaigns that use the agent assisted voice and automated voice delivery modes.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT.

Average wait time after customer connection

This metric measures the average duration of total wait time by the customer after they answer the outbound call through the Connect Customer dialer.

Metric type: String (*hh:mm:ss*)

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AVG_WAIT_TIME_AFTER_CUSTOMER_CONNECTION`

Notes:

- This metric is available only for outbound campaigns that use the agent assisted voice and automated voice delivery modes.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT.

Campaign contacts abandoned after X

This metric counts the outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds. The possible values for X are from 1 to 604800 inclusive. This metric is only available with answering machine detection enabled. For more information about answering machine detection, see Best practices for answering machine detection.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x seconds rate

Notes:

- This metric is available only for outbound campaigns using the agent assisted voice and automated voice delivery modes.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT.

Campaign contacts abandoned after X rate

This metric measures the percentage of outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds divided by the count of contacts connected to a live customer in an outbound campaign. The possible values for X are from 1 to 604800 inclusive.

Metric type: Percent

- Min value: 0.00%
- Min value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_RATE`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned rate

Notes:

- This metric is only available with answering machine detection enabled. For more information about answering machine detection, see Best practices for answering machine detection. This metric is available only for outbound campaigns using the agent assisted voice and automated voice delivery modes.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT.

Campaign contacts abandoned after X from greeting end

This metric counts the outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the greeting end timestamp. The greeting end timestamp marks when the outbound greeting message finished playing to the customer. The possible values for X are from 1 to 604800 inclusive.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_GREETING_END`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from greeting end seconds rate

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted. For AMD-disabled campaigns, all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts abandoned after X from greeting end rate

This metric measures the percentage of outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the greeting end timestamp, divided by the count of eligible connected campaign contacts. The possible values for X are from 1 to 604800 inclusive.

Metric type: Percent

- Min value: 0.00%
- Max value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_GREETING_END_RATE`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from greeting end seconds rate

Calculation logic:

- (Campaign contacts abandoned after X from greeting end / Campaign contacts connected) * 100.0

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted in both the numerator and denominator. For AMD-disabled campaigns, all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts abandoned after X from greeting start

This metric counts the outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the greeting start timestamp. The greeting start timestamp marks when the outbound greeting message began playing to the customer. The possible values for X are from 1 to 604800 inclusive.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_GREETING_START`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from greeting start seconds rate

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted. For AMD-disabled campaigns, all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.

- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts abandoned after X from greeting start rate

This metric measures the percentage of outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the greeting start timestamp, divided by the count of eligible connected campaign contacts. The possible values for X are from 1 to 604800 inclusive.

Metric type: Percent

- Min value: 0.00%
- Max value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_GREETING_START_RATE`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from greeting start seconds rate

Calculation logic:

- (Campaign contacts abandoned after X from greeting start / Campaign contacts connected) * 100.0

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted in both the numerator and denominator. For AMD-disabled campaigns, all connected contacts are counted.

- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts abandoned after X from system connection

This metric counts the outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the system connection timestamp. The system connection timestamp marks when the outbound call was connected to the Connect Customer system (before greeting or agent connection). The possible values for X are from 1 to 604800 inclusive.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_SYSTEM_CONNECTION`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from system connection seconds rate

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted. For AMD-disabled campaigns, all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts abandoned after X from system connection rate

This metric measures the percentage of outbound campaign calls that were connected to a live customer but did not get connected to an agent within X seconds from the system connection timestamp, divided by the count of eligible connected campaign contacts. The possible values for X are from 1 to 604800 inclusive.

Metric type: Percent

- Min value: 0.00%
- Max value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_ABANDONED_AFTER_X_FROM_SYSTEM_CONNECTION_RATE`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts abandoned after x from system connection seconds rate

Calculation logic:

- (Campaign contacts abandoned after X from system connection / Campaign contacts connected) * 100.0

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted in both the numerator and denominator. For AMD-disabled campaigns, all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign contacts connected

This metric counts the outbound campaign contacts that were connected to the Connect Customer system and are eligible for abandonment rate calculation. For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted. For AMD-disabled campaigns, all connected contacts are counted.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_CONTACTS_CONNECTED`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign contacts connected

Notes

- For AMD-enabled campaigns, only contacts with an answering machine detection status of `HUMAN_ANSWERED` are counted. For AMD-disabled campaigns (where the answering machine detection status field is absent), all connected contacts are counted.
- This metric is available only for outbound campaigns using the agent assisted voice delivery mode.
- Data for this metric is available starting from June 29, 2026, 04:43:45 UTC.

Campaign interactions

This metric counts the outbound campaign interactions after a successful delivery attempt. Example interactions include `Open`, `Click`, and `Complaint`.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_INTERACTIONS`

- Dashboard: Outbound campaigns performance dashboard

Notes:

- This metric is available only for outbound campaigns that use the email, WhatsApp, and web notification delivery modes.
- For more details on the interaction event values, see campaign_event_type under Outbound Campaign Events in the Data Lake documentation.
- Data for this metric is available starting from November 6, 2024 0:00:00 GMT for the Email delivery mode, December 2, 2025 0:00:00 GMT for the WhatsApp delivery mode, and May 28, 2026 0:00:00 GMT for the web notification delivery mode.

Campaign progress rate

This metric measures the percentage of outbound campaign recipients attempted for delivery, out of the total number of recipients targeted. This is calculated as: (Recipients attempted / Recipients targeted) * 100.

Metric type: Percent

- Min value: 0.00%
- Max value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_PROGRESS_RATE`

- Dashboard: Outbound campaigns performance dashboard

Notes:

- This metric is only available for outbound campaigns initiated using a customer segment. It is not available for event triggered campaigns.
- Data for this metric is available starting from April 30, 2025 0:00:00 GMT.

Campaign send attempts

This metric counts the outbound campaign send requests sent by Connect Customer for delivery. A campaign send request represents a send attempt made to reach out to a recipient using the email, SMS, telephony, WhatsApp, or web notification delivery mode.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_SEND_ATTEMPTS`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Send attempts

Notes:

- Data for this metric is available starting from November 6, 2024 0:00:00 GMT.

Campaign send exclusions

This metric measures the count of outbound campaign send attempts that were excluded from the targeted segment during a campaign execution. Example exclusion reasons: MISSING_TIMEZONE, MISSING_CHANNEL

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `CAMPAIGN_SEND_EXCLUSIONS`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Campaign send exclusions

Notes:

- For more details on the exclusion reasons, see campaign_event_type under Outbound Campaign Events in the Data Lake documentation.
- Data for this metric is available starting from April 30, 2025 0:00:00 GMT.

Delivery attempts

This metric measures the delivery outcome of a campaign outreach attempt. The count of outbound campaign contact outcomes from the Connect Customer dialer, or the count of outbound campaign email, SMS, WhatsApp, or web notification message outcomes that were successfully sent to Connect Customer to be delivered.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `DELIVERY_ATTEMPTS`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Delivery attempts

Notes:

- For details about telephony disposition definitions, see DisconnectReason for outbound campaigns and AnsweringMachineDetectionStatus in the ContactTraceRecord.
- For details about email, SMS, WhatsApp, and web notification disposition definitions, see campaign_event_type in the Outbound campaign events table.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT for the Telephony delivery mode, November 6, 2024 0:00:00 GMT for the Email and SMS delivery modes,

December 2, 2025 0:00:00 GMT for the WhatsApp delivery mode, and May 28, 2026 0:00:00 GMT for the web notification delivery mode.

Delivery attempt disposition rate

This metric measures the percentage of each delivery outcome from a campaign outreach. The percent of call classification by answering machine detection or disconnect reason from outbound campaign contacts executed by the Connect Customer dialer, or the percent of outbound campaign email, SMS, WhatsApp, or web notification message outcomes that were successfully sent to Connect Customer to be delivered.

Metric type: Percent

- Min value: 0.00%
- Max value: 100.00%

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `DELIVERY_ATTEMPT_DISPOSITION_RATE`

Notes:

- Dispositions for the agent assisted voice and automated voice delivery modes are available with answering machine detection enabled.
- For details about telephony disposition definitions, see DisconnectReason for outbound campaigns and AnsweringMachineDetectionStatus in the ContactTraceRecord.
- For details about email, SMS, WhatsApp, and web notification disposition definitions, see campaign_event_type in the Outbound campaign events table.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT for the Telephony delivery mode, November 6, 2024 0:00:00 GMT for the Email and SMS delivery modes, December 2, 2025 0:00:00 GMT for the WhatsApp delivery mode, and May 28, 2026 0:00:00 GMT for the web notification delivery mode.

Human answered

This metric counts the outbound campaign calls that were connected to a live customer. This metric is available only when answering machine detection is enabled.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `HUMAN_ANSWERED_CALLS`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Human answered

Notes:

- This metric is available only for outbound campaigns that use the agent assisted voice and automated voice delivery modes.
- Data for this metric is available starting from June 25, 2024 0:00:00 GMT.

Recipients attempted

This metric measures the approximate count of outbound campaign recipients attempted for delivery.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `RECIPIENTS_ATTEMPTED`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard, Recipients attempted

Notes:

- This metric is only available for outbound campaigns initiated using a customer segment. It is not available for event triggered campaigns.
- Data for this metric is available starting from April 30, 2025 0:00:00 GMT.

Recipients interacted

This metric measures the approximate count of outbound campaign recipients who interacted with the engagement after a successful delivery attempt. Example interactions include: Open, Click, Complaint

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `RECIPIENTS_INTERACTED`

How to access using the Connect Customer admin website:

- Dashboard: Outbound campaigns performance dashboard

Notes:

- This metric is only available for outbound campaigns initiated using a customer segment. It is not available for event triggered campaigns.
- Data for this metric is available starting from April 30, 2025 0:00:00 GMT.

Recipients targeted

This metric measures the count of outbound campaign recipients identified as the target audience for the campaign.

Metric type: Integer

Metric category: Outbound campaigns driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `RECIPIENTS_TARGETED`

How to access using the Connect Customer admin website:

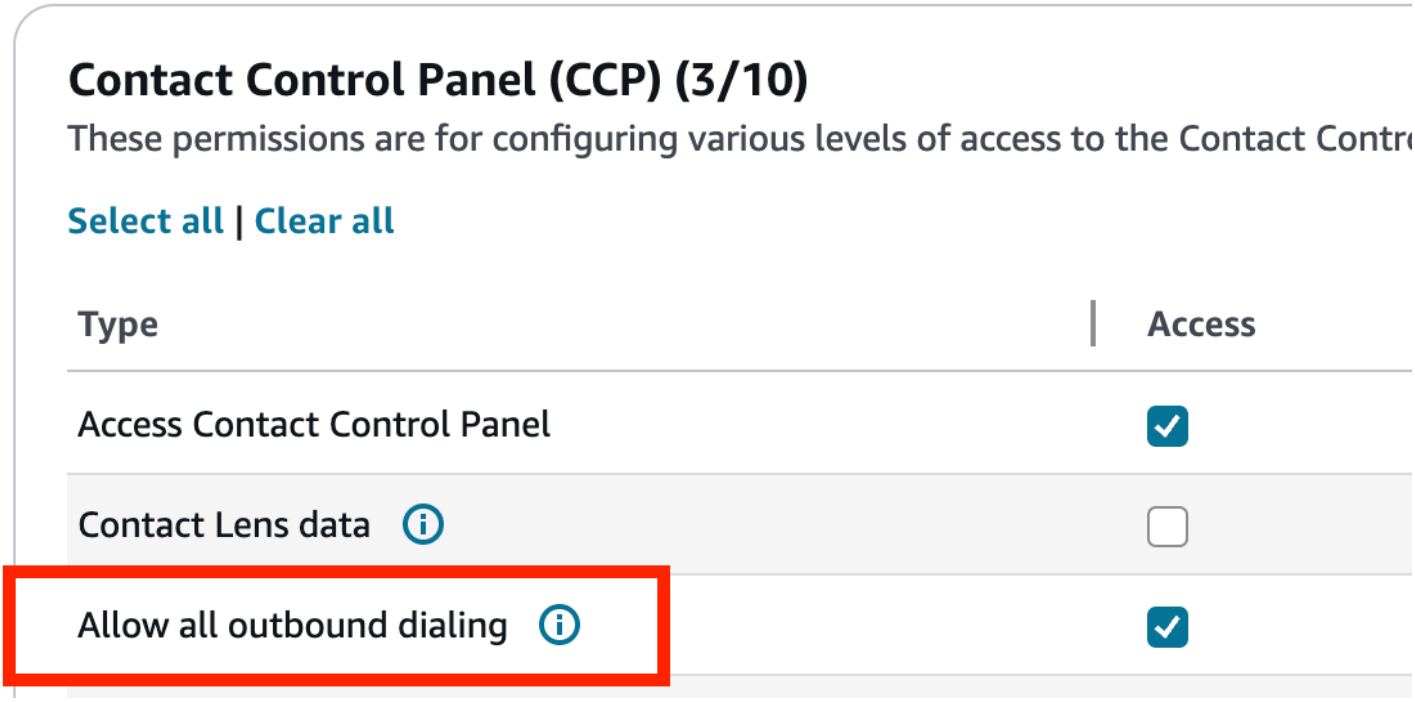
- Dashboard: Outbound campaigns performance dashboard, Recipients targeted

Notes:

- This metric is only available for outbound campaigns initiated using a customer segment. It is not available for event triggered campaigns.
- Data for this metric is available starting from April 30, 2025 0:00:00 GMT.

Security profile permissions for outbound communications in Connect Customer

To enable agents to make outbound calls, assign **Make outbound calls** permissions to the agent's security profile as shown in the following image:



To enable call center managers to create outbound campaigns, assign the following permissions to their security profile:

- **Routing**, **Queues**, **View** permission
- **Outbound campaigns**, **Campaigns**, **View** permission
- **Channels and Flows**, **Flows**, **View** permission

For information about how to add more permissions to an existing security profile, see Update security profiles in Connect Customer.

By default, the **Admin** security profile already has permissions to perform all activities.

Best practices for Connect Customer outbound campaigns using Pinpoint

Important

End of support notice: On October 30, 2026, AWS will end support for Amazon Pinpoint. After October 30, 2026, you will no longer be able to access the Amazon Pinpoint console or Amazon Pinpoint resources (endpoints, segments, campaigns, journeys, and analytics). For more information, see Amazon Pinpoint end of support. **Note:** APIs related to SMS, voice, mobile push, OTP, and phone number validate are not impacted by this change and are supported by AWS End User Messaging.

The topics in this section explain best practices for outbound calling campaigns using Pinpoint. These practices can increase agent productivity, help you comply with regulations, and help protect the integrity of your phone numbers.

Note

Connect Customer outbound campaigns work in concert with Amazon Pinpoint journeys. Journeys have their own best practices. The topics in this section describe some of those practices, but for more information, see Tips and best practices for journeys, in the *Amazon Pinpoint User Guide*.

Topics

- Choose the right campaign
- Agent staffing best practices
- Connection latency best practices
- Best practices for answering machine detection
- Journey best practices
- Schedule best practices
- Best practices for activity settings
- Do Not Call best practices
- Best practices for managing redials

Choose the right campaign

Connect Customer provides several types of dialing campaigns. The following sections describe each type so that you can implement the campaign that best meets your needs.

Topics

- Predictive campaigns
- Progressive campaigns
- Agentless campaigns
- Preview campaigns

Predictive campaigns

When agent productivity, cost per calls, or contact center efficiency are critical metrics, use predictive dialers. Predictive dialers anticipate that many calls won't be answered. They counterbalance that by dialing as many phone numbers in a list as possible during an agent's shift by making predictions about agent availability.

The predictive algorithm calls ahead based on certain performance metrics. This means that calls can be connected before an agent becomes available, and a customer is connected to the next available agent. The predictive algorithm constantly analyzes, evaluates, and makes agent availability predictions in real-time so that agent productivity and efficiency can improve.

Progressive campaigns

When you need to reduce answer speeds, use progressive mode. A progressive mode campaign dials the next phone number in a list after an agent completes the previous call. If there are multiple campaigns targeting the same set of agents, then each of them might end up dialing contacts for the same agents. There are two ways to prevent this:

- Change the bandwidth allocation of the campaigns so the sum of the bandwidth allocation of each of those campaigns is less than or equal to 100%. This greatly reduces the likelihood of multiple campaigns dialing contacts for the same agents, but it does not completely eliminate it.
- If a 1:1 guarantee is required, then have an exclusive set of agents for each campaign. To do this, assign the campaign's queue to a single routing profile. That routing profile must only have this campaign's queue, must only allow voice calls, and no inbound contacts should be put into this queue.

You can use integrated answering machine detection to help identify a live customer pickup or a voicemail, and customize your contact strategy accordingly. For example, if a person answers a call, you can present options for them to select. If a call goes to voicemail, you can leave a message.

You can also manage pacing by specifying capacity for each campaign. For example, you can send more voice notifications faster by setting a higher capacity for a given agentless campaign compared to other dialer campaigns.

Agentless campaigns

You use agentless campaigns to send high-volume personalized voice notifications, appointment reminders, or to enable self-service using the Interactive Voice Response (IVR) with no agents needed.

Preview campaigns

Use preview dialing for personalized customer conversations and to support compliance. Preview dialing enables agents to review recipient details such as name, address, product usage, prior interactions before initiating an outbound call, ensuring personalized and efficient proactive engagement while supporting compliance.

Best Practice for Preview Dialing Mode: disable call classification.

Agent staffing best practices

When call recipients answer a call and hear silence in return, they often hang up. For predictive campaigns, use the following best practices to help reduce that silence:

- Make sure that you have enough agents logged in to your call queue. For more information about staffing, see Forecasting & agent scheduling in Connect Customer.
- Consider using the machine learning services of Connect Customer.
  - Forecasting. Analyze and predict contact volume based on historical data. What will future demand—the contact volume and handle time—look like? Connect Customer forecasting provides accurate and auto-generated forecasts that are automatically updated daily.
  - Capacity planning. Predict how many agents your contact center will require. Optimize plans by scenarios, service level goals, and metrics, such as shrinkage.
  - Scheduling. Generate agent schedules for day-to-day workloads that are flexible, and meet business and compliance requirements. Offer agents flexible schedules and work-life balance. How many agents are needed in each shift? Which agent works in which slot?

    Schedule adherence. Enable contact center supervisors to monitor schedule adherence and improve agent productivity. Schedule adherence metrics are available after the agent schedules are published.

Connection latency best practices

Successful outbound calling campaigns avoid silent calls, the period of silence after a person answers a call and before an agent comes on the line. Legal requirements to limit the number of silent or abandoned calls and keep the called party informed might also apply. You can configure Connect Customer in different ways to reduce call connection delays.

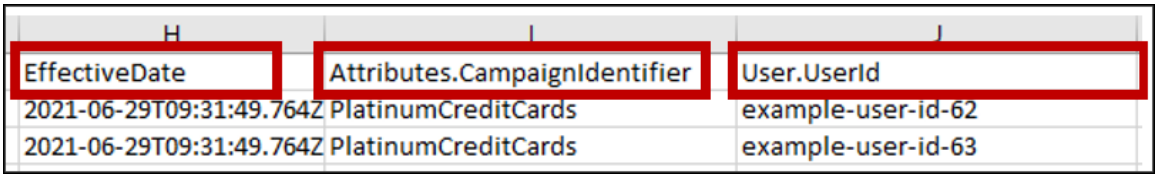
Topics

- Pinpoint segment attributes
- Outbound agent-staffed calling
- Outbound agentless calling
- Whisper and queue flow best practices
- User administration best practices
- Workstation and network best practices

- Testing best practices

Pinpoint segment attributes

When creating an Amazon Pinpoint segment file, add the data (attributes) required for routing logic, custom greetings, or agent screen pop. Do not use Lambda functions in the flow to extract additional information, such as `EffectiveDate`, `Attributes.CampaignIdentifier`, or `User.UserId` before connecting to an agent.



H	I	J
EffectiveDate	Attributes.CampaignIdentifier	User.UserId
2021-06-29T09:31:49.764Z	PlatinumCreditCards	example-user-id-62
2021-06-29T09:31:49.764Z	PlatinumCreditCards	example-user-id-63

For more information, see Supported attributes in the *Amazon Pinpoint User Guide*.

Outbound agent-staffed calling

When using the Check call progress flow block:

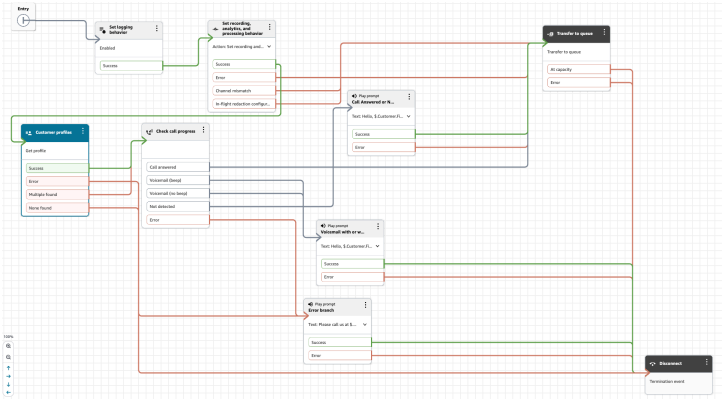
- Call Answered branch - Remove all flow blocks between the Check call progress and Transfer to queue blocks. This minimizes delay between the dialed party saying hello, and the agent answer time.
- Not Detected branch - This branch should be treated in the same manner as a Call Answered with routing to a Transfer to queue block. This branch is used when the ML-model was not able to classify the answer type. Since this could be a voicemail or a live person, you can play a message before to the **Transfer to queue** block in the event that there is a voicemail answering a message can be left.

  For example, "This is Example Corp. calling to confirm your appointment. We couldn't tell if you or your voicemail answered this call. Please stay on the line while we connect you with an agent."

Outbound agentless calling

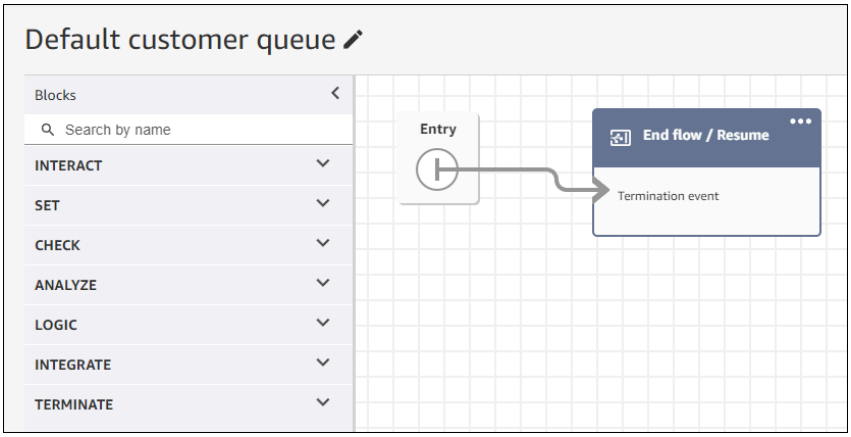
Outbound campaigns often use custom greetings and self service functions. Do not use Lambda functions to get contact attributes. Instead, provide customer data (attributes) through the campaign segment. Use these attributes from the campaign segment to play custom greetings.

- Example - Call Answered or Not Detected: "Hello, `$.Attributes.FirstName`. This is `$.Attributes.CallerIdentity` calling to confirm your upcoming appointment on `$.Attributes.AppointmentDate` at `$.Attributes.AppointmentTime`. If this is still a good time and date for you, just say, "Confirm". If you would like to use our self service system to modify your appointment, just say, "self service" or stay on the line and we will connect you with the next available agent."
- Example - Voicemail with or without beep: "Hello, `$.Attributes.FirstName`. This is `$.Attributes.CallerIdentity` calling to confirm your upcoming appointment on `$.Attributes.AppointmentDate` at `$.Attributes.AppointmentTime`. If this is still a good time and date for you, we will see you then. If you would like to modify your appointment, please call us back at `$.SystemEndpoint.Address` to reschedule your appointment"
- Error branch - Occasionally there could be an issue that causes a call to follow the Error branch. As a best practice, use a Play prompt block with a message that applies to the contact that was dialed, with instruction to "Please call us at `$.SystemEndpoint.Address` to confirm or reschedule your appointment." Do this before the Disconnect / hang up block in case the call recipient answered, but an error occurred in the processing.

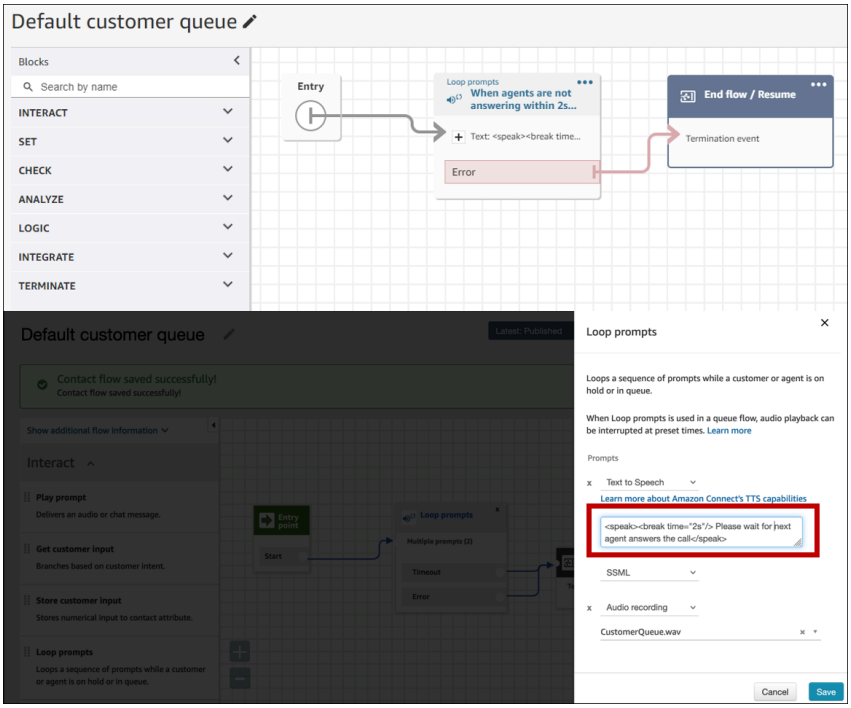


Whisper and queue flow best practices

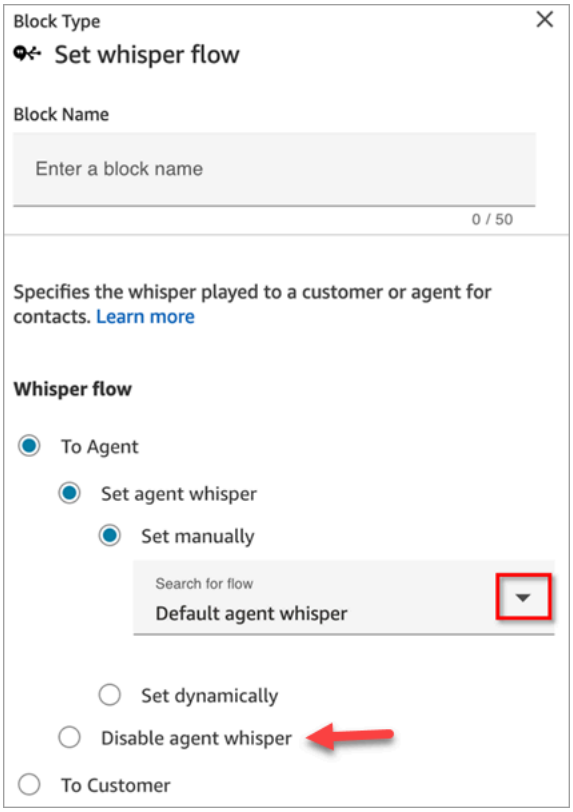
- Remove the **Loop prompts** from the **Default customer queue** flow and replace them with **End flow / Resume**.



- If agents don't answer within 2 seconds of calls going to queue, you can minimize silent calls by using **Loop prompts** and play a message for the customer. The following image shows a typical flow block with a Loop prompt.



- Use the **Disable agent whisper** and **Disable customer whisper** options on the Set whisper flow block. This is so customers perceive less connection latency as part of an outbound campaign. The following image shows the location of the **Disable agent whisper** setting on the block's properties page.



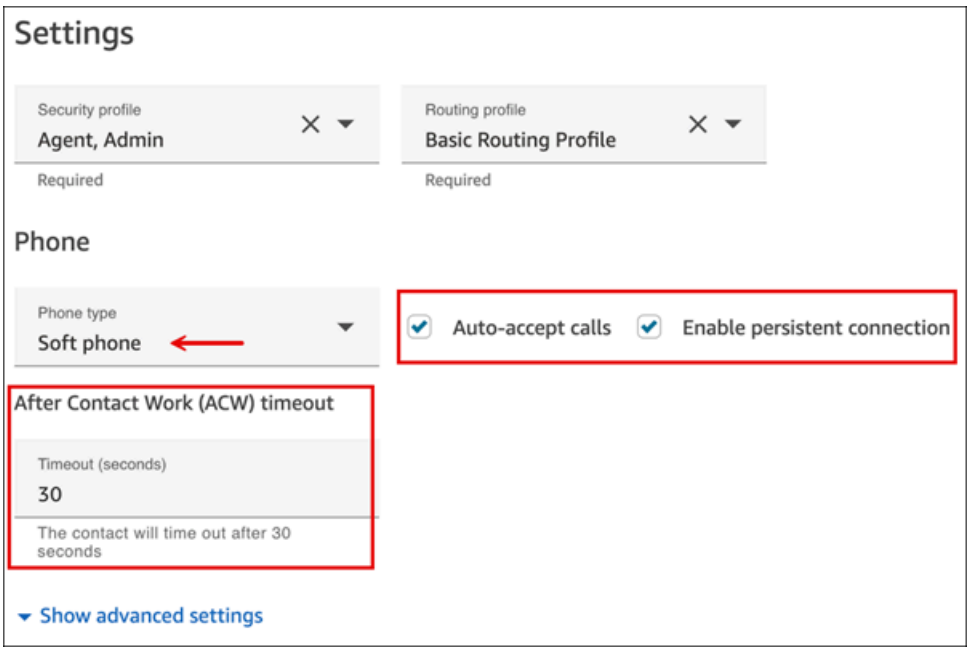
User administration best practices

We recommend setting the following options for your users to reduce connection times. To access these settings, in the Connect Customer admin website navigate to **Users**, **User management**, **Edit**.

These options apply to soft phones only.

- Enable the Auto-accept calls. It reduces the potential for call connection latency/delay after a dialed party answers.
- Set After Contact Work (ACW) timeout to 30. Minimizing the ACW time will optimize the dialing algorithm when using Predictive dialing campaigns.
- Enable persistent connection. This maintains agent connection after a call ends. It enables subsequent calls to connect faster.

The following image shows the **Settings** section of the **Edit user** page.



Workstation and network best practices

The following best practices can help optimize agent efficiency by ensuring adequate hardware and network resources.

- Make sure that agent workstations meet the minimum requirements. For more information, see Agent headset and workstation requirements for using the Contact Control Panel (CCP).
- Make sure that the agent has the CCP or agent workspace open and present on their desktop. This reduces the time spent bringing the screen to the front before greeting the caller.
- On the local network, make sure that the agents are connected to a LAN. This mitigates potential wireless network latency
- If possible, minimize the geographic distance between the AWS Region that hosts your Connect Customer instance and the agents that interact with the outbound campaigns. The greater the geographic distance between your agents and the hosting Region, the higher the possible latency.

> **Note**
>
> Outbound campaigns have limitations on the numbers that agents can dial, depending on the origin of the Connect Customer instance. For more information, see the Connect Customer Telecoms Country Coverage Guide.

Testing best practices

As a best practice, run tests at scale. To achieve the lowest call connection latency, use outbound campaigns to make hundreds of thousands of continuous calls to mimic your production environment. Call connection latency can be relatively high when making a handful of campaign calls.

Best practices for answering machine detection

To use Answering Machine Detection (AMD) in a campaign, use the Check call progress flow block. It provides call progress analysis. This is an ML-model that detects an answered call condition so that you can provide different experiences for calls answered by people and calls answered by machine, with or without a beep. The flow block also provides a branch for routing calls when the ML-model can't distinguish between people and voicemail, or when errors occur in call processing.

AMD uses the following criteria to detect live calls:

- Background noise associated with a pre-recorded message.
- Long strings of words such as "Hello, I am sorry I missed your call. Please leave a message at…"
- A live caller saying something similar to "Hello, hello?" followed by a post-greeting silence.

Forty to 60-percent of calls to consumers go to voicemail. AMD helps eliminate the number of voicemail calls over live calls. However, the detection accuracy has limitations.

- If the voicemail greeting is a short "Hello" or includes a pause, AMD detects it as a live customer (a false negative).
- Sometimes a long greeting by a live customer is incorrectly detected as a voicemail (a false positive).
- There is a small delay while the system connects the call to an agent, which could result in the customer possibly hanging up.
- PBX (private branch exchange) numbers with multiple levels of voicemail prompts are not supported.

The pros, cons, and best uses of Answering Machine Detection

The use of Answering Machine Detection (AMD) might not comply with telemarketing laws. You are responsible for implementing AMD in a manner that is compliant with applicable laws. You should always consult your legal advisor regarding your specific use case.

Use case 1: AMD is on and leaving automatic voicemails

- **Pros** – Agents primarily interact with live calls 95-percent of the time, maximizing talk time. AMD can leave automatic voicemails if a voicemail is detected.
- **Cons** – The technology leaves a voicemail 50-percent to 60-percent of the time due to false positives due to the large variety of answering machine types. Also, AMD can irritate customers because it adds a short delay to live calls.
- **Best uses** – Calling consumers during the day when you might get a large quantity of answering machines and it's not urgent to ensure every call receives a voicemail.

Use case 2: AMD is on but not leaving automatic voicemails

- **Pros** – Agents primarily interact with live calls 95-percent of the time, maximizing talk time.
- **Cons** – Cannot leave any voicemails. Adds a delay to live calls which can annoy customers.
- **Best uses** – Calling consumers during the day when you might get a large quantity of voicemails and you don't want to leave any voicemails.

Use case 3: AMD is off and agents can leave manual voicemails

- **Pros** – Voicemails can be left 100-percent of the time.
- **Cons** – Agents must determine whether they are receiving a live call or voicemail. Must manually leave a voicemail. Most time consuming and can lower the number of calls your agents make in a day.
- **Best uses** – Calling consumers or businesses and leaving customized voicemails.

Use case 4: AMD is off and agents can leave a prerecorded voicemail

- **Pros** – Agents can leave a personalized, pre-recorded voicemail 100% of the time saving significant time by avoiding repeating the same message over and over with 'Voicemail Drop'.

- **Cons** – Agents must determine whether they are receiving a live call or voicemail. More time consuming than AMD but quicker than manually leaving a voicemail.
- **Best uses** – Calling consumers or businesses and leaving generic voicemails.

Journey best practices

As a best practice, give each Amazon Pinpoint journey a single, well-defined goal rather than covering a customer's entire experience in one journey. Keep the scope narrow, such as one goal, one audience, and one time window. With a narrow scope, you can measure whether the journey works and adjust it. You can then chain related journeys together, using the results of one journey to decide who enters the next.

For example, a first journey can welcome new customers and suggest first steps during their first seven days. Based on how each customer responds, you route them into a follow-up journey that matches their level of engagement. If your customers engaged heavily, the follow-up journey provides advanced next steps. If they engaged less, it promotes other products or services. Because each journey stays focused on one goal, you can measure its results and improve it over time.

After you define a goal for your journey, choose journey settings that support it. The settings define the timing, volume, and frequency with which any part of a journey can engage participants.

> **Note**
>
> The following steps assume that you have at least one project and one journey in Amazon Pinpoint. If not, see Managing Amazon Pinpoint projects, and Create a journey, both in the *Amazon Pinpoint User Guide*

To access journey settings

1. Open the Amazon Pinpoint console at https://console.aws.amazon.com/pinpoint/.
2. In the navigation pane, choose **Journeys**, then open a journey with a status of **Draft** or **Paused**.

   You can also choose **Stop journey** to stop a journey.
3. Open the **Actions** list and choose **Settings**.
4. Expand the following sections to implement the various best practices.

Time zone detection

Time zone detection helps estimate an endpoint's time zone based on `Endpoint.Location.Country` and any combination of `Endpoint.Address` and `Endpoint.Location.PostalCode`. The endpoint's time zone is used to avoid calling at inappropriate times of the day, when quiet time is configured, and also when a journey sends messages based on a local time zone. Time zone estimation is only performed on endpoints that do not have a value for the `Demographic.Timezone` attribute.

> **Note**
>
> AWS GovCloud (US-West) does not support time zone detection.

If a journey contains endpoints with multiple time zones:

- When you enable `Recipient's local time zone`:
  - The journey calls or sends a message according to the latest time zone for an endpoint.
  - The journey stops sending when all messages have been sent, or according to the earliest time zone for an endpoint.

Journeys with endpoints in multiple time zones and quiet time

When you enable **Quiet time**, and you have endpoints on multiple time zones, the journey does not call or send messages to an endpoint during the quiet time of any timezone. The journey only calls and sends messages when all the endpoints can receive them, as controlled by the journey's sending rules.

For example, if your journey's quiet time runs from 20:00 (8:00 PM) to 08:00 (8:00 AM), and the journey uses endpoints in UTC-8 America/Los_Angeles and UTC-5 America/New_York, the journey starts sending messages at 08:00 America/Los_Angeles (11:00 America/New_York) and stops sending messages at 17:00 America/Los_Angeles (20:00 America/New_York).

Store and use local time zones

To optimize participant engagement in a journey that has a scheduled start and end time, configure the journey to use each participant's local time zone. This helps to make sure that journey activities occur when a participant is most likely to participate in those activities.

To use recipient time zones

- Under **When to send**, choose the **Recipeints local time zone** radio button.

> **Note**
>
> That setting's usefulness depends on whether you store local time zone values in the endpoint definitions for participants. If you use this setting and the endpoint definition for a participant doesn't specify a time zone, Amazon Pinpoint doesn't include the participant in the journey. To avoid this issue, use the `Demographic.Timezone` attribute to store time zone information for participants. This is a standard attribute provided by Amazon Pinpoint.

Address quiet time conflicts

If you configure an activity to send messages at a time that conflicts with the quiet-time settings for the journey, Amazon Pinpoint doesn't send messages until the quiet time ends. If you chose to resume sending messages after quiet time ends, Pinpoint also sends any messages held during quiet time. If not, it drops the held messages.

Journey limits

For certain use cases, such as telemarketing, organizations limit attempts to call an endpoint over a certain number of days. Amazon Pinpoint provides the following ways to configure the number of attempts:

- Specify the maximum contact attempts made to an endpoint in a 24 hour period.
- Specify the maximum number of times you can reach an endpoint for a particular journey, and across journeys.
- Set a rolling limit by specifying the maximum number of times you can reach an endpoint within a certain time period. For example, contact an endpoint at most 2 times over the next 7 days.

The following image shows the various journey limit settings.

Schedule best practices

With Connect Customer outbound campaigns, you can limit calls to certain times of day and avoid calls during quiet times in the evening or during weekends. You can also set calling exceptions in an Amazon Pinpoint journey. The exceptions overwrite the sending times configured for days of the week.

We recommend using both features. For more information about scheduling in Connect Customer, see . For more information about scheduling in Amazon Pinpoint, see Step 4: Choose when to send the campaign, in the *Amazon Pinpoint User Guide*.

In addition to exceptions, you can:

- Stop calls from predictive and progressive campaigns by logging all agents out of the campaign queue.
- Use the Connect Customer console to manually pause a campaign.

Best practices for activity settings

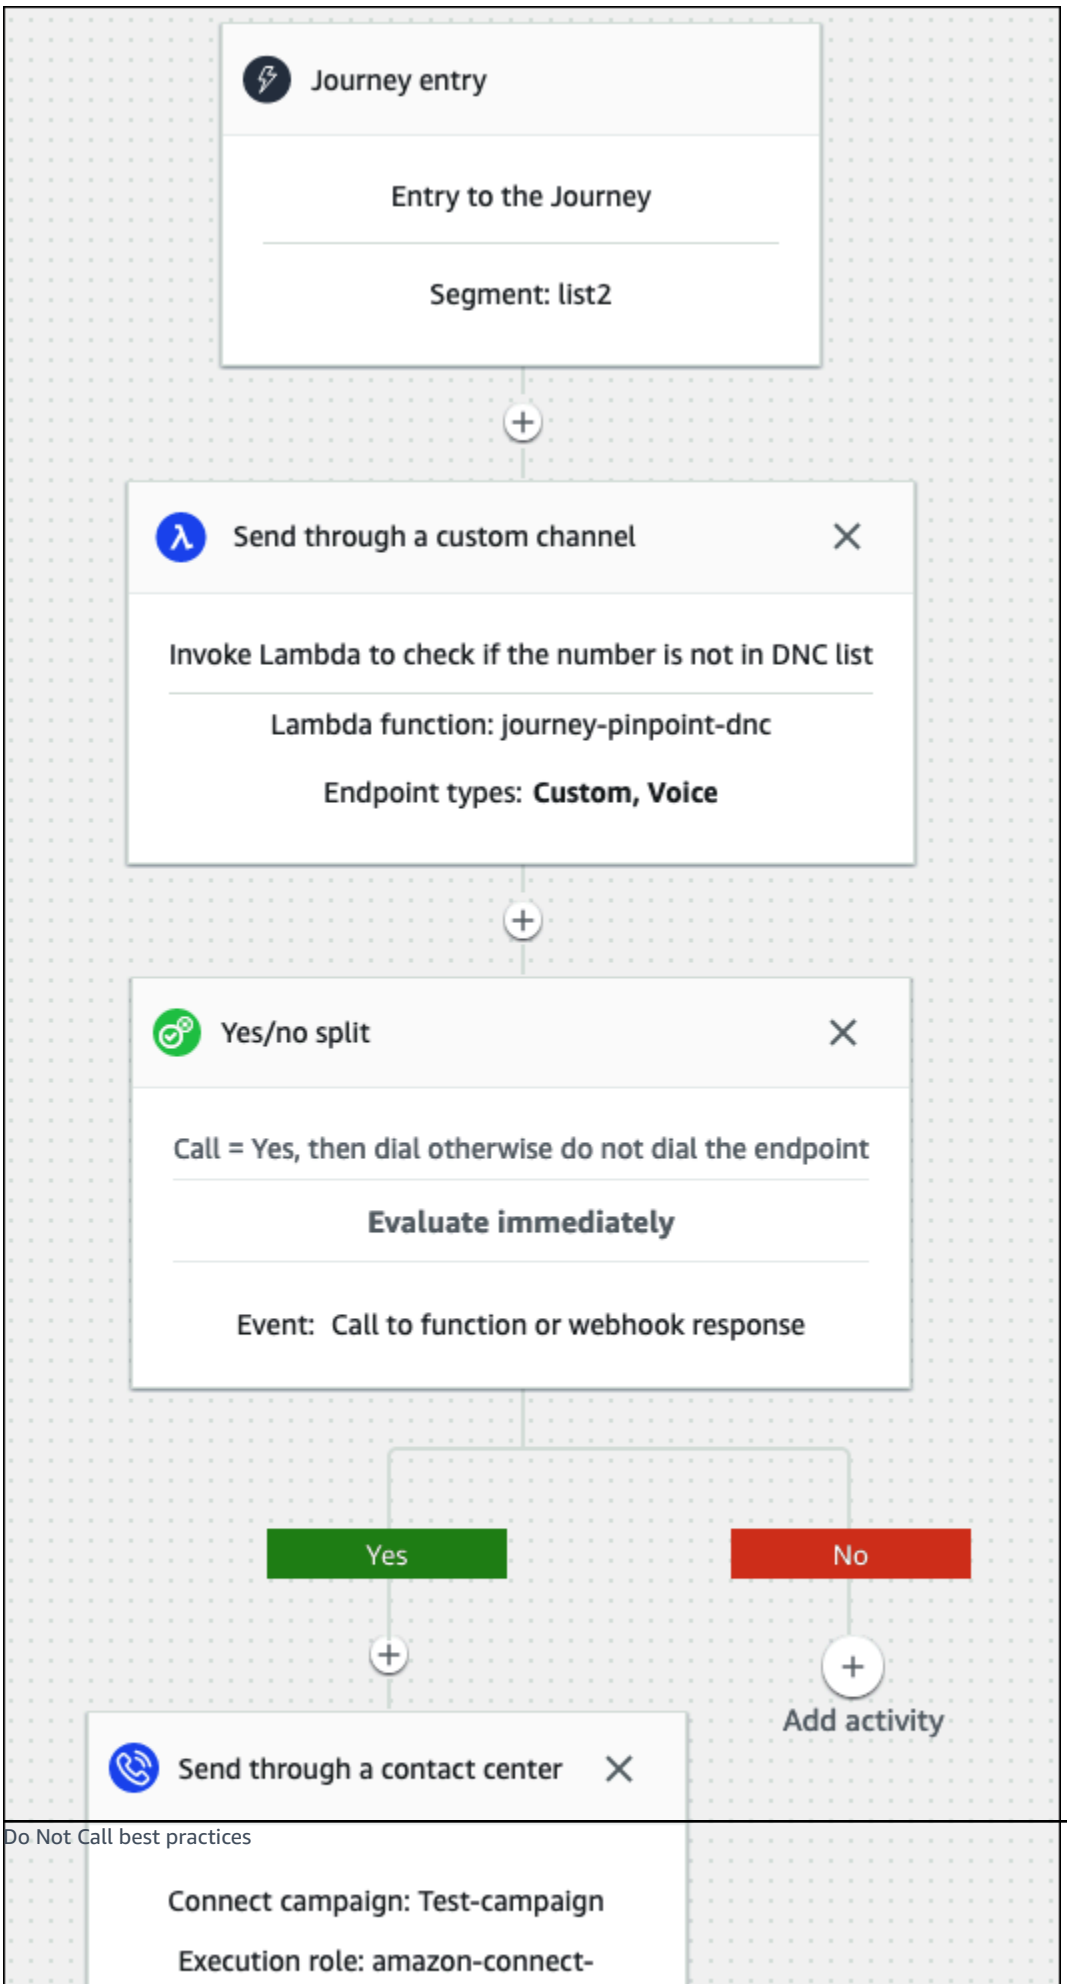
In the **Entry** activity of your journey, only use the **Add participants from a segment** option.

Do Not Call best practices

Many countries have created DNC (Do Not Call) lists. These allow telephone subscribers to not receive marketing calls. Companies must check customer phone numbers against such DNC lists, and remove those numbers before placing a call. You use Amazon Pinpoint to manage DNC lists in outbound campaigns.

With journeys, you can check the status of an endpoint against third-party data sources before sending the messages. You can also add an AWS Lambda function that conducts external DNC checks and does or does not dial based on the response.

The following image shows the suggested DNC flow.



Journey entry
Entry to the Journey
Segment: list2
Send through a custom channel
Invoke Lambda to check if the number is not in DNC list
Lambda function: journey-pinpoint-dnc
Endpoint types: Custom, Voice
Yes/no split
Call = Yes, then dial otherwise do not dial the endpoint
Evaluate immediately
Event: Call to function or webhook response
Yes
No
Add activity
Send through a contact center
Connect campaign: Test-campaign
Execution role: amazon-connect-

Best practices for managing redials

The following sections provide best practices for managing redials and differentiating your call center from spammers.

Automate workflows and use multiple channels

As a best practice, don't persistently call leads and hope the contact answers. The more you call, the less likely the contact might be to answer. Instead, use automation to move the contact to another list and call back 30 days later, then perhaps 60 days later.

Also, look at the number of times a call goes to voicemail. At some point, you might want to stop calling that lead.

An optimal strategy uses automated workflows with multiple communication channels to build an outreach cadence. For example, you start with a phone call, then send an SMS message, then an email. This can significantly increase the chances of contacting the lead. For more information about setting up multiple channels, see:

- Tutorial: Using Postman with the Amazon Pinpoint API, in the *Amazon Pinpoint Developer Guide*.
- Tutorial: Setting up an SMS registration system, in the *Amazon Pinpoint Developer Guide*.

The next sections provide other tips for managing redials.

Manage your call volume

The following best practices can help differentiate your call center from spammers and help protect the integrity of your phone numbers.

- Place no more than 50 calls per area code, per carrier, per day.
- To configure how often a number is dialed, use the **Send through a contact center** activity with a **Wait** activity in your journey. Amazon Pinpoint supports a maximum of three **Send through a contact center** activities per journey. Use that activity strategically.

  For example, use it when a call is **Not answered**, but choose another follow up method for **Voicemail beep** and **Voicemail no beep**, such as email or SMS. Those channels can still provide in-session engagement with the contact by using hyperlinks in emails, or keyword responses such as YES in SMS, to provide self service or contact an agent. This allows contacts to connect when they want to.

To limit dialing

1. As needed, create a journey in Amazon Pinpoint.
2. Set up the journey entry and add the **Send through a contact center** activity.

   For more information about doing that, see Set up the journey entry activity, in the *Amazon Pinpoint User Guide*.
3. After the activity, add a multivariate split.

   For more information about doing that, see Set up a multivariate split activity, in the *Amazon Pinpoint User Guide*.
4. Open the split and add **Branch B** and **Branch C**.
5. Edit the branches in the split as follows:
   - **Branch A**
     a. Open the **Choose a condition** list and select **Event**.
     b. Open the **Choose a journey message activity and event** list and select the **Contact center key**.
     c. Open the **Event** list and select **Not answered**.
   - **Branch B**
     - Repeat the same steps as Branch A but choose **Voicemail beep**.
   - **Branch C**
     - Repeat the same steps as Branch A but choose **Voicemail no beep**.
6. Add a **Wait** activity after each branch, then edit each **Wait** activity as follows:
   - Branch A
     a. In the **Time period** section, enter **4**.
     b. In the **Unit** list and select **hours**.
     c. Select **Save**.
   - Branch B
     a. In the **Time period** section, enter **1**.
     b. In the **Unit** list and select **hours**.
     c. Select **Save**.
   - Branch C
     a. In the **Time period** section, enter **4**.

b. In the **Unit** list and select **days**.

c. Select **Save**.

7. After Branch A, add the **Send through a contact center** activity. Set the parameters of this activity similar as Lab 2.
8. After branches B and C, add the **Send an email** or **Send an SMS** activities. Set up a message template to complete this activity. For more information, see Amazon Pinpoint message templates.

   The following image shows the workflow:

Best practices for Connect Customer outbound campaigns

The topics in this section explain best practices for outbound campaigns. These practices can increase agent productivity, help you comply with regulations, and help protect the integrity of your phone numbers.

Topics

- Choose the right mode for voice communication
- Agent staffing best practices for voice communication
- Connection latency best practices
- Best practices for answering machine detection
- Using sorted segments with outbound campaigns and journeys

Choose the right mode for voice communication

Connect Customer outbound campaign provides several types of voice communication. The following sections describe each type so that you can implement the campaign that best meets your needs.

Topics

- Predictive (Agent assisted voice)
- Progressive (Agent assisted voice)
- Agentless (Automated voice)

Predictive (Agent assisted voice)

When agent productivity, cost per calls, or contact center efficiency are critical metrics, use predictive. Predictive mode anticipate that many calls won't be answered. They counterbalance that by dialing as many phone numbers in a list as possible during an agent's shift by making predictions about agent availability.

The predictive algorithm calls ahead based on certain performance metrics. This means that calls can be connected before an agent becomes available, and a customer is connected to the next available agent. The predictive algorithm constantly analyzes, evaluates, and makes agent availability predictions in real-time so that agent productivity and efficiency can improve.

Progressive (Agent assisted voice)

When you need to reduce answer speeds, use progressive.

A progressive mode campaign dials the next phone number in a list after an agent completes the previous call. If there are multiple campaigns targeting the same set of agents, then each of them might end up dialing contacts for the same agents. There are two ways to prevent this:

- Change the bandwidth allocation of the campaigns so the sum of the bandwidth allocation of each of those campaigns is less than or equal to 100%. This greatly reduces the likelihood of multiple campaigns dialing contacts for the same agents, but it does not completely eliminate it.
- If a 1:1 guarantee is required, then have an exclusive set of agents for each campaign. To do this, assign the campaign's queue to a single routing profile. That routing profile must only have this campaign's queue, must only allow voice calls, and no inbound contacts should be put into this queue.

You can use integrated answering machine detection to help identify a live customer pickup or a voicemail, and customize your contact strategy accordingly. For example, if a person answers a call, you can present options for them to select. If a call goes to voicemail, you can leave a message.

You can also manage pacing by specifying capacity for each campaign. For example, you can send more voice notifications faster by setting a higher capacity for a given agentless campaign compared to other dialer campaigns.

Agentless (Automated voice)

You use agentless mode to send high-volume personalized voice notifications, appointment reminders, or to enable self-service using the Interactive Voice Response (IVR) with no agents needed.

Agent staffing best practices for voice communication

When call recipients answer a call and hear silence in return, they often hang up. For predictive mode, use the following best practices to help reduce that silence:

- Make sure that you have enough agents logged in to your call queue. For more information about staffing, see Forecasting & agent scheduling in Connect Customer.
- Consider using the machine learning services of Connect Customer.

- Forecasting. Analyze and predict contact volume based on historical data. What will future demand—the contact volume and handle time—look like? Connect Customer forecasting provides accurate and auto-generated forecasts that are automatically updated daily.
- Capacity planning. Predict how many agents your contact center will require. Optimize plans by scenarios, service level goals, and metrics, such as shrinkage.
- Scheduling. Generate agent schedules for day-to-day workloads that are flexible, and meet business and compliance requirements. Offer agents flexible schedules and work-life balance. How many agents are needed in each shift? Which agent works in which slot?

  Schedule adherence. Enable contact center supervisors to monitor schedule adherence and improve agent productivity. Schedule adherence metrics are available after the agent schedules are published.

Connection latency best practices

Successful outbound calling campaigns avoid silent calls, the period of silence after a person answers a call and before an agent comes on the line. Legal requirements to limit the number of silent or abandoned calls and keep the called party informed might also apply. You can configure Connect Customer in different ways to reduce call connection delays.

Topics

- Outbound agent-staffed calling
- Outbound agentless calling
- Whisper and queue flow best practices
- User administration best practices
- Workstation and network best practices
- Testing best practices

Outbound agent-staffed calling

When using the Check call progress flow block:

- Call Answered branch - Remove all flow blocks between the Check call progress and Transfer to queue blocks. This minimizes delay between the dialed party saying hello, and the agent answer time.

- Not Detected branch - This branch should be treated in the same manner as a Call Answered with routing to a Transfer to queue block. This branch is used when the ML-model was not able to classify the answer type. Since this could be a voicemail or a live person, you can play a message before to the **Transfer to queue** block in the event that there is a voicemail answering a message can be left.

  For example, "This is Example Corp. calling to confirm your appointment. We couldn't tell if you or your voicemail answered this call. Please stay on the line while we connect you with an agent."

Outbound agentless calling

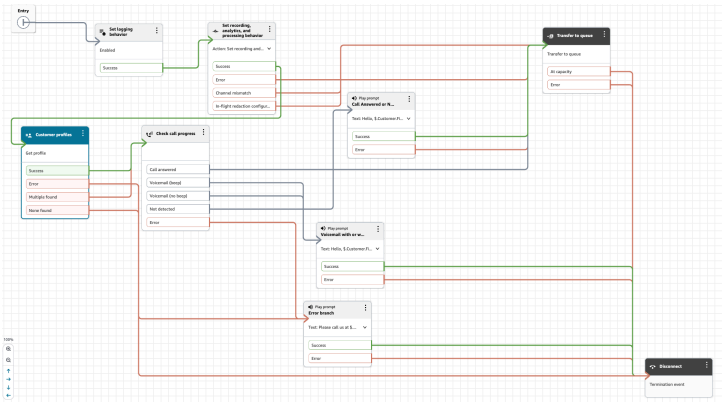
Outbound campaigns often use custom greetings and self service functions. Do not use Lambda functions to get Customer Profile data. Instead, retrieve data from Customer Profiles using the following approach:

- Add a **Customer Profiles** block at the start of your flow and select the **Get profile** action.
- Set the identifier type to **Profile ID**.
- Use `$.Attributes.connect_customer-profile_profile-id` as the identifier value. This attribute is automatically populated when contacts are dialed from a outbound campaign that uses Customer Profiles segments.
- Select the appropriate response fields to retrieve. For standard profile attributes (like FirstName, LastName), add them directly. For custom attributes (like AppointmentDate, AppointmentTime), add them as custom response fields by selecting Custom attribute.
- After the Customer Profiles block, you can access profile attributes using `$.Customer.<AttributeName>` for standard attributes or `$.Customer.Attributes.<CustomAttributeName>` for custom attributes to play custom greetings.

Here are examples of how to use Customer Profile attributes in prompts:

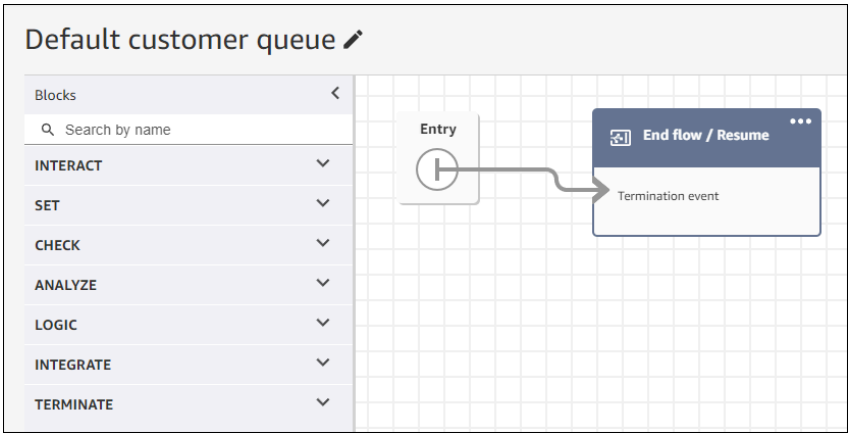
- Example - Call Answered or Not Detected: "Hello, `$.Customer.FirstName`. This is [your organization] calling to confirm your upcoming appointment on `$.Customer.Attributes.AppointmentDate` at `$.Customer.Attributes.AppointmentTime`. If this is still a good time and date for you, just say, "Confirm". If you would like to use our self service system to modify your appointment, just say, "self service" or stay on the line and we will connect you with the next available agent."

- Example - Voicemail with or without beep: "Hello, `$.Customer.FirstName`. This is [your organization] calling to confirm your upcoming appointment on `$.Customer.Attributes.AppointmentDate` at `$.Customer.Attributes.AppointmentTime`. If this is still a good time and date for you, we will see you then. If you would like to modify your appointment, please call us back at `$.SystemEndpoint.Address` to reschedule your appointment"
- Error branch - Occasionally there could be an issue that causes a call to follow the Error branch. As a best practice, use a Play prompt block with a message that applies to the contact that was dialed, with instruction to "Please call us at `$.SystemEndpoint.Address` to confirm or reschedule your appointment." Do this before the Disconnect / hang up block in case the call recipient answered, but an error occurred in the processing.

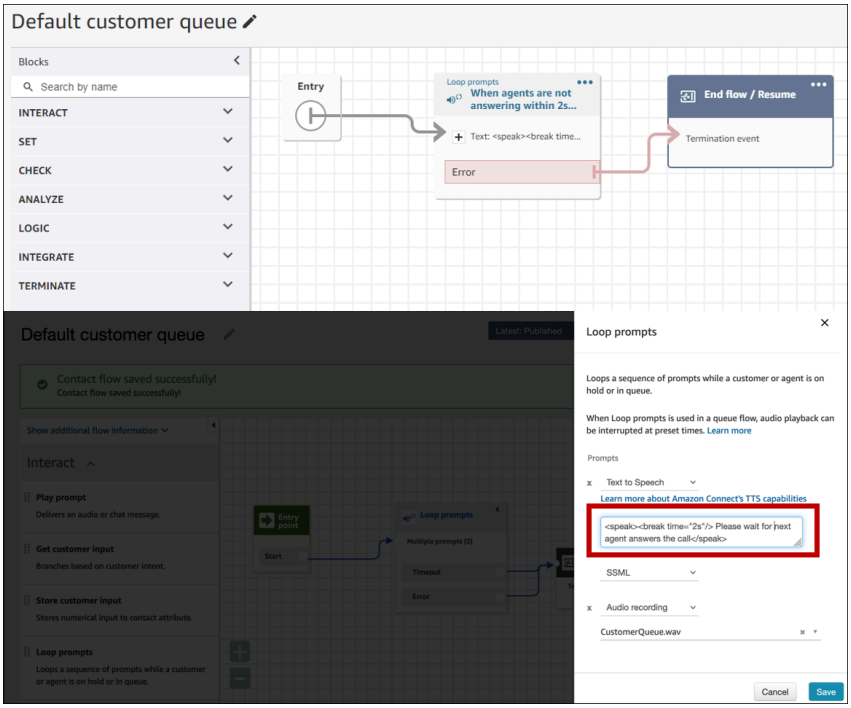


Whisper and queue flow best practices

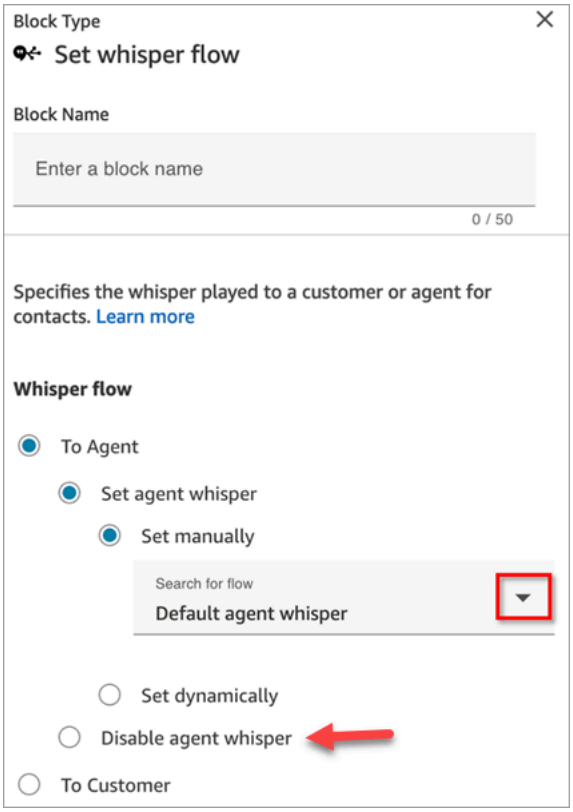
- Remove the **Loop prompts** from the **Default customer queue** flow and replace them with **End flow / Resume**.



- If agents don't answer within 2 seconds of calls going to queue, you can minimize silent calls by using **Loop prompts** and play a message for the customer. The following image shows a typical flow block with a Loop prompt.



- Use the **Disable agent whisper** and **Disable customer whisper** options on the Set whisper flow block. This is so customers perceive less connection latency as part of an outbound campaign. The following image shows the location of the **Disable agent whisper** setting on the block's properties page.



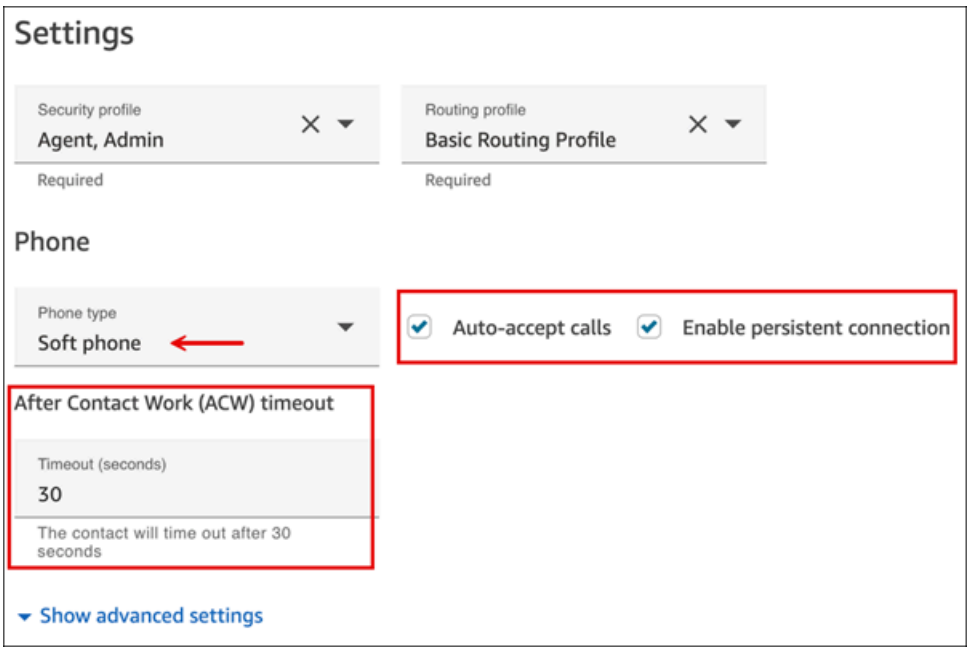
User administration best practices

We recommend setting the following options for your users to reduce connection times. To access these settings, in the Connect Customer admin website navigate to **Users**, **User management**, **Edit**.

These options apply to soft phones only.

- Enable the Auto-accept calls. It reduces the potential for call connection latency/delay after a dialed party answers.
- Set After Contact Work (ACW) timeout to 30. Minimizing the ACW time will optimize the dialing algorithm when using Predictive dialing campaigns.
- Enable persistent connection. This maintains agent connection after a call ends. It enables subsequent calls to connect faster.

The following image shows the **Settings** section of the **Edit user** page.



Workstation and network best practices

The following best practices can help optimize agent efficiency by ensuring adequate hardware and network resources.

- Make sure that agent workstations meet the minimum requirements. For more information, see Agent headset and workstation requirements for using the Contact Control Panel (CCP).
- Make sure that the agent has the CCP or agent workspace open and present on their desktop. This reduces the time spent bringing the screen to the front before greeting the caller.
- Make sure that agents use a wired network connection. This mitigates potential wireless network latency.
- If possible, minimize the geographic distance between the AWS Region that hosts your Connect Customer instance and the agents that interact with the outbound campaigns. The greater the geographic distance between your agents and the hosting Region, the higher the possible latency.

> **Note**
>
> Outbound campaigns have limitations on the numbers that agents can dial, depending on the origin of the Connect Customer instance. For more information, see the Connect Customer Telecoms Country Coverage Guide.

Testing best practices

As a best practice, run tests at scale. To achieve the lowest call connection latency, use outbound campaigns to make hundreds of thousands of continuous calls to mimic your production environment. Call connection latency can be relatively high when making a handful of campaign calls.

Best practices for answering machine detection

To use Answering Machine Detection (AMD) in a campaign, use the Check call progress flow block. It provides call progress analysis. This is an ML-model that detects an answered call condition so that you can provide different experiences for calls answered by people and calls answered by machine, with or without a beep. The flow block also provides a branch for routing calls when the ML-model can't distinguish between people and voicemail, or when errors occur in call processing.

AMD uses the following criteria to detect live calls:

- Background noise associated with a pre-recorded message.
- Long strings of words such as "Hello, I am sorry I missed your call. Please leave a message at…"
- A live caller saying something similar to "Hello, hello?" followed by a post-greeting silence.

Forty to 60-percent of calls to consumers go to voicemail. AMD helps eliminate the number of voicemail calls over live calls. However, the detection accuracy has limitations.

- If the voicemail greeting is a short "Hello" or includes a pause, AMD detects it as a live customer (a false negative).
- Sometimes a long greeting by a live customer is incorrectly detected as a voicemail (a false positive).
- There is a small delay while the system connects the call to an agent, which could result in the customer possibly hanging up.
- PBX (private branch exchange) numbers with multiple levels of voicemail prompts are not supported.

The pros, cons, and best uses of Answering Machine Detection

The use of Answering Machine Detection (AMD) might not comply with telemarketing laws. You are responsible for implementing AMD in a manner that is compliant with applicable laws. You should always consult your legal advisor regarding your specific use case.

Use case 1: AMD is on and leaving automatic voicemails

- **Pros** – Agents primarily interact with live calls 95-percent of the time, maximizing talk time. AMD can leave automatic voicemails if a voicemail is detected.
- **Cons** – The technology leaves a voicemail 50-percent to 60-percent of the time due to false positives due to the large variety of answering machine types. Also, AMD can irritate customers because it adds a short delay to live calls.
- **Best uses** – Calling consumers during the day when you might get a large quantity of answering machines and it's not urgent to ensure every call receives a voicemail.

Use case 2: AMD is on but not leaving automatic voicemails

- **Pros** – Agents primarily interact with live calls 95-percent of the time, maximizing talk time.
- **Cons** – Cannot leave any voicemails. Adds a delay to live calls which can annoy customers.
- **Best uses** – Calling consumers during the day when you might get a large quantity of voicemails and you don't want to leave any voicemails.

Use case 3: AMD is off and agents can leave manual voicemails

- **Pros** – Voicemails can be left 100-percent of the time.
- **Cons** – Agents must determine whether they are receiving a live call or voicemail. Must manually leave a voicemail. Most time consuming and can lower the number of calls your agents make in a day.
- **Best uses** – Calling consumers or businesses and leaving customized voicemails.

Use case 4: AMD is off and agents can leave a prerecorded voicemail

- **Pros** – Agents can leave a personalized, pre-recorded voicemail 100% of the time saving significant time by avoiding repeating the same message over and over with 'Voicemail Drop'.

- **Cons** – Agents must determine whether they are receiving a live call or voicemail. More time consuming than AMD but quicker than manually leaving a voicemail.
- **Best uses** – Calling consumers or businesses and leaving generic voicemails.

Using sorted segments with outbound campaigns and journeys

When you create segments, you can optionally sort them by up to 10 profile attributes. Outbound campaigns and journeys respect this sort order during execution, submitting profiles for dialing in the order specified by the segment at the time the campaign or journey runs. In a recurring campaign or journey, each segment refresh sorts the new profiles that enter alongside profiles that enter again. Profiles already in progress keep their position.

Sorted segments are useful when you want to:

- Prioritize high-value customers by sorting on attributes such as lifetime value or account tier.
- Contact customers with upcoming appointments first by sorting on appointment date.
- Process time-sensitive communications in a specific order.

Note

- The segment sort order applies only to voice campaigns and voice activities in journeys. Other communication channels process profiles in an unsorted order.
- Sorted segments are split into 100 batches. Each batch is processed according to the specified sort order. This results in an execution order that is within 1% of the defined segment order.
- The segment sort order determines the order in which profiles are submitted for dialing, not the order in which calls connect, because multiple calls may be placed at the same time. The difference is most noticeable in agentless mode, and with small audiences that are dialed within a few minutes. Sort order has the most effect on large audiences, where it determines which customers are reached earlier.
- Initial dial attempts take precedence over any reattempts that are defined in a campaign. In a journey, earlier send communication blocks are prioritized over later ones.

For more information about creating and sorting segments, see Build customer segments in Connect Customer.

Best practices for ring duration and caller ID

The following best practices can help you comply with regulations.

Meet the minimum ring duration requirements

Regulations might require unanswered calls to ring for a minimum amount of time, such as 15 seconds, so the customer has time to pick up the call. Connect Customer outbound campaigns let unanswered calls ring until they go to voicemail or automatically terminate.

Maintain Calling Line Identification

Many locations require you to display the phone number associated with a caller ID. Connect Customer enforces the use of Calling Line Identification that corresponds to a number in a Connect Customer instance. The phone number you specify as caller ID for an outbound campaign must be one you have claimed or ported in to your number inventory.

Editing an outbound campaign

> **Note**
>
> You can edit any outbound campaign in the Initialized state. Running or paused campaigns can be updated only if they are journey-type.

While a journey is running or paused, you can update the following settings. Your changes take effect as the journey continues to run.

Journey flow

This change takes effect only at the next scheduled repeat of the journey. Profiles that were already in the journey before the update continue to use the previous flow.

Customer Profiles segment

When you change a journey's segment during execution, newly matched profiles are added to the journey starting at the next refresh. Profiles that no longer meet the segment definition

are not included in the next refresh. Profiles that were already in the journey before the change continue in the journey and are not affected by the segment change.

The replacement segment must have the same sorting type as the current segment. You can't replace a sorted segment with an unsorted segment, or an unsorted segment with a sorted segment.

Communication limits

Updates to communication limits are applied within minutes. If you reduce limits, profiles whose communication counts now exceed the new limits are removed from the journey.

Communication time

Updates to active communication time, or to exceptions to communication time, are applied within minutes, and sending is adjusted accordingly based on the new time windows.

Forecasting & agent scheduling in Connect Customer

> **Tip**
>
> **New user?** Check out the Connect Customer forecasting, capacity planning, and scheduling workshop. This online course is for Contact Center Administrators, Workforce Managers, Forecasters and Schedulers who are responsible for the forecasting and scheduling of agents.

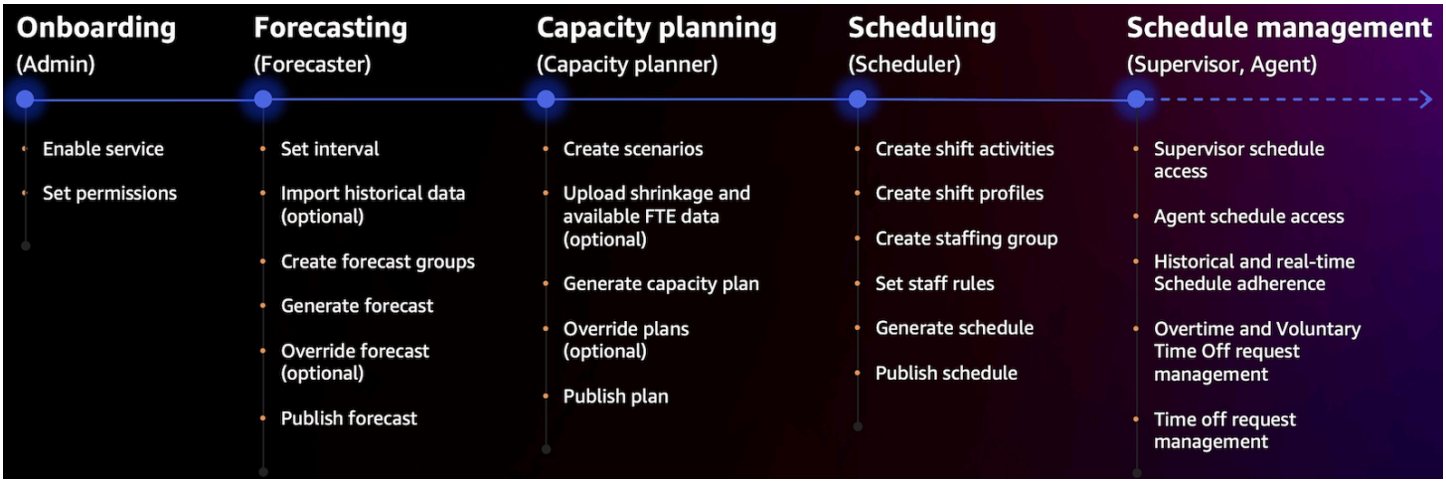
To run a contact center, you need the right number of agents working at the right times to achieve your operational goals. It's critical to not overspend or overrun your workforce.

Connect Customer provides a set of services powered by machine learning that help you optimize your contact center by offering the following:

- Forecasting. Analyze and predict contact volume based on historical data. What will future demand—the contact volume and handle time—look like? Connect Customer forecasting provides accurate and auto-generated forecasts that are automatically updated daily.
- Scheduling. Generate agent schedules for day-to-day workloads that are flexible, and meet business and compliance requirements. Offer agents flexible schedules and work-life balance. How many agents are needed in each shift? Which agent works in which slot?
  - Schedule Adherence. Enable contact center supervisors to monitor schedule adherence and improve agent productivity. Schedule adherence metrics are available after the agent schedules are published.
- Capacity planning. Predict how many agents your contact center will require. Optimize plans by scenarios, service level goals, and metrics, such as shrinkage.

For information about where Connect Customer forecasting & agent scheduling is available, see Availability of Connect Customer features by Region.

The following diagram shows a typical end-to-end optimization workflow by persona: Connect Customer administrator, forecaster, scheduler, capacity planner, and agent. It lists the tasks performed by each persona.



Set up forecasting & agent scheduling in Connect Customer

> **Tip**
>
> **New user?** Check out the Connect Customer forecasting, capacity planning, and scheduling workshop. This online course is for Contact Center Administrators, Workforce Managers, Forecasters and Schedulers who are responsible for the forecasting and scheduling of agents.

Use these steps to set up forecasting & agent scheduling.

1. Enable forecasting & agent scheduling in the Connect Customer console.

   > **Note**
   >
   > After enabling Forecasting & agent scheduling, it might take up to **24 hours** before the feature is available for use.

2. Assign security profile permissions to the Connect Customer users who will use this feature.

Use the following steps to start using forecasting & agent scheduling.

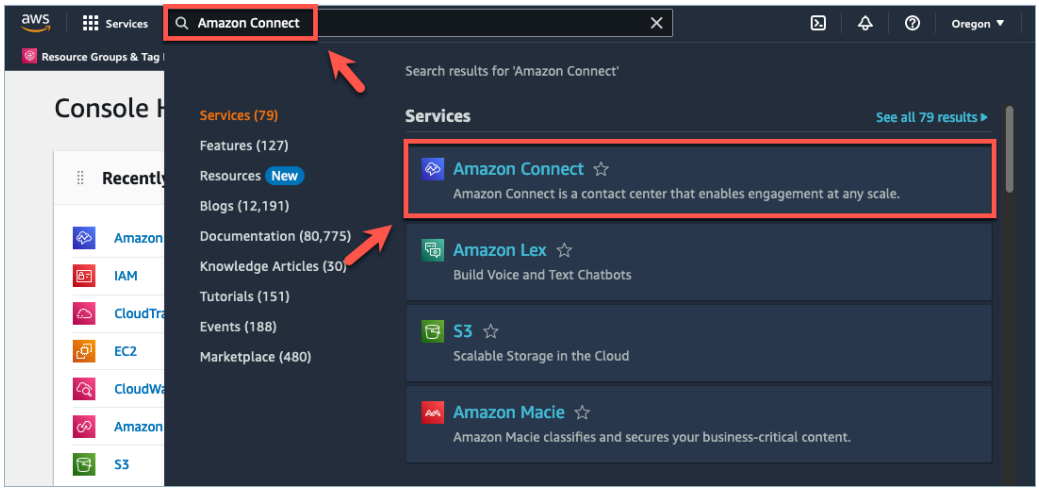
1. Set the forecast and scheduling interval
2. Create forecast groups
3. Create forecasts

4. Create capacity planning scenarios
5. Create staff rules

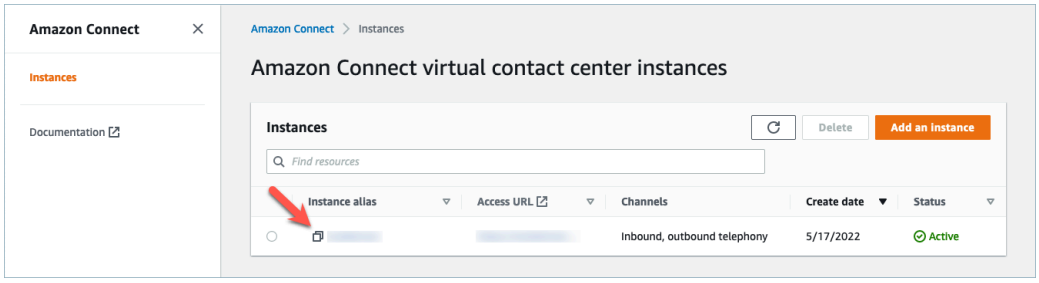
Enable forecasting & agent scheduling in Connect Customer

You must enable forecasting & agent scheduling at the Connect Customer instance level. After you enable forecasting & agent scheduling, it might take up to 24 hours for the feature to be available for use in your AWS account.

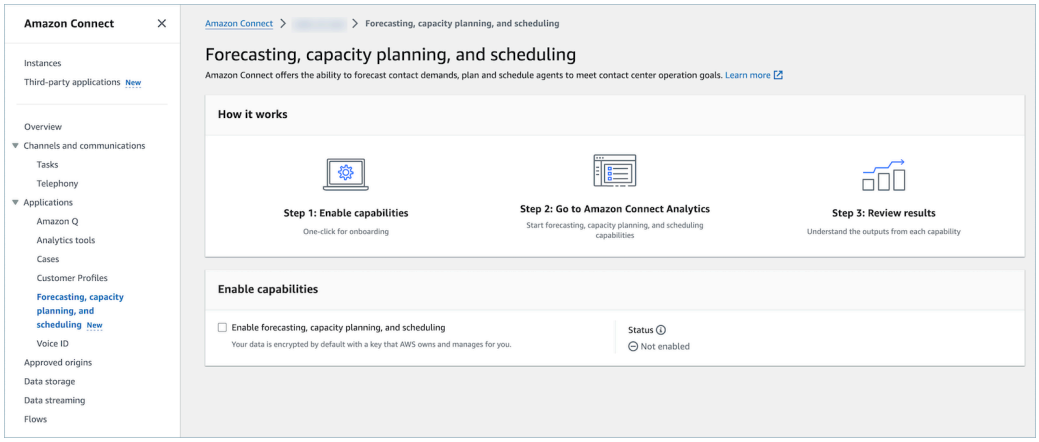
1. Log in to the AWS Management Console using your AWS account.
2. In the AWS Management Console, at the top of the page in the search bar, type *Connect Customer* and then choose **Connect Customer**.This is shown in the following image.



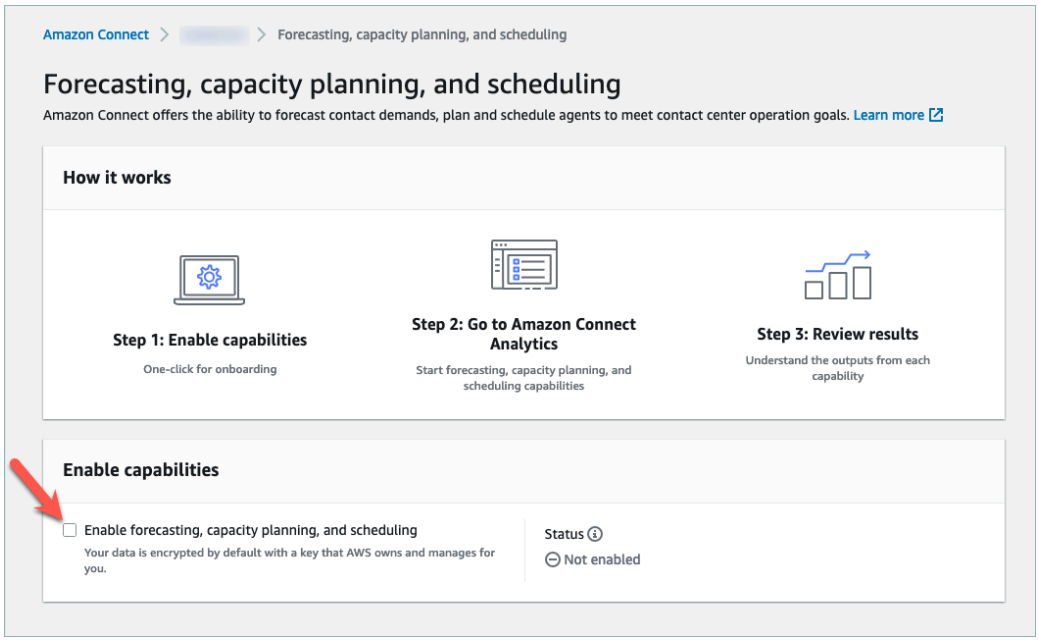
3. On the **Connect Customer virtual contact center instances** page, choose the **Instance alias** where you want to enable forecasting & agent scheduling.



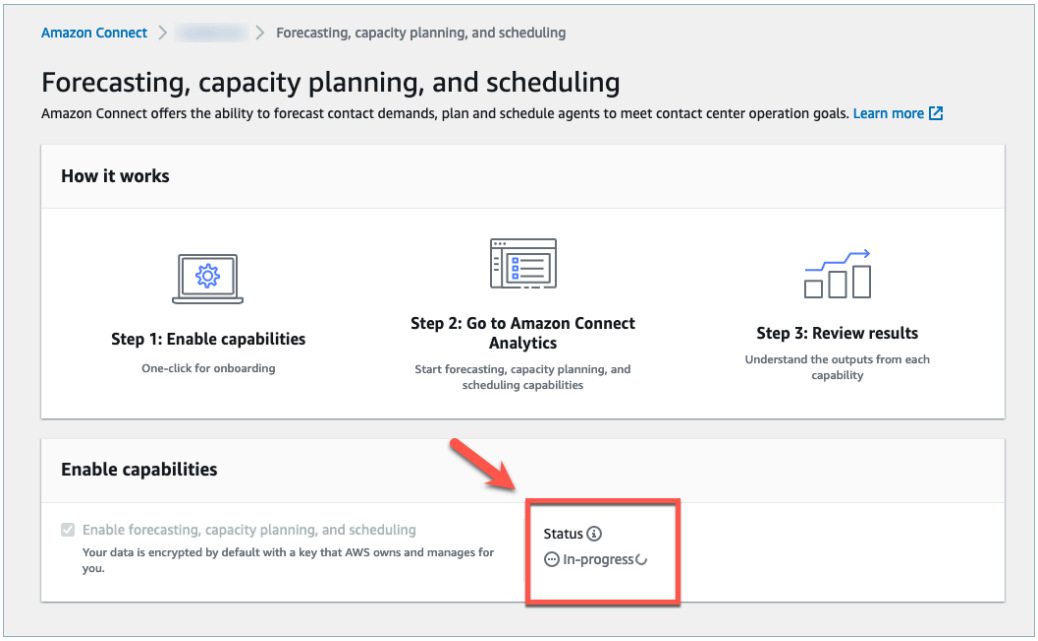
4. In the navigation pane, choose **Forecasting & agent scheduling**.



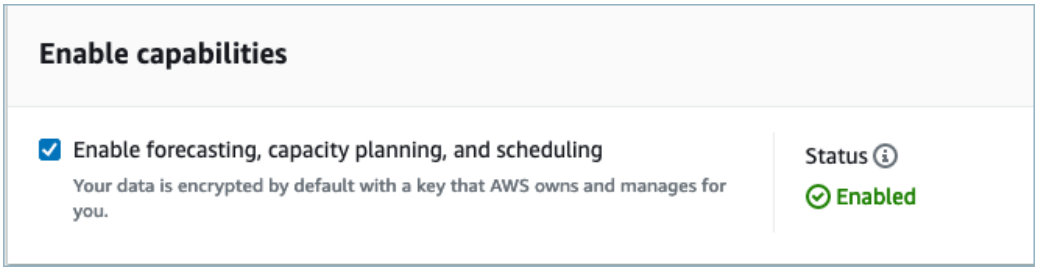
5. On the **Forecasting & agent scheduling** page, select the check box to enable forecasting & agent scheduling.



6. The status changes to *In progress*, as shown in the following image.



7. Within 24 hours the status will change to *Enabled* and forecasting & agent scheduling will be ready to use.



Security profile permissions for forecasting & agent scheduling in Connect Customer

Assign the following security profile permissions as needed to use forecasting & agent scheduling.

Analytics and Optimization permissions

- **Forecasting**: Grants permission to view and edit in forecasting pages. For example, you can:
  - Create forecast groups - **Edit** permission is required.
  - Import historical data - **Edit** permission is required.
  - Create forecasts - **Edit** permission is required.
  - Inspect a forecast - **Edit** permission is required.
  - Download a forecast - **Edit** permission is required.

  - Edit a forecast - **Edit** permission is required.
  - Publish a forecast - **Publish** permission is required.
- **Capacity planning**: Grants permission to view and edit in capacity planning pages, including scenario and capacity plans. It also grants permission to import future estimated shrinkage and available FTEs. For example, you can:
  - Create capacity planning scenarios - **Edit** permission is required.
  - Import estimated future shrinkage and available full-time employees - **Edit** permission is required.
  - Create capacity plans using forecasts and scenarios - **Edit** permission is required.
  - Review capacity plan output - **Edit** permission is required.
  - Override a capacity plan - **Edit** permission is required.
  - Download a capacity plan - **Edit** permission is required.
  - Publish a capacity plan - **Publish** permission is required.
- **Forecast and schedule interval**: Grants permission to:
  - Set the forecast and scheduling interval. Grants access to the **Forecast and schedule interval** tab on the **Forecasting** page.
  - Set the forecast and scheduling interval. Grants access to the **Forecast timezone** tab on the **Forecasting** page.

Scheduling

- **Schedule manager**. Grants permission to view, edit, and publish generated schedules from the Schedule manager. You can also import an agents time off balance to Connect Customer

> **Note**
>
> You need the **View** permission and the **Analytics and Optimization** - **Historical metrics** - **Access** permission to view historical Schedule Adherence metrics.

- **Published schedule calendar**:
  - View - This option also enables the Time off requests - View option.
  - Edit - This option also enables the Time off requests - View Edit, and Approve options.
- **Time off requests**

  - **View**. Grants permissions to agents to view time off requests in the Time off Requests drawer. Users with the View permission can not create or approve time off requests.
  - **Edit**. Grants permissions to create time off requests.
- **Time off balance**. To access the Staff Rules page where time off balance is managed, users must have at least **Schedule manager - View**.
  - **View**. Grants permission to view and download time off balances. Users can also view time off balances with **Schedule manager - Edit**.
  - **Edit**. Grants permission to upload time off balances. Users can also upload time off balances with **Schedule manager - Edit**.

Agent Applications

- **Agent application schedule calendar**. Grants permission to agents to **View** or **Edit** their schedule. Agents require the **Edit** permission to request time off.

  They can accept or decline VTO.

For information about how to add more permissions to an existing security profile, see Update security profiles in Connect Customer.

By default, the **Admin** security profile already has permissions to perform all forecasting, capacity planning, and scheduling activities.

Troubleshooting forecasting & agent scheduling in Connect Customer

These sections outline troubleshooting scenarios and address frequently asked questions for forecasting & agent scheduling.

- Forecasting
- Capacity planning
- Scheduling

Forecasting

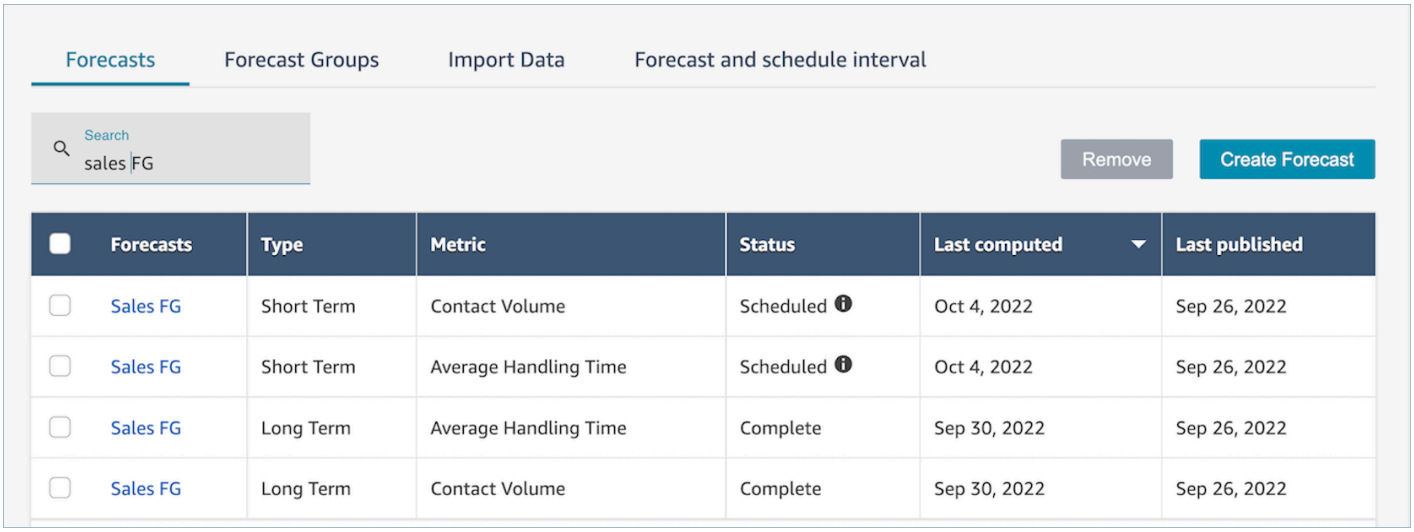
- **How can I create an ad hoc forecast?**

Forecasts are processed automatically, delivering short-term forecasts daily, and long-term forecasts weekly, so users don't need to worry about running forecasts manually. However, you might want to see how a forecast is updated when you add or modify historical data.

For example, if you had an anomaly in your historical contact volume, and you don't want the machine-learning model to use that anomaly in building a forecast, you can modify the historical data and then when the new forecasts are run, the new forecasts are not incorporate that data.

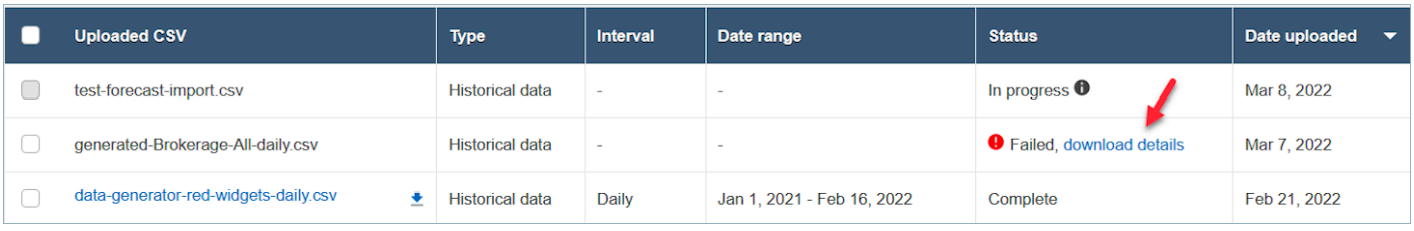
To see the most recent forecasts, check the **Last computed** column.

New forecasts are generated the following day after a user uploads or deletes historical data using the **Import data** tab or adds/removes queues from a forecast group.



- **When I import historical data it returns errors.**

  Select **download details** to make sure that the imported data is in the correct format: If there are any errors, check the error details. It provides additional details for the specific error. You must make sure that your file is in `.csv` format, contains no decimals, no extra rows, or column fields. For more information on the required format, see Import historical data for forecasting.



- **Forecast failed due to error: Insufficient data in Connect Customer.**

  When you receive this error, it could be due to three different reasons:

1. *You have less than 6 month of historical data.* To address this problem, upload more historical data.

   Although Connect Customer can generate forecasts with six months of data, we recommend at least 12 months of recent contact data to ensure that contact patterns (for example, seasonality) are properly captured. If you don't have 6 months of data, you can give Connect Customer synthetic (artificial) data that will be used to generate the forecast. Alternately, you can upload your own forecast using the **Override** function.

2. *You need at least 2,000 contacts per month across all of your forecast groups.* Connect Customer generates forecasts using historical data for all queues that are included across all forecast groups. At least 2,000 monthly contacts in the past 6 months for the Connect Customer instance are required to successfully generate a forecast. Connect Customer does not require 2,000 monthly contacts for every queue. All queues in all forecast groups must total more than 2,000 monthly contacts.

3. *You need recent data.* Connect Customer performs a data recency check (is the data recent enough) based on the aggregation of all queues included across all forecast groups. At least one data point in the past four weeks is required to successfully generate a forecast.

- **Cannot import data, cannot download forecast, cannot create forecast group, or cannot create forecast.**

  Most likely, you do not have the correct permissions. Check with your admin to make sure you have permissions for **Analytics, Forecasting - Edit**.

- **Forecasting override upload failed.**

  Check the error message to make sure the `.csv` file format matches our data schema. For more information on the required format, see Import historical data for forecasting.

  > **Tip**
  >
  > Download the computed or published forecast .csv file. Take the time period for override, and copy the queue ID and queue name, time stamps to the override template.
  > Only the latest uploaded .csv file is used, and the previous uploaded files are overridden.

- **Long-term Forecast failed even after I have uploaded more than 6 months of data.**

  The data uploads for long-term and short-term forecasts are independent, so you need to upload these separately: one for long-term and one for short-term. First, check if you also

uploaded the daily historical data for long-term forecast. The 15 to 30 minute interval data is for short-term forecasts only. Second, check if the long-term daily level `.csv` file has more than 6 consecutive months historical data counted from now.

- **Short-term forecast failed even after I uploaded more than 6 month of data.**

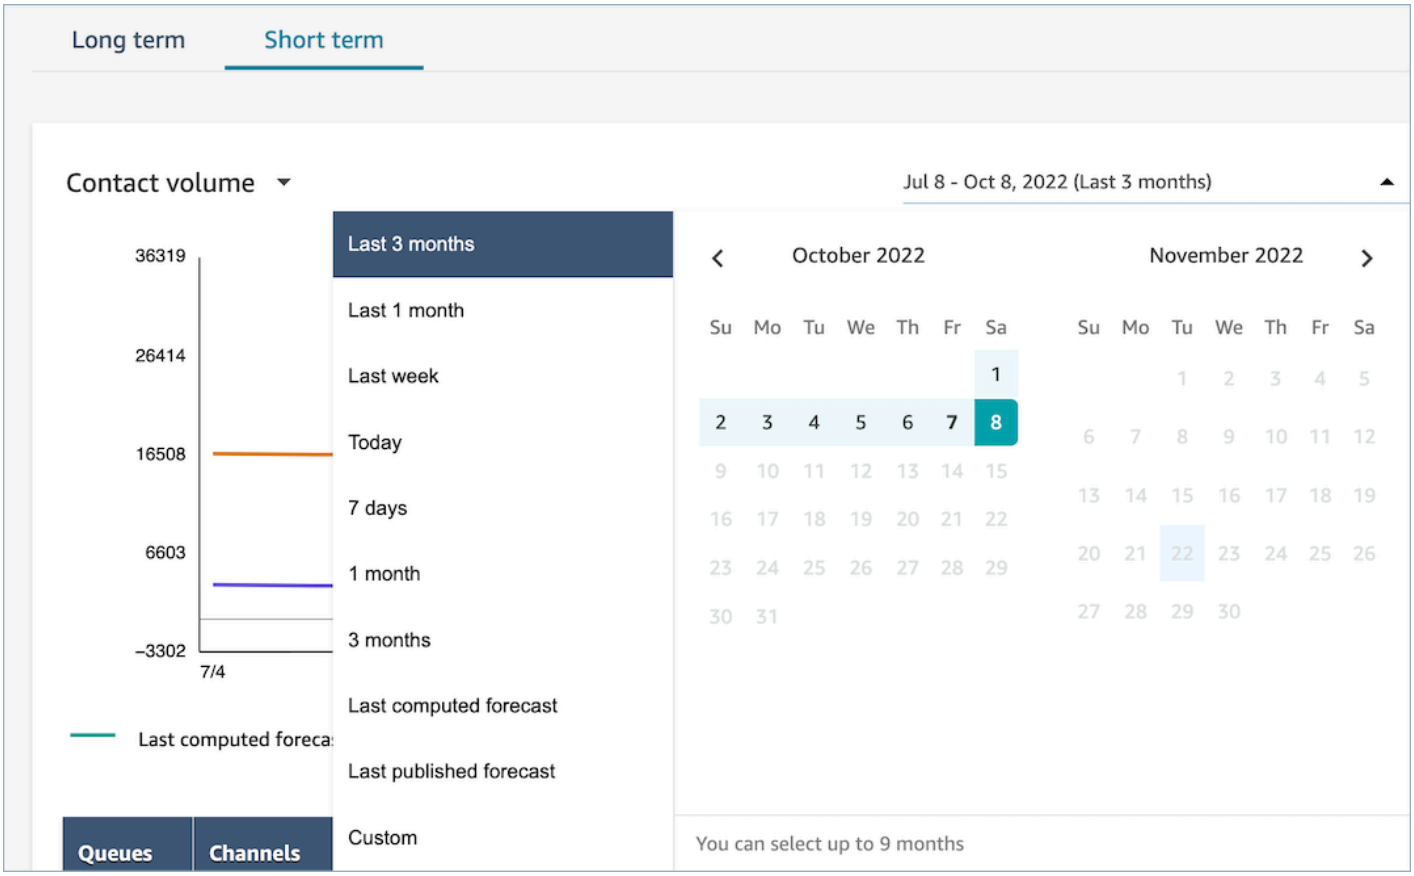
  The data uploads for long-term and short-term forecasts are independent. The daily interval data is for long-term forecast only. First, check if you uploaded the 15 or 30 minute interval historical data for short-term forecast and the file has more than 6 consecutive month data. Second, check what is the forecast interval setting in `.csv` file to make sure it matches the historical intervals on the UI.

- **Why am I unable to publish a forecast?**

  It's possible that you do not have permissions to publish a forecast. It's also possible that the forecasts (both contact volume and handle time for each of short-term and long-term) have not been successfully generated. Check if you have the permission for **Analytics, Forecasting - Publish** and check if the forecasts have been successfully generated (the status column should show **complete"** when the forecasts are generated).

- **How can I see data from a previous period?**

  You are able to view forecasts in a specified period that occurred in the past.



- **Can I see past forecast data?**

  You can see the last published and the last computed forecast. The last computed forecast is overwritten after the next forecast is computed. If you want to retain this data, you can download the `.csv` file that contains the last computed and published forecasts.

- **Why are the forecasts used in capacity planning different than the ones I see in forecasting or scheduling?**

  The forecast that is used in capacity planning is the most recent published long-term forecast. You might see a different forecast in forecasting if you are looking at the most recent computed forecast in comparison to a published forecast. You will see a different forecast in scheduling, as that is the most recently published short-term forecast.

- **Why am I unable to delete a forecast?**

  Forecasts can only be deleted if they are not being used for a capacity plan (long-term forecast) or schedule (short-term forecast). Check if the forecast has been published and that it is used for scheduling or capacity planning. You must delete the schedule or capacity plans to delete the forecast.

- **Why do the long-term and short-term forecasts show different values for the same time period?**

  These two forecasts have different training frequencies and different models, as they are optimized for different purposes. Short-term is designed for interval level granularity over a period of weeks and long-term is designed for daily granularity over a period of months.

- **Why is long-term average handle time flat but short-term average handle time isn't?**

  A flat average handle time performs better when forecasting short-term forecast workloads as it displays interval granularity over a period of weeks. Allowing the average handle time to vary in a long-term forecast results in better performance as displays daily granularity over a period of months.

  Handle time is important when calculating a workload. It generally doesn't vary much in the short term but can vary over longer time periods, which is reflected in our models.

- **Is call volume counted at the time when the call comes in, or when the call ends?**

  Call volume starts counting at the time when call comes in. For example. a call started at 4:50 PM, and ends at 5:05 PM. It is counted as the call volume for the 4:45 PM - 5:00 PM interval.

Capacity planning

- **How do I handle shrinkage in capacity planning?**

  Users can increase capacity planning accuracy by providing estimated future data, which includes available full-time employees (FTE) and Shrinkage, for the existing forecast groups. Providing Available FTE and shrinkage data is optional. Connect Customer can generate a capacity plan without it but providing it improves the accuracy of the capacity plan. In order to import that data, download the `.csv` template from the UI and fill out the empty cells. Note that users need to enter the exact name of the forecast groups they created. Also, users can add multiple forecast groups in this `.csv` file. For more information, see Import estimated future shrinkage and available full-time employees.

- **I am seeing errors during data import in capacity planning.**

  Confirm that the forecast group names in the `.csv` file match the actual forecast group names in forecasting module.

Scheduling

- **The system does not generate schedules for some or all of my agents. What should I check?**

  This can occur because the last date an agent can be scheduled is before the time of the schedule or the agent's maximum working hours don't allow them to work in that shift profile. Review the following steps to address this issue.

  1. Check **Staff Rules** to make sure that the **End date** is not configured for agents who do not have a schedule. **End date** allows schedulers to specify the last date that an agent can be scheduled until.
  2. Check shift profiles to see if the **Start time** and **End time** hourly schedule window is equal to or more than **Maximum working hours** per agent.

     For example, if the shift profile is configured to generate a schedule of an 8 hour duration, when the agent's staff rule is configured for them to work 4 hours per day, Connect Customer applies the staff rule and generates a schedule for only 4 hours.

- **Why am I unable to access the scheduling page while on my company's VPN?**

  It is possible that your company's VPN has security measure in place that could be preventing access to the needed endpoints. If you are unable to access the scheduling page while connected to your company's VPN, reach out to your admin or network security team to have them allowlist the following endpoints:

  ```
  .awsapps.com/connect/markov/schedule-ui/api/graphql
  ```

  ```
  .my.connect.aws/markov/schedule-ui/api/graphql
  ```

- **Why are lunch activities for some agents scheduled before the first break activity, even though I have specified a lunch activity to be placed after the break?**

  This can be caused by having overlaps in the break and lunch activities. Check the specific shift profile to see if the placement window for both activities overlap. For example, you might have configured a break activity to be placed between 11am and 1pm and a lunch activity to be placed between 10am and 3pm, so the system might choose to place the break at 12:30pm and the lunch at 11:30am. Remove or minimize the overlap of activity placement windows to solve this issue.

- **Why do I see agents get scheduled at different start times than expected?**

This is commonly caused by a mismatch between the time zone of the shift profile and the time zones configured for your agents. Shift profiles support any time zone, and staff rules specify which time zone each agent should use. Review the following steps to address this issue.

- On the **shift profile**, set the **Time zone** to the time zone in which you want to enter the **Start time** and **End time**, then enter the times in that time zone. For example, to schedule agents in Boston from 9 AM to 5 PM Eastern time, set the shift profile time zone to America/New_York, the start time to 9:00 AM, and the end time to 5:00 PM.
- Ensure the correct time zone is set for each agent in the **Staff rules** UI so that agents and supervisors see schedules rendered in their local time zone.

- **Can I view the schedule in my local time?**

  Yes. Supervisors and schedulers can view schedules in their local time zone for agents they manage. Agents can view their individual schedules in their local time zone. User time zones can be set in the **Staff rules** UI.

- **Do I need to define activities for workloads like phone or chat?**

  No. *Work* is the default activity on the schedule if there is no break or lunch scheduled for the time slot. Only define the activities for the agent when they are not taking a call or responding to a chat.

- **Why did some agents did not get added to the roster for certain days?**

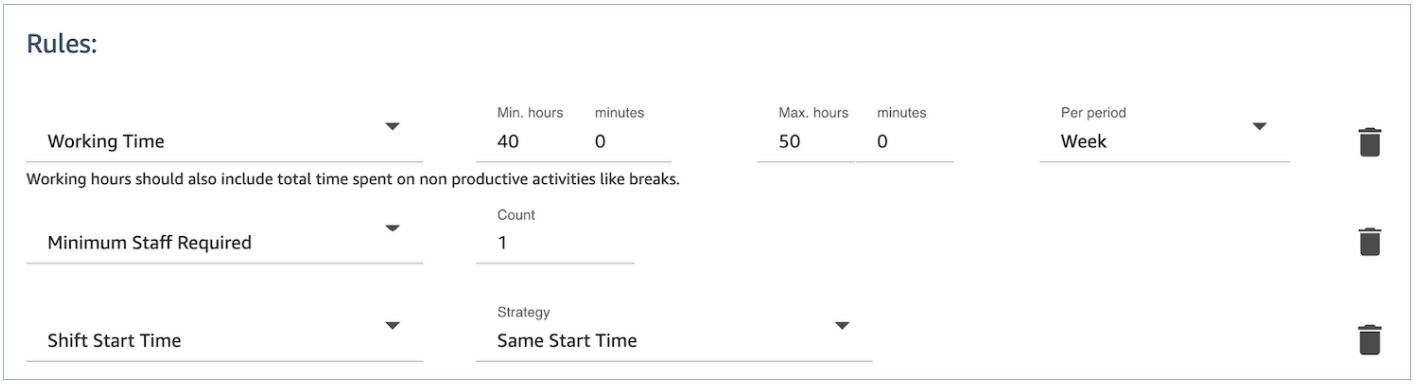
  How agents are added to the roster depends on multiple configurations in staffing groups and staff rules, such as min/max working hours, min staff required, or min/max consecutive work days. Connect Customer takes the defined working hours and adds an agent to the roster by taking into consideration other rules that have been defined in staffing groups and staff rules.

  For example, if the minimum working hours are 40 hours, and the agent belongs to a staff group that operates 12 hours per day and 6 days per week, then the agent is likely to have some days without schedules. The service optimizes schedules based on forecasts. As long as the minimum amount of 40 hours per week (4 days with 10 hours per day) is met, the agent might not be staffed on some days when the call volume is low. In cases where you see that an agent doesn't have a schedule for a day, check the agent's minimum working hours. Also, check if the agent has been added to the roster for the remainder of the week.

- **Why is my agent's scheduled time different than the shift profile time? For example, my shift profile has 10 hours every weekday, but my agent only gets scheduled for 6 hours?**

The shift profile operation hours apply to staffing groups. If you don't set the staffing groups rule for **shift start time**, Connect Customer optimizes your agent start time based on the forecasted workload.

For example, the shift profile has 8 AM - 6 PM Monday - Friday, and the workload is light in the morning, and heavier in the afternoon. Each agent has a minimum of 6 hours and a maximum of 8 hours per day. To save agent cost, Connect Customer would schedule fewer agents in the morning and more agents in the afternoon. Some agents could start at 8 AM, some could start at 8:30 AM, and some could start in the afternoon. Some agents could have 6 hour schedules and some could have 8 hour schedules. In this way, you can maximize your agent resources to meet the service goal. If you want every agent to start at the same time and work an exact number of hours, you can set the rule in the staffing group **shift start time** to **start at the same time** and set the **working hour** to 10 hours every day. In this case, savings on agent cost is less due to less flexibility to optimize based on forecasts.



- **My agents are all full-time employees and they work 8 hours per day. How can I set this up in my schedule?**

  Set your staffing group's and staff's maximum and minimum working hours to 8 hours a day.

- **I have a mix of full-time and temporary employees. What is the best way to define it?**

  The best practice is to use staffing groups to set the working hours to the 8 hours and then use staff rules to set the individual part-time agent working hours to their specific value. The value in the staff rule overrides the value in the staffing group.

- **How do I add meetings or one-off events?**

  Generate a schedule with daily activities first. In the schedule manager view, select any schedule, and use **add shift** to add a one-off shift activity to the schedule.

Forecasting in Connect Customer

Forecasting is the starting point for any scheduling and capacity planning activities. Before you can generate a schedule or capacity plan, you must create a corresponding forecast.

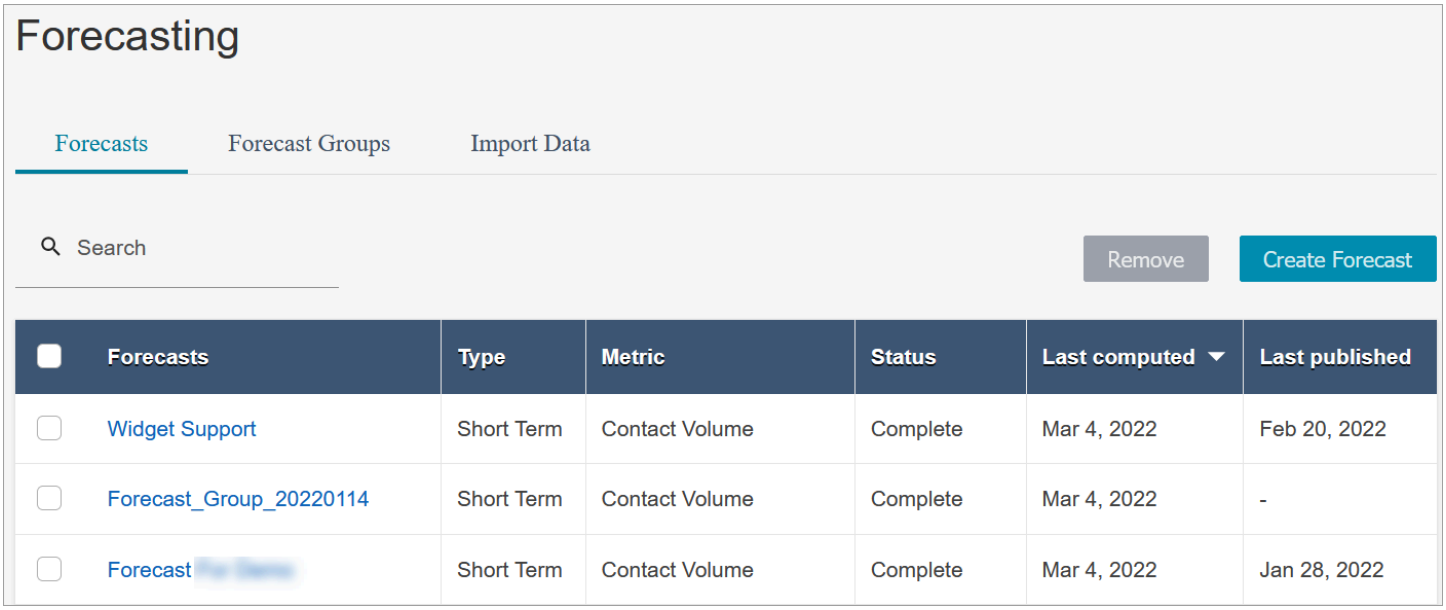
A *forecast* attempts to predict future contact volume and average handle time. Connect Customer uses historical metrics to create the forecast.

- **Short-term forecasts are automatically updated daily**. When you come into work, you can review the forecast that was updated overnight with the most current data. You can publish the forecast to make it available to schedulers whenever you want. The **Forecasting** page displays when a forecast was last updated and published. Use short-term forecasts for scheduling up to 18 weeks ahead.
- **Long-term forecasts are automatically updated every week, based on the day you created the forecast**. For example, if you created the forecast on a Monday, it is updated every Monday. Use long-term forecasts for capacity planning up to 64 weeks ahead.
- **Intraday forecasts are updated every 15 minutes**. Intraday forecasts are generated for queues that meet the following requirements:
  - Contact volume and Average handle time: A minimum of 2000 unique contacts per week per queue-channel for the last 5 weeks.
  - Effective staffing: A minimum of 2000 agent-handled unique contacts per week per queue-channel for the last 5 weeks, and at least 2 weeks of agent-staffing history.
  - Average queue answer time: A minimum of 2000 agent-handled unique contacts per week per queue-channel and agent-staffing history for the last 5 weeks.

  If less data is available, intraday forecasts are not available for those queues. For more information about intraday forecasts, see Intraday forecast performance dashboard.

> **Note**
>
> When a short-term or long-term forecast is created for the first time, it is typically computed and made available within 4 hours. In many cases, the forecast is ready in approximately 1 hour. Any changes to the forecast group configuration—such as importing historical data, adding queues, or removing queues— also automatically triggers a forecast recomputation within the same timeframe.

The following image shows three short-term forecasts on the **Forecasting** page.



Important

Only the most current forecast is available. Because the forecast is updated every day, if you want to keep the current day's forecast, you must download it before Connect Customer overwrites it.

Getting started with forecasting

Use the following steps to create a forecast and then share it with other people in your organization.

1. Set the forecast and scheduling interval: This is a one-time activity typically set up by forecasters. It cannot be undone.
2. Create forecast groups
3. Import historical data
4. Create forecasts
5. Inspect a forecast
6. Publish a forecast

You can take other actions on a forecast, such as downloading it to a .csv file for offline analysis or overriding it. Use the following steps to get started.

Set the forecast and schedule interval in Connect Customer

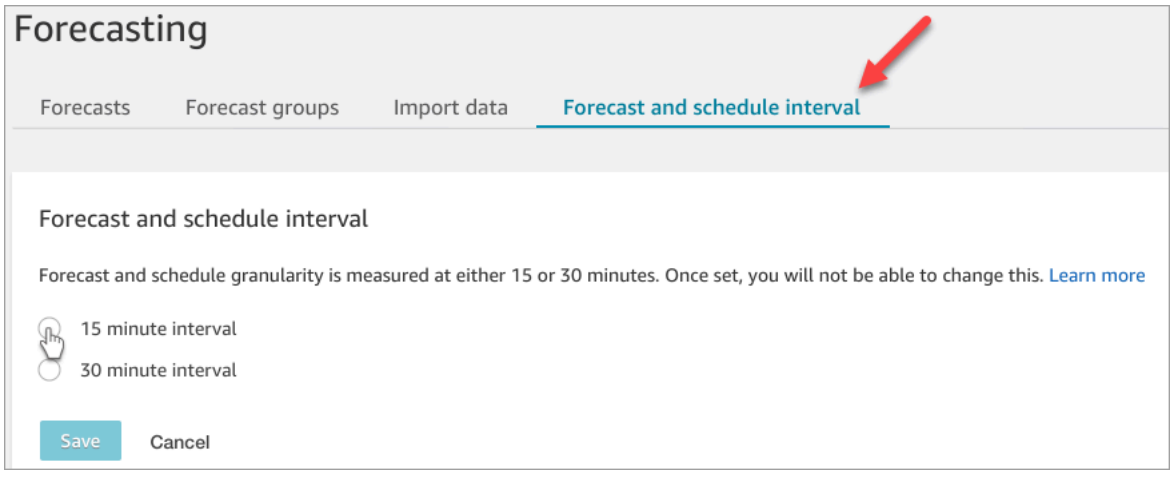
You can set the granularity for your short-term forecasts and your schedules.

Important things to know

- You must have security profile permissions for **Analytics**, **Forecast and schedule interval - Edit**. For more information, see Assign permissions.
- You must specify an interval for short-term forecasting and scheduling.
- Connect Customer supports 15- or 30-minute intervals. For example, if you select 30 minutes as the interval, your short-term forecasts are generated for 30-minute intervals (that is, 20 contacts between 9:00 AM-9:30 AM), and your schedules are computed for 30 minute intervals.
- You must set up a forecast and a schedule interval before you can generate forecasts or create forecast groups.
- After you set the forecast and schedule interval, you cannot change it.

To set the forecast and schedule interval

1. Log in to the Connect Customer admin website.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**.
3. Choose the **Forecast and schedule interval** tab. You'll see this tab only if you have the appropriate security profile permissions.

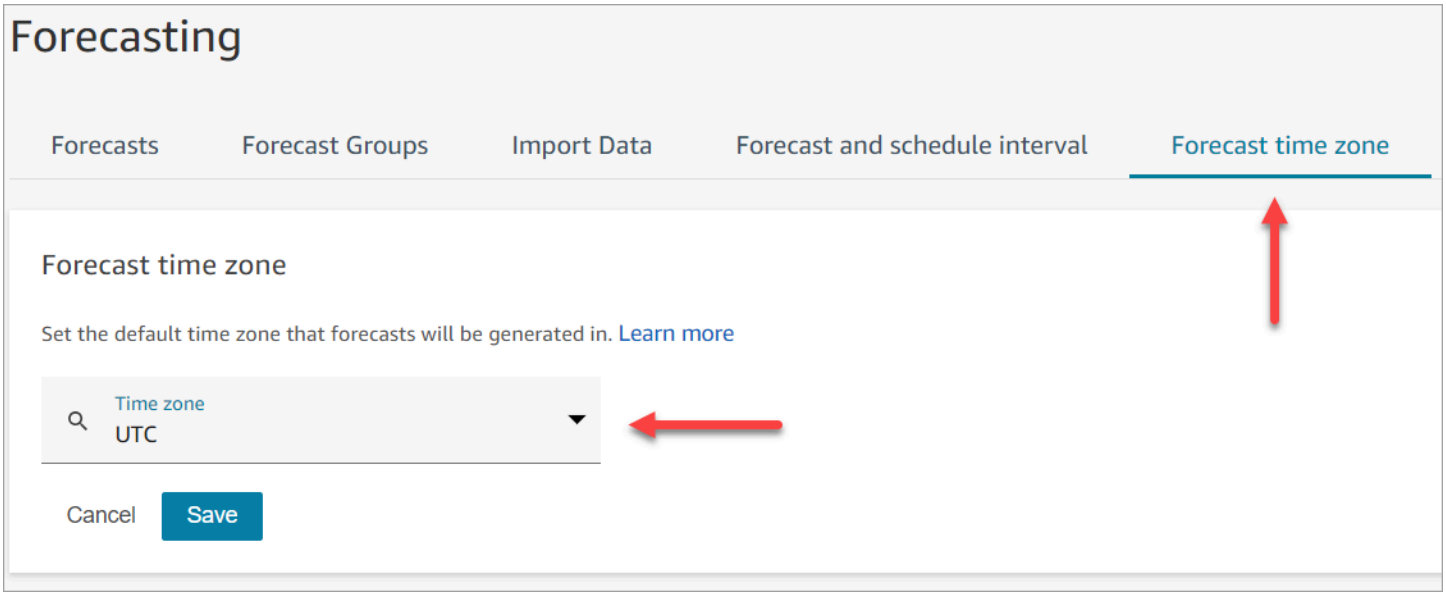


4. Choose one of the following options:

- **15 minute interval** – Generates short-term forecasts in 15-minute intervals. For example, 20 contacts between 9:00 AM to 9:15 AM, and 30 contacts between 9:15 AM to 9:30 AM.
- **30 minute interval** – Generates short-term forecasts in 30-minute intervals. For example, 20 contacts between 9:00 AM to 9:30 AM, 30 contacts between 9:30 AM to 10:00 AM.

Set the forecast time zone

On the **Forecasting** page, you set the time zone for your forecasts. The following image shows the **Forecast time zone** tab, and the dropdown menu where you choose the time zone.



Important things to know

- To edit the forecast time zone, you must have security profile permissions for **Analytics, Forecast and schedule interval - Edit**. For more information, see Assign permissions.
- The default value for the forecast time zone is UTC.
- When you change the forecast time zone, Connect Customer regenerates both the short-term and long-term forecasts.
  - Updated forecasts in the selected time zone are available within 24 hours.
  - The forecasts are automatically adjusted for daylight savings if the selected time zone observes daylight savings.

Forecast time zones on the Connect Customer admin website and in downloads

- **Short-term forecasts**: You can view short-term forecasts in the selected time zone after updating the time zone configuration.
- Downloads are in the time zone that the forecast was computed in. For example:
  - Let's say today is May 1st, and the forecast time zone is currently set to UTC.
  - The latest computed forecast generated on May 1st is in UTC.
  - Later that day (at 1PM) you change forecast time zone to US/Pacific.
  - The forecast computed on May 2nd is in US/Pacific time zone.
- **Long-term forecasts**: You will continue to view and download long-term forecasts in the time zone they were computed in. Long-term forecasts that are computed after updating the time zone configuration. You can view and download forecasts in the selected time zone.

Forecast overrides

- **Short-term forecasts**: When overriding a short-term forecast, the timestamp column must be in the ISO8601 format. You can use UTC values or time zones with the appropriate offset.

  For example, if you are overriding the forecast for the May 30th 8AM - 8:15AM interval and you've configured the time zone as US/Pacific, you can use either of the following values:

  - 2024-05-30T15:00:00Z
  - 2024-05-30T08:00:00-07:00
- **Long-term forecasts**: When overriding a long-term forecast, the timestamp column must be in the ISO8601 format and the time value must be midnight in the configured time zone.

  For example, if you are overriding the forecast for May 30th and you have configured the time zone as US/Pacific, then the following are acceptable values for the timestamp:

  - 2024-05-30T07:00:00Z
  - 2024-05-30T00:00:00-07:00

> **Note**
>
> Long-term forecast overrides are not available while the forecasts are being computed in the updated time zone.

Historical data upload

- **Interval data**: When uploading interval (15min/30min) level historical data, the timestamp column must be in the ISO8601 format. The time value can be in UTC or in the configured time zone with the appropriate offset.

  For example, if you are uploading the forecast for the May 30th 8AM - 8:15AM interval and you have configured the time zone as US/Pacific, then the following are acceptable values for the timestamp:

  - 2024-05-30T15:00:00Z
  - 2024-05-30T08:00:00-07:00
- **Daily data**: When uploading daily aggregated historical data for long-term forecasting, the timestamp column must be in the ISO8601 format and the time value must be midnight in the configured time zone.

  For example, if you are uploading the forecast for May 30th and you have configured the time zone as US/Pacific, then the following are acceptable values for the timestamp:

  - 2024-05-30T07:00:00Z
  - 2024-05-30T00:00:00-07:00

Create forecast groups in Connect Customer

Forecast groups are a way for you to combine different queues into one forecast. With forecast groups, you can create a forecast from aggregated data from multiple queues, instead of from just one queue.

Important things to know

- Forecast groups are associated with a staffing group for scheduling purposes. Therefore, we recommend you group queues that share the same pool of staff (agents) under the same forecast group. With this grouping, you can generate a more accurate forecast.
- Each queue can belong to only one forecast group. This prevents duplicates in the forecast.
- You must create at least one forecast group before you can generate any forecast.
- We strongly recommend that you create all forecast groups before creating any forecast.

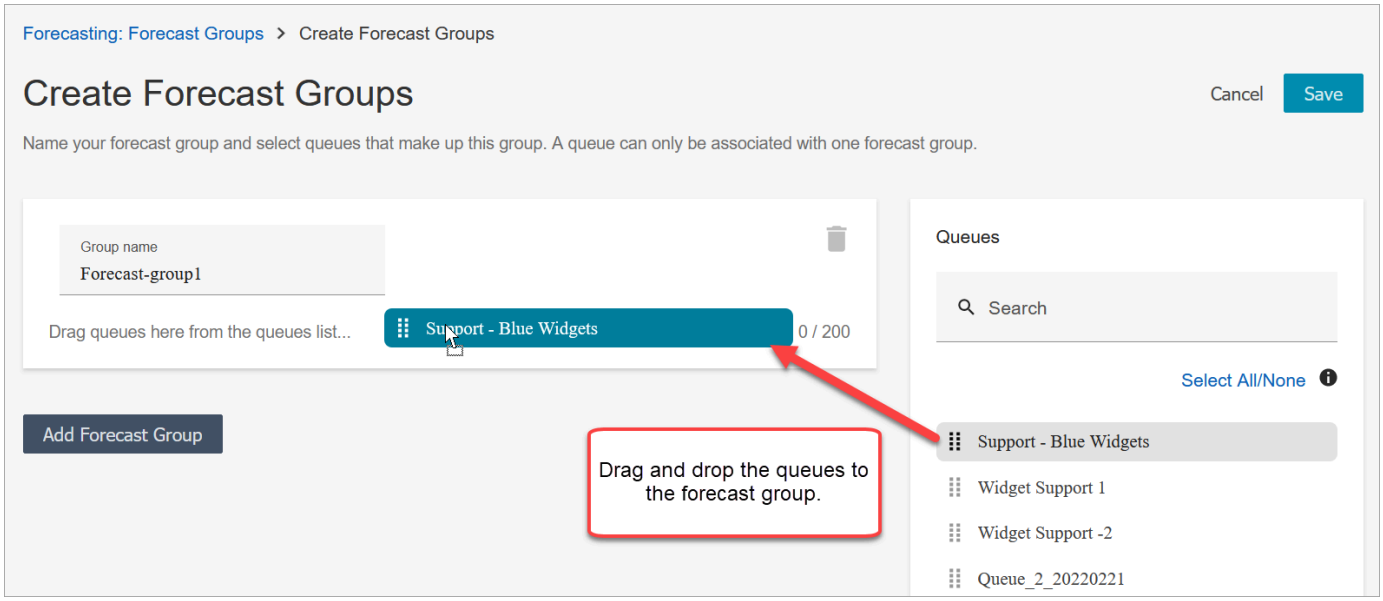
Connect Customer uses historical data for queues included in all forecast groups to train your forecasting model. By creating forecasts after all forecast groups are created, you ensure historical data of all relevant queues are included in the training.

- If a queue is associated with a forecast group and is later disabled, you don't have to remove this queue from the forecast group. This is because: Although the queue is included by the forecast group and the historical data associated with it is included in the forecast, over time, no contact reaches the disabled queue, and thus stops impacting the forecast. Only the active queues contribute to the forecast.

How to create forecast groups

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Forecasting - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**.
3. Select the **Forecast groups** tab, and then choose **Create forecast group**.
4. On the **Create Forecast Groups** page, under **Queues**, you'll see a list of queues that are not yet associated with a forecast group are listed. If no queues are listed, it means they are all associated with a forecast group already.
5. Drag and drop one or more queues to the forecast group, as shown in the following image. You can press and hold CTRL (COMMAND for macOS users) or SHIFT to select multiple queues at a time.

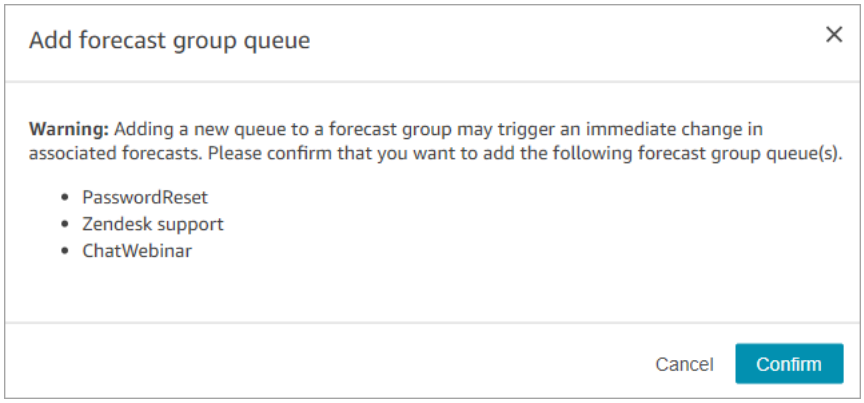


6. Choose **Save**. The following image shows the new forecasting group, along with the number of queues in the group and the date it was last changed.

7. After creating a forecast group, you can add or remove queues. However, doing so might initiate an immediate change in associated forecasts.

   For example, if you made a change for forecast group today, Connect Customer automatically computes the new short-term and long-term forecasts tomorrow. Your change to the forecast group also impacts downstream capacity plans and schedules that are created based on the forecast group.

   The following image shows a sample warning message when adding a queue might trigger an immediate change in associated forecasts. You must choose **Confirm** if you want to continue.



8. You can remove the forecast group by using the **Remove** function.

   a. delete the forecasts that are associated with the forecast group you want to delete.

      For example, in the following image, a forecast group named *Network_Issues* cannot be deleted because this forecast group was used to create forecasts.

      Therefore, go to **Forecasts** tab to delete those associated forecasts.

   b. Delete the forecast group.

Next steps

Now you're ready to create a forecast. For instructions, see Create forecasts.

Import historical data for forecasting in Connect Customer

Connect Customer requires sufficient historical data to learn the contact pattern and make good forecasts. By default, it uses historical contact data in Connect Customer for forecasting. You can import historical data from external applications for Connect Customer to use for forecasting. When you import data, Connect Customer uses both its data and the imported data for forecasting. However, *the imported data takes precedence over the Connect Customer data*.

When to import data

We recommend importing historical data from external applications in the following use cases:

- **Insufficient historical data in Connect Customer**. If you have less than one year of historical data in Connect Customer, we strongly recommend that you extract historical data from your previous system and upload the data to Connect Customer. It is fine to have data split between your Connect Customer data and uploaded historical data. For example, if you want to generate forecasts on January 1, 2022, and you have nine months of historical in Connect Customer (from April 1 to December 31, 2021), we recommend importing three additional months of data (from January 1 to March 31, 2022) to make a *continuous* one-year historical data set available.
- **Incorrect historical data in Connect Customer**. If the historical contact pattern is incorrect (for example, the contact volume is abnormally low on the day of a wide-spread power outage in the contact center), you can import data that is more representative to override historical data and correct for the anomaly.

If you have more than one year of historical data in Connect Customer, you can choose to skip data import and start creating forecasts.

Important things to know

- The data file must be a CSV file and it must be in the required format. If the file format and data don't meet the requirements, the upload does not work. We recommend downloading and using the template provided through the Connect Customer admin website (see step 4 in How to import historical data) to help you prepare the historical data.

  The following image shows an example of the CSV template. There are headings in the first row for `QueueName`, `QueueId`, `ChannelType`, and so on.

	A	B	C	D	E	F	G	H
1	QueueName	QueueId	ChannelType	TimeStamp	IntervalDuration	IncomingContactVolume	AverageHandleTime	ContactsHandled
2								
3								

  Following are the requirements for imported data:

  - `QueueName`: Enter the Connect Customer queue name.
  - `QueueId`: Enter the Connect Customer queue ID. To find the queue ID in the Connect Customer admin website, on the left navigation, go to **Routing**, **Queues**, choose the queue, select **Show additional queue information**. The queue ID is the last number after `/queue/`.

- `ChannelType`: Enter `VOICE`, `CHAT`, `TASK`, or `EMAIL`. You must capitalize the channel type.
- `TimeStamp`: Enter the timestamp in ISO8601 format. For `Daily` interval data, the time value must be midnight in the selected time zone.
- `IntervalDuration`: Enter `15mins` or `30mins` for short-term forecast, depending on your forecast and schedule interval. Enter `daily` for long-term forecast.
- `IncomingContactVolume`: Enter the number of inbound, transfer, and callback contacts as an integer.
- `AverageHandleTime`: Enter the amount of average handle time (in seconds) as type double/decimal.
- `ContactsHandled`: Enter the number of inbound, transfer, and callback contacts handled as an integer.

- You can import multiple files. You do not have to consolidate all data in one big file. You can divide data by year, queue, interval duration types, and more, per your preference.

  If duplicate data are found across multiple files, the last uploaded records are used. For example:

  1. You have the original historical data (from Connect Customer) from 7/1 to 8/1.
  2. You uploaded a new historical data file X to override 7/10 to 8/1.
  3. You uploaded another new historical file Y to override 7/15 to 8/1.
  4. And now, the historical data baseline is: 7/1 to 7/9 from original, 7/10 to 7/14 from file X, 7/15 to 8/1 from file Y.
- You need to upload historical data *separately* for short-term and long-term forecast.
  - Data aggregated in 15- or 30-minute intervals is used for short-term forecasting.
  - Data aggregated at daily grain is used for long-term forecasting.

For example, if you only upload data in 15- or 30-minute interval, you won't be able to generate long-term forecasts.

- The following special characters are allowed in the CSV file: -, _, ., (, and). Space is allowed.

The following image shows an example of what the data looks like in a CSV file that has been opened with Excel.

	A	B	C	D	E	F	G	H	I
1	Column header	QueueName	QueueId	ChannelType	TimeStamp	IntervalDuration	IncomingContactVolume	AverageHandleTime	ContactsHandled
2	Accepted value/format	Queue name in Connect	36-digit queue_id in Connect	- VOICE - CHAT	UTC (ISO8601)	- 15mins - 30mins - daily	Integer	Integer	Integer
3	Notes		QueueId is available in Connect UI. (Click "show additional info" in queue page)	Has to be capitalized		Has to be one of the three values above	The number of incoming inbound, transfer, and callback contacts	Average handle time (AHT) for contacts	The number of inbound, transfer, and callback contacts handled
4	**Example**: a record in a file uploaded for *short-term* forecast	Queue1	qbsey48u-1522-5cac-8b17-	CHAT	2020-02-14T05:15:00Z	15mins	20	250	18
5	**Example**: a record in a file uploaded for *long-term* forecast	Queue1	qbsey48u-1522-5cac-8b17-	VOICE	2020-02-14T00:00:00Z	daily	150	200	130

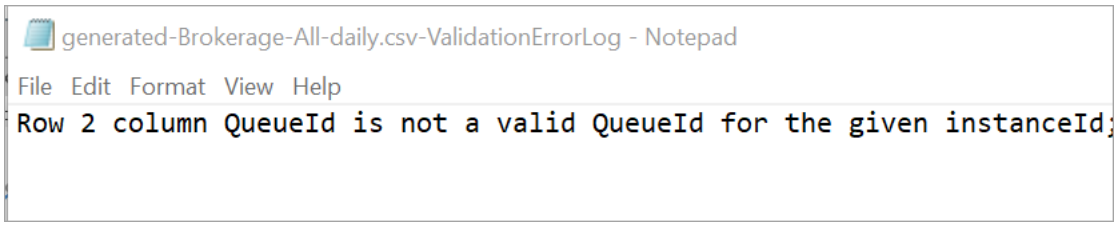
How to import historical data

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Forecasting - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**, and then choose the **Import Data** tab.
3. Choose **Upload data**.
4. On the **Upload historical data** dialog box, choose **download the .csv template for historical data**.
5. Add historical data to the CSV file, and then choose **Upload file** to upload it. Choose **Apply**.
6. If the upload fails, choose **download details** to view the error log message for more information. The following image of the **Forecasts** page shows the location of the **download details** link, next to the **Failed** status message.

   The following image shows the download details file opened by using Notepad. It indicates the error is in Row 2, the QueueId is not valid.



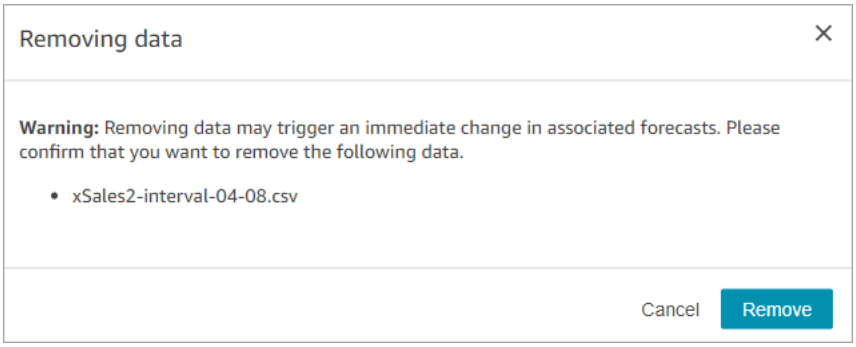
7. If the forecast was uploaded successfully, its **Status** = **Complete** and **Date uploaded** = today.

Delete imported historical data

You can delete previously imported historical data in Connect Customer.

> **Note**
>
> Deleting or adding historical data triggers an immediate change in associated forecasts because this action changes the historical data baseline that the model is trained for.

The following image shows an example warning message about the consequences of removing data.



After the imported historical data is deleted, the last previously uploaded data is used for the baseline. Take the previous example:

- You have the original historical data (from Connect Customer) from 7/1 to 8/1.
- You uploaded a new historical data file X to override 7/10 to 8/1.
- You uploaded another new historical file Y to override 7/15 to 8/1.
- And now, the historical data baseline is: 7/1 to 7/9 from original, 7/10 to 7/14 from file X, 7/15 to 8/1 from file Y.
- If:
  1. You deleted file Y, the baseline will be: 7/1 to 7/9 from original, 7/10 to 8/1 from X.
  2. You deleted file X, the baseline will be: 7/1 to 7/14 from original, 7/15 to 8/1 is from Y.

Data requirements for forecasting in Connect Customer

Connect Customer generates forecasts using a machine-learning model tailored for contact center operations. The following are the historical input data requirements for both short-term and long-term forecasts.

- **Historical data minimum requirement**: A queue and channel combination must have at least 1 contact in the last 28 days and at least 1 contact older than 7 days.
- **Historical data maximum duration**: Forecasting models use a maximum of 156 weeks of historical data.
- **Recommended for forecast accuracy**: A forecast group should have a minimum of 1,000 contacts per month in the last 6 months.

Create forecasts in Connect Customer

Forecasts are a projection of the workload in your contact center. Connect Customer provides long-term and short-term forecasts for you to generate capacity plans and agent schedules. The forecasts include inbound, transfer, and callback contacts across voice, chat, tasks, and email channels.

After creating a forecast, you do not need to generate it manually.

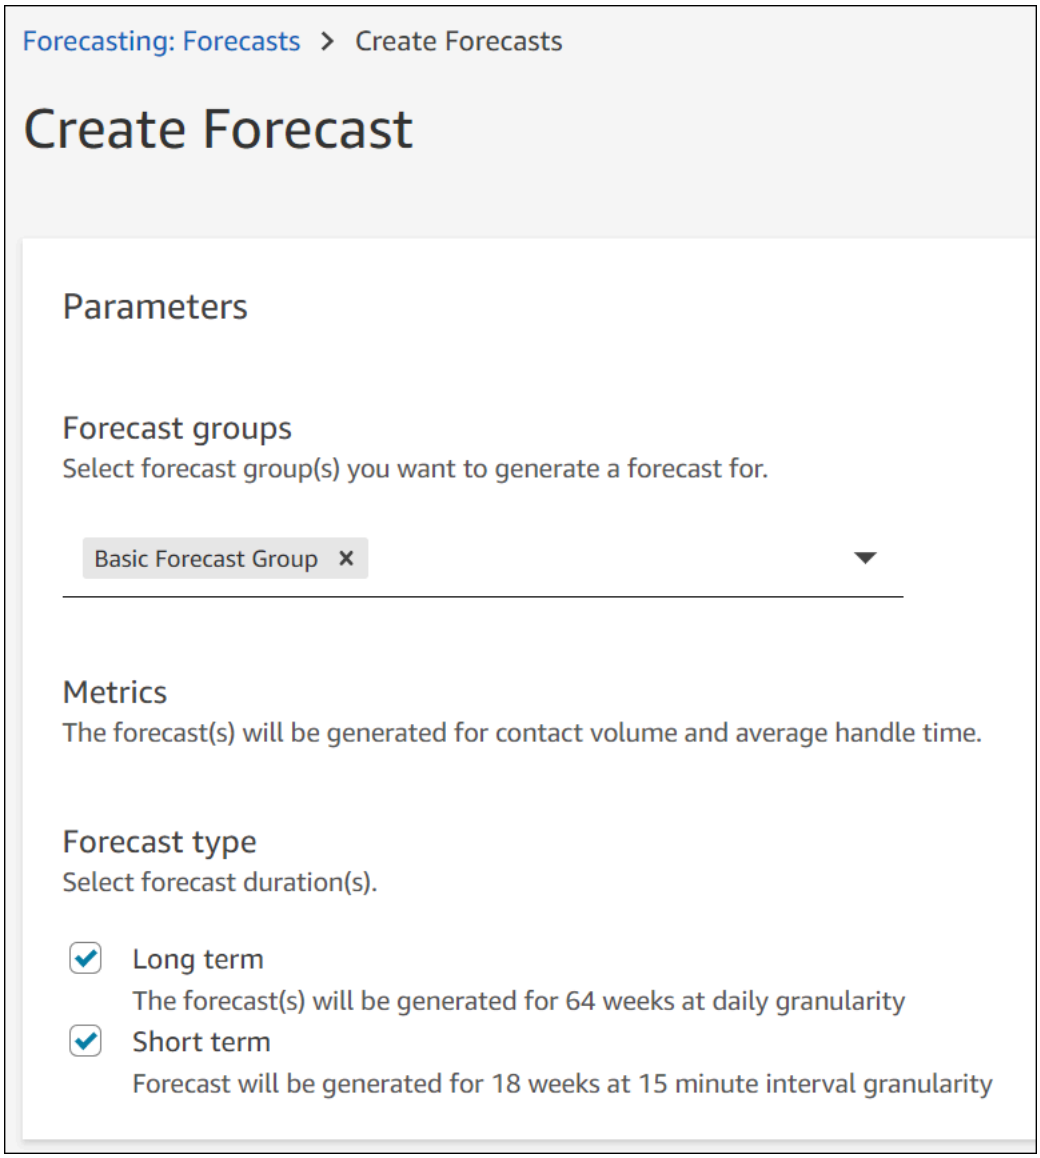
- Long-term forecasts are generated for 64 weeks and automatically updated weekly.
- Short-term forecasts are generated for 18 weeks and automatically updated daily.
- Every forecast is computed using the most current contact data. In addition, the forecasting models are retrained every time a new forecast is generated.
- You can delete forecasts. However, downstream capacity plans and schedules created based on the forecasts are impacted.

To create a forecast

1. Before creating a forecast, you must create at least one forecast group. If you haven't done that, see Create forecast groups. We strongly recommend creating all of your forecast groups before creating any forecasts.
2. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Forecasting - Edit**.

For more information, see Assign permissions.

3. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**.
4. Select the **Forecast** tab, and then choose **Create Forecast**.
5. On the **Create Forecast** page, choose the forecast groups.



6. Choose the forecast type. Connect Customer creates a forecast for each type you select.

   - **Long-term** forecasts are used for capacity planning. For example, how many Full Time Equivalent (FTE) agents you need to hire in the next few months, quarter, and year.
   - **Short-term** forecasts are used for scheduling agents and interval level agent headcount estimation.

7. Choose **Save**. If the forecast group has already been included in a forecast, an error message is displayed.
8. If the forecast was created successfully, it's Status = **Scheduled**.

   The status is **Complete** when the computation finishes. You can use **Search** to find forecasts by forecast group name.
9. Connect Customer creates a forecast for each forecast type, as shown in the following image.

Forecasts	Type	Metric	Status	Last computed	Last published
Widget Support	Short Term	Contact Volume	Complete	Mar 14, 2022	Feb 20, 2022
Widget Support	Short Term	Average Handling Time	Complete	Mar 14, 2022	Feb 20, 2022
Widget Support	Long Term	Contact Volume	-	Feb 23, 2022	Feb 23, 2022
Widget Support	Long Term	Average Handling Time	-	Feb 23, 2022	Feb 23, 2022

Inspect a forecast in Amazon Connect Customer

You can inspect your forecasts before publishing them. You can do this in the online Connect Customer admin website, or download the forecasts for offline analysis.

To help make it easier to inspect a forecast in the Connect Customer admin website, the forecast data is displayed in both a graph and a table. Use the controls on the report settings panel and calendar picker to adjust and filter the data for a more granular view. For example, you can:

- Use the calendar to change the horizon. You can zoom into specific dates.
- Choose 15 minute intervals if your date range is less than a week. With 15 minute intervals, you can see the exact contact pattern of the day.
- Compare **Last computed forecast** and **Last published forecast** as shown in the following image.
- Compare **Actuals** and forecasts to identify any abnormalities in either the line chart or the **Variance** chart. The Actuals data distinguishes between live data from Connect Customer and data supplied from historical uploads. Historical upload data is indicated by **Actuals Overrides** in the graph legend. **Actuals Prior Year** and **Actuals Prior Year Overrides** show data from the same date one year prior. The following image shows the forecast data displayed as graphs.

Choose the **Override** setting to inspect the effect of any override you uploaded. The **Override** option is active only after an override has been uploaded. For more information, see Edit a forecast.

- Filter by queues or channels to limit your forecast to one or more type.

How average handle time is aggregated

The forecasted average handle time (AHT) for a given interval represents the expected time to handle a single contact during that interval. It indicates the average time, from start to finish, that a contact is connected with an agent.

When you view forecasted AHT aggregated across multiple intervals or queues (for example, daily or weekly totals), Connect Customer uses a weighted average rather than an arithmetic average. An arithmetic average is misleading because intervals or queues with higher forecasted contact volume contribute proportionally more to the aggregate forecasted AHT. For example, an interval forecasted to receive 100 contacts influences the aggregated forecasted AHT more than an interval forecasted to receive 2 contacts.

The aggregated forecasted AHT uses contact volume as the weight. The formula is: `Aggregated AHT = Sum(AHT × weight) / Sum(weight)`, where the weight is the total forecasted contact volume for each queue, channel, and interval.

A minimum weight of 1.0 applies to every interval or queue. Even if a queue or interval has a forecasted contact volume of zero, it still contributes to the aggregate forecasted AHT. This minimum weight ensures that every interval or queue in the forecast group is represented in the aggregated forecasted AHT. It also maintains mathematical validity when forecasted volume is

zero. When all intervals have a forecasted volume of zero, each interval receives equal weight, so the aggregated AHT equals the arithmetic average of the individual AHT values.

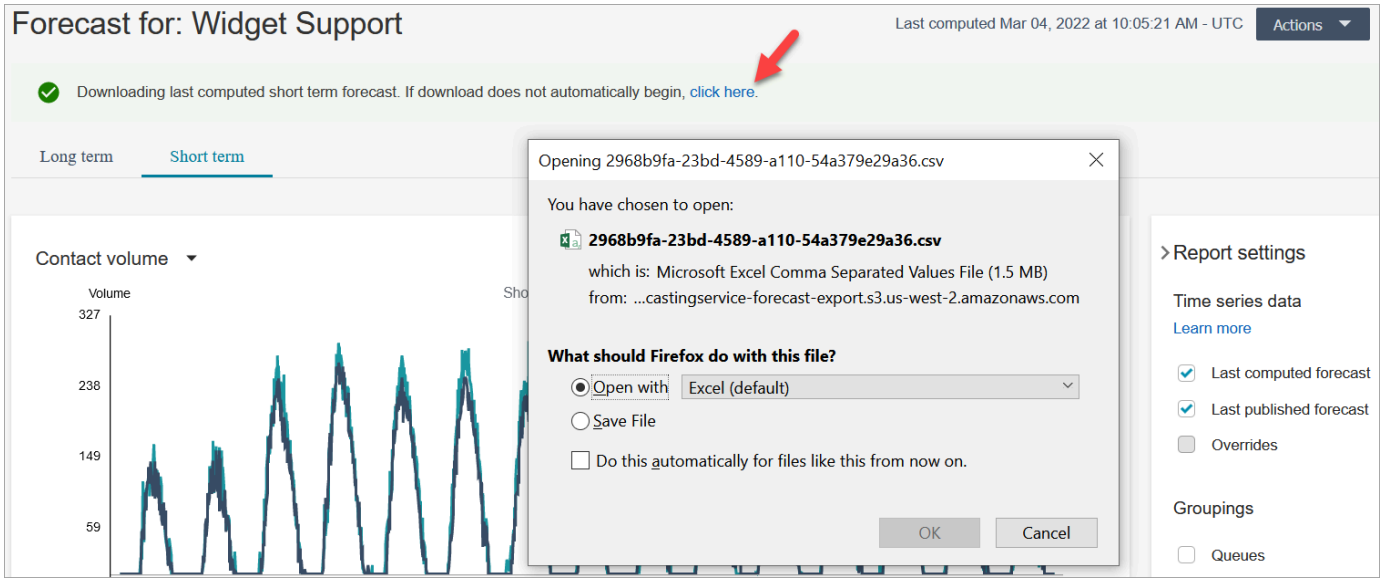
Download a forecast from Connect Customer to view offline

You can download a forecast so you can inspect it offline. A forecast is downloaded as a .csv file of the forecast data. It has the queue name, channel type, timestamp, incoming contact volume and average handle time data.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Forecasting - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer navigation menu, choose **Analytics and optimization**, **Forecasting**.
3. On the **Forecasts** tab, choose the forecast.
4. Choose **Actions**, and then download either the last computed forecast or the last published forecast.
5. We recommend choosing **choose here**. With this option, you can choose the name of the file download and where to save it, as shown in the following image. Otherwise, the file is saved to your **Downloads** folder and its name is a generated number.



Edit a forecast in Connect Customer

In the Connect Customer admin website, there are two ways you can edit a forecast at the queue channel level: you can make your edits directly in the user interface, or you can upload a CSV file that contains your edits.

By editing the forecast, you can modify the forecast values to better reflect changes in contact patterns, such as a special event that could increase volume by 10 percent during a specific week. If the edited forecast is no longer applicable, you can also remove the changes.

> **Important**
>
> Editing a forecast is not available when viewing data at the demand group level. However, edits that you make at the queue level do impact demand group level forecasts.

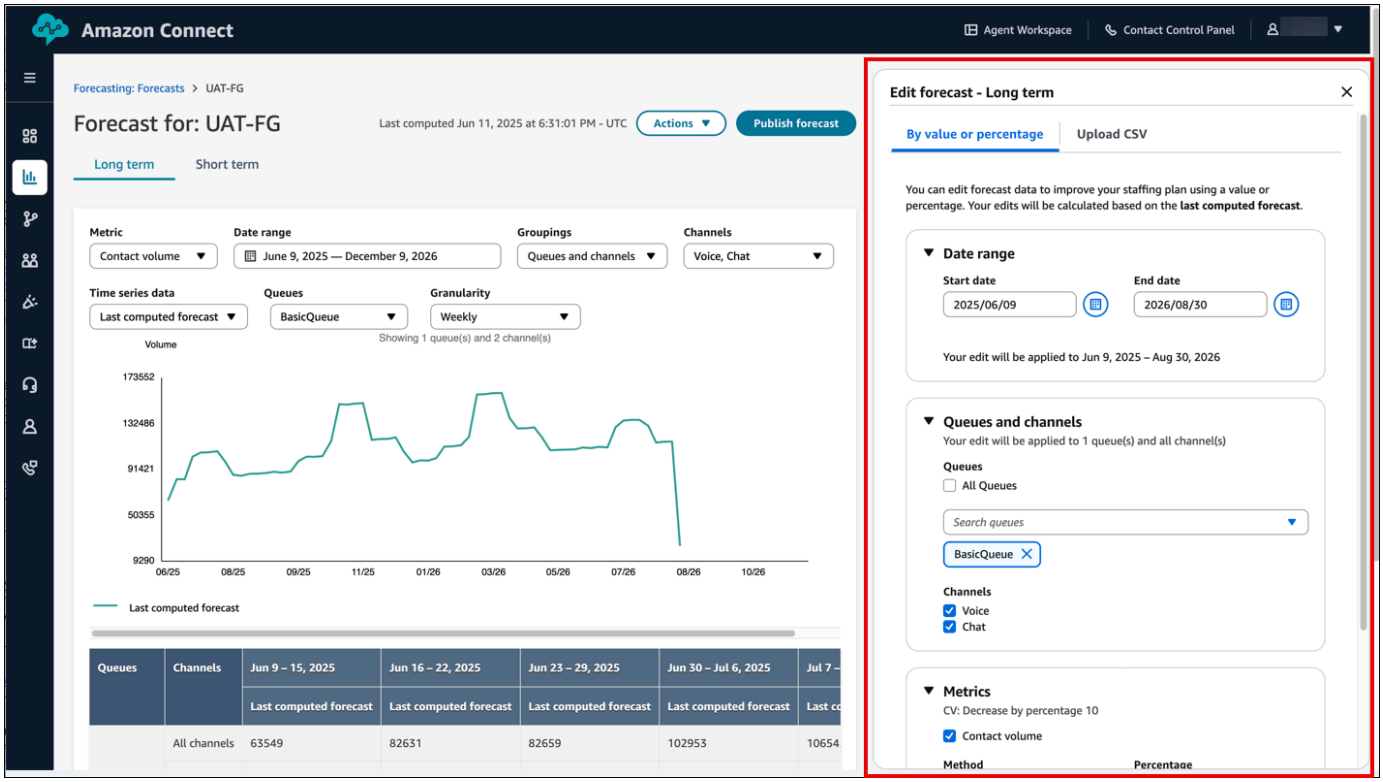
Topics

- How to edit a forecast
- Important things to know about using a CSV file to edit forecasts
- How to edit a forecast using a CSV upload
- How to remove your forecast edits

How to edit a forecast

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics and Optimization**, **Forecasting - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**, and then choose the **Forecast** tab.
3. Choose the forecast to edit, and then choose **Actions**, **Edit forecast**.
4. The **Edit forecast** pane opens. It displays pre-filled values based on your selections from the currently selected forecast, as shown in the following image.



For example, the preceding image shows a long-term forecast selected with **BasicQueue** and the **Voice** and **Chat** channels. The **Edit forecast** pane is automatically populated with these selections.

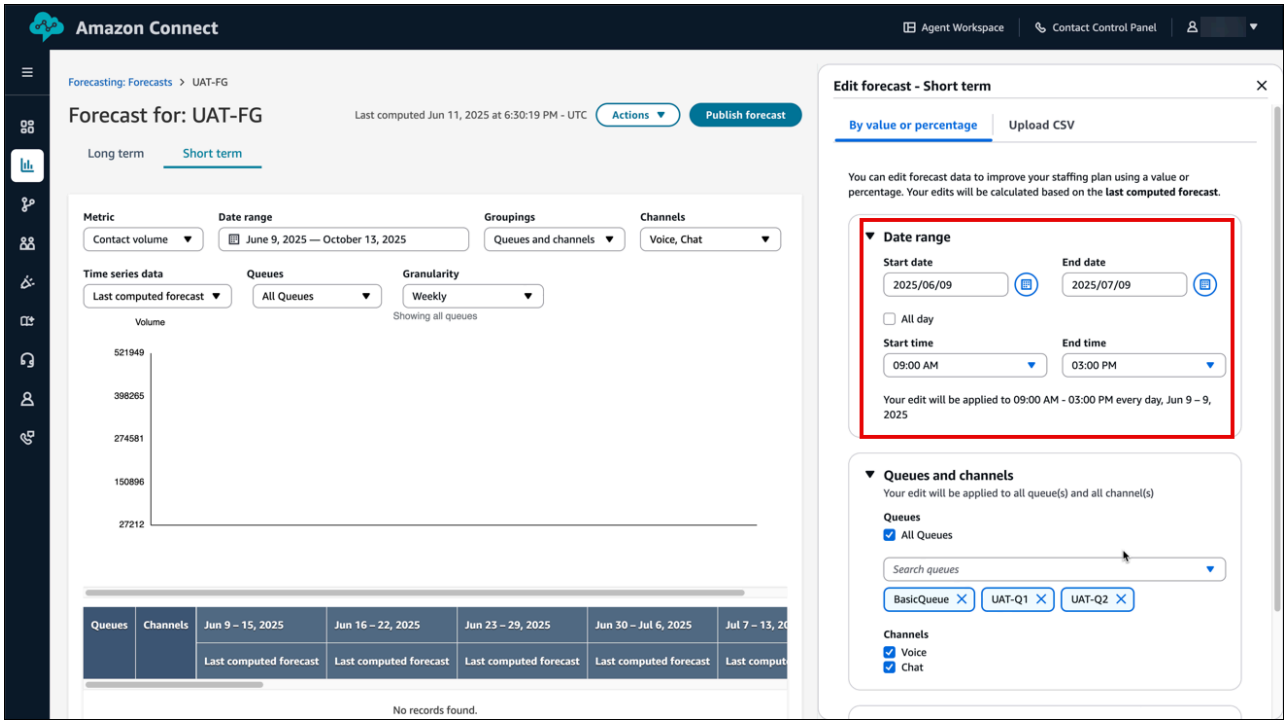
5. You can further configure the date range, queues, channels, and metrics, depending on the type of operation you want to use for editing the forecast:

   a. **Date range**:

   - For short-term forecasts, you can select a 31-day range for editing at a time. The changes are applied to each interval (either 15 minutes or 30 minutes, depending on your default settings) within the selected date range.

     You can also limit the edits to a specific time range by clearing **All day** and instead selecting a start and end time. With this feature, you can adjust the forecast for a specific time window.

     The following image shows the **Data range** section of the **Edit forecast - Short term** pane.

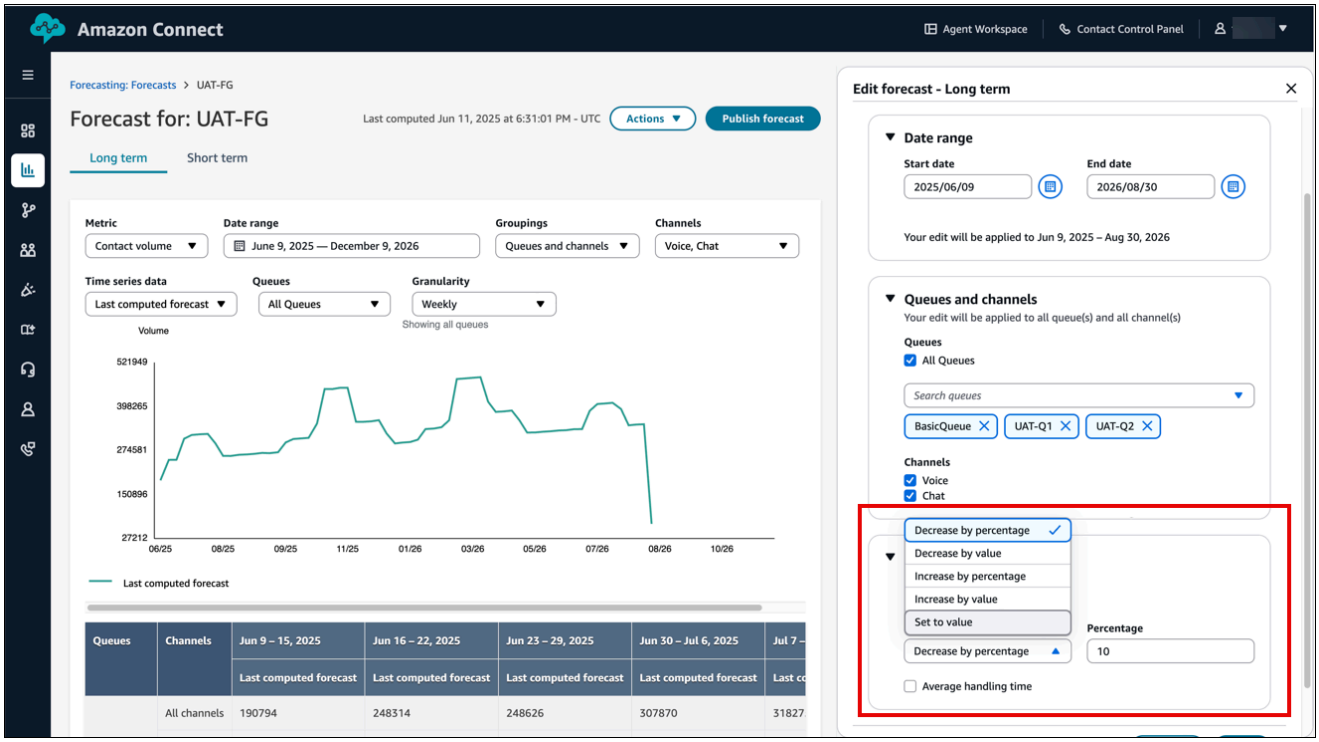


- For long-term forecasts, you can select a date range of up to 64 weeks. Edits are applied at a daily granularity.

b. **Queues and channels**: You can choose **All queues** or search and add individual queues one by one. You also have the option of removing any selected queues. Similarly, you can select channels such as **Voice** or **Chat** as needed.

c. **Metrics**: With metrics, you can apply specific operations to your selection based on the type of edit you want to make. You can apply these operations to either Contact volume, Average handle time, or both, depending on your needs.

   The following image shows the location of **Metrics** on the page, and the dropdown list of options.



Choose from the following operation types:

- **Decrease by percentage**: The percentage decrease is applied based on the distribution of the last computed forecast value across the selected time range intervals.

  For example, if you have 100 contacts in a 15-minute interval and apply a 10% decrease, the new value will be 90 contacts.

- **Increase by percentage**: The percentage increase is applied based on the distribution of the last computed forecast value across the selected time range intervals.

  For example, if you have 100 contacts in a 15-minute interval and apply a 10% increase, the new value will be 110 contacts.

- **Decrease by value**: The decrease is applied based on the distribution of the last computed values across the selected time range intervals.

  For example, if you're editing a long-term forecast spanning two days with intervals showing 40 contacts on day 1 and 60 contacts on day 2, and you want to decrease the value by 10, the decrease will be proportionally distributed across both days. For interval 1, the decrease would be 10 * (40 / (40+60)) = 4, resulting in a final value of 36. Similarly for interval 2, the final value would be 54.

- **Increase by value**: The increase is applied based on the distribution of the last computed values across the selected time range intervals, similar to the decrease by value operation.

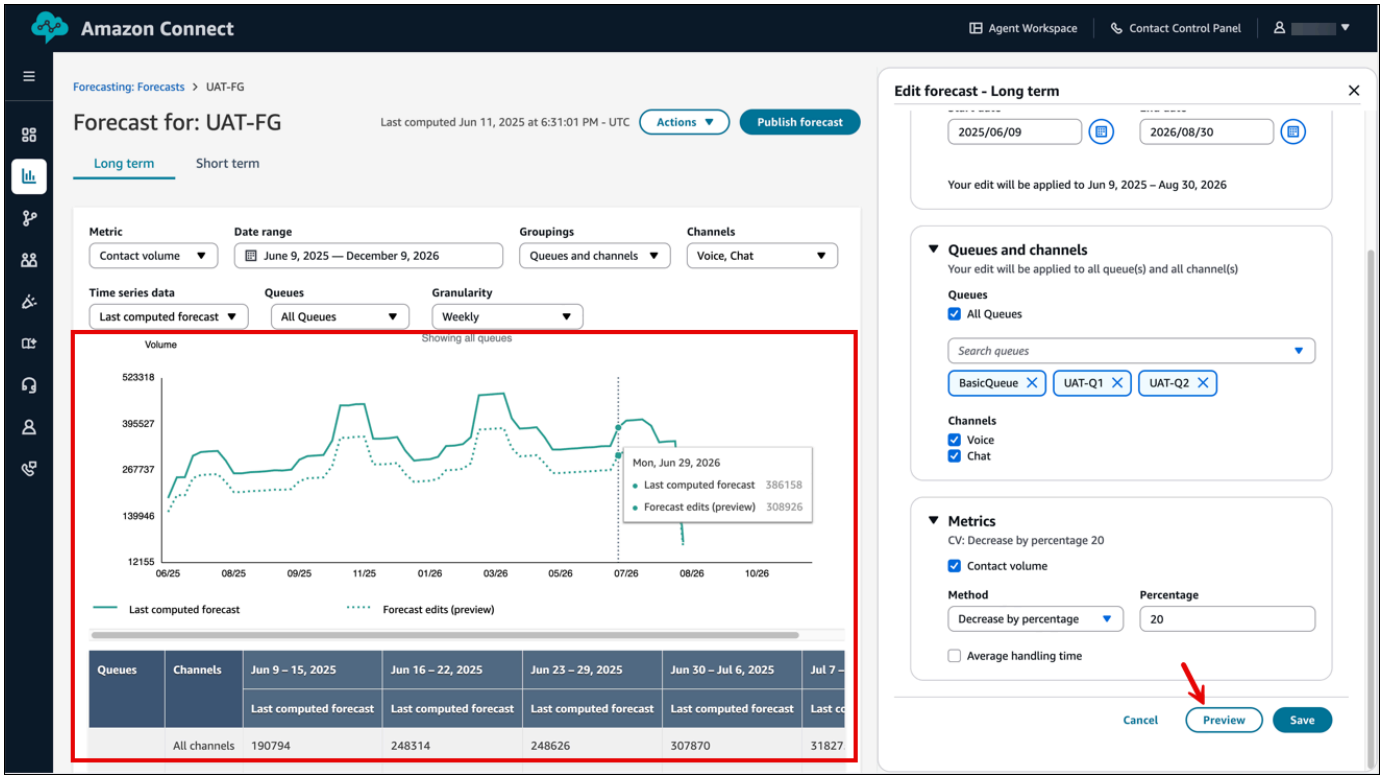
  For example, Interval 1 will increase to 44, and Interval 2 will increase to 66.

- **Set by value**: The selected value is applied based on the distribution of contact volume or average handle time across intervals, similar to the decrease by value operation.

  For example, in this case, Interval 1 will be set to 4, and Interval 2 will be set to 6.

> **Note**
>
> Any operation resulting in a value of less than 0 will automatically set the value to 0.

6. After you've made your selection, choose **Preview** to view the changes on your screen, as shown in the following image

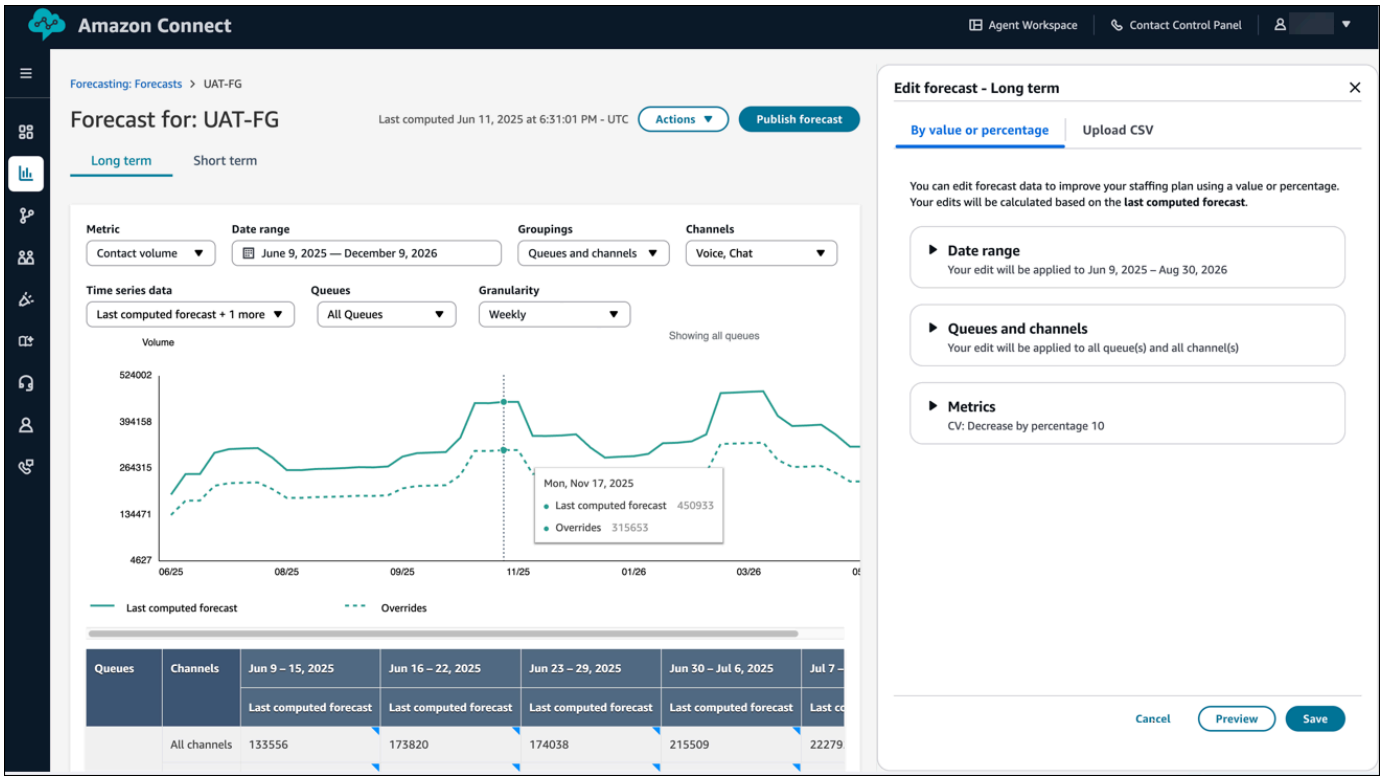


7. Choose **Save** to apply your changes. Your edits are reflected as overrides. You can make edits as many times as needed.

   - For overlapping intervals, the most recent edit persists.

- For non-overlapping intervals, all interval edits persist.

The following image shows an example of edits saved to the UAT-FG forecast.



Important things to know about using a CSV file to edit forecasts

- The override data file be must a CSV file and it must be in the required format. If the file format and data don't meet the requirements, the upload does not work. We recommend downloading and using the template provided to help you prepare the historical data.

The following image shows an example CSV file with data in it.

	A	B	C	D	E	F	G	H
1	Column header	QueueName	QueueId	ChannelType	TimeStamp	IntervalDuration	AverageHandleTime	IncomingContactVolume
2	Accepted value/format	Queue name in Connect	36-digit queue_id in Connect	- VOICE - CHAT	UTC (ISO8601)	- 15mins - 30mins - daily	Integer	Integer
3	Notes		QueueId is available in Connect UI. (Click "show additional info" in queue page)	Has to be capitalized		Has to be one of the three values above	Average handle time (AHT) for contacts	The number of incoming inbound, transfer, and callback contacts
4	Example	Queue1	qbsey48u-1522-5cac-8b17-[redacted]	CHAT	2020-02-14T05:15:00Z	15mins		20
5		Queue1	qbsey48u-1522-5cac-8b17-[redacted]	VOICE	2020-02-14T00:00:00Z	daily	200	

Following are the requirements for imported data:

- `QueueName`: Enter the Connect Customer queue name.

  - `QueueId`: Enter the Connect Customer queue ID. To find the queue ID in the Connect Customer admin website, on the left navigation, go to **Routing**, **Queues**, choose the queue, select **Show additional queue information**. The queue ID is the last number after `/queue/`.
  - `ChannelType`: Enter `VOICE`, `CHAT`, `TASK`, or `EMAIL`.
  - `TimeStamp`: Enter the timestamp in ISO8601 format. For long-term forecast overrides, the time value must be midnight in the selected time zone.
  - `IntervalDuration`: Enter `15mins` or `30mins` for short-term forecast, depending on your forecast and schedule interval. Enter `daily` for long-term forecast.
  - `IncomingContactVolume`: Enter the number of inbound, transfer, and callback contacts as an integer.
  - `AverageHandleTime`: Enter the amount of average handle time (in seconds) as type double/decimal.
- You can upload only one override file for a forecast group.
  - This means if you previously uploaded an override file (for example, with 120 lines of overrides), you must add new overrides to this override file (for example, add 50 new lines of overrides) and re-upload the file that now has 170 lines of overrides.
  - This also means you need to include overrides for both short-term and long-term forecasts in one file.
- Both Contact volume and Average handle time are included in one override file. Both columns must be populated in the override file.
- The following special characters are allowed in the CSV file: -, _, ., (, and). Space is allowed.

How to edit a forecast using a CSV upload

1. Review Important things to know about using CSV upload to edit forecasts if you have not yet already done so.
2. On the **Forecasts** page, choose the forecast you want to edit, and then choose **Actions**, **Edit forecast**.
3. In the **Edit forecast** pane, choose the **Upload CSV** tab.
4. Choose **Download the .csv template for override data**.

> **Note**
>
> Connect Customer supports one, which would be the latest, override file per forecast group.
>
> - When you choose to download a template, your template will contain headings but no data.
> - When you choose to download forecast edits, you will receive the file that was previously uploaded. This option is only visible if a file has been uploaded.

If you need to make changes later on to the same forecast, you must download the last uploaded file, make your changes, and then upload the file. Connect Customer retains only the last uploaded file.

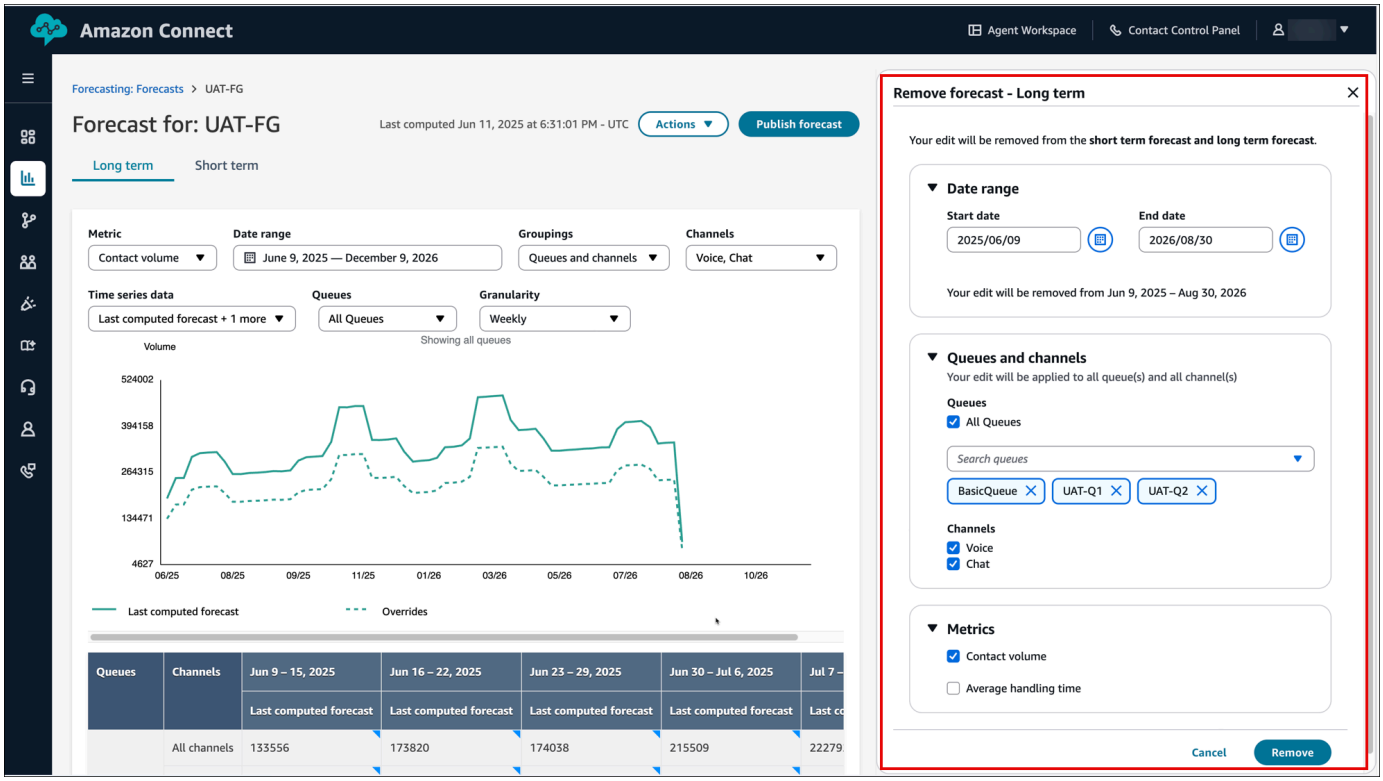
5. Add override data, and then choose **Upload CSV** to upload it. Choose **Save** to confirm forecast override.

How to remove your forecast edits

1. On the **Forecasts** page, choose the forecast you want to change, and then choose **Actions**, **Remove forecast edits**.
2. In the **Remove forecast** pane, select a date range, queues, channels, and metrics (Contact volume and Average handle time) from which to remove your edits.

   - The **Date range** works the same way as when you edit a forecast.
   - You can apply multiple edits across different time ranges, and all changes will be applied.

   The following image shows an example **Remove forecasts** pane. Edits made between 2025/06/06 and 2026/08/30 for all queues, for the voice and chat channels, and for only the **Contact volume** metric will be removed.



3. Choose **Remove** to apply the changes.

Publish a forecast in Connect Customer

When you publish a forecast, you make it visible to other users, such as capacity planners and schedulers, so that they can use the forecasts for capacity planning and scheduling.

> **Important**
>
> Connect Customer retains only the last published forecast. We strongly advise you to download the last published forecast before publishing a new one because the last forecast will be permanently replaced. For instructions, see Download last published forecast.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics and Optimization**, **Forecasting - Publish**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**.
3. On the **Forecasts** tab, choose the forecast.

4. Choose **Actions**, **Publish forecast**.
5. Choose the forecasts.

   The status is **Complete** for successfully published forecasts. When publish fails, the status is **Publish failed**.

Download the last published forecast

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Forecasting - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Forecasting**.
3. On the **Forecasts** tab, choose the forecast.
4. Choose **Actions**, **Download last published forecast**.
5. We recommend choosing **choose here** as shown in the following image. With this option, you can specify the name of the downloaded file and the location. Otherwise, the file is saved to your **Downloads** folder and its name is a generated number.

Multi skill forecasting in Connect Customer

The multi-skill feature optimizes staffing by scheduling agents based on their specialized capabilities. It introduces "demand groups" as distinct subsets of work within forecast groups, where each demand group represents specific workloads that are independently forecasted and require specialized agent skills. A demand group is a set of queue-channel pairings.

Important things to know

- You can enable demand groups within a forecast group if you want to schedule agents for specific queues.
- A demand group is a set of queue-channel pairings. A forecast group is segmented by multiple demand groups.
- If you are using demand groups, every combination of queue and channel must belong to a demand group.

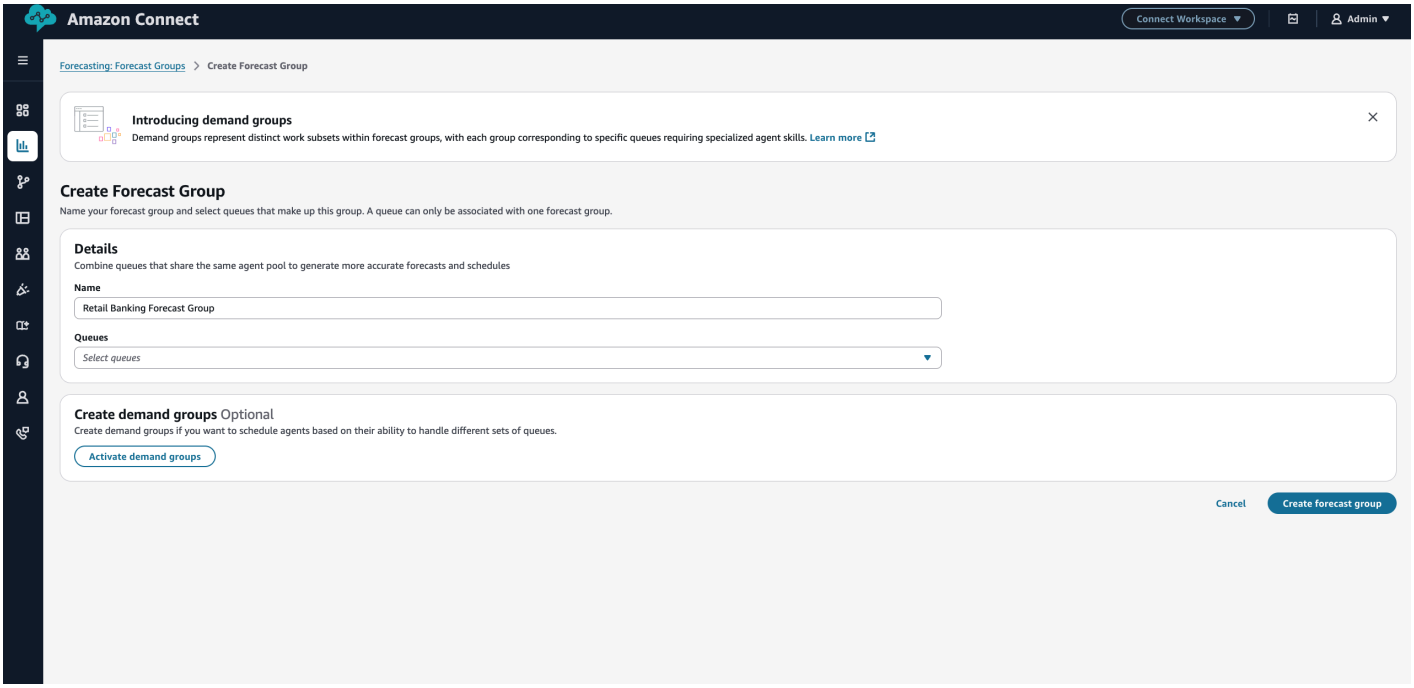
- Before generating the first forecast for the forecast group, we strongly advise creating all necessary demand groups.

Creating demand groups

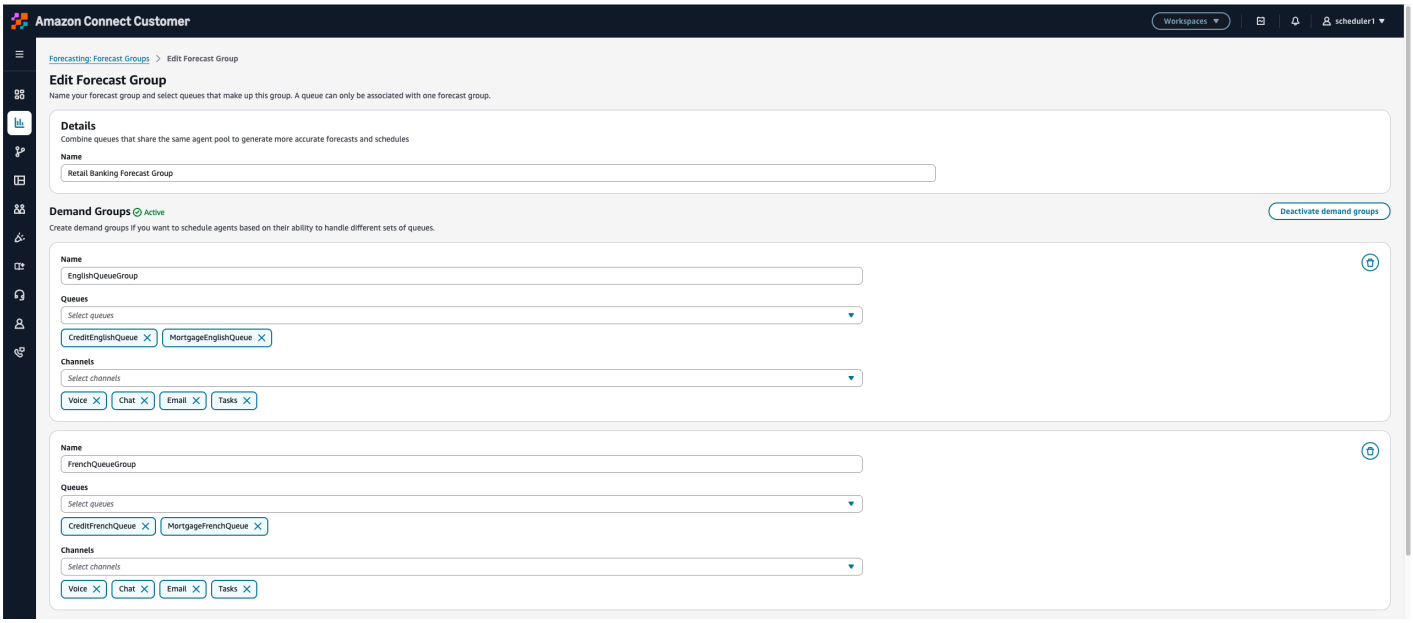
- Log in to the Amazon Connect admin website with an account that has security profile permissions for **Analytics, Forecasting - Edit**

  For more information, see Assign permissions
- Create a forecast group.

  For more information, see Create forecast groups
- Choose on Activate demand groups.



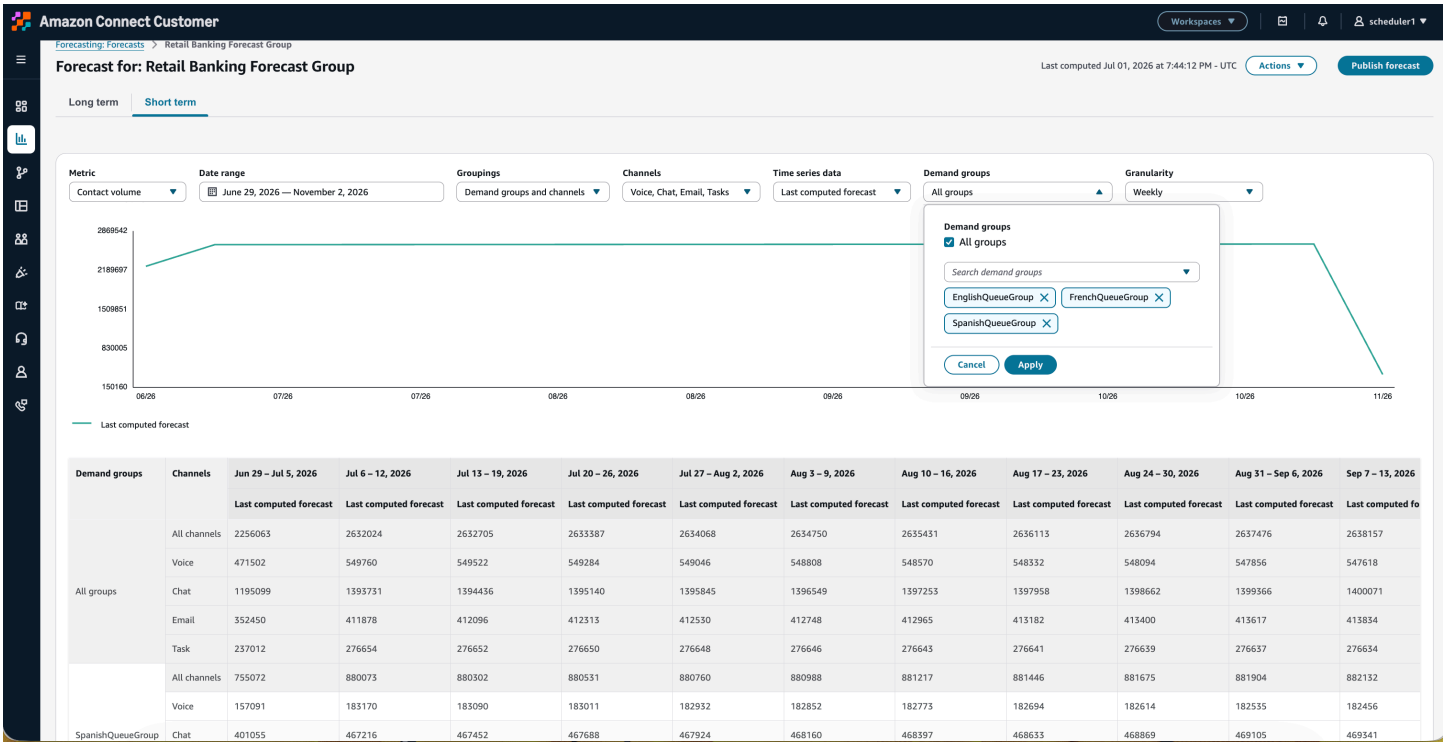
- Create demand groups by searching and adding queues and channels.



Generate and publish forecast

Generate and publish your forecast. Forecasting requires additional configurations including - time zone selection, setting up an interval of granularity (15/30m) and importing of historical data if there is no history on connect. Once these settings are enabled, forecasters can generate both long term (64 weeks ahead) and short term (18 weeks ahead) forecasts for the forecast group. You can view both contact volume and average handle time forecasts at interval level detail. You might examine forecasts for individual demand groups to assess peak and lull period variations and might override if required. After you are satisfied, you might publish your forecast.

For more information, see Publish a forecast



Capacity planning in Connect Customer

A capacity plan helps you determine how many agents your contact center needs. It uses forecasts and scenario inputs to set staffing targets for a given time period.

When you create a capacity plan, you choose one of two plan types. With a *Hiring plan*, you get long-term FTE estimates for hiring and workforce planning. With a *Scheduling plan*, you get interval-level headcount needs for scheduling and resource use. For more information, see Capacity plan types.

For Hiring plans, capacity planning estimates your long-term FTE (full-time equivalent) needs up to 64 weeks in the future. You can share these estimates with Human Resources, Finance, and Training. These estimates help when your business launches a new product or enters a new Region and needs to hire staff.

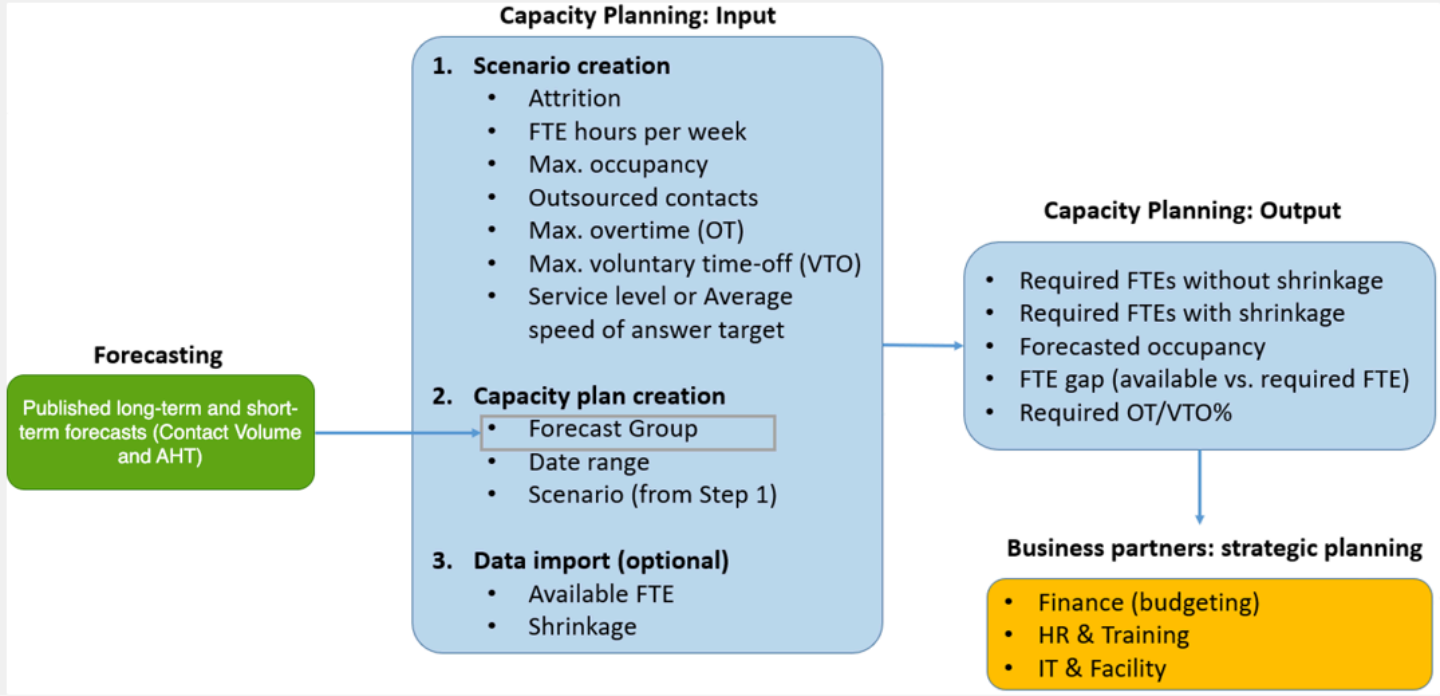
Hiring plans use both long-term and short-term forecasts as inputs, along with scenario data that you provide. We recommend an overlap of at least 4 weeks between the two forecasts. The overlap helps identify contact patterns within a day. At a minimum, the two forecasts must overlap by at least 1 day.

Scheduling plans require only a published short-term forecast for the forecast group. No long-term forecast or overlap is needed. The plan gives you headcount needs in 15-minute or 30-minute

intervals. The interval size matches your short-term forecast settings. Your plan dates must fall within the forecast date range. For more information, see Forecast requirements by plan type and Date range requirements.

Use Scheduling plan output to find staffing gaps across a short horizon. You can see how many agents you need in each interval and align staffing to demand patterns. The output also shows how each interval performs against your target metric. For details, see Review Scheduling plan output.

The following diagram shows the Hiring plan flow and the integration among published long-term forecasts, capacity planning, and capacity planning output.



Capacity plan types in Connect Customer

When you create a capacity plan, you choose a **Plan type**. Your choice sets the purpose of the plan, the forecast inputs, and the output format.

Connect Customer provides the following plan types:

- **Hiring plan** — Focused on hiring and workforce planning. Produces daily, weekly, or monthly FTE estimates you can share with Human Resources and Finance.
- **Scheduling plan** — Focused on scheduling and resource use. Produces headcount needs and service level data at 15-minute or 30-minute intervals.

Forecast requirements by plan type

Each plan type has different forecast needs:

- **Hiring plan** — Requires a published long-term forecast and a published short-term forecast. The two must overlap by at least one day. For best results, use at least 4 weeks of overlap.
- **Scheduling plan** — Requires only a published short-term forecast. No long-term forecast is needed. If the short-term forecast is not published, you cannot generate a Scheduling plan.

Date range requirements

For a Scheduling plan, the plan start and end dates must fall within the short-term forecast date range. For a Hiring plan, the plan dates use the long-term forecast range instead.

Shrinkage

Both plan types support a total shrinkage percentage. Enter this value in the **Shrinkage** field in the **Scenario inputs** section when you Create capacity planning scenarios. You can override this value with interval-level or day-level values by uploading a CSV on the **Import** tab.

Getting started

To create and share a capacity plan, complete the following steps. Some steps differ depending on whether you create a Hiring plan or a Scheduling plan.

1. Create capacity planning scenarios
2. (Optional) Import estimated future shrinkage and available full-time employees in Connect Customer: This step can improve the accuracy of your capacity plan. For Hiring plans, you upload day-level shrinkage and Available FTE data. For Scheduling plans, you import interval-level headcount and shrinkage data instead (see Import headcount and shrinkage data for Scheduling plans).
3. Manage starting backlog projections: If you use an average time to complete target for the Task or Email channels, Connect Customer automatically generates starting backlog projections for capacity planning to use. You can review or override these projections.
4. Create capacity plans using forecasts and scenarios
5. Review capacity plan output
6. Review, override, re-run, or download a capacity plan.

> **Note**
>
> Plan override is not available for Scheduling plans.

7. Publish a capacity plan

Create capacity planning scenarios in Connect Customer

A scenario has two parts:

- Scenario inputs: The maximum occupancy, daily attrition, full-time equivalent (FTE) hours per week. For example, you might enter data that represent your best case scenarios (everyone is at work) or worst case scenarios (a large number of people are out sick during winter months).
- Optimization inputs: The optimization target for each channel that you want FTE estimates for. Depending on the channel, you can set a service level, average speed of answer (ASA), or average time to complete target. For example, 85% of calls are answered within 30 seconds of entering the queue.

You can then use this scenario to generate a capacity plan that represents how many people you need to hire accordingly to meet your business goals. The output includes the required FTE employees with and without shrinkage, forecasted occupancy rate, the gap between available required FTEs, and maximum overtime (OT) and voluntary time-off (VTO) rate allowed.

To create a capacity planning scenario

1. Before you can create a capacity plan, you must create and publish a long-term forecast. Connect Customer uses the published long-term forecast as the input for creating the capacity plan. If you haven't yet created a forecast, see Getting started with forecasting.
2. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

   For more information, see Assign permissions.
3. On the Connect Customer navigation menu, choose **Analytics and optimization**, **Capacity planning**.
4. On the **Planning Scenarios** tab, choose **Create a Scenario**.
5. On the **Create scenario** page, enter a name and description.

6. In the **Scenario inputs** section, enter the following information:

   a. **Max Occupancy (optional)**: The percentage of time agents will spend handling contact volume when they log in.

      i. **Daily attrition**: The percentage of staff leaving your contact center.

         For example, if the annual attrition is 50%, the daily attrition would be 50%/250 working days per year = 0.2%.

      ii. **Full-time equivalent (FTE) hours per week**: How many hours each FTE employee will work per week.

   b. **Outsourced contacts (optional)**: You can outsource a percentage to a third-party.

   c. **Max overtime (OT) allowed (optional)**: Specify the maximum percent of overtime to plan for peaks. As a planner, you don't want to burn out your workforce.

      For example, you specify 40 as FTE hours per week, with 10 percent maximum overtime. The total work week would be up to 44 hours.

   d. **Max voluntary time off (VTO) allowed (optional)**: Specify the maximum percent of time off to plan for troughs, when there is a lull in contacts and you can save in costs. Be sure not to give too much time off in case traffic increases again.

      For example, you specify 40 as FTE hours per week, with 10 percent maximum time off. The total work week would be at least 36 hours.

   e. **Shrinkage (optional)**: Enter a total shrinkage percentage to apply to the plan. This field applies to both Hiring plans and Scheduling plans.

      If you need more granular interval-level or day-level shrinkage values, you can upload a CSV on the **Import** tab instead. For more information, see Import estimated future shrinkage and available full-time employees in Connect Customer.

   f. **Hours of operation**: Select the hours of operation that represent when your agents are available to work. This list shows the hours of operation defined in your Connect Customer instance. For more information, see Set the hours of operation and time zone for a queue using Connect Customer.

      You must select an hours of operation to save a scenario. When you select an hours of operation, Connect Customer displays a snapshot of its name, time zone, and weekly

hours. Capacity planning uses only the base weekly operating hours, and doesn't include overrides or inherited hours.

For scenarios that were created before hours of operation became a required input, Connect Customer asks you to select an hours of operation before you can save your changes.

> **Note**
>
> The time zone of the selected hours of operation must match the time zone of the plan when you generate it.
> When you generate a plan, Connect Customer saves a snapshot of the selected hours of operation and uses that snapshot for the plan. If you later change the hours of operation in your Connect Customer instance, re-run the plan to use the updated hours.

7. In the **Optimization inputs** section, configure an optimization target for each channel that you want FTE estimates for. You can configure one target per channel, for up to four channels: Voice, Chat, Task, and Email. The targets do not have to be the same type. For example, you can use service level for Voice and average time to complete for Task.

   The following image shows the **Optimization inputs** section with a different target type configured for each channel.

   a. **Service level**: The percentage of contacts answered within a defined target time threshold. Service level is available for all channels.

b. **Average speed of answer** (ASA): The average amount of time it takes for contacts to be answered during a specific time period. Average speed of answer is available for the Voice and Chat channels.

c. **Average time to complete**: The average amount of time it takes for an agent to complete a contact. Average time to complete is available for the Task and Email channels.

   When you set this target for the Task or Email channel, capacity planning treats the channel as asynchronous. It uses starting backlog projections to estimate headcount. If you set a **Service level** target for the Task or Email channel instead, capacity planning treats the channel as synchronous. For more information, see Manage starting backlog projections.

d. To add an optimization target for another channel, choose **Add another goal**.

Import estimated future shrinkage and available full-time employees in Connect Customer

You can increase capacity planning accuracy by providing estimated future data for your existing forecast groups. You can import data for either plan type: Hiring plans use day-level Available FTE and shrinkage data, and Scheduling plans use interval-level available headcount and shrinkage data. Providing this data is optional. Connect Customer can generate a capacity plan without it, but providing it improves the accuracy of your plan.

How to import data for Hiring plans

Use this procedure to import day-level Available FTE and shrinkage data for Hiring plans. To import interval-level data for Scheduling plans, see Import headcount and shrinkage data for Scheduling plans.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Capacity Planning**.

3. On the **Import Data** tab, choose **Upload data**, and then choose **Hiring shrinkage and FTE**.

The .csv file you upload must have the following headings: FORECAST_GROUP, Date, AVAILABLE_FTE, IN_OFFICE_SHRINKAGE_OUT_OFFICE_SHRINKAGE. These are shown in the following image of a .csv file opened with Excel.

	A	B	C	D	E
1	FORECAST_GROUP	Date (use ISO 8601 format: YYYY-MM-DDThh:mm:ssZ)	AVAILABLE_FTE	IN_OFFICE_SHRINKAGE	OUT_OFFICE_SHRINKAGE
2	Forecast For Demo	2022-01-01T00:00:00Z	0	8%	12%
3	Forecast For Demo	2022-01-02T00:00:00Z	0	8%	12%
4	Forecast For Demo	2022-01-03T00:00:00Z	100	8%	12%
5	Forecast For Demo	2022-01-04T00:00:00Z	100	8%	12%
6	Forecast For Demo	2022-01-05T00:00:00Z	100	8%	12%
7	Forecast For Demo	2022-01-06T00:00:00Z	100	8%	12%
8	Forecast For Demo	2022-01-07T00:00:00Z	100	8%	12%
9	Forecast For Demo	2022-01-08T00:00:00Z	0	8%	12%

4. Update values in this template, and then choose `Upload CSV` to upload it. Choose `Upload`.

It usually between 2 - 5 minutes for the .csv file to upload. If the upload fails, check if the `FORECAST_GROUP` name in the .csv file matches the name of the forecast group that you created.

Important things to know about your Hiring plan .csv file

The following applies to the day-level .csv file for Hiring plans. For the interval-level file used by Scheduling plans, see Import headcount and shrinkage data for Scheduling plans.

- FORECAST_GROUP: Enter the EXACT name of the forecast group you created. You can add multiple forecast groups in this `.csv` file.
- Date: Each row is one day. In the previous image, row 2 is January 1, row 3 is January 2, row 4 is January 3, and so on. Use ISO 8601 format ending with Z. The time component of this field must represent midnight the time zone of the long term forecast. For example, if the long term forecast is in US/Pacific time, then the Date field should be as follows: 2024-05-30T07:00:00Z
- AVAILABLE_FTE: Based on your estimation, how many full-time agents will be available for working that day. For example, your contact center currently has 100 FTEs and you expect this number to be the same next year.

  In the previous image, 0 indicates no full-time agents are available on January 1 for the forecast group named **Forecast For Demo**. On January 3, 100 agents are available.

> **Tip**
>
> Required FTE (the output) is how many full-time agents are required to meet the Service Level target. For example, if the Required FTE = 120 and Available FTE = 100 for next year, then that means a deficit = 20.

- IN_OFFICE_SHRINKAGE: Percentage of agents in the office but not in production mode. For example, they might be in training or in meetings.
- OUT_OFFICE_SHRINKAGE: Percentage of agents absent from work (for example, no show or personal time off).

> **Note**
>
> The latest uploaded .csv file always overrides the previous one you updated. Make sure errors aren't introduced to the uploaded .csv file accidentally. For example, don't press **Enter** and add new rows to the end of the file. Otherwise, the data won't validate and an error message is displayed.

Import headcount and shrinkage data for Scheduling plans

For Scheduling plans, you can import headcount and shrinkage data at the interval level. Each row covers a 15-minute or 30-minute interval, matching your short-term forecast. To upload this data, choose **Scheduling shrinkage and headcount** from the **Upload data** dropdown on the **Import Data** tab.

To import headcount and shrinkage data for a Scheduling plan

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Capacity Planning**.
3. Choose the **Import Data** tab.
4. Choose **Upload data**, and then choose **Scheduling shrinkage and headcount**.

5. In the **Import scheduling interval data** dialog, upload your `.csv` file, and then choose **Upload**.

The upload takes 2 to 5 minutes. If it fails, check that the `FORECAST_GROUP` value in your file matches the name of an existing forecast group.

CSV field reference for Scheduling plan data

Your `.csv` file must have the following columns in this order:

- `START_INTERVAL_TIMESTAMP`: Required. The start of the interval. Use ISO 8601 format with a UTC offset. For example: `2026-01-01T00:00:00-08:00`.
- `END_INTERVAL_TIMESTAMP`: Optional. Use the same format as the start. If you omit this field, the row covers one interval. If you include it, the row covers every interval in that range.
- `FORECAST_GROUP`: Required. Enter the exact name of a forecast group you created. You can add multiple forecast groups in one `.csv` file.
- `AVAILABLE_HC`: Required. Enter the number of agents available for that interval. Use zero or a positive number.
- `IN_OFFICE_SHRINKAGE`: Required. Percentage of agents in the office but not in production mode. For example, they might be in training or meetings. Enter a value from 0 to 100.
- `OUT_OFFICE_SHRINKAGE`: Required. Percentage of agents absent from work (for example, no-show or personal time off). Enter a value from 0 to 100.

> **Note**
>
> The latest uploaded file always overrides the previous file. Check that your file has no errors before you upload it.

Manage starting backlog projections in Connect Customer

When you set an **Average time to complete** target for the Task or Email channel, capacity planning treats that channel as asynchronous. Contacts can accumulate in a backlog instead of agents handling them immediately. To accurately estimate staffing for an asynchronous channel, capacity planning needs to know the backlog size and age at the start of the plan. Capacity planning calls this input a starting backlog projection.

Connect Customer automatically generates a starting backlog projection for each queue in your Connect Customer instance. You don't need to provide anything to use this feature. The system-generated projection estimates the backlog by weekday, queue, and channel, and Connect Customer refreshes it daily. You can upload your own values to override the system-generated projection for specific combinations of weekday, queue, and channel.

Starting backlog projection file format

Starting backlog projection files are .csv files with the following columns:

- **Weekday**: The day of the week, for example `MONDAY`.
- **QueueName**: The name of the queue.
- **Channel**: The channel, either `TASK` or `EMAIL`.
- **AgeInIntervals**: The age of the backlogged contacts, measured in 15-minute intervals.
- **BacklogSize**: The number of backlogged contacts of that age.

When you download a merged view of the system-generated projection and your overrides, the file includes an additional **Source** column that indicates whether each row comes from the system-generated projection (`SYSTEM`) or from your override (`USER`).

How overrides work

Overrides are tracked by a combination of weekday, queue, and channel. A single combination can have multiple rows, one for each **AgeInIntervals** value. When you work with overrides, Connect Customer treats all of the rows that share the same weekday, queue, and channel as a single group.

How uploads merge with existing overrides

Each upload merges with your existing overrides at the weekday, queue, and channel level. When an upload contains rows for a weekday, queue, and channel combination, those rows replace all previously uploaded rows for that combination. Combinations that you don't include in the upload are left unchanged.

For example, suppose you have already uploaded the following overrides.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	20

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	2	15
TUESDAY	SalesQueue	TASK	1	5

You then upload the following file.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	30
MONDAY	SalesQueue	EMAIL	3	10

After the upload, your overrides are as follows. The `MONDAY`, `SalesQueue`, `EMAIL` combination is replaced entirely by the rows in the new upload. The previous row for **AgeInIntervals** 2 is removed because the upload didn't include it. The `TUESDAY`, `SalesQueue`, `TASK` combination is unchanged because the upload didn't include it.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	30
MONDAY	SalesQueue	EMAIL	3	10
TUESDAY	SalesQueue	TASK	1	5

Clear an override

To clear your override for a specific weekday, queue, and channel, upload a row for that combination with a blank **AgeInIntervals** value and a blank **BacklogSize** value. After you clear an override, capacity planning uses the system-generated projection for that combination when you generate a plan.

For example, to clear your override for the `MONDAY`, `SalesQueue`, `EMAIL` combination, upload the following row.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL		

The blank **AgeInIntervals** and **BacklogSize** values remove all of your override rows for the `MONDAY`, `SalesQueue`, `EMAIL` combination.

How overrides replace the system-generated projection

When you generate a plan, Connect Customer selects projections for the queues in your forecast group and the plan's start weekday. It then merges your overrides with the system-generated projection, grouped by weekday, queue, and channel. If an override exists for a combination, Connect Customer uses those override rows. If no override exists, Connect Customer uses the system-generated rows. If neither exists, Connect Customer uses a starting backlog of 0.

For example, suppose the system-generated projection for `MONDAY`, `SalesQueue`, `EMAIL` is as follows.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	100
MONDAY	SalesQueue	EMAIL	2	80
MONDAY	SalesQueue	EMAIL	4	40

And you have uploaded the following override for the same combination.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	30
MONDAY	SalesQueue	EMAIL	3	10

When you generate the plan, Connect Customer uses only the override rows for `MONDAY`, `SalesQueue`, `EMAIL`. It ignores the system-generated rows for that combination, including the rows for **AgeInIntervals** 2 and 4.

Weekday	QueueName	Channel	AgeInIntervals	BacklogSize
MONDAY	SalesQueue	EMAIL	1	30
MONDAY	SalesQueue	EMAIL	3	10

For any weekday, queue, and channel combination that you have not overridden, Connect Customer uses the system-generated projection.

Download or override projections

You download and upload starting backlog projections on the **Import Data** tab.

1. Sign in to the Connect Customer admin website using an account that has security profile permissions for **Analytics** and **Capacity planning - Edit**.

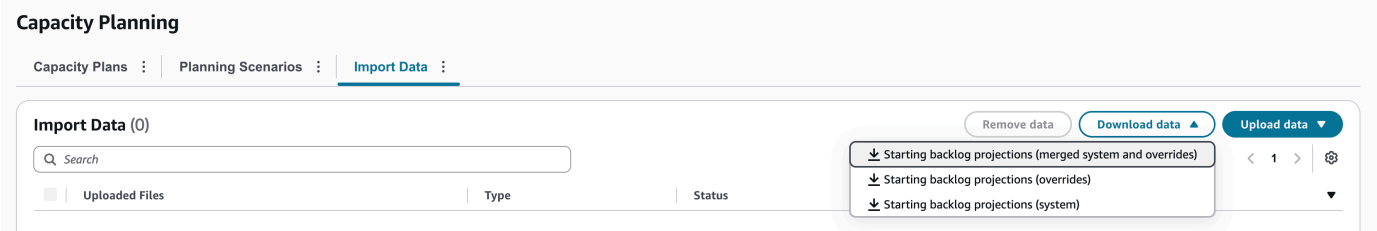
   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, choose **Analytics and optimization**, **Capacity Planning**.
3. Choose the **Import Data** tab.
4. To download projections, choose **Download data**, and then choose one of the following:

   a. **Starting backlog projections (system)**: The latest system-generated projection.

   b. **Starting backlog projections (merged system and overrides)**: A merged view of the system-generated projection and your overrides, including the **Source** column.

   c. **Starting backlog projections (overrides)**: Your current overrides.

   The following image shows the **Download data** menu with the starting backlog projection options.



5. To override projections, enter your values in a .csv file, using the columns described in Starting backlog projection file format. Choose **Upload data**, **Starting backlog projections**, and then upload the file.

   The following image shows the **Upload data** menu with the **Starting backlog projections** option.

   Each upload merges with your existing overrides at the weekday, queue, and channel level. For more information, see How overrides work.

Create capacity plans using forecasts and scenarios in Connect Customer

Before you can create a capacity plan, you must create a planning scenario and publish the forecasts required for your plan type. Hiring plans require a published long-term forecast and a published short-term forecast. Scheduling plans require only a published short-term forecast. For more information, see Forecast requirements by plan type.

Connect Customer uses the forecasts and planning scenarios as inputs for creating the capacity plan. If you haven't yet created a forecast and planning scenario, see Getting started with forecasting and Create capacity planning scenarios in Connect Customer.

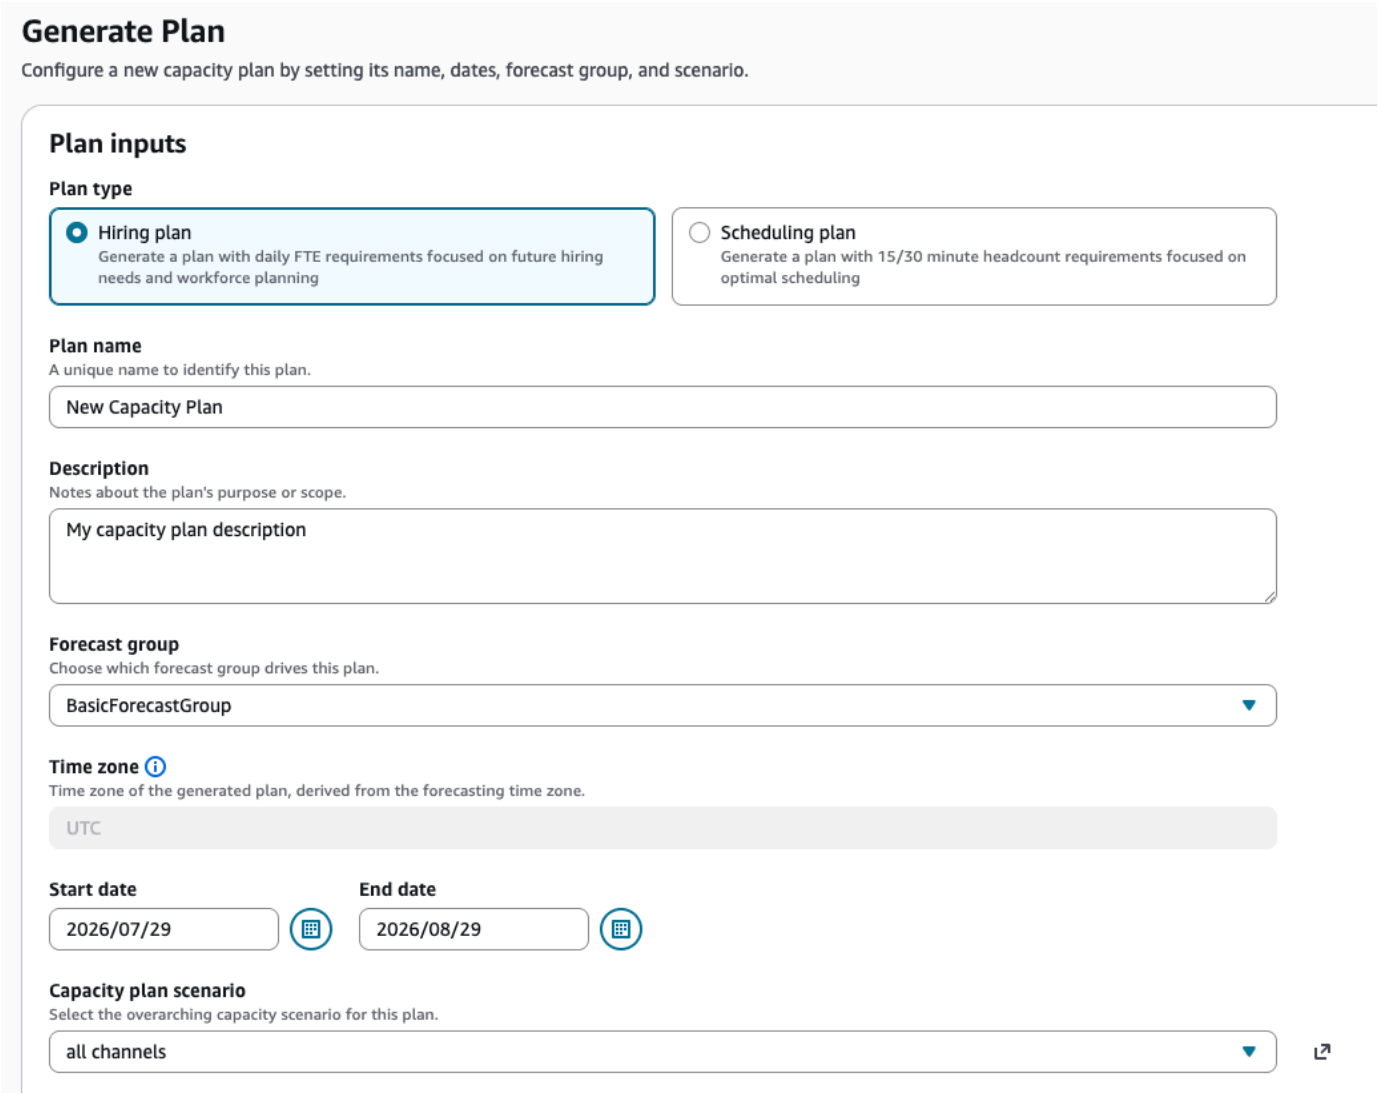
How to create a capacity plan

1. Navigate to the **Capacity Plans** tab, and choose **Generate Plan**.
2. For **Plan type**, choose the type of capacity plan to generate:

   - Choose **Hiring plan** for long-term FTE estimates focused on hiring requirements. This requires a forecast group with both published long-term and short-term forecasts.
   - Choose **Scheduling plan** for interval-level headcount requirements focused on scheduling and resource allocation. This requires a forecast group with a published short-term forecast only. The plan start and end dates must fall within the short-term forecast date range.

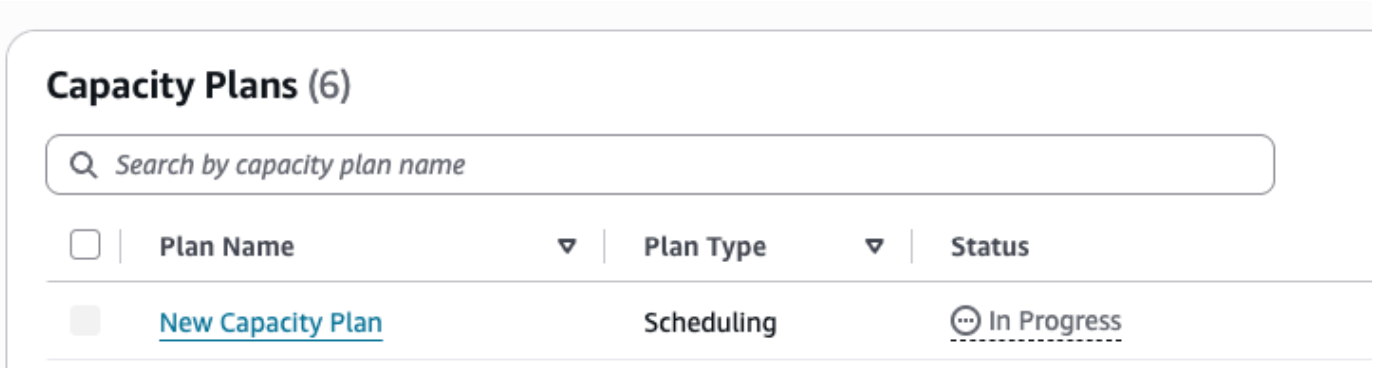
For both plan types, you can enter a total shrinkage percentage in the **Shrinkage** field in the **Scenario inputs** section. For more information, see Create capacity planning scenarios.

3. Provide the plan name, description, forecast group (which has the published forecasts required for your selected plan type), start/end date, and plan scenario. The following image shows example values for these fields.



4. Choose **Generate Capacity Plan**.

5. To quickly identify the plan that is in processing, choose **Last Computed** to sort the table list. In the following image, the status of the plan is **In Progress**.



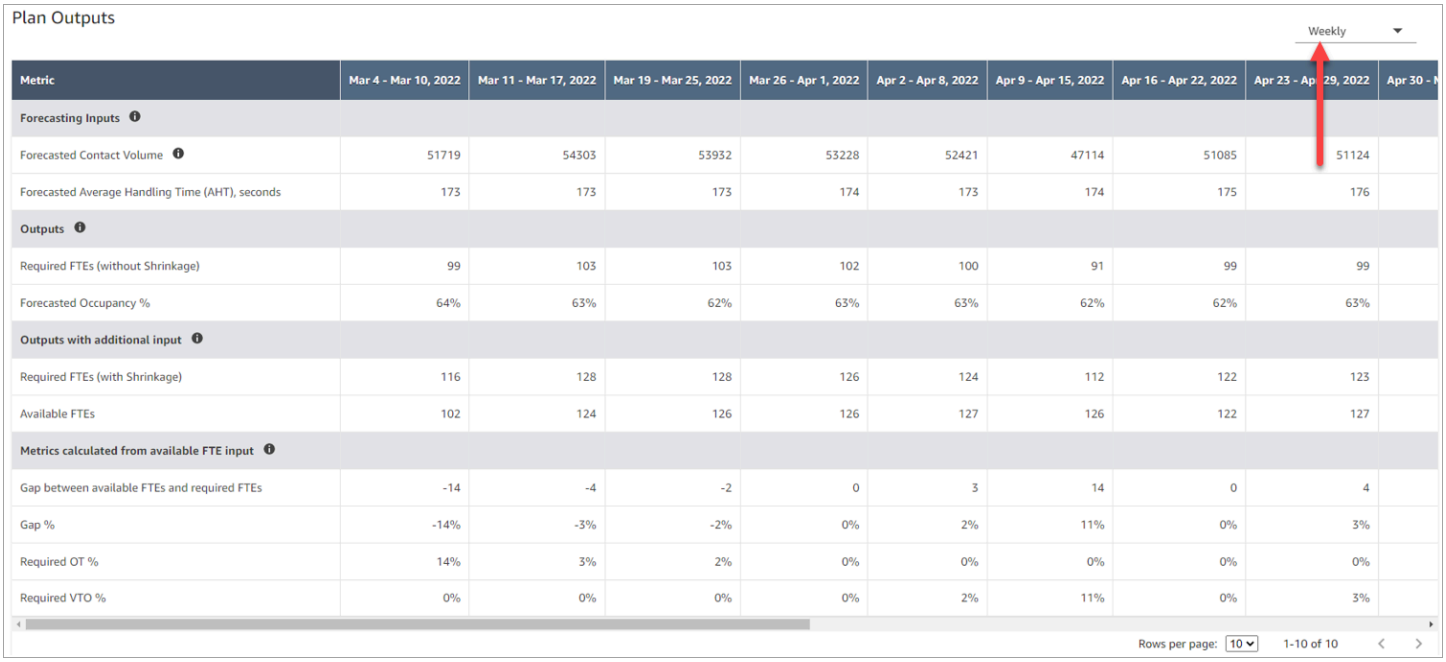
It usually takes between 5-10 minutes for the plan to be generated. If the plan generation fails, check the forecasts for the selected forecast group, and then generate the capacity plan again. For Hiring plans, try publishing the selected long-term forecasts. For Scheduling plans, confirm that a short-term forecast is published and that it covers the plan date range.

Review capacity plan output in Connect Customer

To review capacity plan output, choose the hyperlink for the plan you generated. The first half of the page summarizes the input you used in scenario and capacity plan generation.

The plan output shows a week-by-week or month-by-month calculation. To switch from weekly to monthly view, select **Monthly** from the dropdown, as shown in the following image.

> **Note**
>
> The following output description, screenshot, and metrics list apply to Hiring plans only. For Scheduling plan output, see Review Scheduling plan output.



Plan Outputs

Weekly

Metric	Mar 4 - Mar 10, 2022	Mar 11 - Mar 17, 2022	Mar 19 - Mar 25, 2022	Mar 26 - Apr 1, 2022	Apr 2 - Apr 8, 2022	Apr 9 - Apr 15, 2022	Apr 16 - Apr 22, 2022	Apr 23 - Apr 29, 2022	Apr 30 - M
Forecasting Inputs									
Forecasted Contact Volume	51719	54303	53932	53228	52421	47114	51085	51124	
Forecasted Average Handling Time (AHT), seconds	173	173	173	174	173	174	175	176	
Outputs									
Required FTEs (without Shrinkage)	99	103	103	102	100	91	99	99	
Forecasted Occupancy %	64%	63%	62%	63%	63%	62%	62%	63%	
Outputs with additional input									
Required FTEs (with Shrinkage)	116	128	128	126	124	112	122	123	
Available FTEs	102	124	126	126	127	126	122	127	
Metrics calculated from available FTE input									
Gap between available FTEs and required FTEs	-14	-4	-2	0	3	14	0	4	
Gap %	-14%	-3%	-2%	0%	2%	11%	0%	3%	
Required OT %	14%	3%	2%	0%	0%	0%	0%	0%	
Required VTO %	0%	0%	0%	0%	2%	11%	0%	3%	

Rows per page: 10 1-10 of 10

Following is a description of the metrics in the plan output:

- **Forecasting Inputs**
  - **Forecasted Contact Volume**: The total forecasted contact volume across the channels in your selected scenario's optimization targets.
  - **Forecasted Average Handling Time (AHT), seconds**: The forecasted average handling time across the channels in your selected scenario's optimization targets.
  - The forecasted contact volume and AHT in the plan output table reflects only the values from the selected forecast group. After there are newly published forecasts, consider re-running the capacity plan to reflect the latest published contact volume and AHT.
- **Outputs**
  - **Required FTEs (without Shrinkage)**: How many full-time equivalent agents need to be hired to meet the defined business goals (such as service level target), without considering shrinkage.
  - **Forecasted Occupancy %**: How much occupancy is for the agents.
- **Outputs with additional input**
  - **Required FTEs (with Shrinkage)**: How many full-time equivalent agents needed to be hired to meet the defined business goals (such as service level target), with considering shrinkage.
  - **Available FTEs**: How many agents are available for working that day. It can be uploaded in the **Import data** section.

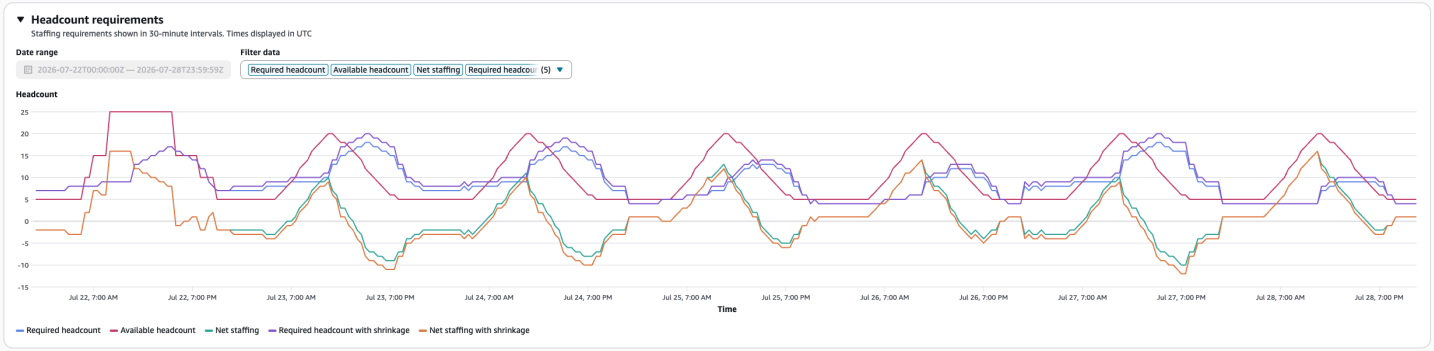
- **Metrics calculated from available FTE input**
  - **Gap between available FTEs and required FTEs**: The difference between available FTEs and required FTEs.
  - **Gap %**: The percentage of the gap.
  - **Required OT %**: if there is a supply deficit (required FTEs higher than available FTEs), required OT% indicates how much overtime would be needed to cover the deficit.
  - **Required VTO %**: If there is a supply surplus (the number of required FTEs is lower than the available FTEs), required VTO % indicates how much voluntary time off could be used to lower the amount of agent idle time and thus lower costs.

Review Scheduling plan output

To review Scheduling plan output, open the plan from the **Capacity Plans** tab. The page shows two graphs and a data table for the date range you select. Data appears in 15-minute or 30-minute intervals. The interval size matches your short-term forecast settings.

Headcount requirements graph

The **Headcount requirements** graph shows how many agents you need at each interval. The x-axis shows time. The y-axis shows headcount.



The graph plots the following series:

- Required headcount
- Available headcount
- Net staffing
- Required headcount with shrinkage
- Net staffing with shrinkage

The graph includes a legend and tooltips. Point to a data point to view details. To show or hide series, use the **Filter data** control.

Optimization target performance graph

The **Optimization target performance** graph shows data for one channel at a time. To change the channel, use the **Channel** selector. You can choose Voice, Chat, Email, or Tasks.

The y-axis label changes based on the target type for that channel:

- **Service level** – Percentage
- **Average Speed of Answer (ASA)** – Average Speed of Answer
- **Average Time to Complete (ATC)** – Average Time to Complete

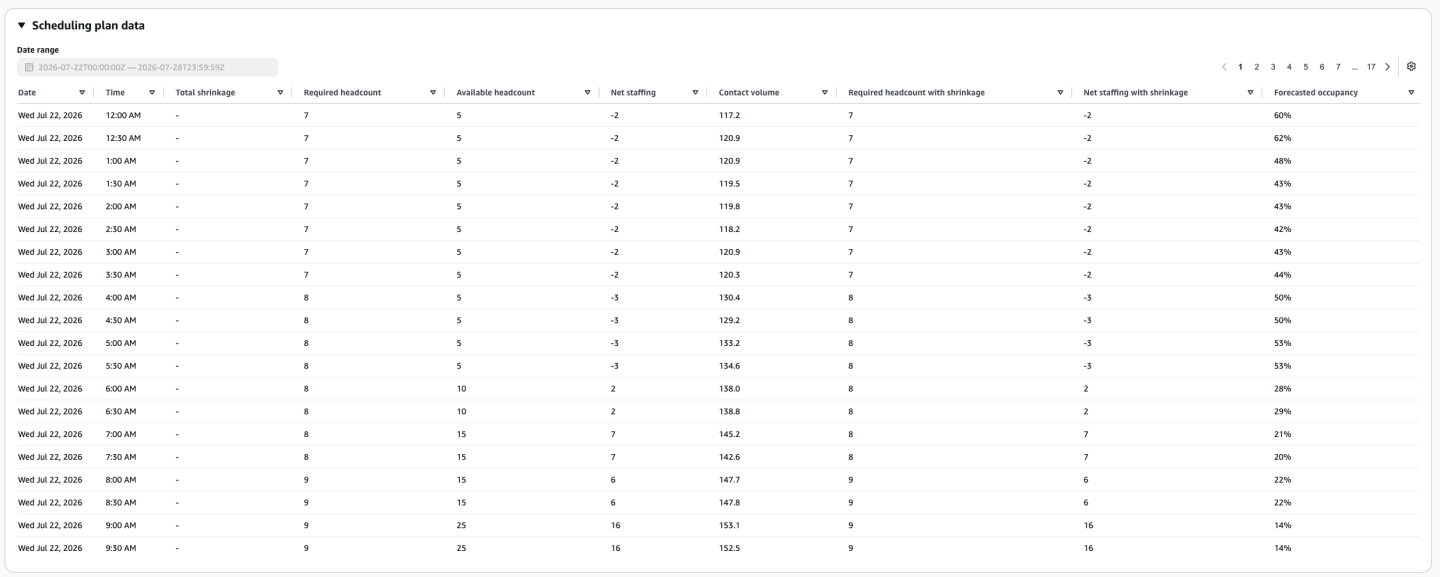
The graph plots three lines for the selected channel: the goal, the projected value, and the projected value with shrinkage. It includes a legend and tooltips. Use **Filter data** to show or hide series.

Date range filter

Use the **Date range** picker to choose which days appear in the graphs and table. The maximum range is 7 days. By default, the page shows 7 days starting from the plan start date. You can pick dates only within the plan start and end date range. Relative date options are not available.

Scheduling plan data

The **Scheduling plan data** table shows one row per interval (15 or 30 minutes). It includes the following columns:



Scheduling plan data

Date range

2026-07-22T00:00:00Z — 2026-07-28T23:59:59Z

1 2 3 4 5 6 7 ... 17

Date	Time	Total shrinkage	Required headcount	Available headcount	Net staffing	Contact volume	Required headcount with shrinkage	Net staffing with shrinkage	Forecasted occupancy
Wed Jul 22, 2026	12:00 AM	-	7	5	-2	117.2	7	-2	60%
Wed Jul 22, 2026	12:30 AM	-	7	5	-2	120.9	7	-2	62%
Wed Jul 22, 2026	1:00 AM	-	7	5	-2	120.9	7	-2	48%
Wed Jul 22, 2026	1:30 AM	-	7	5	-2	119.5	7	-2	43%
Wed Jul 22, 2026	2:00 AM	-	7	5	-2	119.8	7	-2	43%
Wed Jul 22, 2026	2:30 AM	-	7	5	-2	118.2	7	-2	42%
Wed Jul 22, 2026	3:00 AM	-	7	5	-2	120.9	7	-2	43%
Wed Jul 22, 2026	3:30 AM	-	7	5	-2	120.3	7	-2	44%
Wed Jul 22, 2026	4:00 AM	-	8	5	-3	130.4	8	-3	50%
Wed Jul 22, 2026	4:30 AM	-	8	5	-3	129.2	8	-3	50%
Wed Jul 22, 2026	5:00 AM	-	8	5	-3	133.2	8	-3	53%
Wed Jul 22, 2026	5:30 AM	-	8	5	-3	134.6	8	-3	53%
Wed Jul 22, 2026	6:00 AM	-	8	10	2	138.0	8	2	28%
Wed Jul 22, 2026	6:30 AM	-	8	10	2	138.8	8	2	29%
Wed Jul 22, 2026	7:00 AM	-	8	15	7	145.2	8	7	21%
Wed Jul 22, 2026	7:30 AM	-	8	15	7	142.6	8	7	20%
Wed Jul 22, 2026	8:00 AM	-	9	15	6	147.7	9	6	22%
Wed Jul 22, 2026	8:30 AM	-	9	15	6	147.8	9	6	22%
Wed Jul 22, 2026	9:00 AM	-	9	25	16	153.1	9	16	14%
Wed Jul 22, 2026	9:30 AM	-	9	25	16	152.5	9	16	14%

- Date
- Time
- Contact volume
- Average handle time
- Required headcount
- Available headcount
- Net staffing
- Total shrinkage
- Required headcount with shrinkage
- Net staffing with shrinkage
- Forecasted occupancy

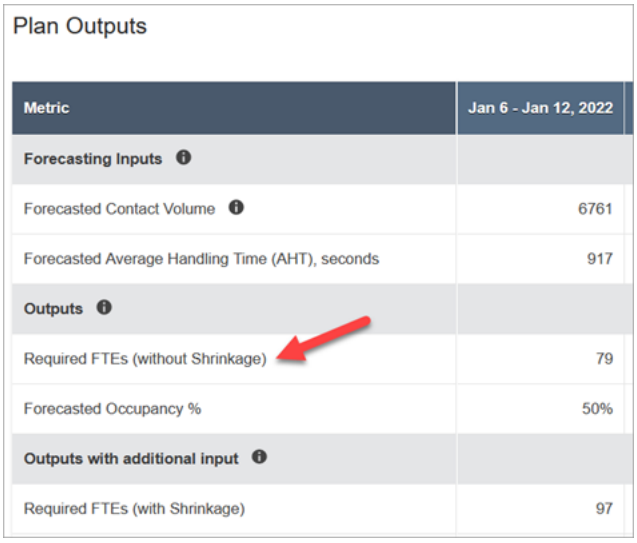
The table also shows columns for each channel. These include the service level goal, projected service level, and projected value with shrinkage. For ASA or ATC targets, it shows projected values. For Task and Email, it shows projected backlog.

To change the page size or show and hide channel columns (Voice, Chat, Email, Task), choose **Preferences**.

Override a capacity plan in Connect Customer

> **Note**
>
> Plan override is not available for Scheduling plans. The following procedure applies to Hiring plans only.

You can upload a .csv file that overrides the **Required FTEs (without Shrinkage)** data in the **Plan outputs** section of a capacity plan. This section is shown in the following image.

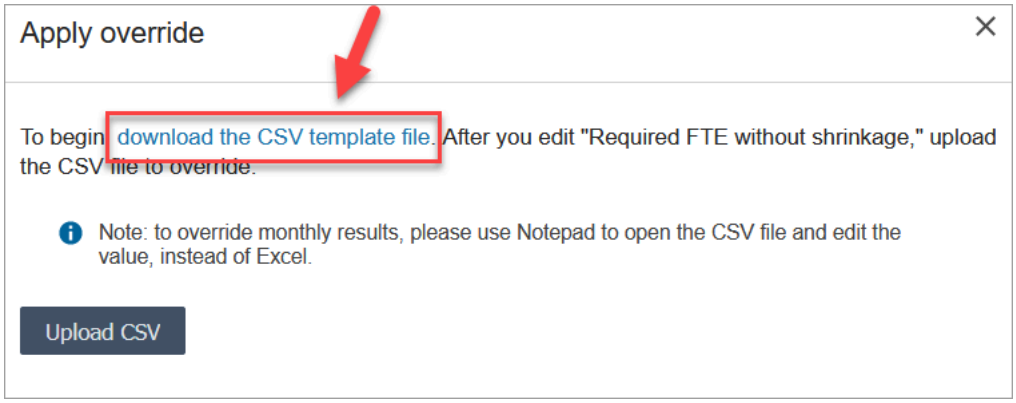


You might want to do this, for example, to give your team of agents a buffer.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

   For more information, see Assign permissions.

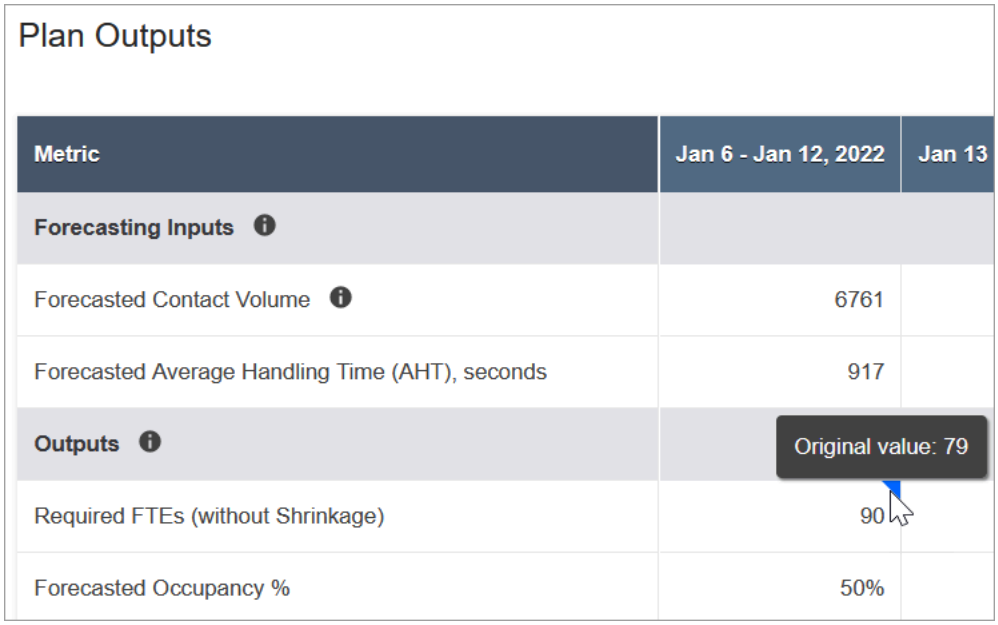
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Capacity Planning**.
3. On the **Capacity Plans** tab, choose the plan.
4. On the detailed page for the capacity plan, choose **Actions**, **Upload plan override**, and then choose **download the CSV template file**. This option is shown in the following image.



The .csv file template has one row. It contains the values that were displayed in the **Required FTEs (without Shrinkage)** row of the **Plan outputs** table. The following image shows an example of this data in a .csv file

	A	B	C	D	E
1	Metrics	Jan 6 - Jan 12, 2022	Jan 13 - Jan 19, 2022	Jan 20 - Jan 26,	Jan 27 - Fe
2	Required FTEs (without Shrinkage)	79	78	81	78
3					
4					

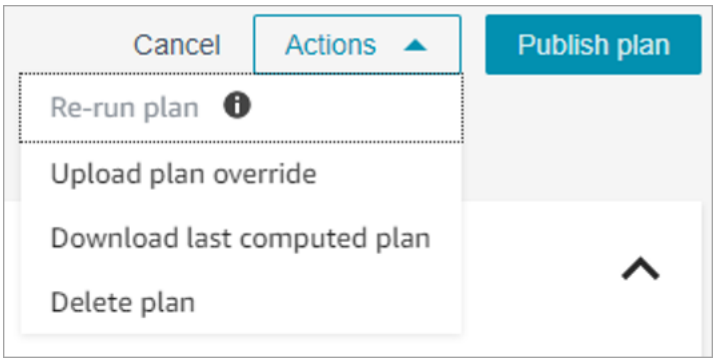
5. Make your changes, and save the template file with a different name. Return to the **Upload override** dialog box (you might need to choose **Actions**, **Upload plan override** to redisplay the dialog box), choose **Upload CSV**, and then choose **Override**.
6. After you upload the .csv file, the metrics in the **Required FTEs (without Shrinkage)** row are automatically re-calculated and updated. Pause on the blue triangle to see the original value, as shown in the following image.



7. The rest of the metrics are updated automatically to reflect the latest change for **Required FTEs (without Shrinkage)**.

Re-run a capacity plan in Connect Customer

You can re-run capacity plans when you make any changes on the plan start or end date, or the scenario. When there are no changes to plan inputs or the scenario, the **Re-run plan** option is not active, as shown in the following image.



To re-run a plan

1. Go to the **Capacity Plans** tab, and choose the plan.
2. Change the start or end date, or select a different scenario.
3. Choose **Actions**, **Re-run plan**.

Download a capacity plan in Connect Customer

When you download a capacity plan file, it downloads as a .csv file type with multiple tabs. It's helpful to open this file using Excel. The following image shows an example of what a capacity plan file looks like in Excel.

> **Note**
>
> The multi-tab workbook format described in this section applies to Hiring plans only. For information about downloading a Scheduling plan, see Download a Scheduling plan.

	A	B	C	D	E	F	G
1	Date	Forecasted Contact Volume	Forecasted Average Handling Time (AHT)	Required FTEs (without shrinkage)	Required FTEs (with shrinkage)	Available FTEs	Gap between available FTEs and requ

Following is a description of each worksheet:

- **Metrics**: When you download the Monthly view, the capacity plan output shows Monthly and Daily granularities. When you download the Weekly view, it shows Weekly and Daily granularities.
- **Capacity Plan**: The capacity plan metadata, such as name, starting date, and ending date of the plan.
- **Scenario**: The input defined for the capacity plan.
- **Generation Details**: The metadata indicating when someone last changed the capacity plan.

How to download capacity plan results

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Capacity Planning**.
3. On the **Capacity Plans** tab, choose the plan.

4. On the detailed page for the capacity plan, choose **Actions**, **Download capacity plan**.

Download a Scheduling plan

You can download a Scheduling plan as a single .csv file. The file has one row per interval (15 or 30 minutes). The columns match the Scheduling plan data table on the plan detail page.

The download runs in the background. You can leave the page while it runs. When the export finishes, you receive a notification and the file is ready to download.

The following image shows a downloaded Scheduling plan .csv file opened in a spreadsheet application.

How to download Scheduling plan results

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Analytics**, **Capacity planning - Edit**.

For more information, see Assign permissions.

2. On the navigation menu, choose **Analytics and optimization**, **Capacity Planning**.
3. On the **Capacity Plans** tab, choose the Scheduling plan.
4. Choose **Actions**, **Download**.

Publish a capacity plan in Connect Customer

When you are satisfied with the capacity plan outputs, choose **Publish plan** to finalize your plan.

> **Note**
>
> You cannot edit the plan after it is published.

Your login name and the published date is displayed on the list view of the capacity plans. For example, the following image shows a plan that was first created on January 11, 2022, and then it was published on January 20, 2022 by Admin.

Date Created	Last Computed	Published Date	Published By
Jan 11, 2022	Jan 11, 2022	Jan 20, 2022	Admin

Scheduling in Connect Customer

Contact center schedulers or managers need to create agent schedules for day-to-day workloads that are flexible and meet business and compliance requirements. Connect Customer helps you create efficient schedules that are optimized for per-channel Service Level or Average speed of answer targets. You can generate and manage agent schedules based on the following:

- A short-term published forecast
- Shift profiles (templates for weekly shifts)
- Staffing groups (agents that can handle specific types of contacts from a specific forecast group)
- Human resources and business rules

> **Note**
>
> Connect Customer scheduling is not designed to ensure compliance with any particular laws. It is your responsibility to make sure that your actions and your use of scheduling comply with any applicable laws including employment regulations. You should confer with your legal counsel to determine your obligations.

Getting started

Following is the order of steps for creating a schedule and publishing it so supervisors and agents can view it.

1. Add users to your Connect Customer instance.
2. Double-check with your Connect Customer admin that users have the required security profile permissions to access scheduling features. For more information, see Assign permissions.
3. Create staff rules for scheduling in Connect Customer
4. Create daily activities in Connect Customer for an agent's shift in your contact center
5. Create a template for an agent's weekly shift in Connect Customer
6. Create groups and rules for staffing and scheduling in Connect Customer
7. Generate, review, and publish a schedule by using Schedule Manager in Connect Customer

To learn how supervisors and agents view schedules, see How supervisors view published schedules using the Connect Customer admin website and How agents view their schedule in the Connect Customer agent workspace.

The roles responsible for contact center scheduling in Connect Customer

There are a variety of roles for people who might create and manage schedules in a contact center, such as the following:

1. **Connect Customer administrator** – Maintains user profiles, grants security profile permissions, sets up holiday hours for the contact center.

2. **Scheduler** – Creates manages staffing groups, creates staffing rules, configures shift components (such as creating shift activities and profiles), generates schedules, revises, and publishes schedules.

   After the scheduler publishes a schedule, the supervisors and agents receive a notification in the user interface that the schedule has been published and they can view it.
3. **Supervisor** – Manages agents and schedules, updates schedules, manages requests for time off, overtime (OT), and voluntary time off (VTO).
4. **Agent** – Answers contacts, views the generated schedule, manages requests for time off, overtime (OT), and voluntary time off (VTO).

Connect Customer provides security profile permissions that you can assign to each role, so that you can manage access to specific features by role. For more information, see Assign permissions.

Key terminology for scheduling your agents in Connect Customer

This topic provides important terms to know when scheduling agents in your contact center.

Draft schedule

A collection of schedules for all agents in a set of staffing groups that the schedule is for.

Only schedulers can view and adjust draft schedules. Agents or their supervisors cannot view these schedules until published.

Overtime / Time off / Voluntary time off

- Requesting overtime to agents allows your contact center to handle a contact surge or agent shortages without hiring more employees.
- Requesting time off to agents allows your business to handle contacts while paying employees.
- Requesting voluntary time off to agents allows your business to handle contacts without paying employees to be idle.

Publish a schedule

An action taken by schedulers to make agent schedules formal and visible in agent and supervisor Schedule calendars (which are separate user interfaces).

Schedule

Multiple shifts tied together between the start and end dates for a specific agent.

Schedule adjustment

Before schedule publishing to supervisors or agents, the Scheduler or the person with permission can add, edit, remove, replace agent activities, or edit and remove shifts to orchestrate supply (that is, the number of agents and shift activities) vs demand (the number of contacts).

Schedule generation

The ability to generate and publish shift schedules for specific date range for a Forecast Group - Staff Group combination.

Shift activities

Daily activities that the agent does during their shift. For example, meetings, training, and lunch.

Shift profiles

The base structure of a shift, schedule window, daily shift activities that go into it.

Staffing groups

A group or team of agents who are skilled to take specific types of contacts. For example, you might create one staffing group named General Enquiry, and another named Tier 2 Support.

Create staff rules for scheduling in Connect Customer

Use staff rules to specify optional details for individual agents and supervisors, such as their local time zone, start and end dates, and contract details.

> **Note**
>
> The individual staff rules you specify here override any staffing group rules when their schedule is generated.

For example, you might set up the staffing group to generate a schedule where everyone works 40 hours per week. In the staff rules, you can choose specific employees to schedule for 20 hours per week.

Topics

- Create staff rules for individuals
- Import time off balance for individuals

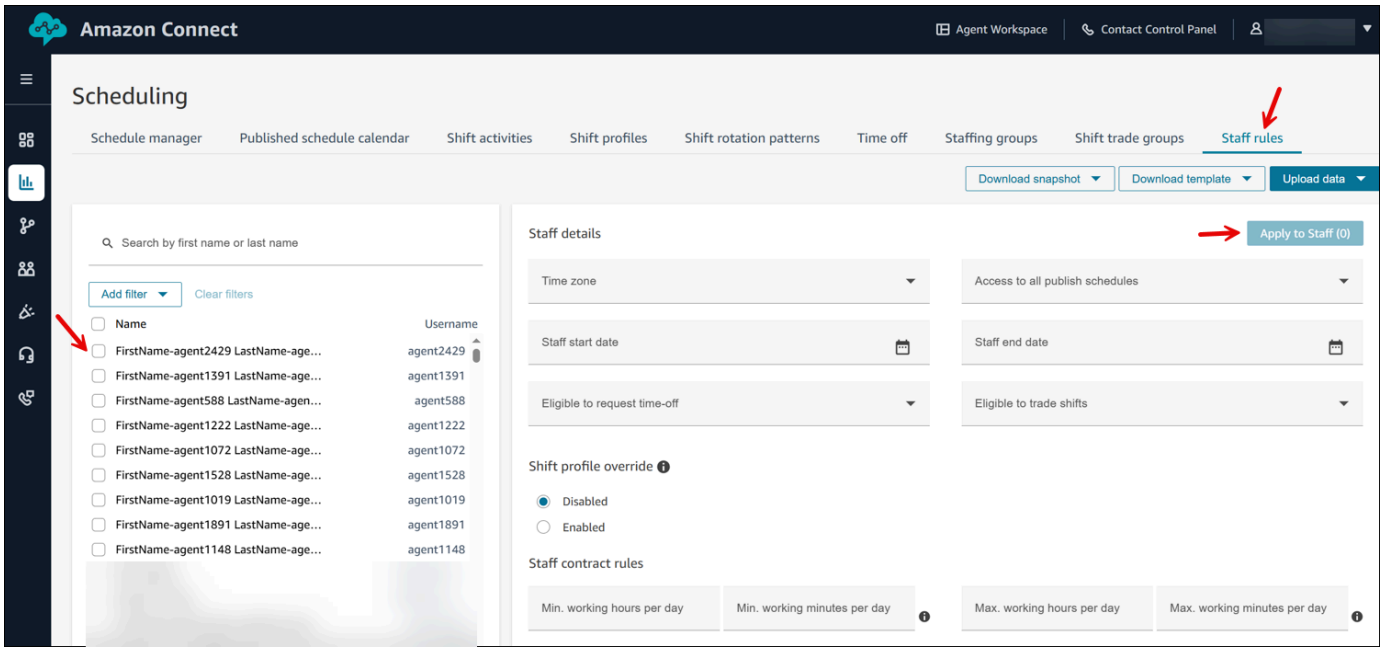
Create staff rules for individuals

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. On the **Scheduling** page, choose the **Staff rules** tab, and then search and choose one or more staff from the list. Every time staff is selected, the staff count is displayed in the **Apply to Staff** button.

   The following image of the **Scheduling** page shows you **Staff rules** tab, the list of agents, and the **Apply to Staff** button.



4. In the **Staff details** section, specify optional details such as:

   - **Time zone**: Render schedules in the local time zone of the agent.

- **Access to all published schedules**: Select **Yes** to give this user access to all published schedules without being a supervisor in staffing groups. Note that the user still needs **Scheduling, Schedule manager - Edit** permission in their security profile.
- **Staff start date** and **Staff end date**: Schedule agents based on respective start and end dates. For example, if someone is starting on May 15th, set this start date as May 15th to make sure that schedules are not generated for this agent before this date.
- **Eligible to request time-off**: Specify whether this agent is eligible to request time-off.
- **Eligible to trade shifts**: Specify whether this agent eligible to trade shifts.

5. In the **Shift profile override** section, choose **Enabled** to define a specific shift profile or shift rotation pattern for each agent.
6. In the **Staff contract rules** section, define rules that must be applied when scheduling this agent. For example, they must get 2 consecutive days off every week, they cannot work more than 40 hours per week, they must have a gap of 11 hours between consecutive shifts, and more.
7. Choose **Apply to Staff**. This saves the rules, and makes sure they are applied during the next scheduling cycle.

Import time off balance for individuals

For the maximum file size that you can upload, see *File size per upload of agent time off data* in Forecasting, capacity planning, and scheduling feature specifications.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. On the **Scheduling** page, choose the **Staff Rules** tab.
4. Choose Download template and store the .csv file on your desktop. It looks similar to the following image.

	A	B	C
1	Login	Time off activity name	Time off balance in hours
2		Vacation	180.9
3		Sick day	60.5
4		Vacation	230
5		Sick day	120

5. Add data or make changes to the .csv file as needed and then save to your desktop with a new file name.
6. Choose **Upload data** to upload the .csv file. Connect Customer does the following:
   - Validates the data and provides details if there are errors.
   - Prompts you for confirmation that you want to upload the data.
   - Uploads the file and displays a confirmation message when complete.

After the .csv file is successfully uploaded, Connect Customer checks the available time off balance when time off requests are submitted. If there is enough time off balance it approves the request. Otherwise, the request is declined.

> **Note**
>
> The time off balance for the requested time off type must be equal to or greater than the duration of the requested time off.

Create daily activities in Connect Customer for an agent's shift in your contact center

Shift activities are daily activities that the staff (agents) does during their shift. For example:

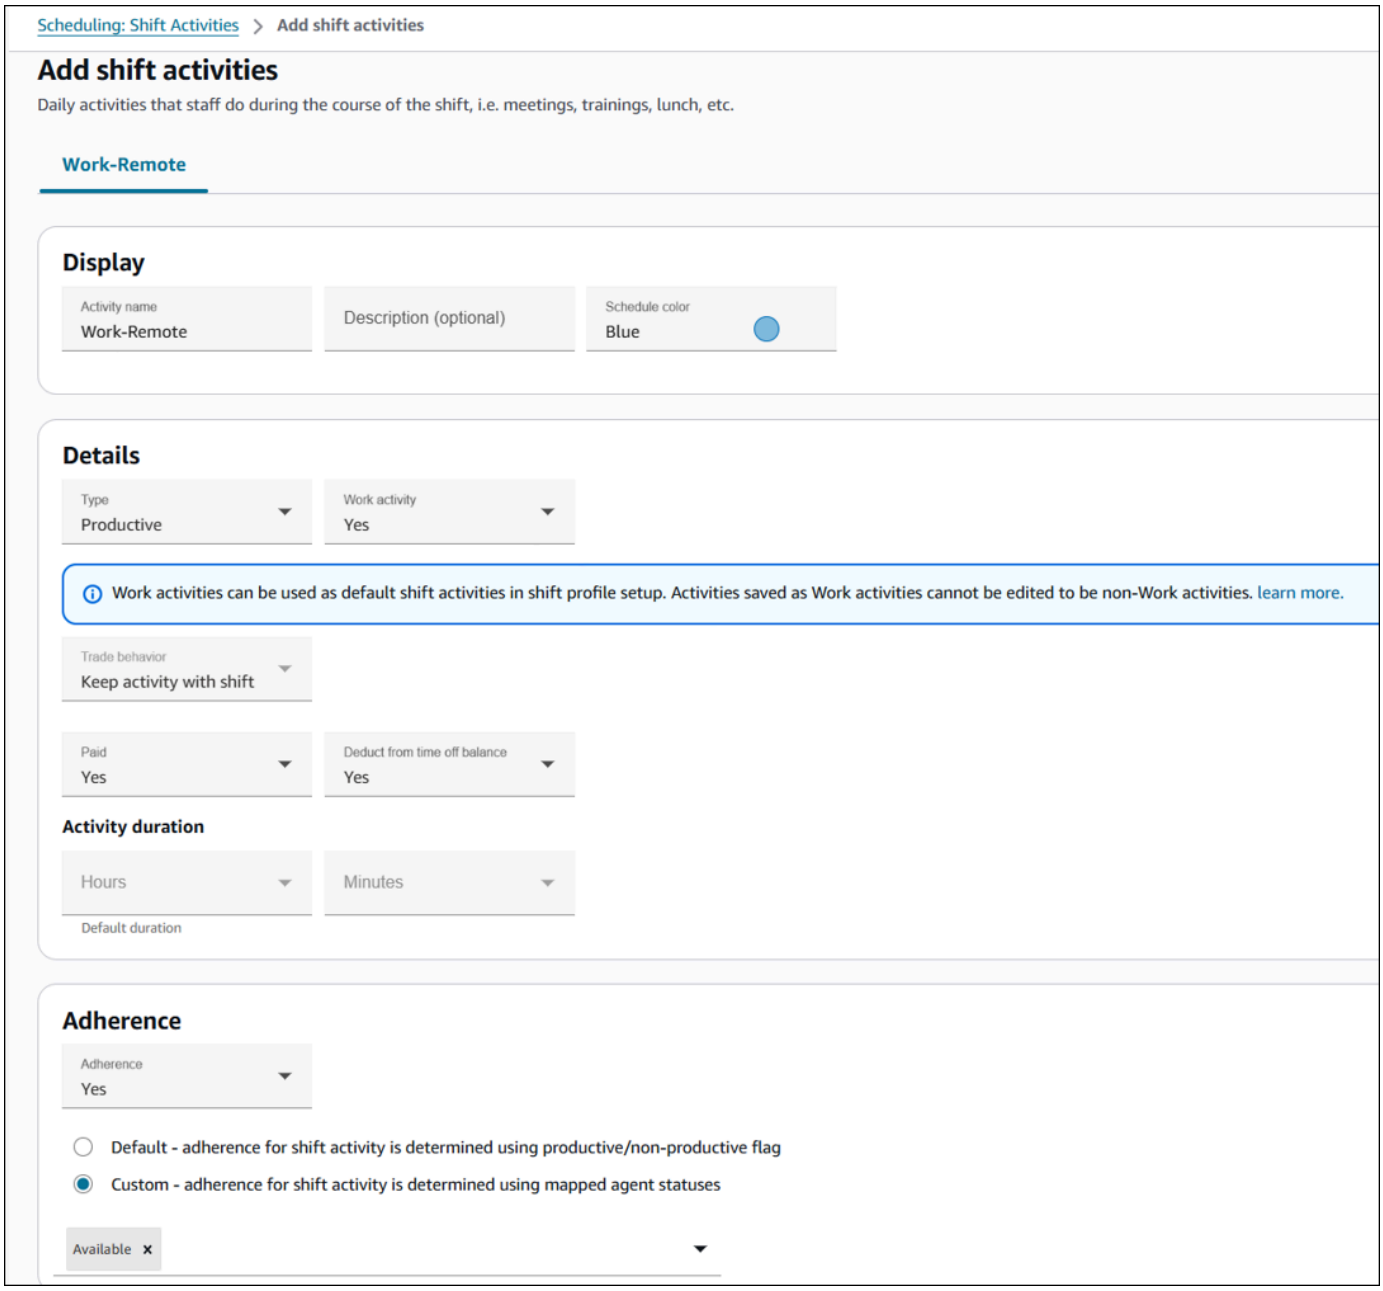
- **Productive**: At work activities that agents do that are counted as productive work, such as answering contacts.
- **Non-Productive**: At work activities that agents do that are not counted as productive work, such as breaks and team meetings.
- **Time off**: Absent from work. Their status in the agent application is **Offline**.

You can create multiple shift activities to include as part of your staff shifts.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.

3. On the **Scheduling** page, choose the **Shift Activities** tab, and then choose **Add shift activities**. The following image is an example **Add shift activities** page.



4. Complete the following details on the page.

- **Activity name**: Name of the activity
- **Description (Optional)**: Additional information on the activity
- **Schedule color**: Choose the color you want this activity to appear in supervisor and agent view of schedules. By default Light blue is the first option. Choose inside the box to see other options.

The color you choose appears in both the draft and published versions of the schedule.

- **Type**: Select if this activity is of type Productive, Non-productive, or Time off
  - **Productive**: Use this type for activities that represent time spent by agents doing productive work such as handling contacts in Connect Customer, or working on tasks in another system.
  - **Non-productive**: Use this type for activities that represent time spent by agents on activities such as meetings, training, 1:1s.
  - **Time off**: Use this for activities that agents and supervisors use for creating time-off requests such as PTO, sick leave, leave of absence.
- **Sub-type**
  - **If non-productive: Break or meal**: Set this subtype for breaks, lunches or meal activities. This option is available only for Non-Productive activity types. This setting allows automated break or meal time adjustments when time offs or overtimes are added or removed from staff shifts, to comply with the break rules configured in the Staffing Group and Shift Profiles.
  - **Time off: Staff Requestable**: Set to **Yes** to allow agents to see and pick the respective time off activity during time off creation. Set to **No** for time off activities that can be requested only by supervisors on behalf of an agent.
- **Work activity**: This option is available only for productive activities. Select **Yes** if this activity represents agents scheduled for this activity are working towards forecasted demand in Connect Customer.

  > **Note**
  >
  > - Existing activities cannot be changed to a work activity.
  > - An activity saved as work activity cannot be changed back to non-work activity.
  > - When editing agent schedules, you can replace a work activity with another work activity for the entire shift.

- **Trade behavior**: This option controls how shift exchange works for the shift activity. Choose one of the following values:
  - **Do not trade shift**: This is the default. Choose this option to block trades if this shift activity exists.
  - **Keep activity with shift**: Choose this option to move the activity together with the shift.

- **Remove from shift**: Choose this option to remove the activity from the shift.

> **Important**
>
> For work activities, the default configuration is **Keep activity with shift**.

- **Paid**: Yes/No
- **Deduct from time-off balance**: Select **Yes** if this activity should be deducted from the agent's time-off balance. Otherwise choose **No**.

  For example, an agent requests an all day time-off on July 31. They have an 8 hour shift on that day and have this activity in their shift for 30 minutes.

  - If this field is set to **Yes**, the 8 hours will be deducted from agent's time-off balance.
  - If it's set as **No**, then 7 hours and 30 minutes will be deducted from agent's time-off balance.
- **Default duration**: Select default duration for this activity. Not applicable for work activities.
- **Adherence**: The following options are enabled when **Adherence** = **Yes**:
  - **Default**: Determines adherence using the productive/non-productive flag.
  - **Custom**: Enables an additional dropdown for mapping shift activity to specific agent statuses.

  The Adherence metric is not calculated when you set **Adherence** to **No**.

  For more information about these options, see Schedule Adherence.

5. If desired, add another activity.
6. Choose **Save**.
7. The next time a schedule is created as part of the scheduling cycle, the shift activities are applied.

> **Tip**
>
> Create shift profiles to ensure the desired sequence of the shift activities. For example, to schedule agents to go on their break two hours before lunch. For instructions, see Create a template for an agent's weekly shift in Connect Customer.

Create a template for an agent's weekly shift in Connect Customer

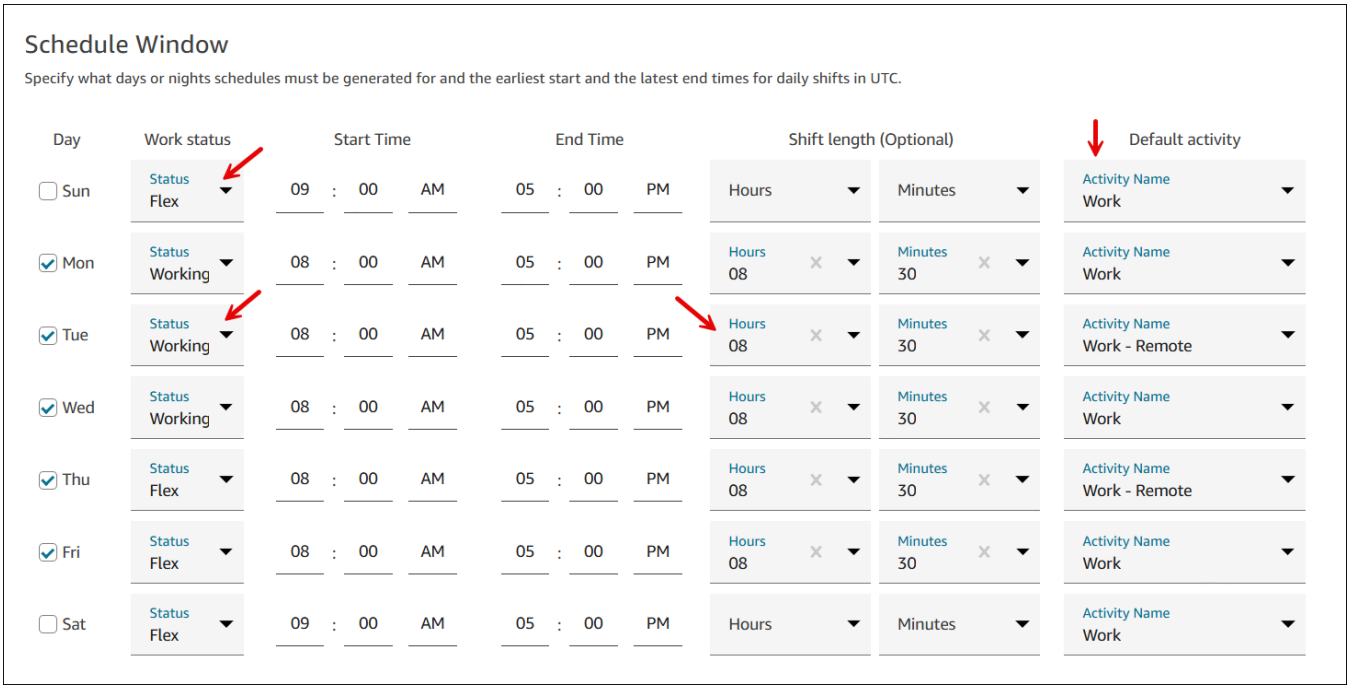
Use shift profiles to create templates for weekly shifts. The template includes the days of the week worked, the earliest start time and the latest end times the staff can be scheduled, the activities they would do during their shift, and various roles.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. Choose the **Shift Profiles** tab, and then choose **Add shift profiles**.
4. On the **Add shift profile** page, choose a time-zone for this shift profile. This time-zone configuration will automatically adjust agent shifts for daylight saving changes. For example, an 8AM - 5PM (8:00 - 17:00) shift profile for US/Pacific time-zone will automatically switch from 8AM - 5PM (8:00 - 17:00) Pacific Standard Time to 8AM - 5PM (8:00 - 17:00) Pacific Daylight Savings Time.
5. In the **Schedule Window** section, complete the section as follows:

   - For **Work status**, choose one of the following options:
     - **Working**: This means when Connect Customer generates the schedule, it must schedule the staff to work between the specified hours and minutes.
     - **Flex**: This means if Connect Customer predicts enough contact volume to warrant scheduling the agent, it might schedule them to work between the specified hours and minutes.

   The following image shows the **Schedule Window** section of the **Add shift profile** page. It shows examples of Flex, Working (with a shift length of 8 hours and 30 minutes), and the Default activity.



- **Start Time** and **End Time**: Specify the earliest start time and the latest end time for each day in the selected time zone.
- **Shift length (Optional)**: Specify the maximum shift length that an agent can be scheduled on a specific day. This option is especially useful if your contact center is open for long periods of time, such as 24 hours, but each shift is shorter than that, such as 8 hours.
- **Default activity**: Specify the default activity for each day. Only activities set up as work activities can be selected as default activities. For more information about work activities, see Create shift activities.

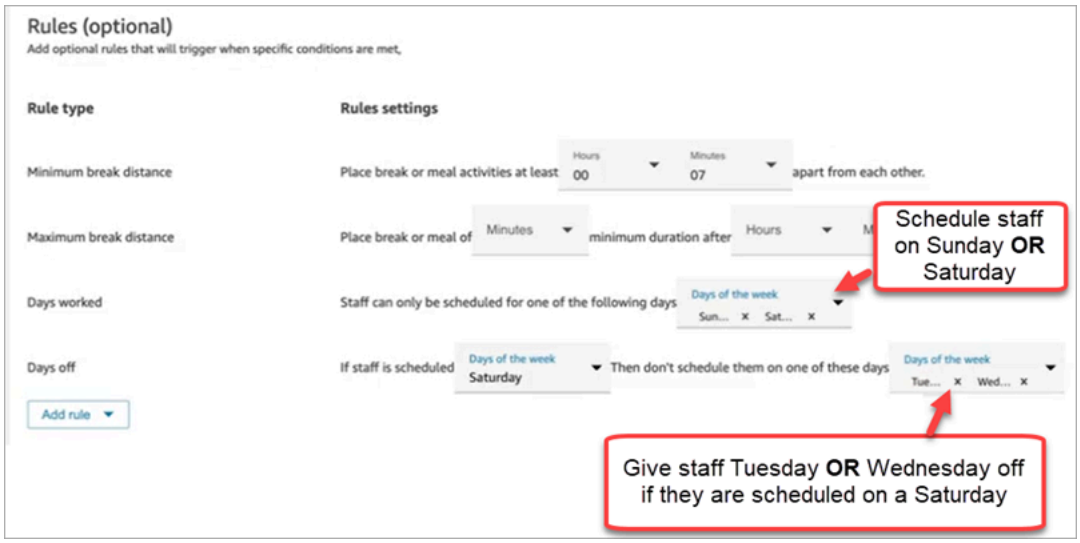
Depending on the contact demand pattern forecast, Connect Customer determines the best possible start and end times for shifts, while adhering to the minimum and maximum hours per day and week worked.

6. Choose **Add shift activities**. Select the shift activities the staff will do during their shift. (You create the shift activities that appear in the list, such as Productive, Time off, and Non-Productive.)
7. For each activity, set placement rules. The rules include:

   - The time duration from the beginning to end of the shift where the activities need to be placed.
   - The time window for Connect Customer to pick the best spot to maximize efficiency of the generated schedules to meet the goals, such as the service level percent (SL%) targets.

8. Optionally, complete the **Rules** section as follows:

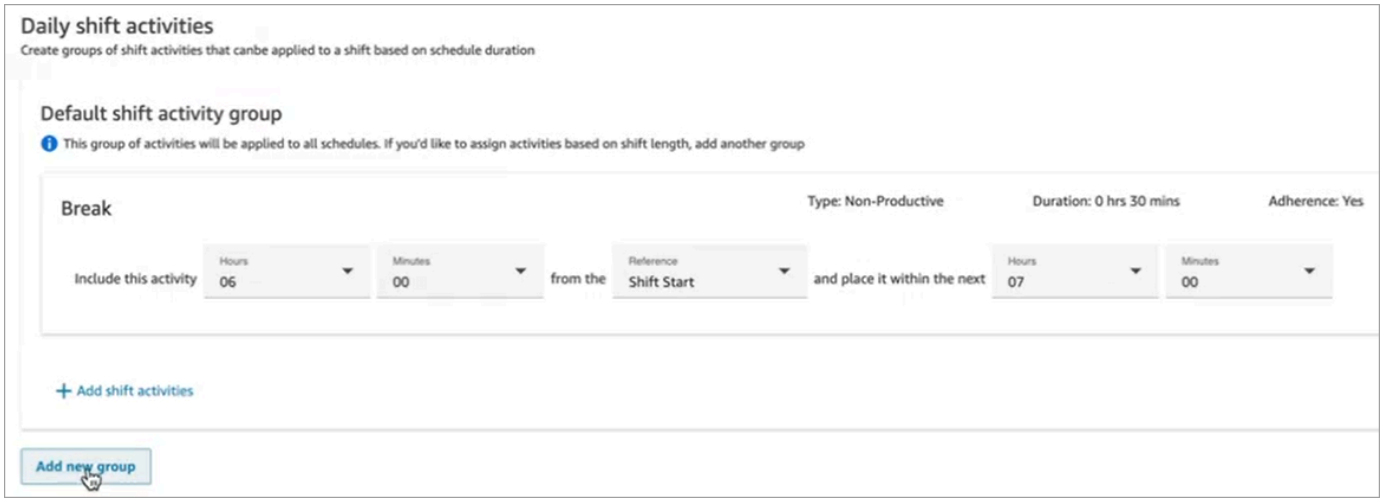
> **Important**
>
> These rules override the settings in the **Schedule Window** section.



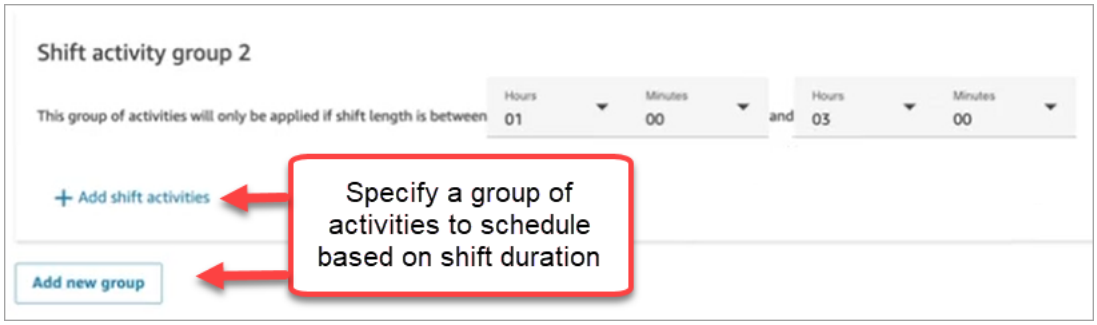
Choose the **Add rule** dropdown box and choose from the following options:

- **Minimum break distance**
- **Maximum break distance**
- **Days worked**: If you list multiple days, they are separated by OR.
- **Days off**: If you list multiple days, they are separated by OR.

9. In the **Daily shift activities** section, complete the **Default shift activity group** section to specify when activities such as lunch breaks and training should be scheduled during the shift. The shift activities apply to everyone in the shift. In the following image, agents are scheduled for a **Break** 6 hours after starting their shift and within 7 hours.



Optionally, choose **Add new group** to add a subgroup of agents and specify shift activities for them. In the following image, the shift is 2 hours and no activities are specified. This means the agents in **Shift activity group 2** don't get a break.



10. After saving the shift profile, you can edit or remove it from the list view.

For example, if you set break to start 6 hours after the start of a shift and lunch to start 3 hours after the start of a shift, the lunch is scheduled to occur first.

Create shift trade groups

You create shift trade groups so that agents within the same forecast group can trade shifts with each other. For information about the shift exchange capability, see Set up shift exchange in Connect Customer.

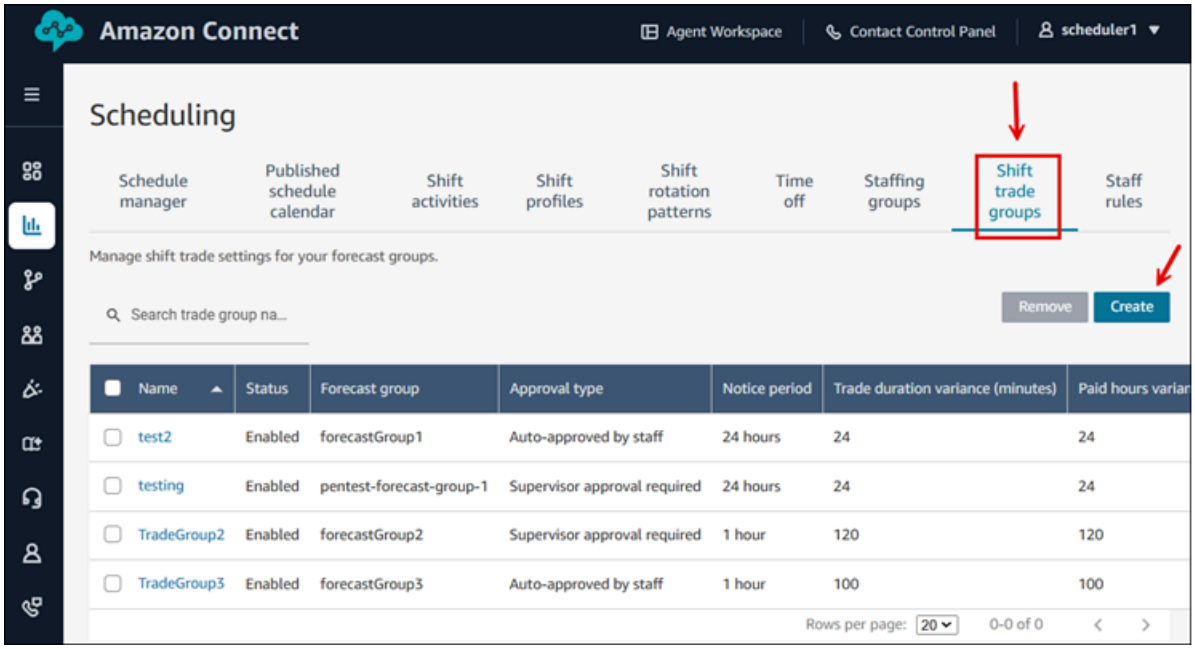
You can create up to 500 trade groups per Connect Customer instance. You can create up to 100 custom trade groups.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.

3. On the **Scheduling** page, choose the **Shift trade groups** tab, and then choose **Create**, as shown in the following image.



4. On the **Add shift trade group** page, complete the following boxes:

   a. **Trade group name**: Name of the trade group.

   b. **Description (Optional)**: Additional information on the trade group.

   c. **Associate to forecast group**: Choose the forecast group to associate to this trade group. Each forecast group can be associated to only one trade group.

   d. **Status**: Enable or disable this trade group.

   e. **Notice period (hours)**: The number of hours before a trade can be active.

   f. **Approval type**:

   - **Auto-approval by staff**: Choose this option to automatically approve shift exchange requests between agents when all the specified criteria are met.
   - **Supervisor Approval required**: Choose this option to mandate that a supervisor must manually approve trade requests.

g. **Trade duration variance (minutes)**: The maximum number of minutes between two shifts to allow the trade.

h. **Paid hours variance (minutes)**: The maximum number of paid minutes that can be different between two shifts to allow the trade.

   For example, say you set this to 30 minutes. One agent has a paid break that's 90 minutes, and another agent has a paid break that's 30 minutes. They wouldn't be able to trade shifts because the difference is 60 minutes.

   This option is useful if you have agents with contracts that guarantee them a certain number of paid hours, for example.

i. **Override labor laws**: Do you want to allow agents to make trades that override the labor laws specified in staff rules? These rules are specified on the **Staff rules** page.

   For example, say an agent cannot work more than 40 hours a week. But that agent wants to make a trade to work more than 40 hours, and the **Paid variance** setting allows it. If **Override labor laws** is set to **Enable**, then the agent is allowed to make the trade that overrides the 40 hour per week rule.

j. **Staffing groups**

   - All staffing groups within the forecast group can trade shifts.
   - **Custom**
     - Create a custom trade group by selecting the desired staffing groups. This restricts trades to only the selected staffing groups.
     - You can create a maximum of 100 custom trade groups.

Create groups and rules for staffing and scheduling in Connect Customer

A *staffing group* is a group or team of agents who are skilled to take specific types of contacts.

You add agents who need a schedule generated for them, and supervisors who manage agent schedules. You can also add rules that apply at the staffing group level, such as the minimum staff required and the minimum working hours per day or week for the group.

For example, say your contact center opens at 9AM but the forecast says no contacts arrive between 9-9:30AM. You can add a rule that says, despite what the forecast predicts, there should be a minimum of one agent during this time.

If you don't have a shift start time rule, then the schedule is built using the predictions from the forecast.

For a list of staffing group limits, see Forecasting, capacity planning, and scheduling feature specifications.

Example

For example, you might create one staffing group named General Enquiry, and another named Tier 2 Support. Because you map one or more staffing groups to a forecast group, here's how you would create staffing groups in this case:

1. Group all General Enquiry queues to a General Enquiry forecast group.
2. Map the General Enquiry forecast group to multiple staffing groups that have agents who can take general enquiry contacts.

Important things to know

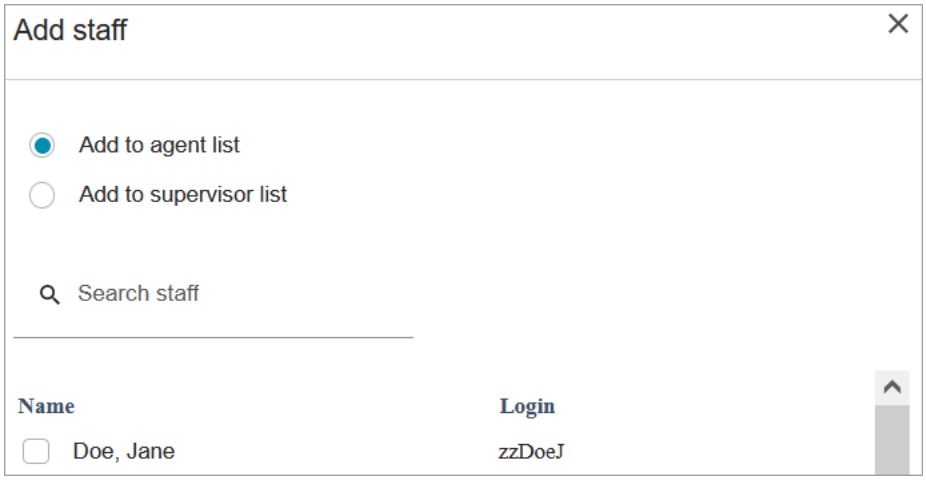
- Every agent must be in a staffing group in order for a schedule to be generated for them. You can add and remove agents in between schedule cycles and manually add shifts.
- Even after an agent is in a staffing group, you can assign them their own shift profile by using the **Staff rules** tab. The agent-level shift profile overrides the profile set at the staffing group level. For more information, see Create staff rules for scheduling in Connect Customer.
- If a user needs to view published agent schedules from the **Published** calendar view, then the user must be added to the staffing group as a supervisor.
- A user cannot be an agent in one staffing group AND a supervisor in another staffing group.
- When you remove an agent from a staffing group, it does not automatically delete their shifts. Adherence will continue to be tracked. If you don't plan on adding them to another staffing group, we recommend removing the shifts for that agent before removing them from the staffing group.

Create group and add staff

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. Choose the **Staffing Groups** tab, and then choose **Create staffing group**.
4. On the **Create Staffing Group** page, under **Associate to forecast group**, use the dropdown to choose the forecast group to associate with this staffing group.

   In the following example, contacts from the queues in the Forecast_Group_20220124 will be routed to the agents in this staffing group.
5. Choose **Add staff** to add agents and supervisors to this staffing group. Only names for Connect Customer users appear in the list of staff. The following image shows the name Jane Doe, which can be added to the agent list.



Add rules

To generate a schedule, Connect Customer uses information from the forecast group, which reflects the historical demand pattern for your contact center. With staffing rules, you can specify conditions that must be accounted for in the schedule, regardless of what the forecast predicts.

For example, your contact center opens at 9AM but the forecast says no contacts arrive between 9AM-9:30AM. You can add a rule that, despite what the forecast predicts based on historical demand, there should be a minimum of one agent during this time. This forces Connect Customer

to keep one agent in the schedule from 9-9:30AM. In addition, you can add a rule to set the **Working Hours** to start at 9AM, even though the forecast would start it at 9:30AM.

To add rules

- In the **Rules** section, choose **+** and then use the dropdown to choose the type of rule to create for the staffing group. For example, you can specify:
  - **Minimum staff required**: Specify the minimum number of agents that should be available, despite what the forecast indicates. For example, if the forecast says that you do not need any agents in the first half hour that your contact center opens, you can make sure that there is a minimum of one agent during this time.
  - **Shift start time:**
    - **Same Start Time**: This creates schedules with the same shift start time for all staff.
    - **Previous day's start time**: This creates schedules such that for each agent in the staffing group, a shift does not start earlier than previous day's shift.
  - **Working time**: Specify the group's minimum and maximum working hours per day or week. This setting applies to all staff in the staffing group. You can override this setting for individual staff. For instructions, see Create staff rules for scheduling in Connect Customer.
  - **Minimum rest between shifts**: Specify the minimum number of hours of rest period a staff should receive between the end of one shift and start of next shift. This setting applies to all staff in the staffing group. You can override this setting for individual staff.
  - **Consecutive working days**: Specify the minimum and maximum consecutive days each staff in the staffing group should be scheduled for. This setting applies to all staff in the staffing group. You can override this setting for individual staff.
  - **Maximum consecutive day of the week worked**: For each day of the week, specify if staff should not be scheduled for more than the defined number of times consecutively. For example, do not schedule staff for more than 2 Sundays in a row. This setting applies to all staff in the staffing group.
  - **Minimum consecutive rest period per week**: Specify the rest period (in hours or days) a staff should receive each week. This setting applies to all staff in the staffing group.

Generate, review, and publish a schedule by using Schedule Manager in Connect Customer

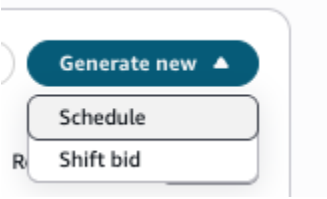
Connect Customer is designed to generate the least number of shifts for agents based on the forecasted demand pattern and configured constraints to hit the optimization goal.

After you create shift activities, shift profiles, staffing groups and staffing group rules, you can generate a schedule.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. Choose the **Schedule Manager** tab, and then choose **Generate new**. You have the following two options:

   - **Schedule** - Generate a standard schedule that is not a shift bid.
   - **Shift bid** - Generate a schedule that agents bid on. To learn how to set up and run shift bidding, see Shift bidding.



> **Note**
>
> The rest of this topic describes how to generate a schedule that is not a shift bid. To learn how to do shift bidding, see Shift bidding.

4. Enter a name and description for the schedule.
5. In the **Schedule input** section, select the forecast group from the dropdown menu.

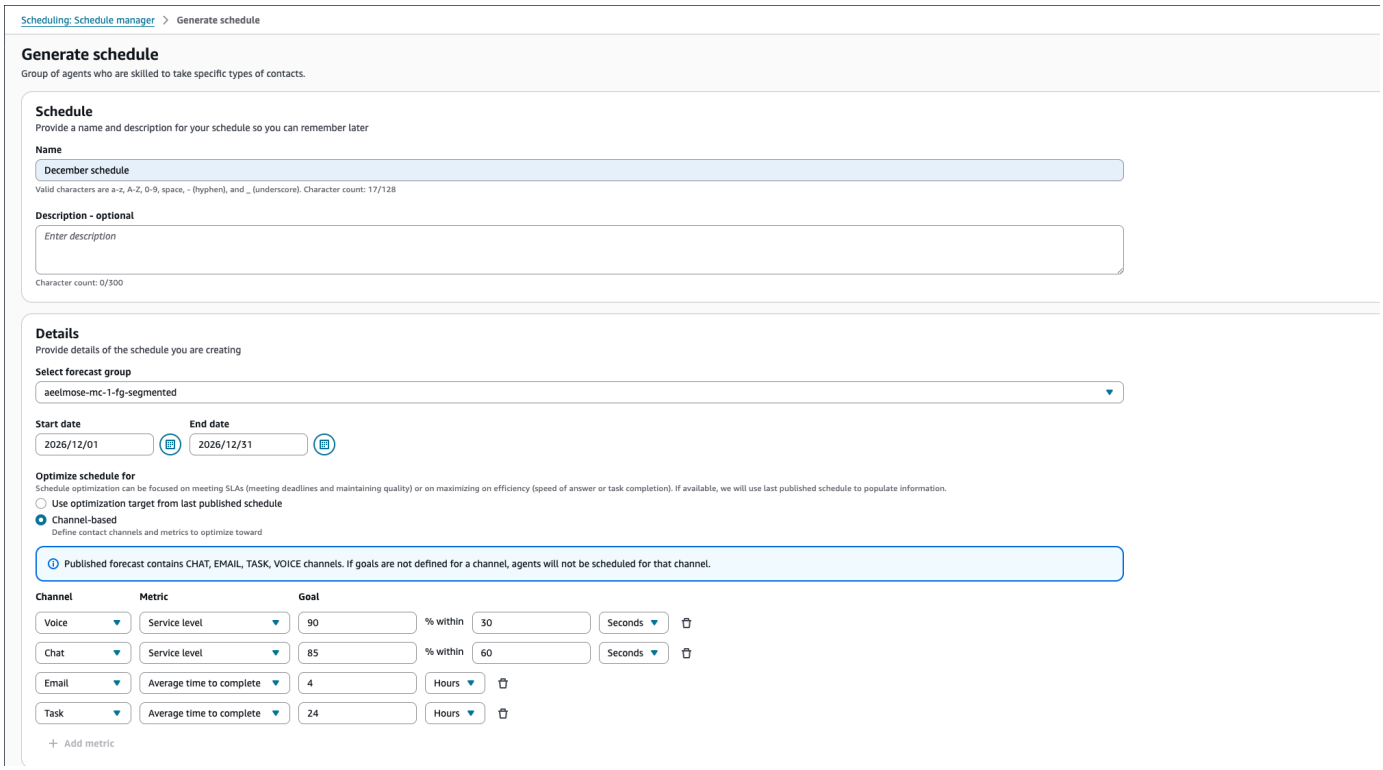
   Currently you cannot schedule for multiple forecast groups.
6. Specify the duration of the schedule - the start and end dates. You can schedule up to 18 weeks out.

7. Select optimization goals for each channel in your forecast:

   - **Voice**: **Service level** or **Average speed of answer**
   - **Chat**: **Service level** or **Average speed of answer**
   - **Task**: **Service level** or **Average time to complete**
   - **Email**: **Service level** or **Average time to complete**

   For Task and Email: use **Service level** when the work is done synchronously, for example, a Task is picked up within 5 minutes of arriving. Use **Average time to complete** when the work can be deferred and is completed over hours or days.

   > **Note**
   >
   > Backlog metrics are only available when **Average time to complete** is selected as the optimization goal.



8. Choose **Generate schedule**.

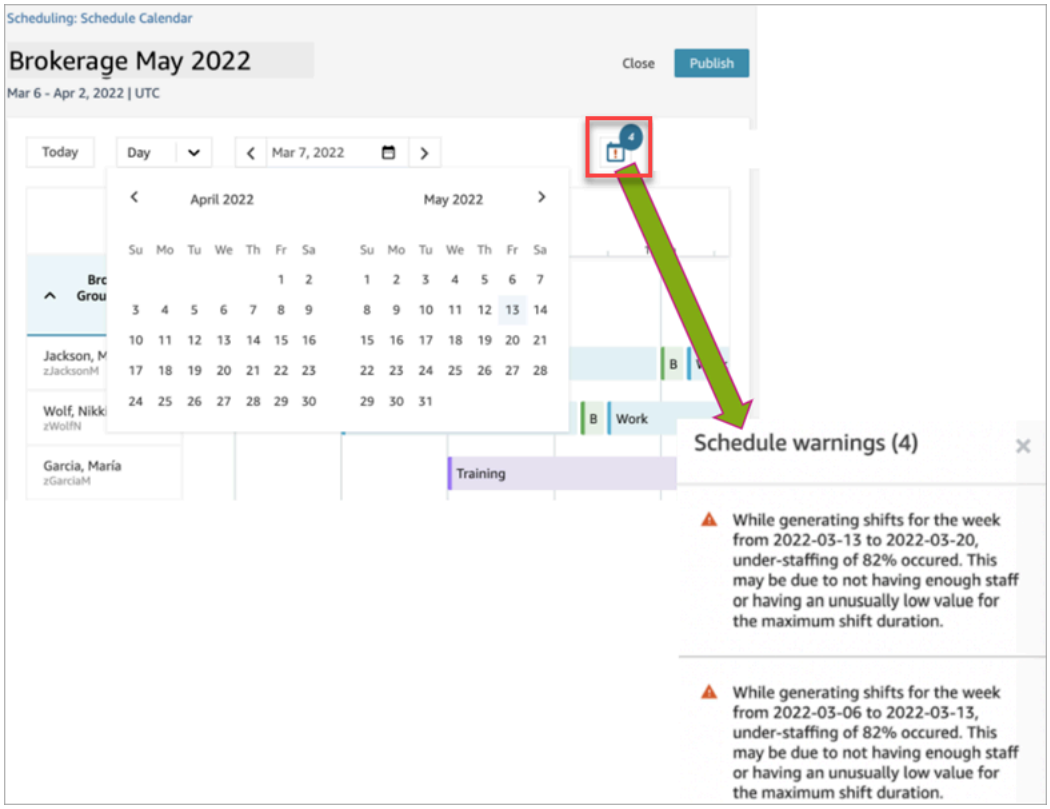
> **Note**
>
> Connect Customer generates a draft schedule. It will not be visible to agents or supervisors until you publish it.

9. In the list of schedules, the schedule you created shows a status of **In progress**. It takes 30 minutes to 3 hours to generate, depending on the number of agents, number of configured rules, schedule duration, and more. After the schedule is generated, it's status is **Complete** or **Failed**.
10. To view any warnings, breaches of rules, or constraints breaches, choose the warnings icon, as shown in the following image. More information about the warnings is displayed. Schedule generation warnings come in three severities: **HIGH**, **MEDIUM**, and **LOW**.

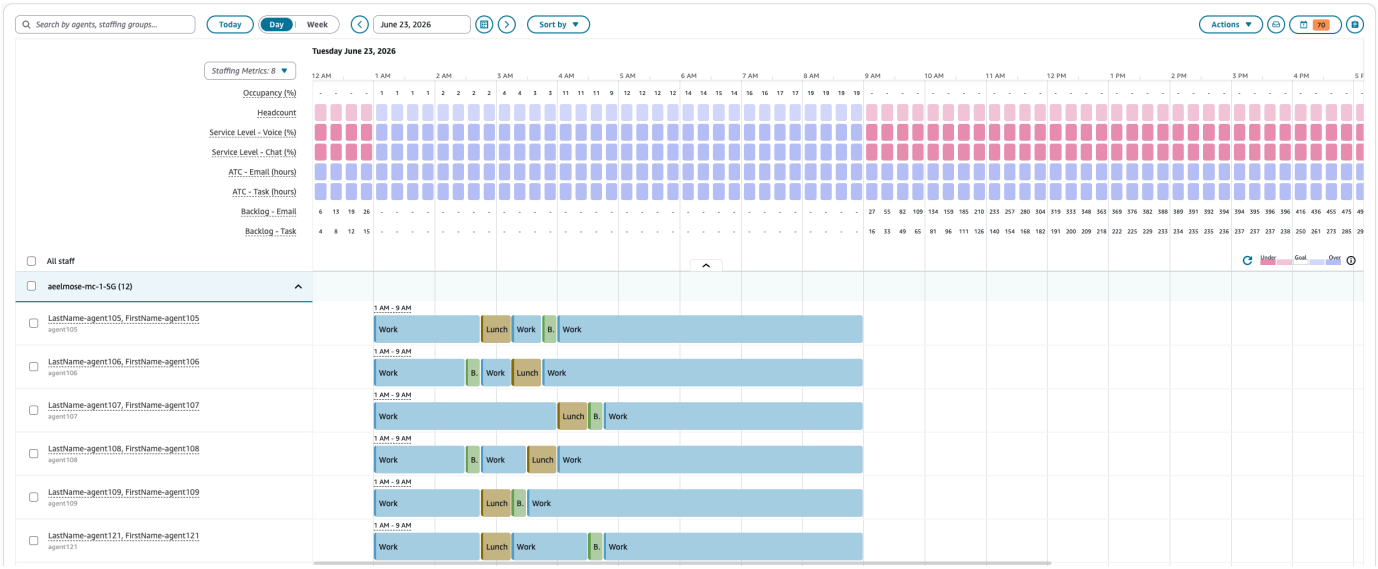
    a. **HIGH** warnings indicate an agent has not been successfully scheduled.

    b. **MEDIUM** warnings indicate an agent was scheduled but could not meet all the given requirements (for example, an agent's schedule for a day not meeting the minimum working hours required for them).

    c. **LOW** warnings indicate minor problems with the schedule (for example, overstaffing occurring for a given day).



11. When the status is **Complete**, choose the draft schedule to view it. The following image shows a sample schedule for one day, with staffing metrics and individual agent shifts.

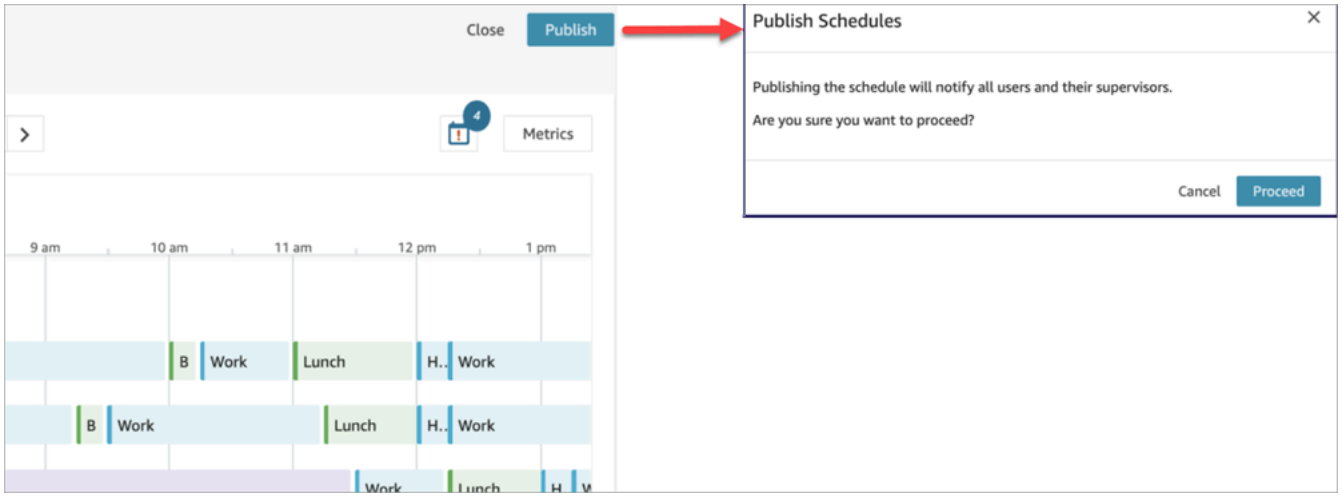


Schedulers can:

- View schedules for all agents.

- Pick a date to view a specific shift.
- Navigate back to today's date.
- View failed rules and goals.

12. When you're satisfied with the schedule, choose **Publish**. You'll get a confirmation page. Choose **Proceed** to make the schedule official!



Staff (agents) and supervisors specified in the staffing groups can now view the schedule. See the following topics to learn about their experience:

- How supervisors view published schedules using the Connect Customer admin website
- How agents view their schedule in the Connect Customer agent workspace

Edit a schedule

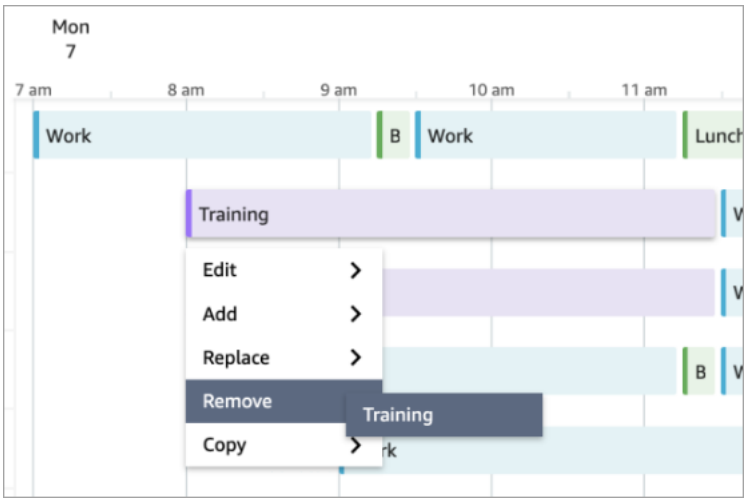
Before publishing a schedule, you might want to edit it. For example, if you notice that all the agents are scheduled to be on break at the same time and no one is scheduled to take contacts.

You can:

- Change agent shift start or end time, duration.
- Change activity shift start or end time, duration.
- Add an activity to one or more agents shift.
- Remove or replace activity from an agent shift.
- Copy an entire shift from one agent to another.

- Recompute metrics to ensure schedule adjustments result in better service level (SL%) or occupancy.

The following image shows these options in the dropdown list: **Edit**, **Add**, **Replace**, **Remove**, **Copy**.



Regenerate a schedule

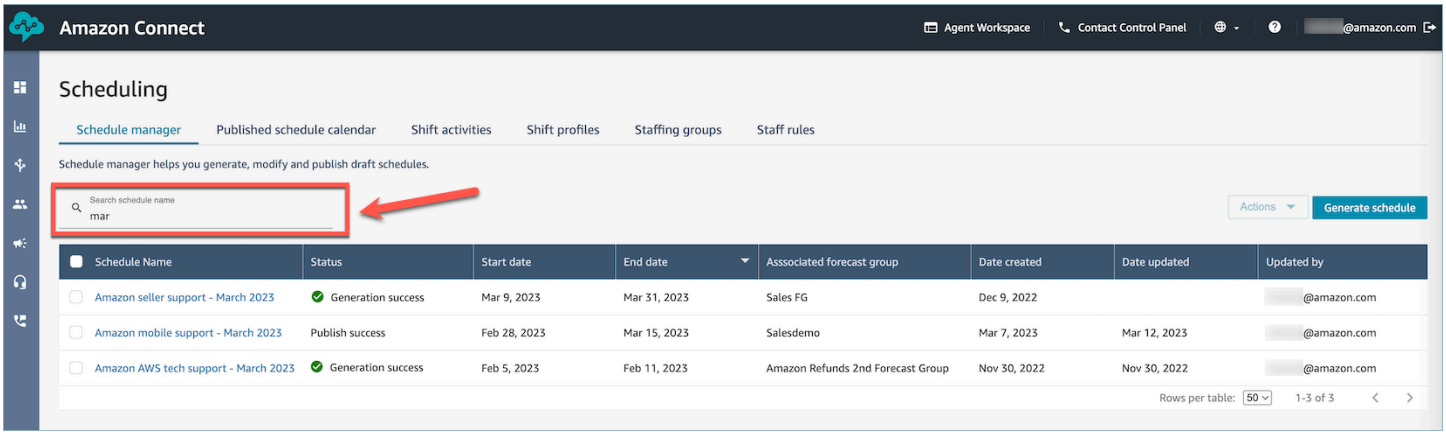
Managers and supervisors can regenerate agent schedules for up to six different forecast groups after making changes to the scheduling configuration.

1. To edit a schedule, select the schedule, choose **Actions**, and select **Edit Schedules**. Make your changes and choose **Save**.
2. To regenerate one or more schedules, select the schedules you want to regenerate, choose **Actions**, and select **Regenerate schedules**.

Search and sort a schedule

Managers and supervisors can search and sort schedules from within the schedule manager. Schedulers can search for schedule names using partial keywords or sort the schedule list based on start date, end date, creation date, or updated date.

The following image shows the search box on the **Scheduling** page. Entering **mar** returns schedules that have March in their name.



Shift bidding

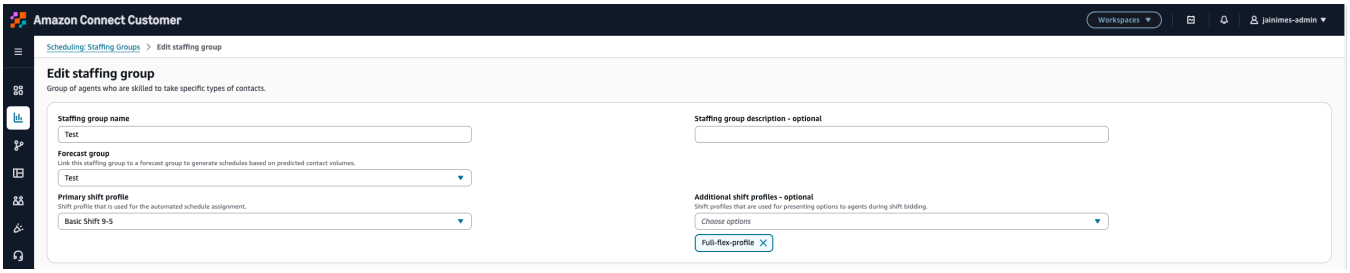
With shift bidding, you let agents influence their schedules by ranking the shifts they prefer, rather than assigning shifts to them directly. As a scheduler, you define the parameters for a shift bid, such as the forecast group, bidding window, scheduling period, and agent ranking. Amazon Connect Customer then generates shift patterns from the shift profiles assigned to agents and opens the bid automatically for a set period. While the bid is open, agents rank the available shift patterns from their calendar in the agent workspace. After the bid closes, Amazon Connect Customer assigns shifts based on each agent's ranked preferences and their assigned rank. This gives agents a better chance of getting the shifts they want, while your contact center still meets its forecasted demand and service level goals.

To configure shift bidding

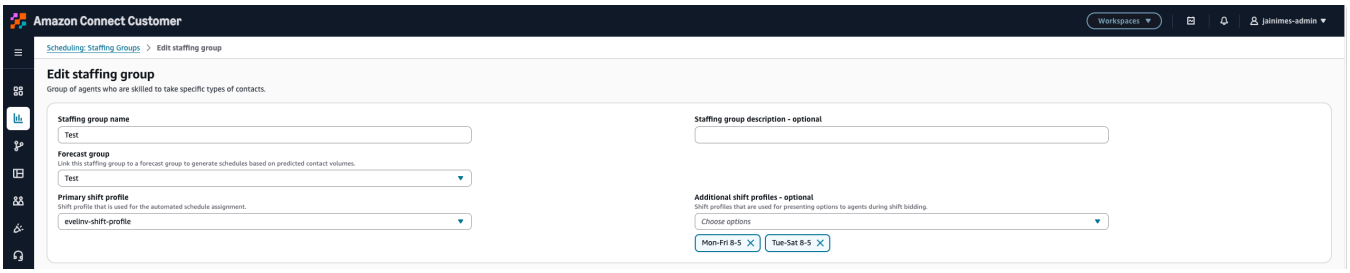
- Assign additional shift profiles to the agents who will participate in the bid. Amazon Connect Customer uses these profiles to generate the shift patterns that agents rank. You assign them by using the **Additional shift profiles** option in either of the following ways:
  - For all agents in a staffing group, on the **Staffing group details** page.
  - For an individual agent, on the **Staff rules** page.

  You can take one of the following approaches when you assign profiles:

  - **A single flexible profile** – For example, a 9-hour shift anywhere between 6 AM and 10 PM. Amazon Connect Customer uses the forecasted demand to determine the shift patterns within that window.



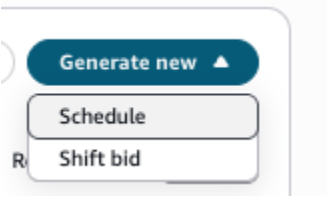
- **Multiple working profiles**, where each profile is a fixed working window – for example, Monday-Friday 8 AM-5 PM, Tuesday-Saturday 8 AM-5 PM. Amazon Connect Customer generates shift patterns from the fixed windows that you define.



Generate a shift bid

To create a shift bid, you use the **Create shift bid** wizard, which walks you through four steps: **Configure schedule details**, **Configure shift bid details**, **Optimize schedule**, and **Review and create**.

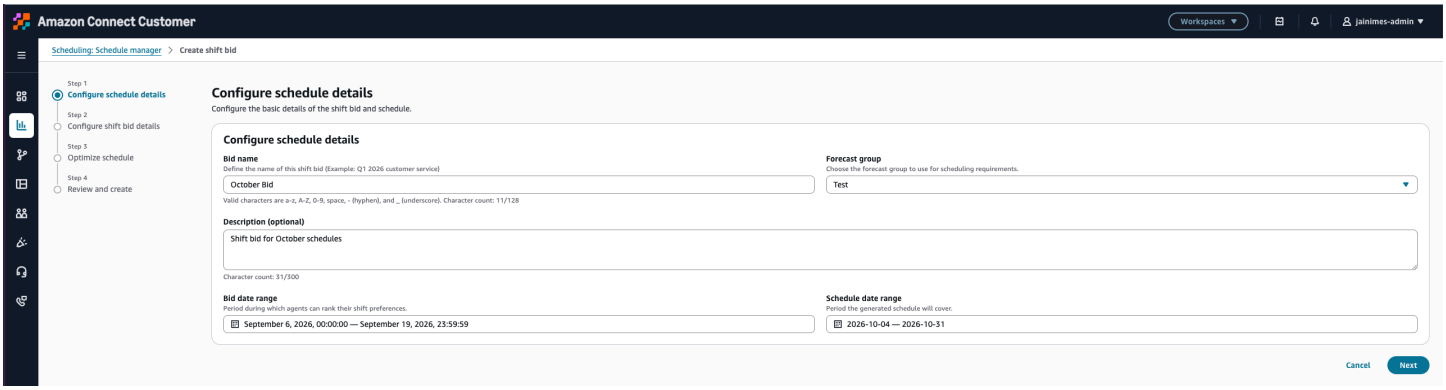
1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**. For more information, see Assign permissions.
2. On the Amazon Connect Customer navigation menu, choose **Analytics and optimization**, **Scheduling**.
3. Choose the **Schedule Manager** tab, choose **Generate new**, and then choose **Shift bid**. The **Create shift bid** wizard opens.



Step 1: Configure schedule details

On the **Configure schedule details** page, configure the basic details of the shift bid and schedule.

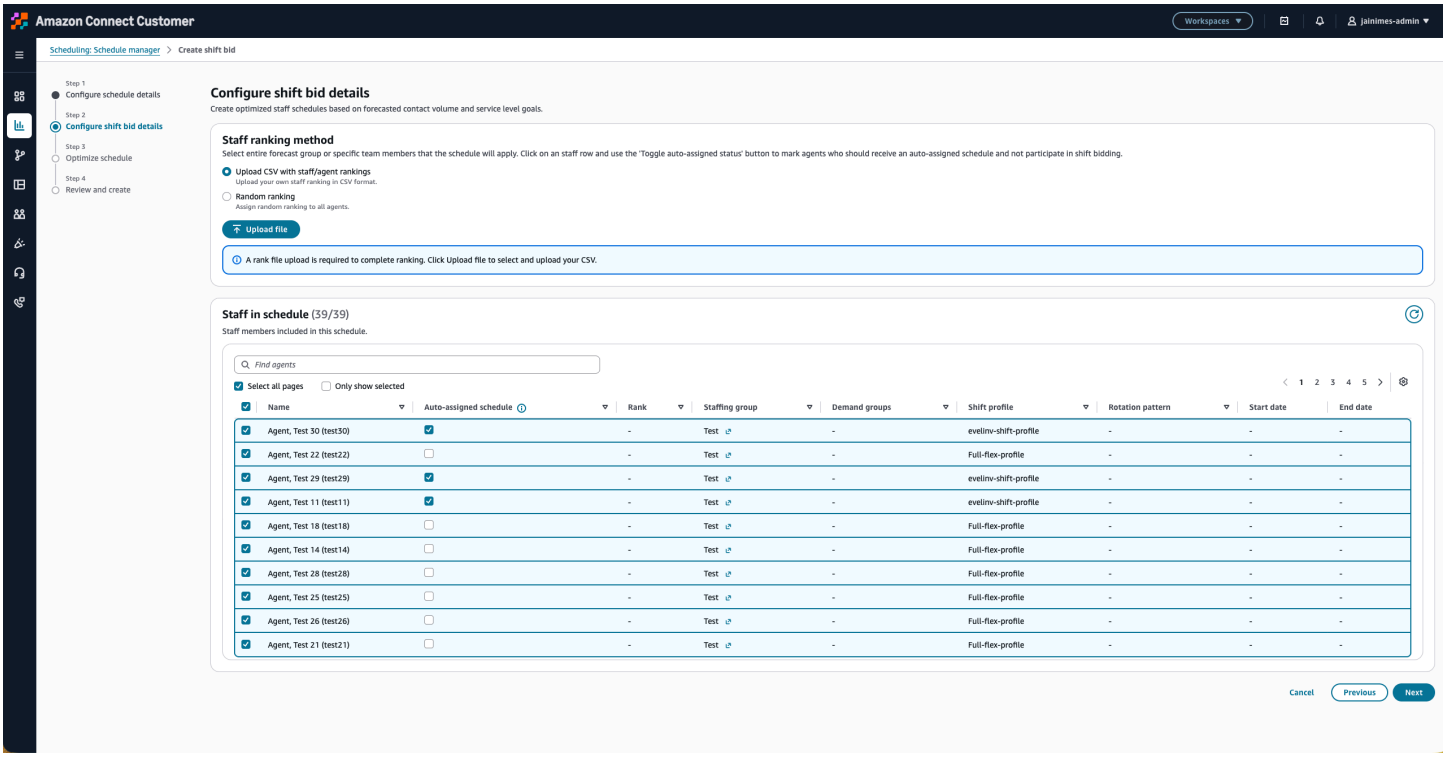
1. For **Bid name**, enter a name for the shift bid.
2. For **Forecast group**, choose the forecast group to use for the scheduling requirements.
3. (Optional) For **Description**, enter a description for the shift bid.
4. For **Bid date range**, specify the period during which agents can rank their shift preferences.
5. For **Schedule date range**, specify the period that the generated schedule covers.
6. Choose **Next**.



Step 2: Configure shift bid details

On the **Configure shift bid details** page, choose how to rank agents and select the agents to include in the bid.

1. Under **Staff ranking method**, choose one of the following:
   - **Upload CSV with staff/agent rankings** – Upload your own staff ranking in CSV format.
   - **Random ranking** – Assign a random ranking to all agents.
2. Choose **Generate staff ranking**. After the ranking is generated, each agent's rank appears in the **Staff in schedule** table.
3. In the **Staff in schedule** table, select the agents to include in the bid. For any agent who should receive a fixed schedule instead of participating in the bid, select **Auto-assigned schedule**. Only the agents you select are included in this schedule.
4. Choose **Next**.



Step 3: Optimize schedule

On the **Optimize schedule** page, select the optimization goals for each channel in your forecast:

- **Voice**: **Service level** or **Average speed of answer**
- **Chat**: **Service level** or **Average speed of answer**
- **Task**: **Service level** or **Average time to complete**
- **Email**: **Service level** or **Average time to complete**

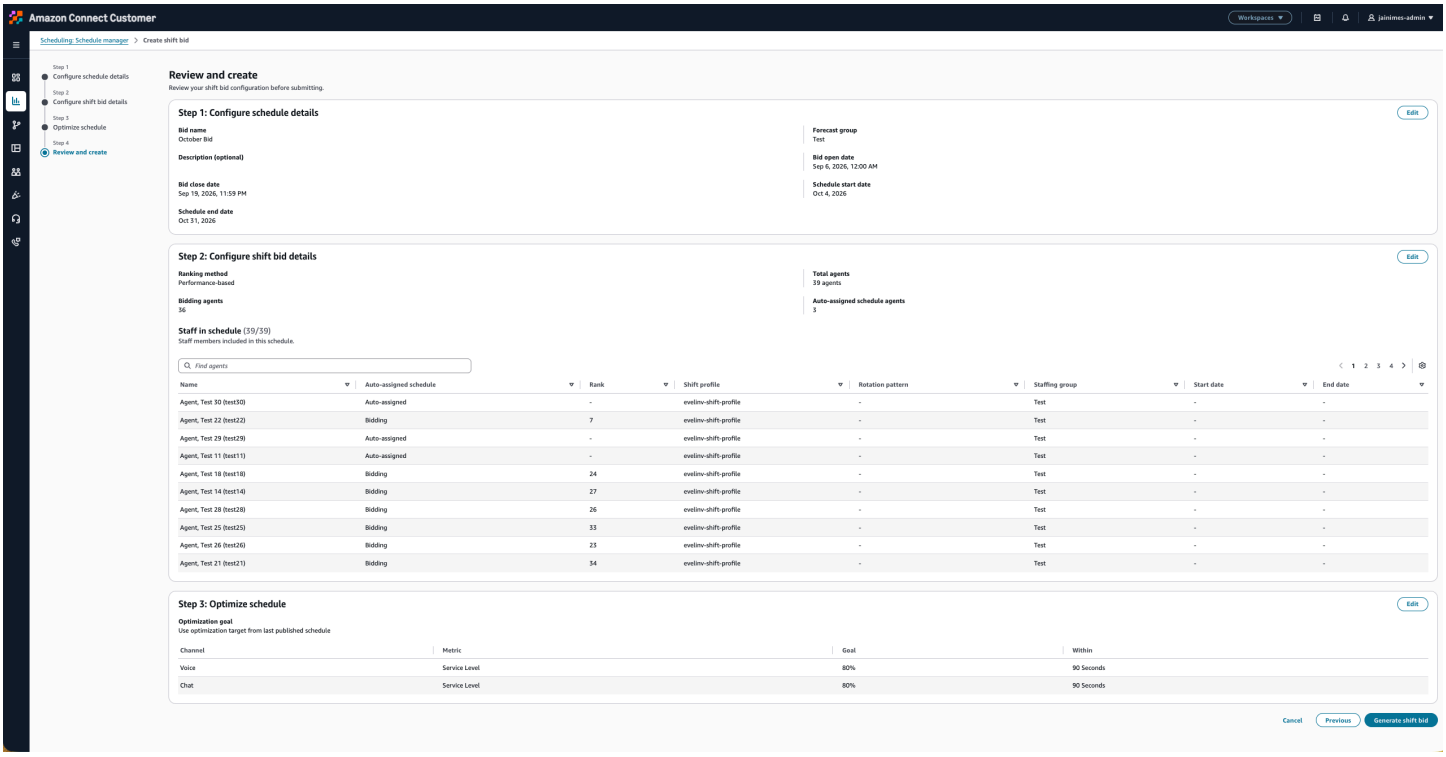
For Task and Email, use **Service level** when the work is done synchronously – for example, when a task is picked up within 5 minutes of arriving. Use **Average time to complete** when the work can be deferred and is completed over hours or days.

> **Note**
>
> Backlog metrics are only available when **Average time to complete** is selected as the optimization goal.

Choose **Next**.

Step 4: Review and create

On the **Review and create** page, review your shift bid configuration. To change any section, choose **Edit**. When you're satisfied with the configuration, choose **Generate shift bid**.



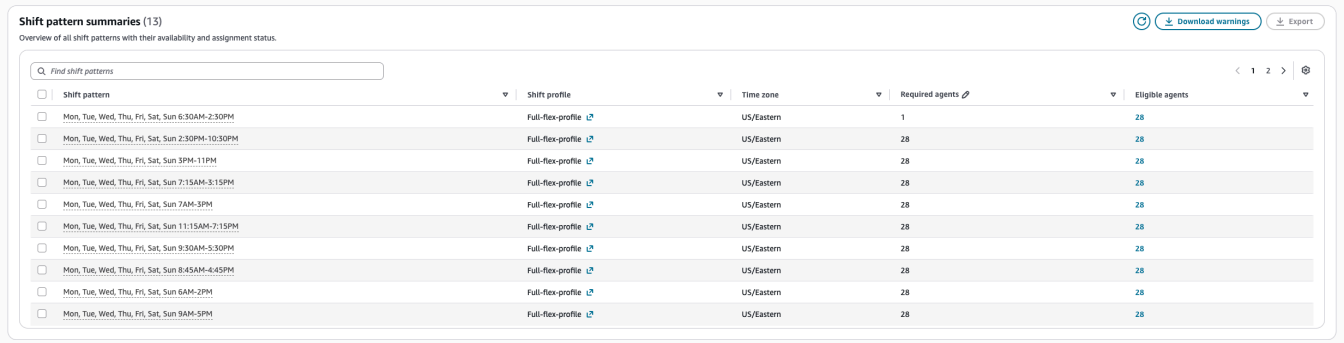
Review and manage a shift bid

After you generate a shift bid, you review it, open it for agents to rank their preferences, close it, and then assign shifts.

1. After the bid is generated, the **Schedule Manager** page shows a **Schedule status** of **Bid generation success** and a **Bid status** of **Ready to open**.
2. Choose the schedule name to open the bid details.
3. On the **Overview** tab, you can open or close the bid, review the shift pattern summaries and metrics, and monitor agent preference submissions, as described in the following list:

   - Open or close the bid.

- In the **Shift pattern summaries** table, view an overview of all shift patterns with their availability and assignment status, including the **Shift pattern**, **Shift profile**, **Time zone**, **Required agents**, and **Eligible agents**. You can edit the **Required agents** count as needed.



- View the shift pattern metrics, which show the projected service levels if all available slots are filled.
- View the agents included in the bid, the status of each agent's preference submission, and the preferences that they submitted.

4. Open the bid. You can open it manually, or let Amazon Connect Customer open it automatically at the start of the bid date range.
5. After the bid is open, agents can rank their shift preferences. For more information, see [How agents enter shift preferences].
6. Close the bid. You can close it manually, or let Amazon Connect Customer close it automatically at the end of the bid date range. To close it manually, set **Bid status** to **Closed**, and then choose **Save**.

> **Note**
>
> You can re-open a closed bid at any time before you start assignment. After assignment is complete, the bid can no longer be re-opened.

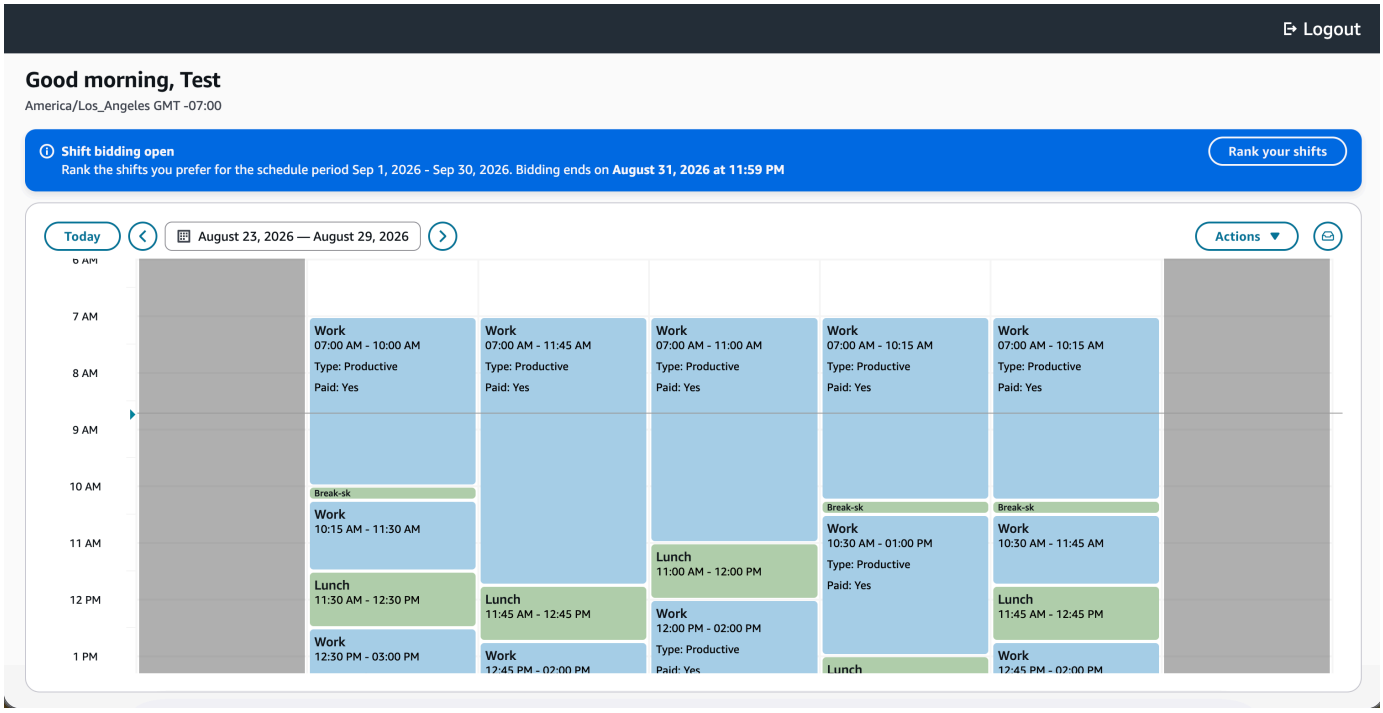
7. To assign shifts to agents, choose **Start assignment**.

8. After the assignment is complete, the **Schedule status** changes to **Generation success** and the **Bid status** changes to **Completed**.

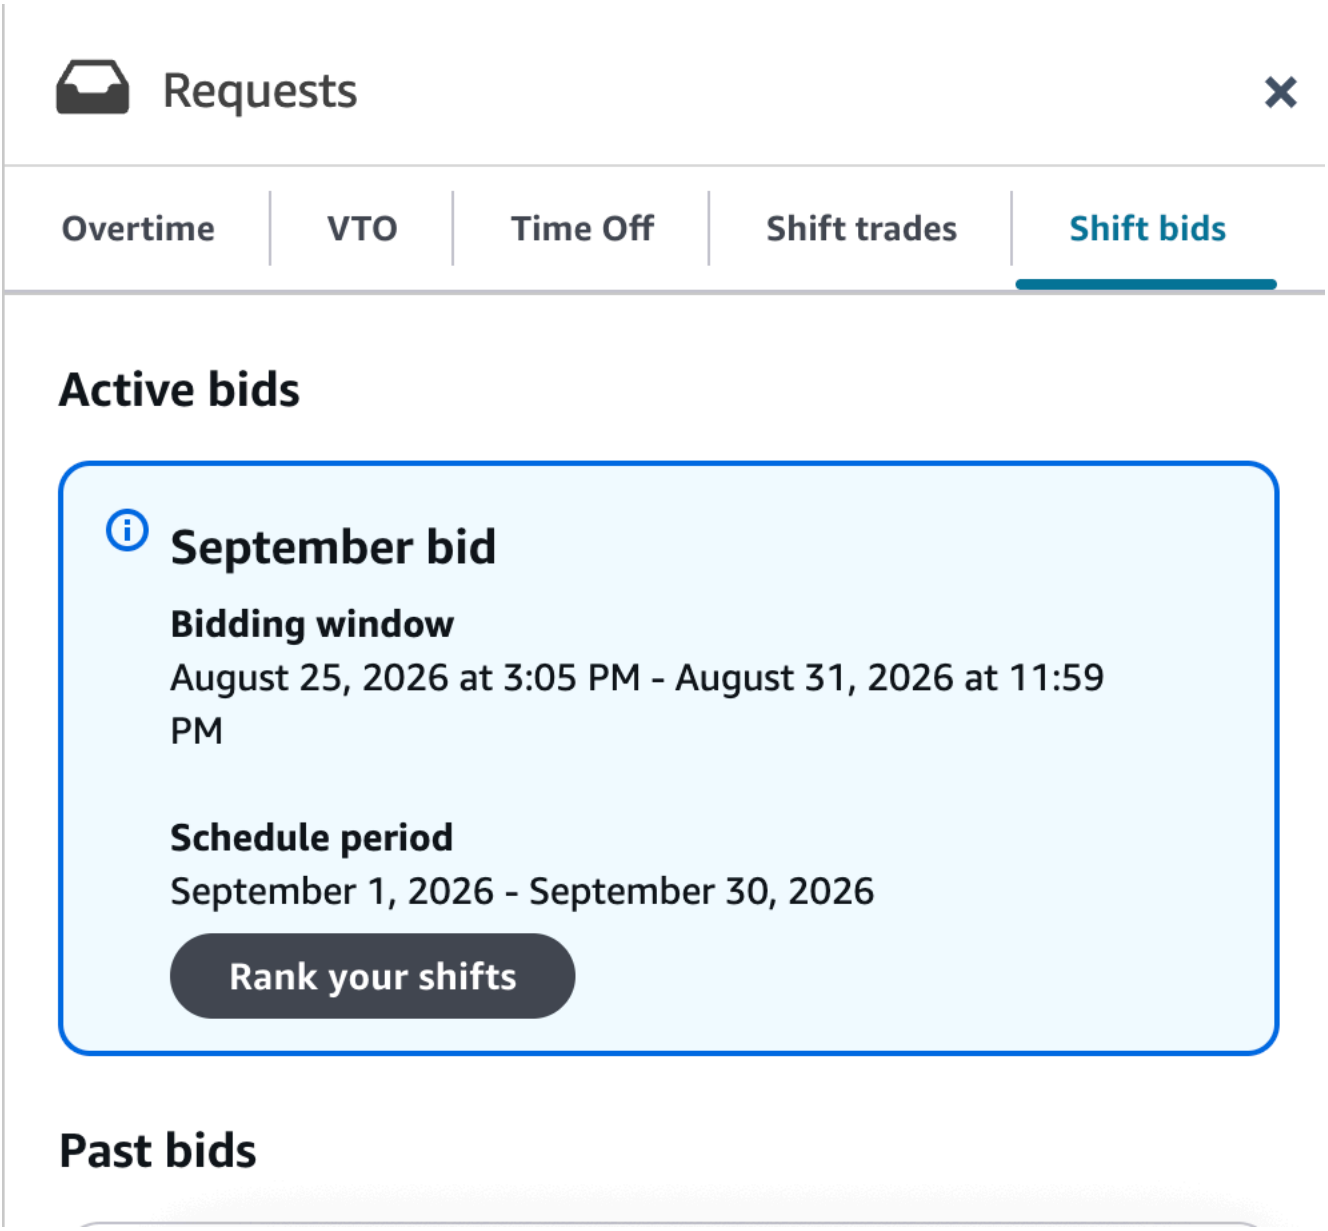
How agents enter shift preferences

When a bid is open, agents rank the shifts they prefer from their calendar in the agent workspace. Agents can rank shifts at any time while the bid is open, before the bidding deadline. For more information about the agent calendar, see How agents view their schedule in the Connect Customer agent workspace.

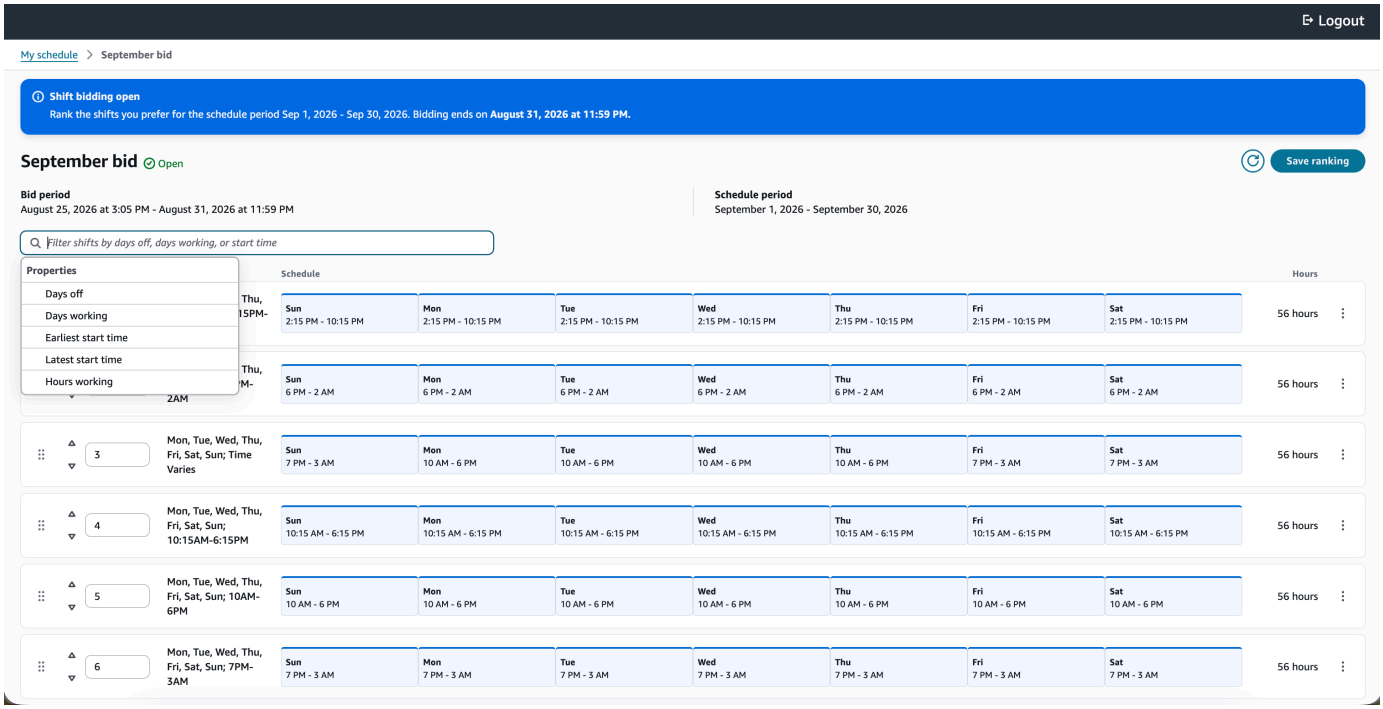
1. While a bid is open, the agent calendar displays a **Shift bidding open** banner that shows the schedule period and the date and time when bidding ends. To start ranking, the agent chooses **Rank your shifts**.



Alternatively, the agent can open the **Requests** panel, choose the **Shift bids** tab, and then choose **Rank your shifts** for the bid under **Active bids**. This tab also shows the bidding window and schedule period for each active bid, and any past bids.



2. On the bid page, the agent reviews the available shifts. Each row is a shift with its weekly schedule (the start and end times for each day) and the total **Hours**. To narrow the list, the agent can use the filter box to filter shifts by the following properties: **Days off**, **Days working**, **Earliest start time**, **Latest start time**, and **Hours working**.
3. To rank a shift, the agent enters a rank in the rank field, or uses the up and down arrows to change its position. Rank 1 is the most preferred shift. Agents rank all the shift patterns in the list.



4. To submit the rankings, the agent chooses **Save ranking**. The agent can update the ranking at any time while the bid is open.

> **Note**
>
> If an agent is unavailable to rank their shift patterns, someone can submit preferences on their behalf in either of the following ways:
>
> - A supervisor can submit preferences from the published calendar view.
> - A scheduler can submit preferences from the bid management page.

How supervisors view published schedules using the Connect Customer admin website

After a scheduler publishes a schedule, it's official. Agents can now view their individual scheduling using the agent workspace. Supervisors can also view their agents schedules using the Connect Customer admin website.

Supervisors who have **Scheduling**, **Schedule manager - Edit** permissions in their security profile can edit agent schedules.

Important

When a supervisor edits an agent schedule and publishes it, the change appears immediately to the agent. They do not need to refresh their browser for the agent workspace to reflect the change.

Topics

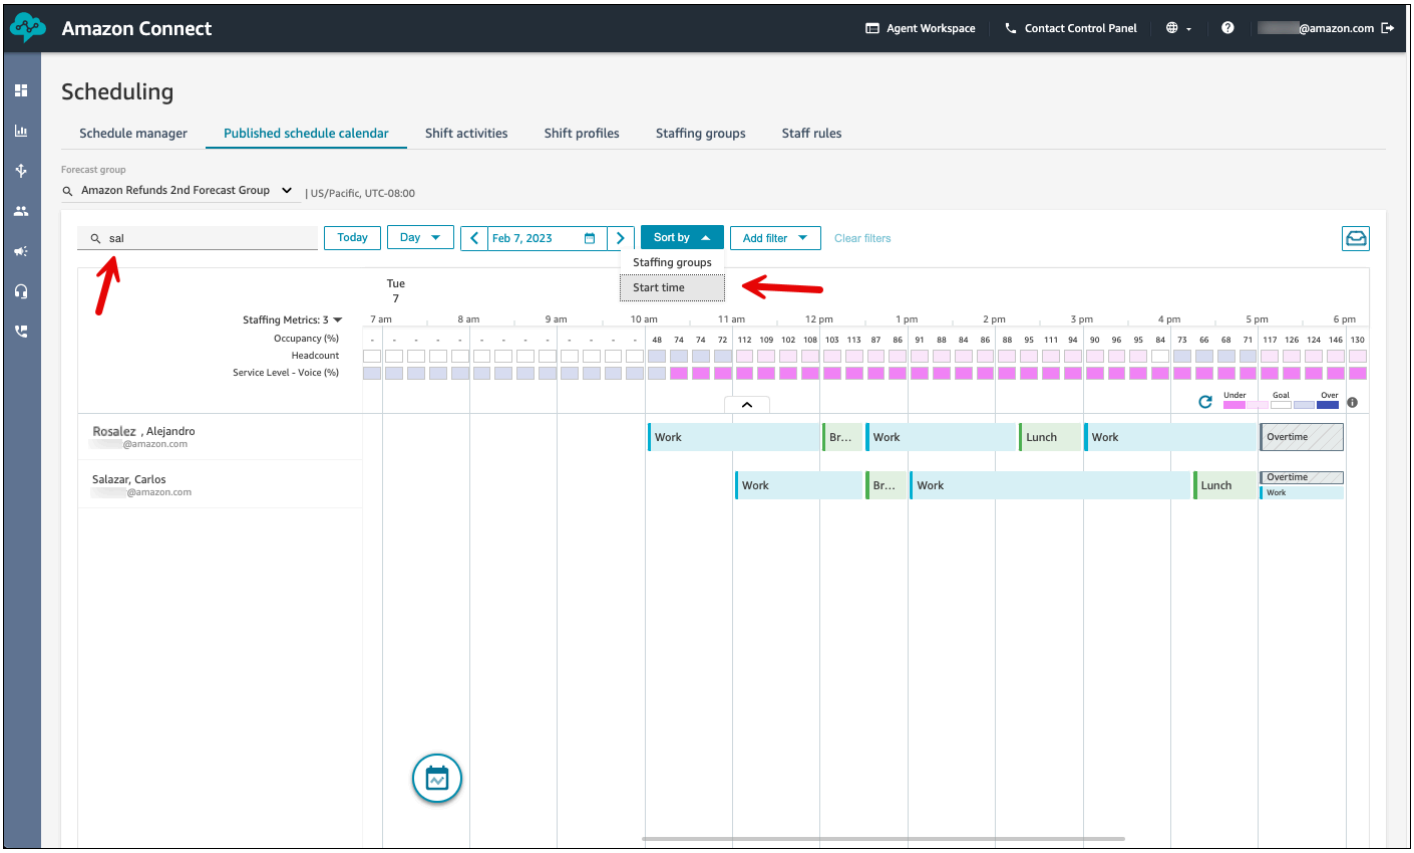
- Sort and filter schedules
- Display adherence data
- Display Week schedule view

Sort and filter schedules

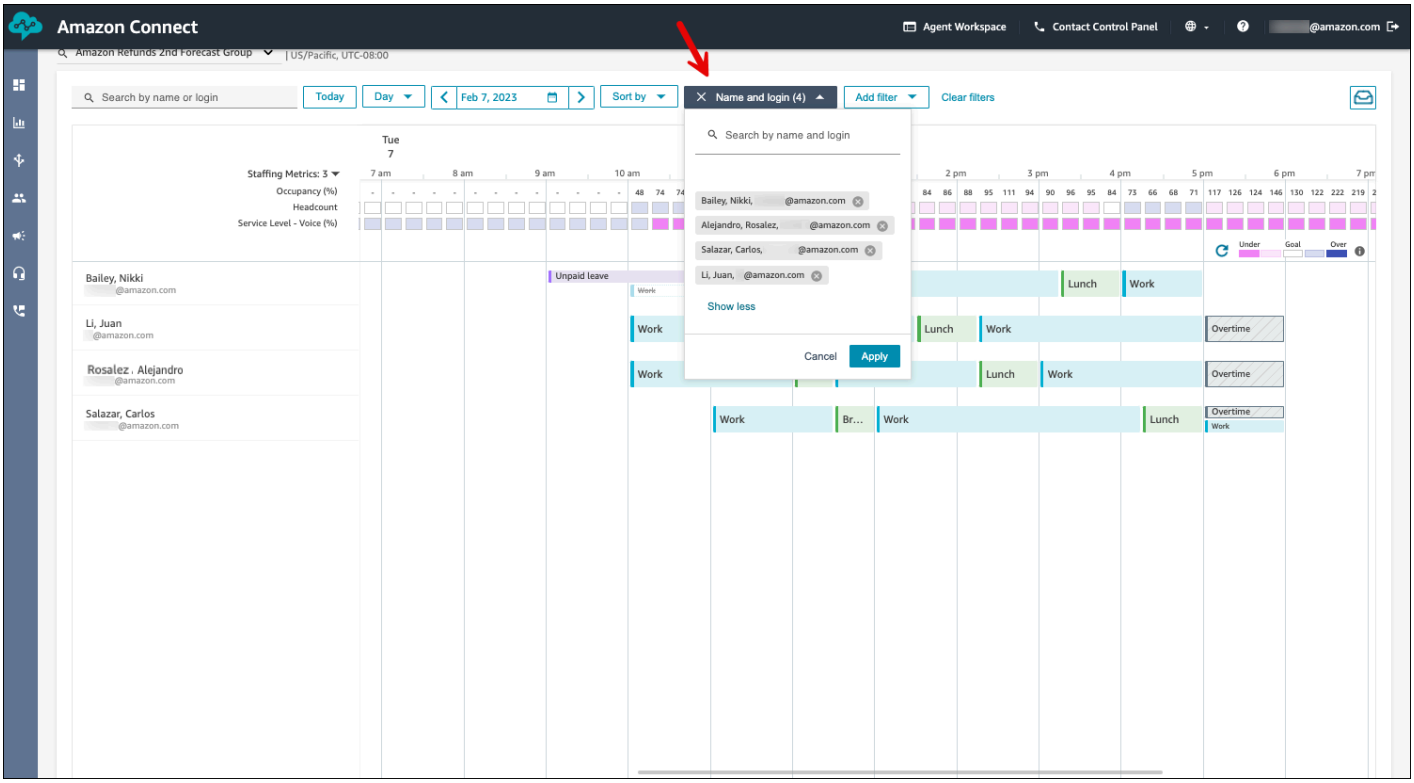
Managers and supervisors can sort or filter schedules based on the following criteria.

- **Sort** schedules based on the earliest shift start time. For example, agents who login first to take customer contacts are listed first in the schedule.

  The following image shows a schedule by agent first name, last name, or login ID with the string `sal`, sorted by their shift start times. Alejandro logged in first so he is listed first.



- **Filter** schedules based on agent names or agent IDs, staffing groups, or supervisor names. The following image shows a schedule filtered by name and login.

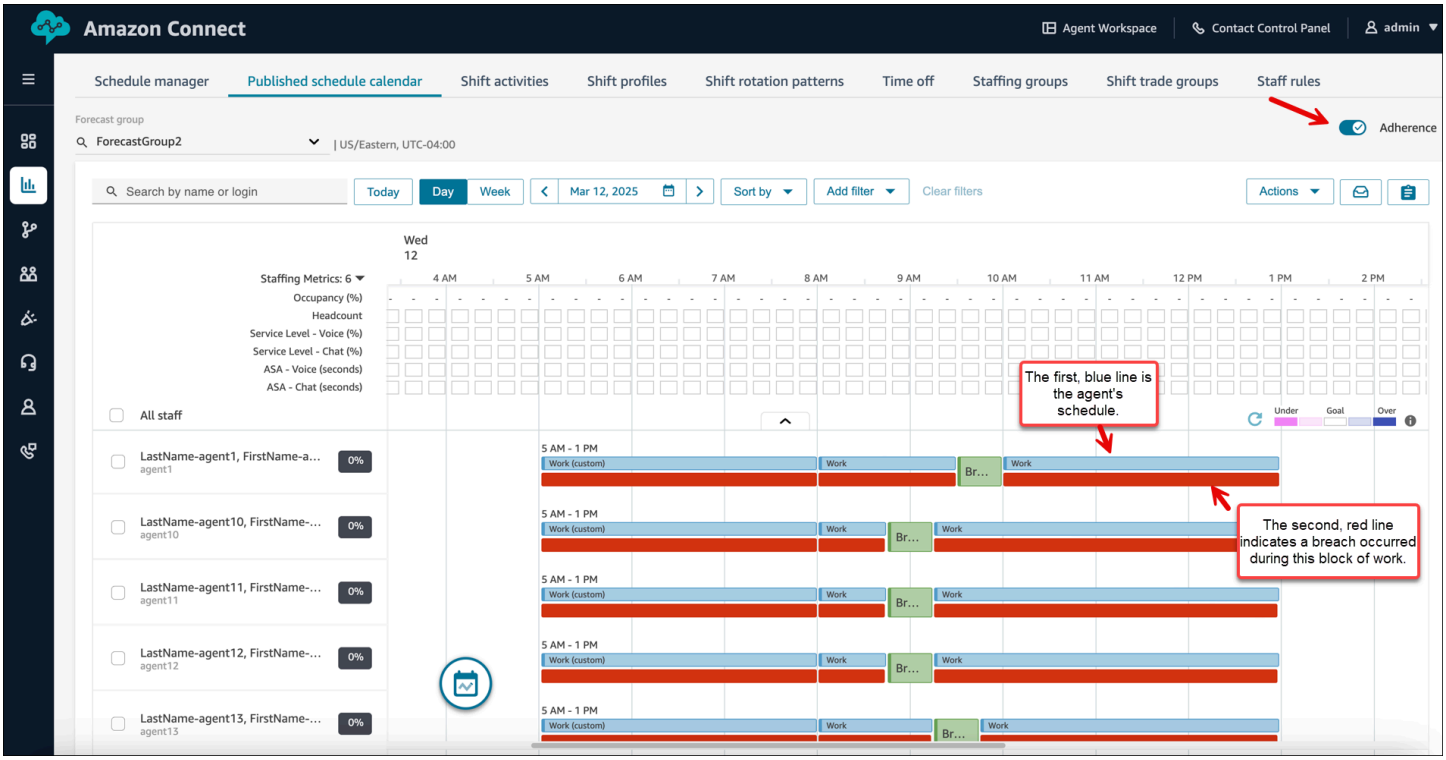


> **Tip**
>
> Supervisors view agent schedules in the time zone defined on the Supervisor's profile on the **Staff Rules** page. Supervisors can choose to view agent schedules in a different time zone by selecting the desired time zone from the date filter.

Display adherence data

As a manager or supervisor, you can display the adherence view by enabling the **Adherence** toggle.

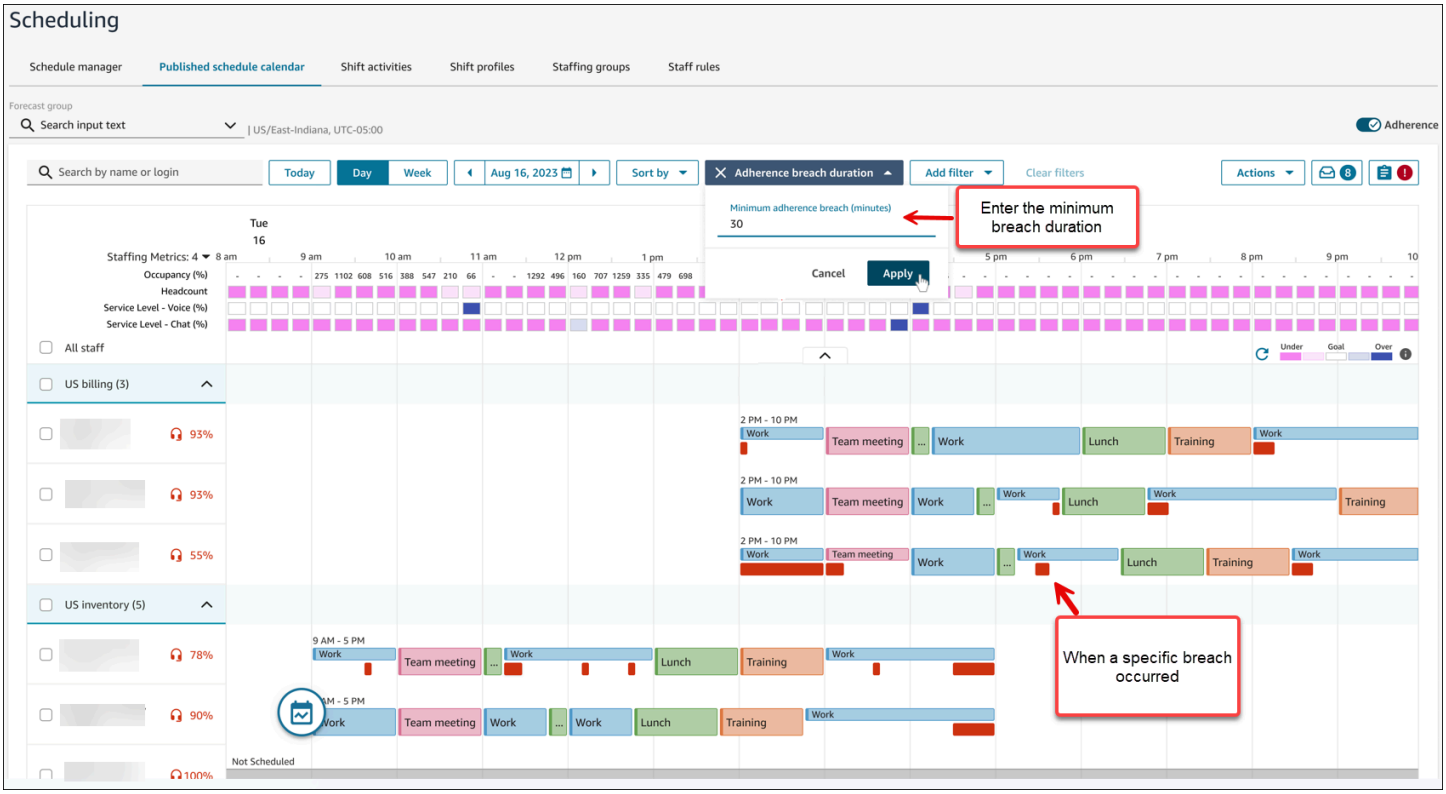
The following image shows the agent's schedule, and a second line under it that indicates a breach occurred during that block of the agent's schedule, for example, after their break. It doesn't indicate how long the breach was.



- The adherence view displays the agents' non-adherence data alongside their scheduled activities. It displays breaches that are longer than a minute. The data refreshes approximately every 5 minutes.
- You can pause on the non-adherence activities to view details such as start time, end time, duration, scheduled activity, and actual activity. You can also view the adherence percentage that is calculated for this shift.

- Non-adherence data is visible for up to 90 days in the past. It is available only in the daily view.

To see which agents have exceeded a specified adherence duration, you can filter agents based on adherence breach duration. For example, you can choose to view agents who have breached adherence by more than 10 minutes. The following image shows the breach duration filter set to 30 minutes. The red lines indicate when the breach occurred.



> **Note**
>
> If an agent's schedule is changed within the last 30 days from the current date (not the date of the schedule), adherence is re-calculated with the new schedule. With this re-calculation, you can make real-time adjustments to an agent's shift and correctly evaluate their adherence.

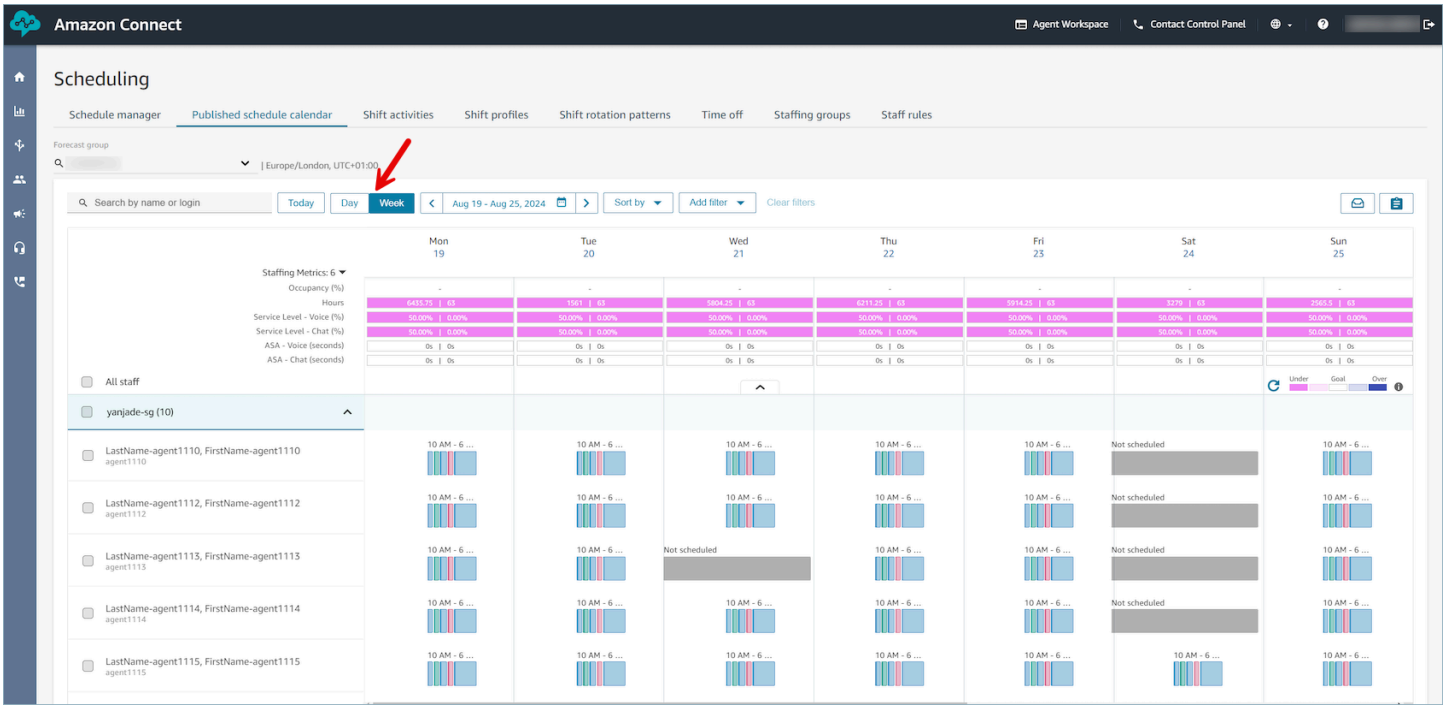
Display Week schedule view

In addition to Day view, supervisors can display a Week view of agent schedules in both draft and published calendars.

- You can toggle between Day view and Week view by choosing on the respective option at the top of the calendar. As you toggle between Day and Week views, any filters and sort options you have applied are preserved. It also preserves your scroll position.

  > **Note**
  >
  > Sort by start time is not available in Week view.

- By default, Weekly view is Sunday to Saturday. You can change start day of the week to another day from the date filter. For example, for a weekly view starting on Monday September 16th, choose that date in the date filter while in the Week view. It automatically selects the remaining 6 days of the week. Choose **Apply**.
- You can make the following shift level edits from the weekly view by choosing the shift: Edit shift, Copy shift, and Remove shift. For editing activities within a shift, you can switch to Day view by choosing that date.
- Week view provides the following metrics, aggregated at a day level:
  - Occupancy
  - Hours: forecasted versus scheduled hours
  - Service level (by channel): goal versus actual based on scheduled agents
  - Average speed of answer (by channel): goal versus actual based on scheduled agents



Upload unplanned shrinkage data to published schedules in Connect Customer

You can upload unplanned shrinkage assumptions to improve the accuracy of published schedules. Unplanned shrinkage accounts for anticipated deviations from the schedule, such as late logins, early logouts, and last-minute sick call outs.

By uploading this data, you help the system account for expected agent unavailability and generate more accurate staffing metrics.

> **Note**
>
> Shrinkage data uploaded through the **Published calendar** tab is also used when generating new schedules for the dates where unplanned shrinkage data is available.

Required permissions

To upload unplanned shrinkage data, you must have the following security profile permissions:

- **Analytics and Optimization - Scheduling - Edit**
- **Analytics and Optimization - Team calendar - View**

Upload unplanned shrinkage data

1. Log in to the Connect Customer admin website at `https://instance name.my.connect.aws/`.
2. In the navigation pane, choose **Analytics and Optimization**, **Scheduling**.
3. Navigate to a published schedule.
4. Choose **Actions**, **File upload**, **Unplanned shrinkage**.
5. Upload a .csv file that follows the format described in Unplanned shrinkage file format.

Unplanned shrinkage file format

The .csv file must contain the following columns:

Unplanned shrinkage file columns

Column	Required	Description
START_INTERVAL_TIMESTAMP	Yes	The start time of the interval in ISO 8601 format. For example, `2026-08-21T00:00:00-07:00` .
END_INTERVAL_TIMESTAMP	Yes	The end time of the interval in ISO 8601 format. For example, `2026-08-21T23:45:00-07:00` . You can upload one row for each 15-minute or 30-minute interval, cover an entire day in one row, or span multiple days in a single row.
FORECAST_GROUP_NAME	Yes	The name of the forecast group to apply the shrinkage data to.
DEMAND_GROUP_NAME	No	The name of the demand group. When provided, demand group level values override forecast group level metrics.
UNPLANNED_SHRINKAGE_PERCENT	No	The expected unplanned shrinkage as a percentage. For example, 25 represents 25% unplanned shrinkage.

Column	Required	Description
DAY_OF_SC HEDULE_SH RINKAGE_PERCENT	No	The unplanned shrinkage expected on the day of the schedule. The system automatic ally updates metrics on the schedule using the value in this field.

Example Sample .csv file

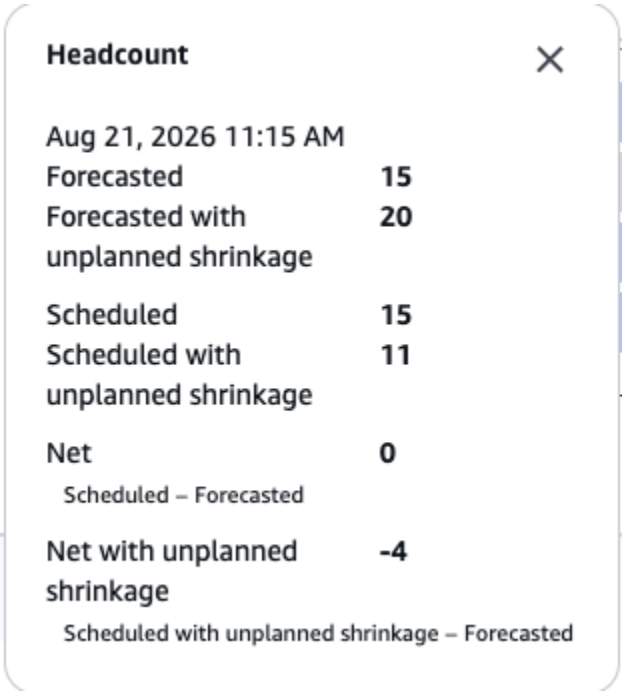
```
START_INTERVAL_TIMESTAMP,END_INTERVAL_TIMESTAMP,FORECAST_GROUP_NAME,DEMAND_GROUP_NAME,UNPLANNED
2026-08-21T00:00:00-07:00,2026-08-21T23:45:00-07:00,Billing-Queues-Forecast-Group,,25,5
```

How unplanned shrinkage is applied

Unplanned shrinkage data is applied in two ways:

- **During schedule generation** – Unplanned shrinkage is used to increase the required headcount numbers. This allows the system to schedule more agents than it would have without the unplanned shrinkage data, compensating for anticipated agent unavailability.
- **When calculating projected metrics** – When calculating projected net staffing, service levels, average speed of answer, and average time to complete metrics, unplanned shrinkage is applied to the *scheduled headcount* metric. It is not applied to the required headcount metric.

The following image shows an example of the Headcount popup for an interval where unplanned shrinkage has been applied.



In this example:

- **Forecasted** = 15. This is the original required headcount based on the forecast.
- **Forecasted with unplanned shrinkage** = 20. The system increases the required headcount from 15 to 20 to account for unplanned shrinkage. During schedule generation, the system uses this higher number to schedule more agents.
- **Scheduled** = 15. The number of agents actually scheduled for this interval.
- **Scheduled with unplanned shrinkage** = 11. The effective number of agents expected to be available after applying unplanned shrinkage to the scheduled headcount.
- **Net** = 0 (Scheduled − Forecasted = 15 − 15). Without considering unplanned shrinkage, staffing appears balanced.
- **Net with unplanned shrinkage** = -4 (Scheduled with unplanned shrinkage − Forecasted = 11 − 15). After accounting for unplanned shrinkage, there is a projected shortfall of 4 agents for this interval.

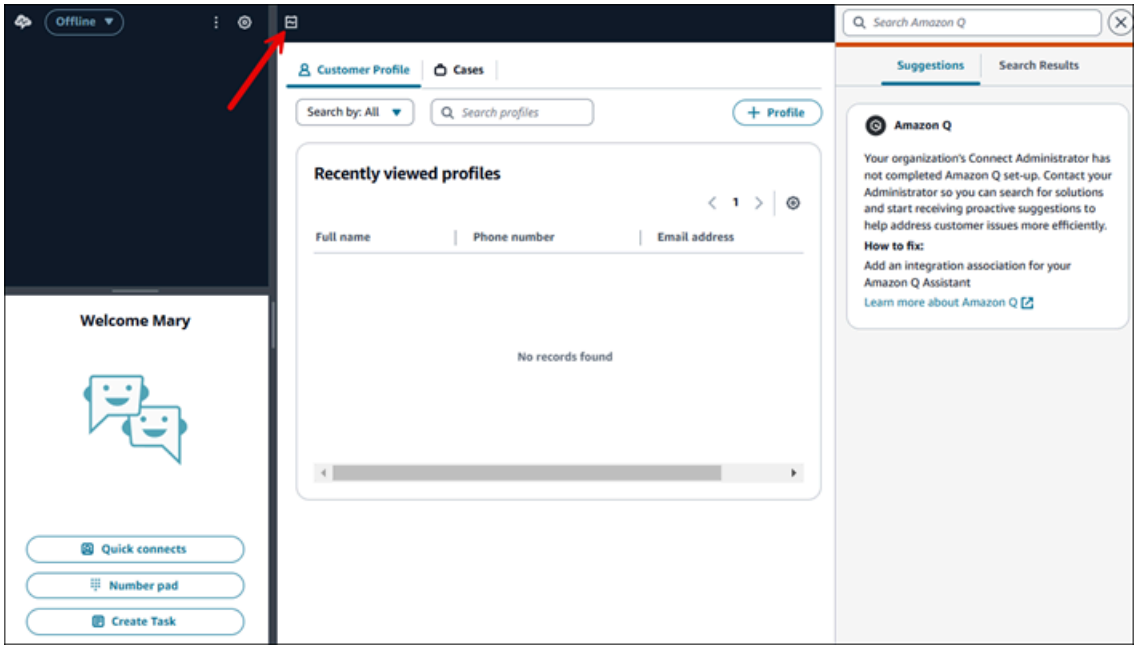
How agents view their schedule in the Connect Customer agent workspace

There are two ways agents can access their schedules:

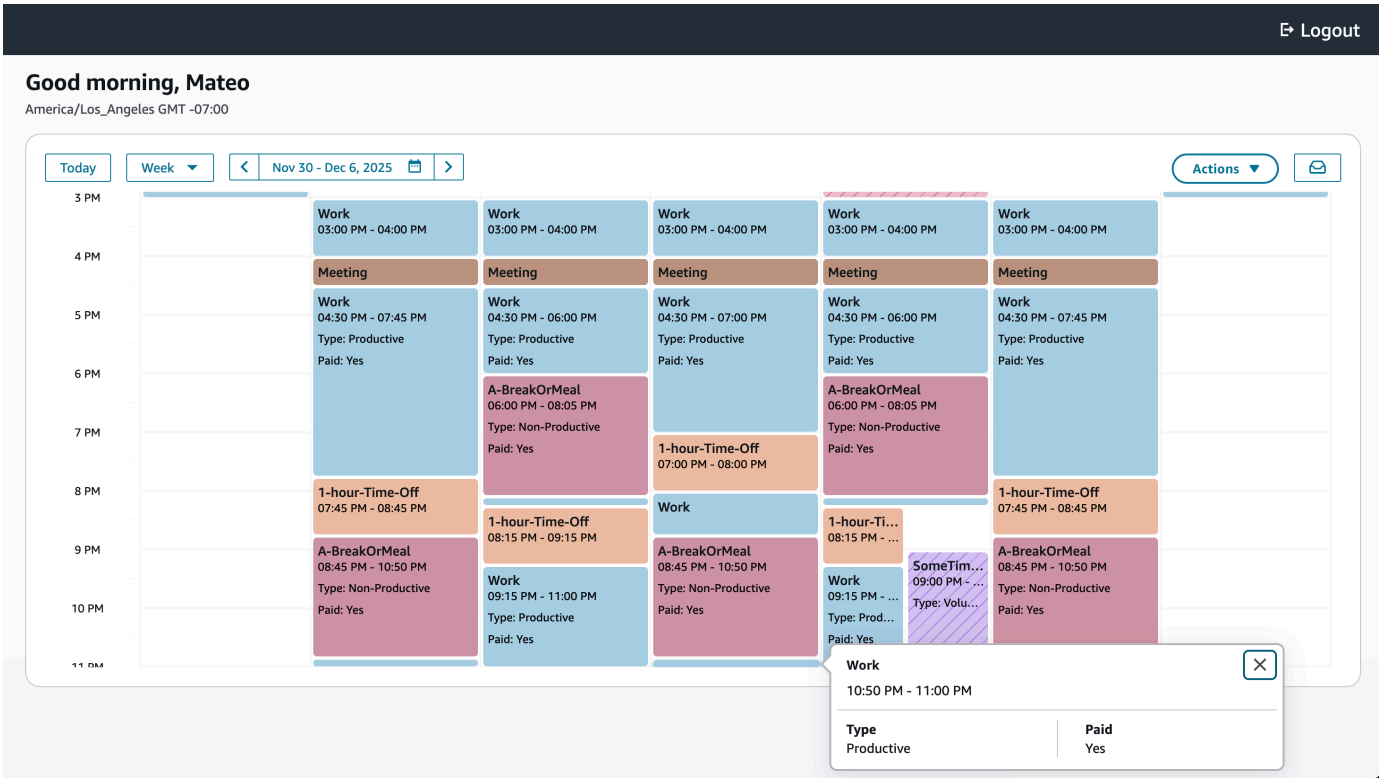
- If your organization uses the Connect Customer agent workspace, agents access their schedule by entering `https://instance-name/connect/agent/` into their browser and then choosing the calendar icon.
- If your organization uses the Salesforce CTI, or a custom agent application, agents access their schedule by entering `https://instance-name/connect/agent/scheduling` into their browser, logging into Connect Customer, and then choosing the calendar icon.

Following are steps agents use to view their schedule in the agent workspace.

1. Log on to the agent workspace using the URL that your admin gives you.
2. Choose the **Calendar** icon on the application navigation bar to launch the staff schedule manager viewer, shown in the following image. Otherwise, the staff schedule manager viewer launches automatically.



The following image shows a sample schedule in the agent workspace.



The Agent Calendar displays times according to the following prioritized timezone logic:

- Agent-specific timezone — If the administrator has explicitly configured a timezone in the agent's staff rules or profile settings, this timezone is used.
- Fallback: Agent's local device timezone — If no agent-specific timezone has been configured, the calendar uses the timezone detected from the agent's computer or browser settings.

Add shift activities in draft or published schedules in Connect Customer

Connect Customer scheduling allows contact center managers, supervisors, and schedulers to insert activities into agent schedules, both draft and published. For example, activities such as team meetings, 1:1 coaching sessions, and trainings can be added into an agent's schedule.

Note

- You cannot use the **Add Shift Activity** option described in this topic to add activities to an agent's shift when they are flagged as Work activities.

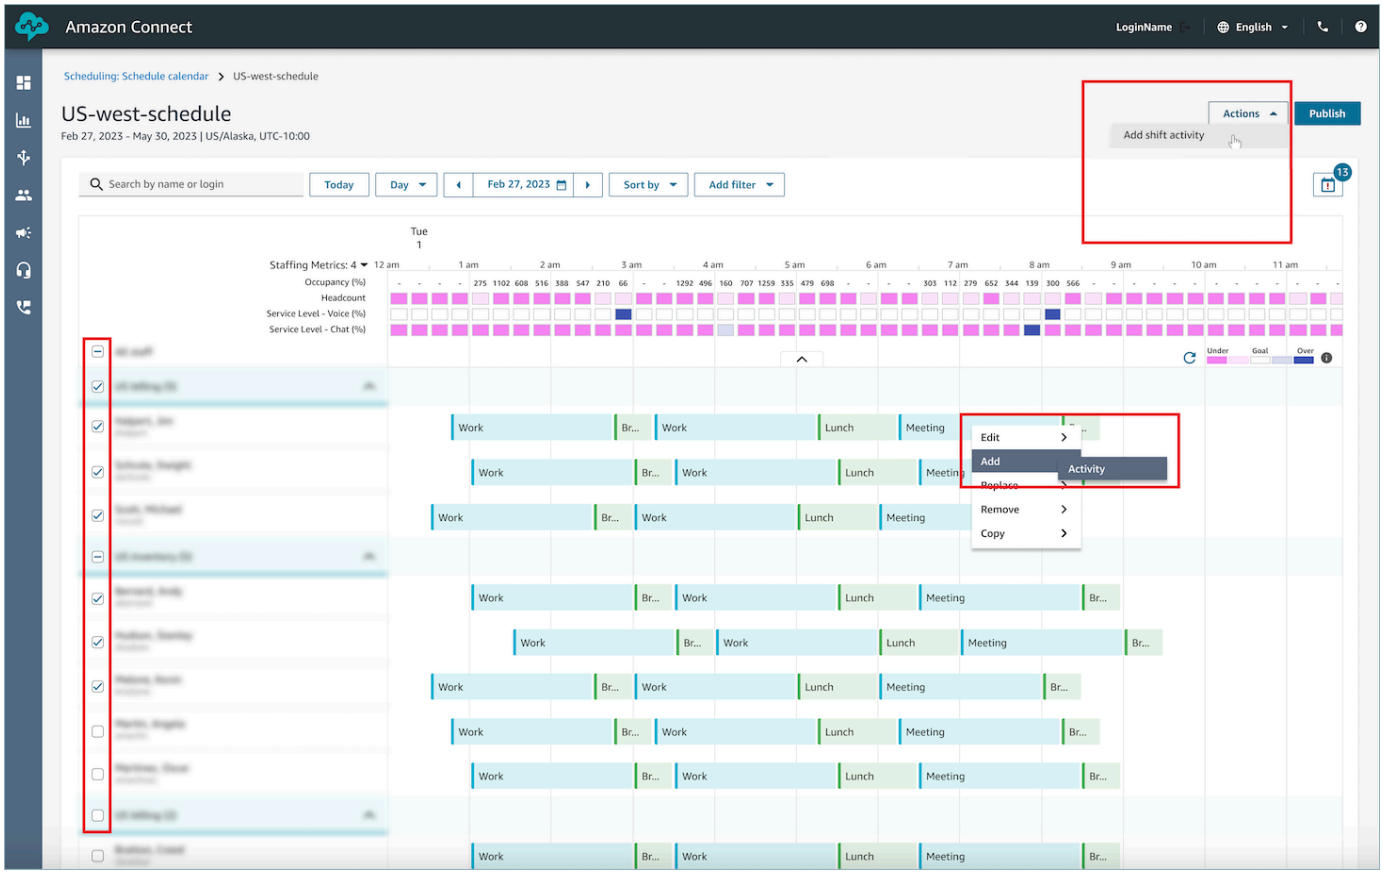
- You can replace activities of type = work with another work activity, and it will replace it for the whole shift.
- A work activity cannot be replaced with a non-work activity.

Add a shift activity

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer admin website, on the navigation menu, choose **Analytics and optimization**, **Scheduling**, and then select the **Published scheduled calendar** tab.
3. Choose the agents you want to include in the activity by selecting the check-boxes next to their names.
4. Choose the **Actions** drop-down and select **Add Shift Activity**. The **Add Shift Activity** page is displayed, populated with all the agents you selected in the previous step.

   - An alternative way to access the **Add Shift Activity** page is as follows: choose any agent's shift, then select **Add**, followed by **Activity**. The **Add Shift Activity** pop-up is displayed, showing the shift of the agent you initially chose. To include additional agents in the activity, choose **Edit staff**.



5. Select a shift activity from the drop-down.
6. Select an activity type of **Shared** or **Individual**:
   a. **Shared** activity: A singular occurrence of the activity is shared among all participating agents. Any modifications made to the activity, such as adjustments to the date or time, will apply to all agents simultaneously.
   b. **Individual** activity: Separate instances of the activity will be created for each individual agent. Any modifications made to the activity, such as adjustments to the date or time, will apply to an individual agent.
7. Select activity placement method:
   a. **Do not optimize**: activity will be placed for the date and time that you specify.
   b. **Anytime within shift**: Optimizes placement across the entire shift to minimize impact to service level targets. Specify a date range, and the system finds the best time within each agent's shift. For individual activities, placement might vary by agent. For shared activities, all agents receive the same date and time.

c. **Time window**: Optimizes placement within a specific date and time range you define. The system finds the best time within that window to minimize impact to service level targets. For individual activities, placement might vary by agent. For shared activities, all agents receive the same date and time.

d. **Relative to shift**: Optimizes placement within a time window defined by offsets from each agent's shift start and end (for example, "1 hour after shift start" to "2 hours before shift end"). The system finds the best time within that window to minimize impact to service level targets. For individual activities, placement might vary by agent. For shared activities, all agents receive the same date and time.

> **Note**
>
> Additional things to note when you select one of the optimized placement options:
>
> - To create a recurring activity, use the Do not optimize placement method.
> - For individual optimized activities, you can download a CSV file from the **Actions log** to view where the activity was placed for each agent. Date and time in this file are in UTC.
> - Breaks and meals are automatically optimized during schedule generation. To adjust their timing, modify the schedule rather than using activity placement.
> - Set a minimum attendance percentage to control when the activity is placed. To ensure placement regardless of attendance, set minimum attendance to 1%.
> - Wait for placement to complete before editing agent shifts within the placement window.

8. Select the date and time for the activity.
9. Select if you want to create this as a repeating activity.

   For example, let's say you have:

   - A published schedule that runs through August 31, 2025
   - A weekly team meeting you want to add that occurs every Monday at 9 AM indefinitely

   When you add this meeting to the current published schedule:

   1. It appears on all Mondays through August 31, 2025.

2. When you create a draft schedule for September 2025, the meeting automatically carries over.
3. If you modify the meeting in the draft schedule (for example, moving it from Monday to Tuesday), publishing the draft schedule will:
   - Update all future occurrences of the meeting to the new day.
   - Apply any other changes you made to the recurring meeting pattern.

10. Choose **Override rules check** to bypass scheduling restrictions like minimum and maximum working hours.

    If you don't select this option:

    - Agents who would violate scheduling rules are automatically excluded from the activity.
    - You can view excluded agents and the reasons for their exclusion in the **Actions log**.

11. Enter any note in the provided **Comment** text box.
12. Choose **Apply** to add the activity to agent schedules.
13. You can monitor the progress in the **Actions log**, where the status will transition from **In progress** to **Complete**.

> **Note**
>
> The **Actions log** is designed to track the status of long running actions, such as adding a shift activity with optimization. The **Actions log** does not track all changes made to schedules.

Edit a shift activity

1. From an agent's shift, choose the activity, select **Edit**, and then select the activity name to open the edit activity screen.
2. Select activity placement method. For details on placement methods, see Add a shift activity.
3. If the activity you are editing is part of a recurring series, you can choose to edit just this occurrence. Or, you can edit the series.
   - To edit just this occurrence, continue editing using steps below.

- To edit the series, choose **Go to series**. When editing a series, you cannot edit activity name and activity type, you can edit other fields.

> **Note**
>
> When a series is edited, any occurrences that are in the past are not modified. Only future occurrences are modified based on the latest repeating pattern.

4. If the activity was added as a **Shared activity**, then all of the agents added to the activity will be listed under **Staff**.

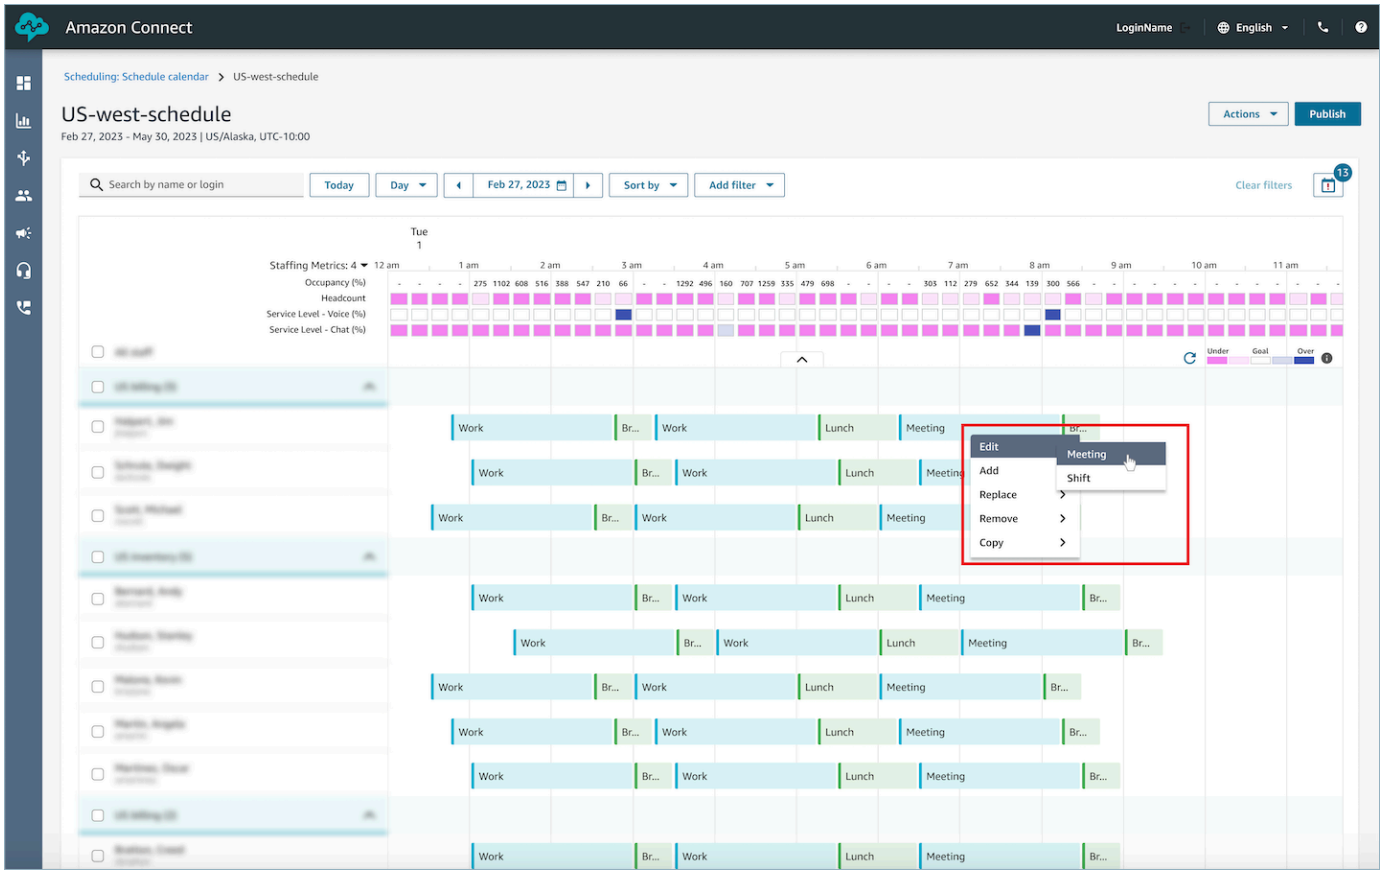
   a. From here, you can add or remove agents, change the date or time of the activity, apply the **Override rules check**, and add or update **Comments**.

   b. Choose **Apply** to commit the changes.

5. If the activity was added as an **Individual activity**, then only the agent whose shift you chose will be listed under **Staff**.

   a. From here, you can: change the date or time of the activity, apply the **Override rules check**, and add or update **Comments**.

   b. Choose **Apply** to commit the changes.



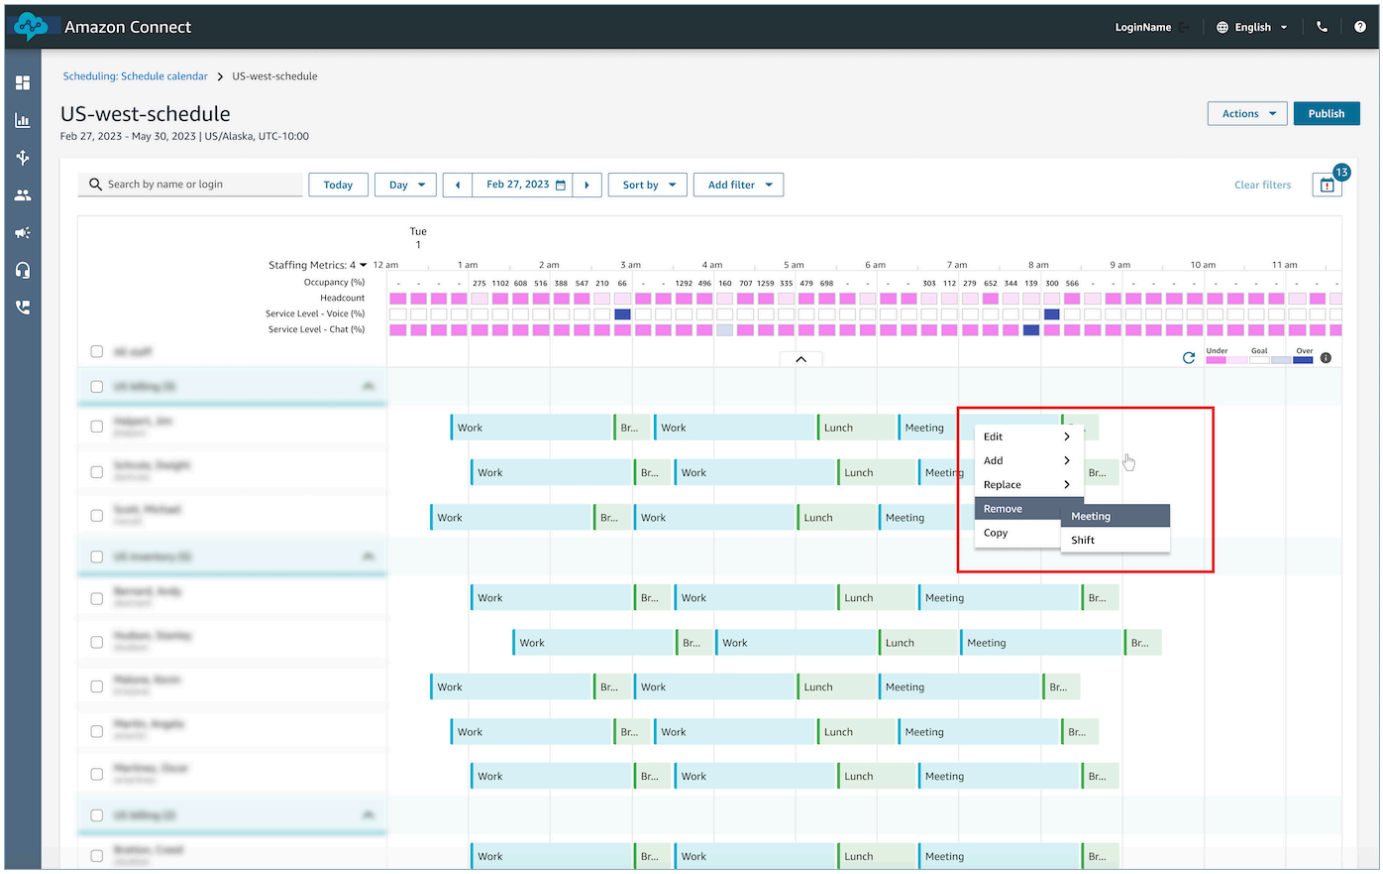
Remove a shift activity

1. From an agent's shift, choose the activity, select **Remove**, and then select the activity name to open the remove activity screen.
2. If the activity you are removing is part of a recurring series, you can choose to remove just this occurrence or you can remove the entire series.
   - To remove just this occurrence, continue removing using steps below.
   - To remove the series, choose **Go to series** and then continue removing using steps below.

   > **Note**
   >
   > When a series is removed, any occurrences that are in the past are not modified. Only future occurrences are modified based on the latest repeating pattern.

3. Choose the **Override rules check** option as needed.

4. Choose **Remove** to remove the activity.



Copy agent shifts

Contact center managers, supervisors, and schedulers can copy shifts from one agent to another agent or to that same agent. They can copy shifts one day at a time or multiple days at a time. For example, copy the schedule for agent A for this week to next week, or copy agent A's schedule for the next two weeks to agent B.

Complete the following steps to copy shifts

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

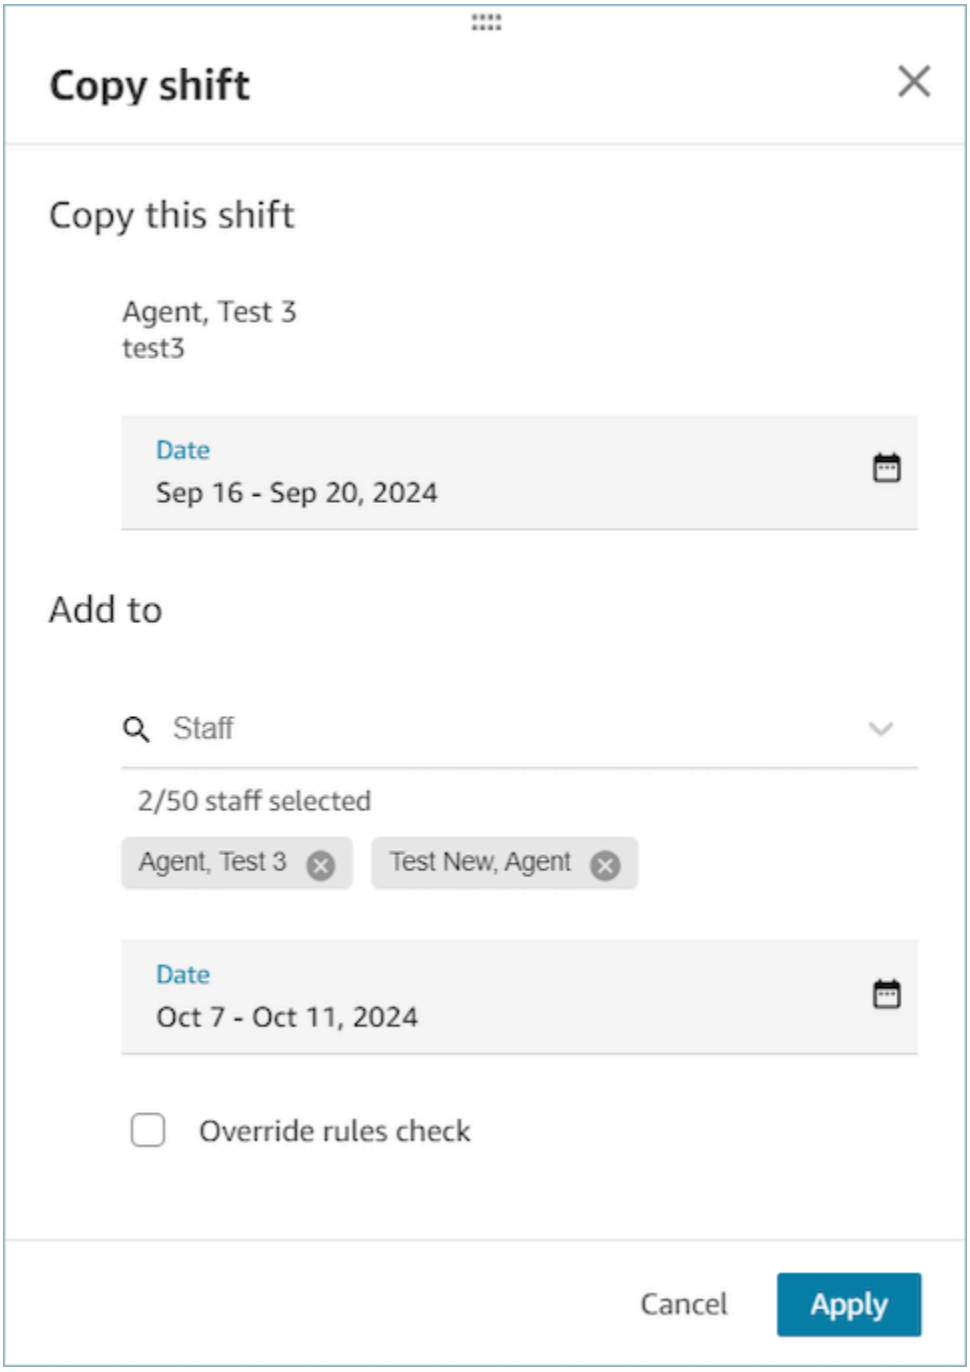
   For more information, see Assign permissions.

2. On the Connect Customer admin website, on the navigation menu, choose **Analytics and optimization**, **Scheduling**, and then select the **Published scheduled calendar** tab.

3. Select the shift that you would like to copy and choose **Copy shift**. This will open the **Copy shift** screen. You can copy shifts from either the day view or week view.
4. In the **Copy this shift** section, select a single date or a date range (up to 14 days) that you would like to copy from.
5. In the **Add to** section, select the agents (up to 50 agents) you would like to copy the shift to.
6. In the **Add to** section, select a single date or date range to copy to. Make sure that the number of days selected in **Copy from** matches the number of days selected in **Copy to**.
7. Choose **Apply** and then **Confirm**.
8. Select **Override rules check** if you want the system to ignore rules such as minimum and maximum working hours. If unselected, copying the shift will fail for agents on specific dates where rule violations occur and you will be able to review the list of errors after choosing **Confirm**.

Note

- Time-off, Overtime, and, Voluntary time-off are not copied.
- If one or more agents in **Copy To** have Time-off, Overtime, or, Voluntary time-off, copy will fail on those specific days. **Override rules check** does not override these validations.



Remove agent shifts

Contact center managers, supervisors, and schedulers can remove agent shifts, for either one agent at a time or multiple agents simultaneously. For example:

- Remove all shifts for next Monday.
- Remove future shifts for an agent who is no longer with the organization.

You can remove up to 30 days of shifts for an agent. You can remove shifts for up to 400 agents for a day.

To remove shifts

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

   For more information, see Assign permissions.

2. On the Connect Customer admin website, on the navigation menu, choose **Analytics and optimization**, **Scheduling**, and then select the **Published scheduled calendar** tab.

3. Complete the following steps to remove shift(s):

   - **Remove one shift for one agent**: Choose that shift and then choose **Remove Shift**, as shown in the following image.

   - **Remove multiple shifts for one agent**:

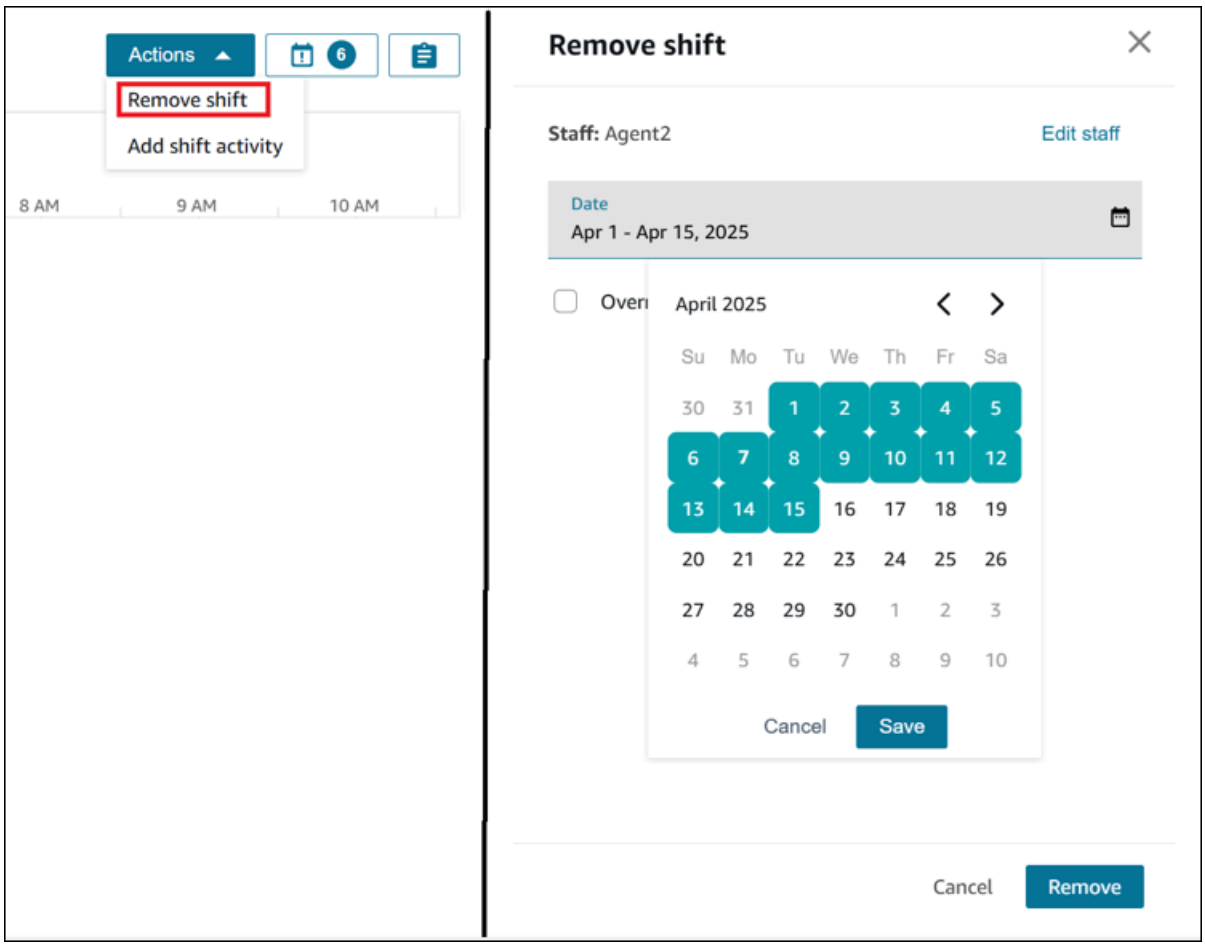
> **Note**
>
> The following procedure does not remove any time-offs that are scheduled for the selected date range.

     a. One the left side of the **Scheduling** - **Published schedule calendar** page, select the agent.

     b. Use the **Actions** dropdown list to select **Remove shift**.

     c. Select a date range in the **Remove shift** section.

     d. Choose **Remove**.



- **Remove shifts for multiple agents for a single day**:

> **Note**
>
> The following procedure does not remove any time-offs that are scheduled for the selected date range.

a. On the left side of the page, select up to 400 agents. If you select more than 400 agents, only the first 400 agents will be part of the remove shift operation.

b. Use the **Actions** dropdown list to select **Remove shift**.

c. Select a date range in the **Remove shift** section.

d. Choose **Remove**.

You can repeat this operation to select remaining agents and remove shifts for them.

Set up shift rotation patterns in Connect Customer

Use shift rotation patterns to create a set of shift profiles that are rotated based on sequential order and a defined set of weeks. The shift rotation pattern includes the rotation step, shift profile, the time zone assigned to the shift profile, and a duration defined in weeks.

This topic explains how to:

- Set up a shift rotation pattern. In our example, the pattern contains at least 2 shift profiles, a start date, and a duration in weeks.
- Assign agents to those shift rotations and to a starting step.
- Generate schedules that use the shift rotation patterns assigned to agents.

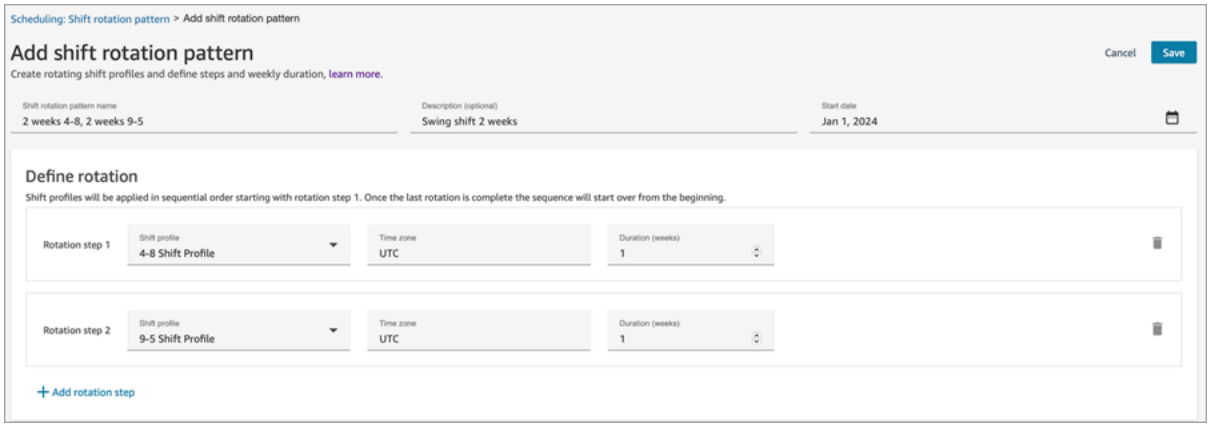
> **Tip**
>
> For the maximum number of shift rotation patterns per instance and other feature specifications, see Forecasting, capacity planning, and scheduling feature specifications.

Set up shift rotation patterns

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling, Schedule manager - Edit**.
2. On the Connect Customer navigation menu, select **Analytics and Optimization**, **Scheduling**.
3. On the **Scheduling** page, choose the **Shift rotations patterns** tab, and then choose **Create shift rotation pattern**.
4. On the **Add shift rotation pattern** page, complete the following boxes:

   - **Name** and **Description (optional)**
   - **Start date**: The start date will be used as the reference point to rotate to the next shift in the pattern.
   - **Define rotation**: In this section, choose the shift profile from the dropdown menu, timezone, and duration.

   The following image shows an **Add shift rotation pattern** page. This pattern has two rotation steps, each 1 week long.



For example, if you set the start date to January 1, and the first rotation step is 1 week, the next shift rotation - **Rotation step 2** - will take place on January 7. You can add up to 51 additional steps and each step can be up to 51 weeks.

5. Choose **Save**.

Assign agents to shift rotation patterns

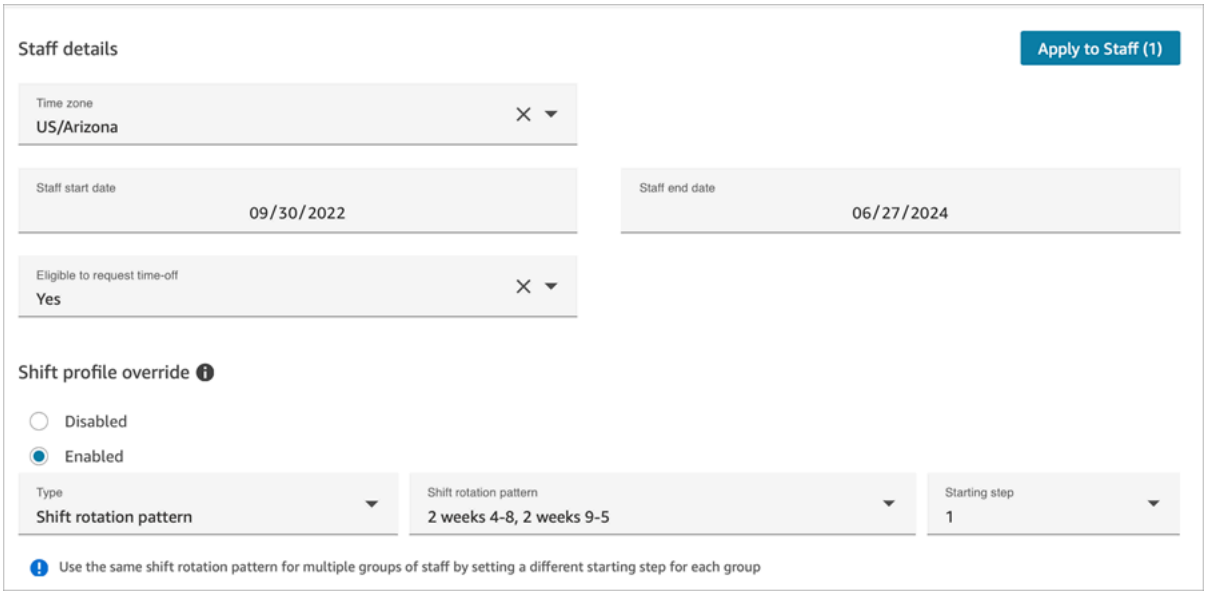
You assign agents to shift rotation patterns on the **Scheduling**, **Staff rules** page. There are two ways you can update the shift rotation pattern of an agent:

- Individually, on the **Staff rules** page. This is a simple way to apply shift rotation patterns or staff rules overrides to up to 50 agents at the same time.
- In bulk, by uploading a .csv file.

These options are discussed next.

Assign individual agents to shift rotation patterns

1. On the **Staff rules** page, choose **Shift Profile override**, **Enabled**, and then select the shift rotation pattern.
2. Define the agents shift rotation pattern and starting step. The following image shows a pattern of **2 weeks 4-8, 2 weeks 9-5**.



3. When complete, choose **Apply to Staff**.

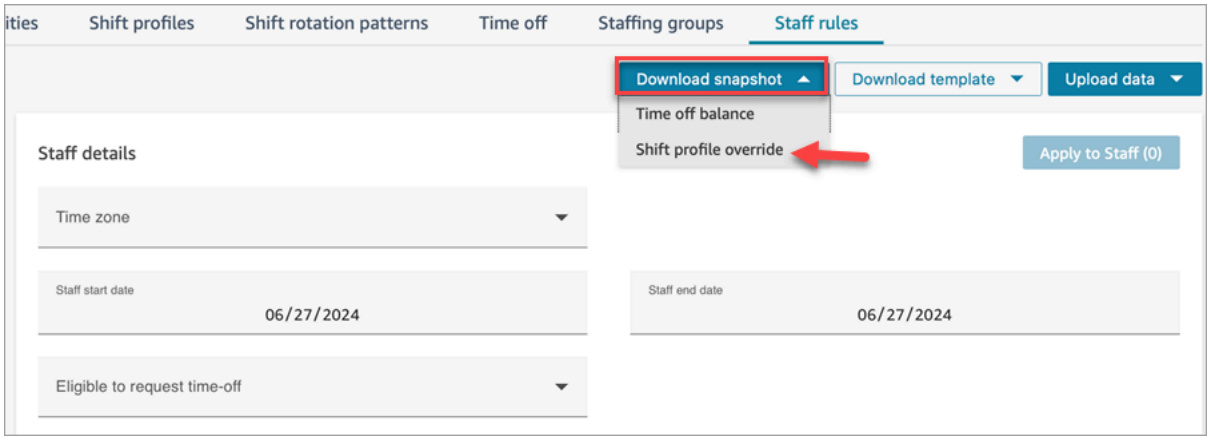
Bulk upload shift rotation pattern assignments

When managing a larger number of agents, use the bulk upload option to set the shift profile override, shift rotation pattern, and starting step in a .csv file.

> **Note**
>
> Make sure that your pop-up blocker is off so you can download the .csv file template.

- On the **Staff rules** page, choose one of the following options:
  - **Download snapshot**, **Shift profile override** to download a snapshot of existing shift rotation pattern assignments for your agents.
  - **Download template**, **Shift profile override** to download a blank .csv file.

  The following image shows the an example **Staff rules** page, and the option to download a snapshot of existing shift rotation pattern assignments for your agents.



The .csv templates contain key fields that you can update:

- Login name
- Shift profile name
- Shift rotation pattern name
- Shift rotation starting step

Note

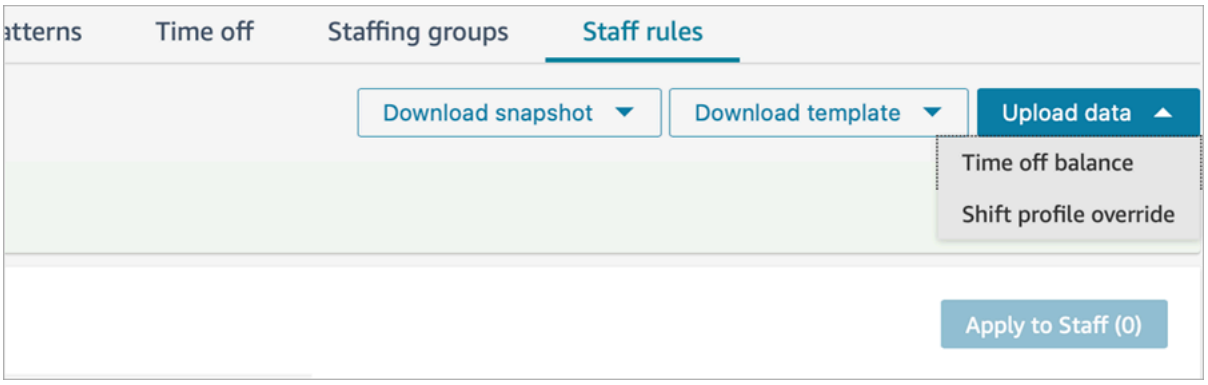
In the .csv template, you can't populate column B and column C in the same row. That is, you can't set both the SHIFT_PROFILE_NAME and SHIFT_ROTATION_PATTERN_NAME for an agent in the same .csv file. You can set only one.

- To set the shift profile name for the agent, add it to column B and leave columns C and D blank.
- To set the shift rotation pattern for an agent, set columns C and D, and leave column B blank, as shown in the following image.

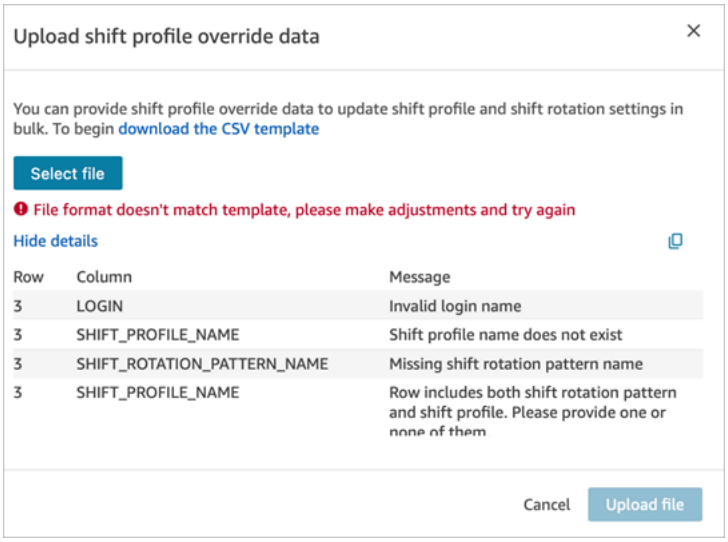
A	B	C	D
LOGIN	SHIFT_PROFILE_NAME	SHIFT_ROTATION_PATTERN_NAME	SHIFT_ROTATION_STARTING_STEP
OPS1		2 weeks 4-8, 2 weeks 9-5	1

Upload shift rotation and shift profiles

To upload a .csv file that contains shift rotation overrides, on the **Staff rules** page, choose **Upload data**, **Shift profile override**, as shown in the following image.



If there is a problem with your .csv file, Connect Customer displays an error message that indicates which fields have mismatches. This makes it easier for you to troubleshoot your file uploads. The following image shows example error messages.



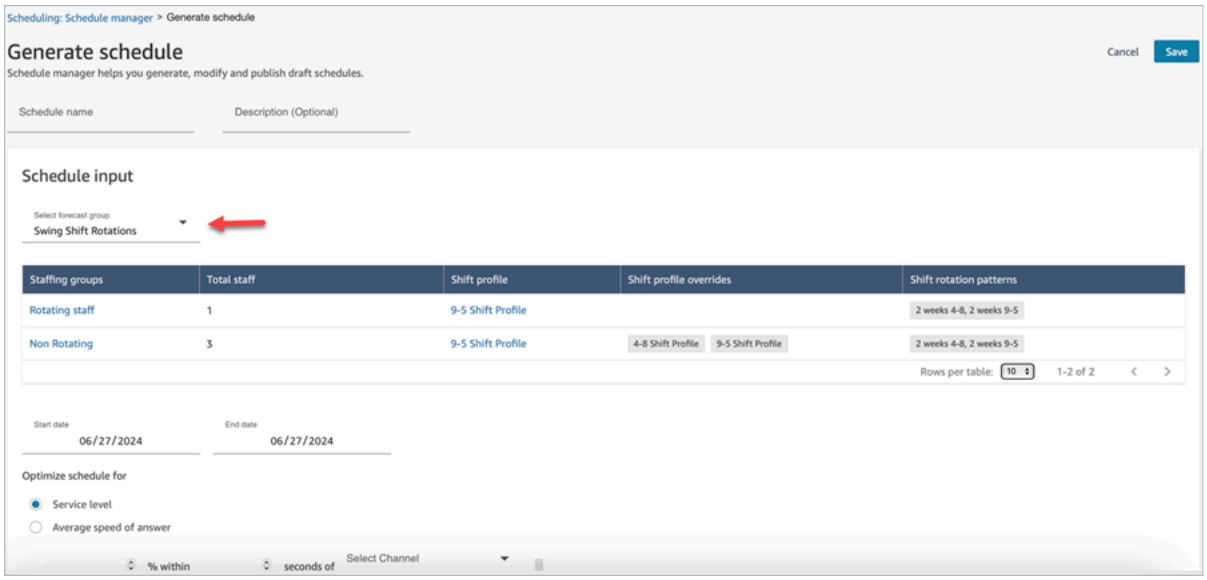
After the .csv file is uploaded, a banner is displayed indicating that the data is being loaded into agent scheduling. That process can take up to 10 minutes for thousands of agents. The banner automatically refreshes when the shift profile override data has been successfully processed. This means the data has been loaded into agent scheduling.

Generate schedules that use shift rotation patterns

1. On the **Scheduling** page, choose **Schedule manager**, **Generate schedule**.
2. Enter a name of the schedule, and an optional description.

3. In the **Schedule input** section select the forecast group that you want to schedule.

   The **Generate schedule** page is automatically updated with the data for that forecast group. It displays the number of agents, the associated shift profiles, and the shift rotation patterns, as shown in the following image.



Remove a shift rotation pattern

Before you can remove a shift rotation pattern, you must first remove all agents linked to the shift rotation pattern. You can unset up to 50 agents by using the **Staff rules** page.

You can also use the bulk upload and download to quickly unset hundreds or even thousands of agents.

Set up shift exchange in Connect Customer

You can set up Connect Customer to allow agents to exchange shifts with each other. Agents can initiate shift trades directly from their agent calendar. They don't need to send emails their manager. This self-service functionality enables agents to manage unexpected life events and achieve better work-life balance.

Managers can approve shift exchange requests manually from their **Published schedule calendar**. Or, approvals can be automatic if the request meets certain criteria that you specify.

Before completing the steps in this topic, you need to create a shift trade group. A *shift trade group* is a list of agents in the same forecast group who can trade shifts with each other.

> **Tip**
>
> Want to watch a video that shows how to set up shift exchange? See How Schedulers Configure the Shift Exchange Feature on the Connect Customer Enablement channel on YouTube.

To define how shift exchange will work for the agents in a shift trade group

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**.

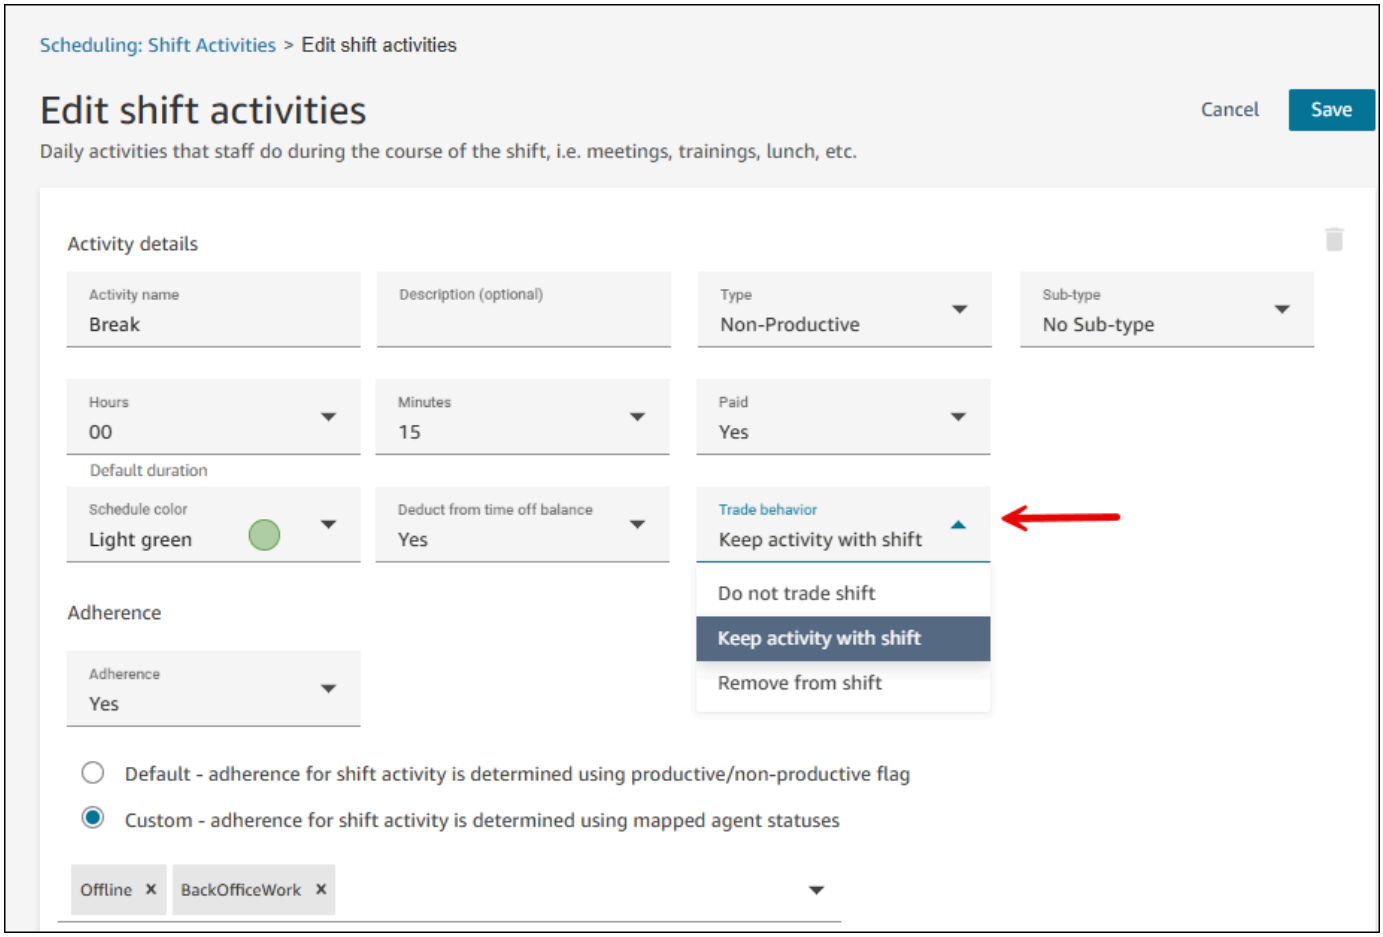
   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. On the **Scheduling** page, choose the **Shift activities** tab, choose the shift activity you want to edit, and choose **Edit**.
4. On the **Edit shift activities** page, in the **Trade behavior** box, choose one of the following values:

   - **Do not trade shift**: This is the default. Choose this option to block the trade if this shift activity exists.

     > **Important**
     >
     > For for the system-created activity **Work**, the default configuration is **Keep activity with shift**.

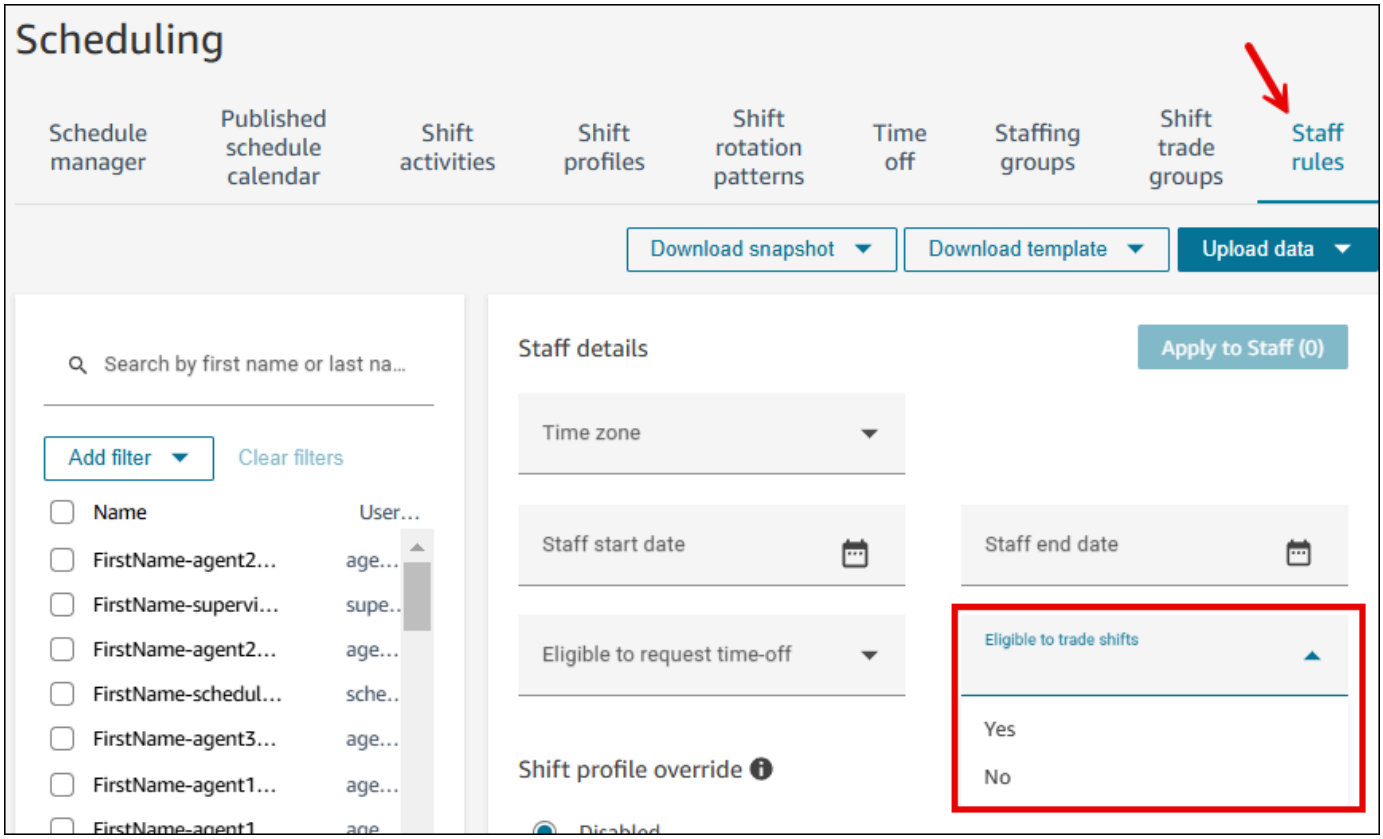
   - **Keep activity with shift**: Choose this option to move the activity together with the shift.
   - **Remove from shift**: Choose this option to remove the activity from the shift.

   The following image shows the **Trade behavior** dropdown list.



5. Choose **Save**.
6. On the **Scheduling** page, choose **Staff rules**. In the **Eligible to trade shifts** box, choose **Yes** to allow agents to trade shift with each other. Default = Yes.

   The **Eligible to trade shifts** dropdown box is shown in the following image.



How agents create shift trade requests

> **Tip**
>
> Check out this video that shows how agents use shift exchange: How Agents Use the Shift Exchange Feature to Trade Shifts on the Connect Customer Enablement channel on YouTube.

Agents can exchange shifts when:

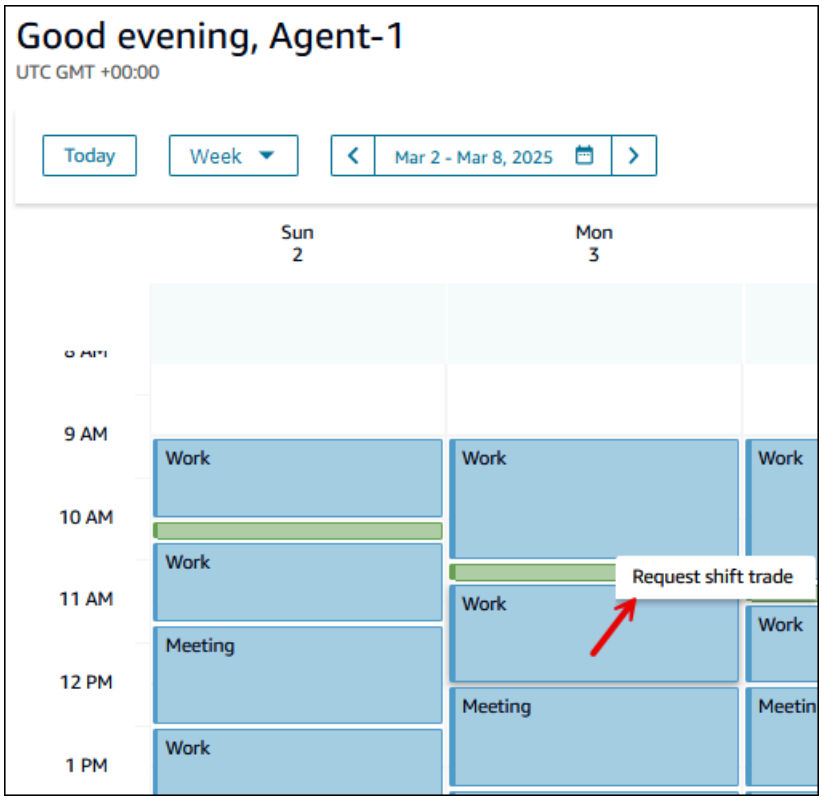
- Their shift is in the future.
- Their staffing group is in a trade group.
- The staff rules have **Eligible to trade shift** = **Yes**.

The option to **Request shift trade** only appears to agents when this criteria is met.

To initiate a shift trade request

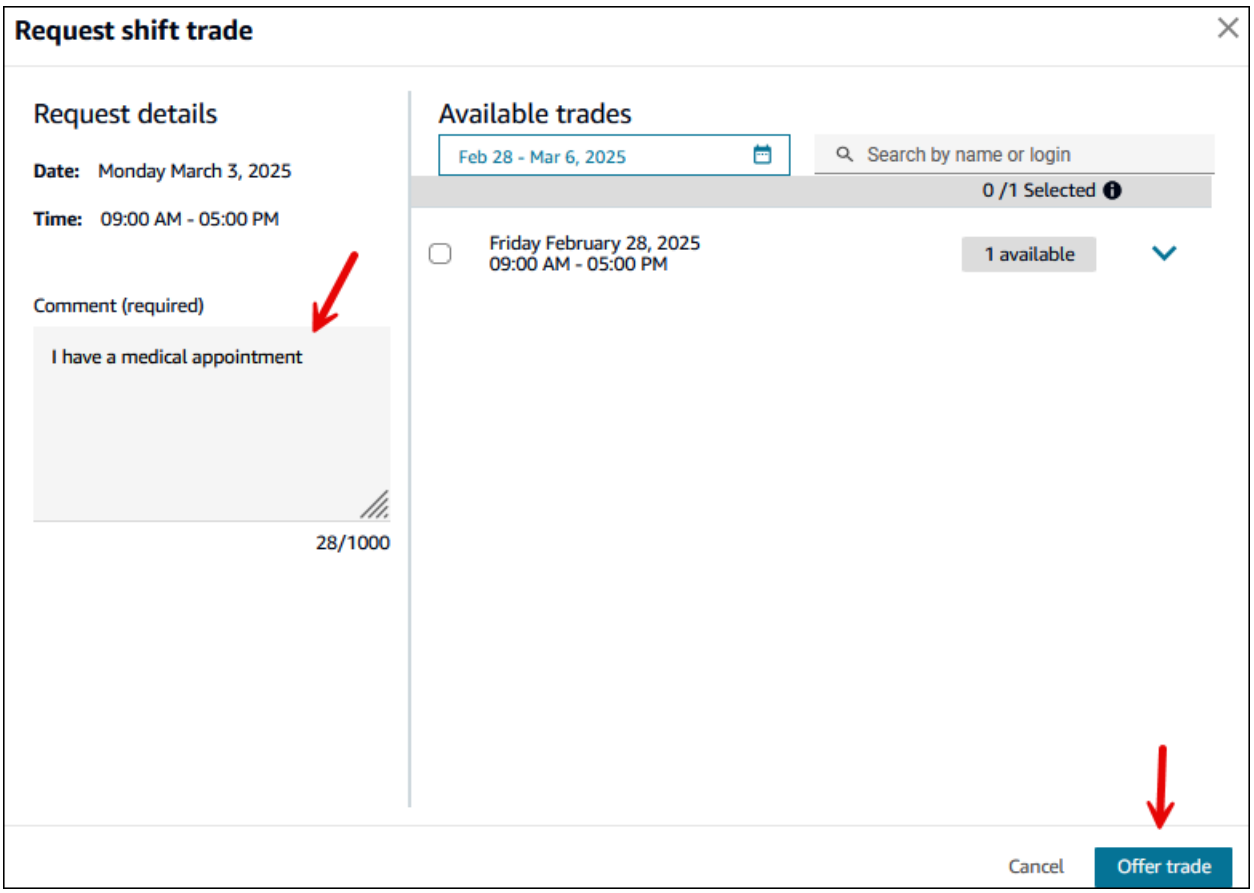
1. Navigate to your schedule and choose the shift that you want to trade. The **Request shift trade** option appears. Choose or tap on it.

   The following image shows a **Work** shift and the **Request shift trade** option.



2. On the **Request shift trade** dialog box, you can either offer a trade or request a shift trade. You can see your selected shift details on the left side of the screen.

   - **To offer a trade**: Enter a comment. This comment can be viewed by your manager and other agents who want trade shifts. Choose **Offer trade**, as shown in the following image.

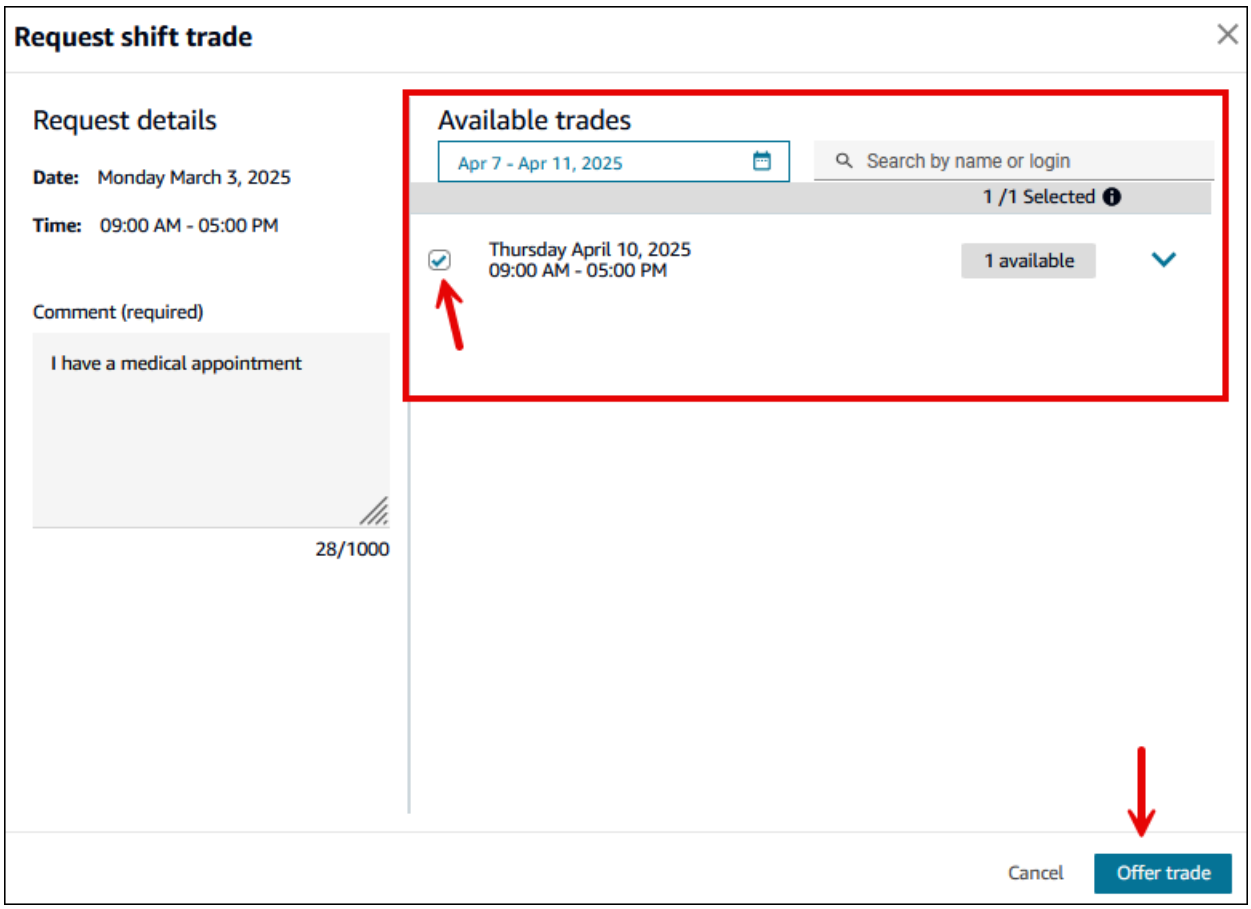


- **To trade your shift with another shift**

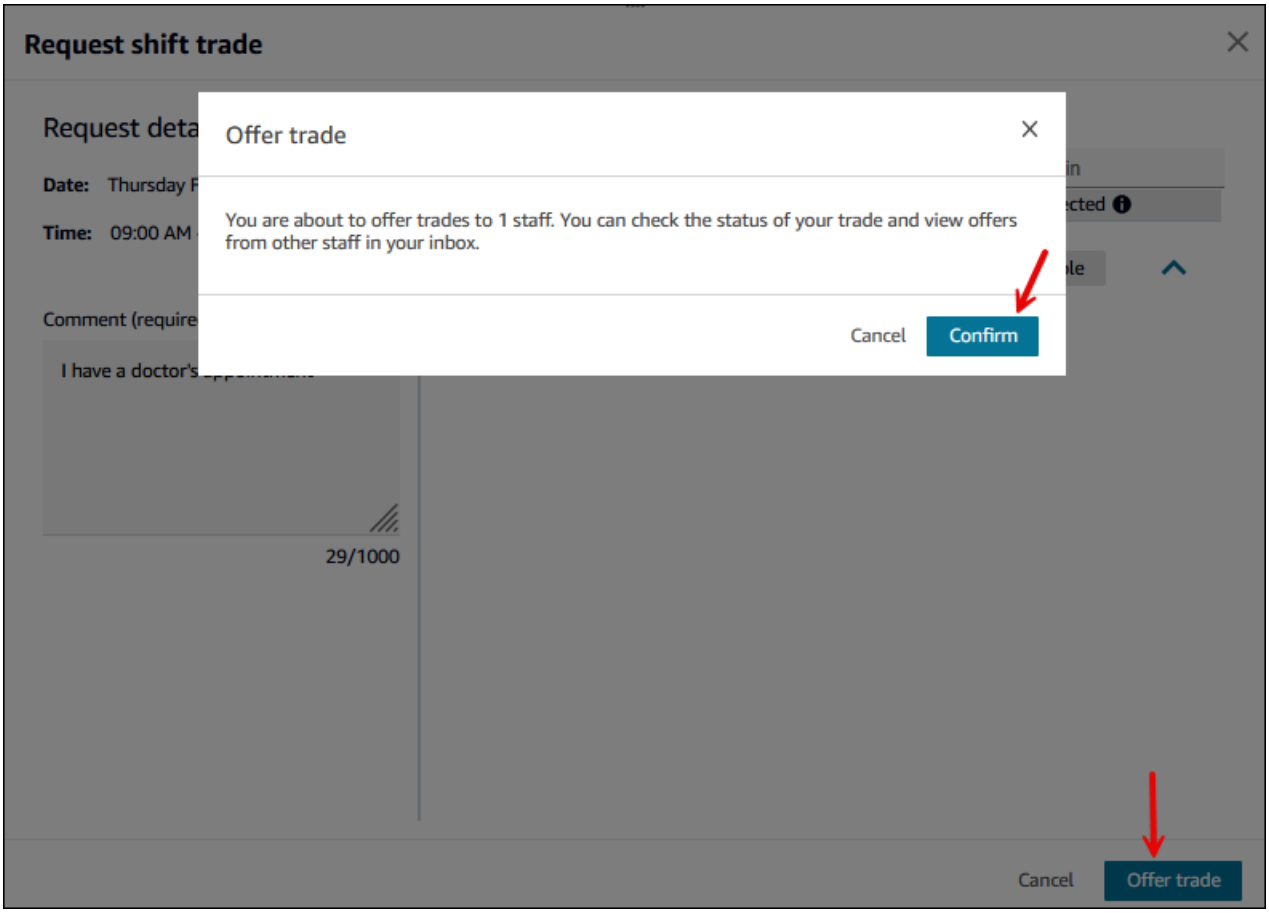
  1. If no available trades appear automatically for your time range you can search for offered shifts in other time ranges or search by agent. The following image shows a search for shifts in April.

  2. Select the shift(s) to trade, and then choose **Offer trade**. You can choose multiple requests to trade.

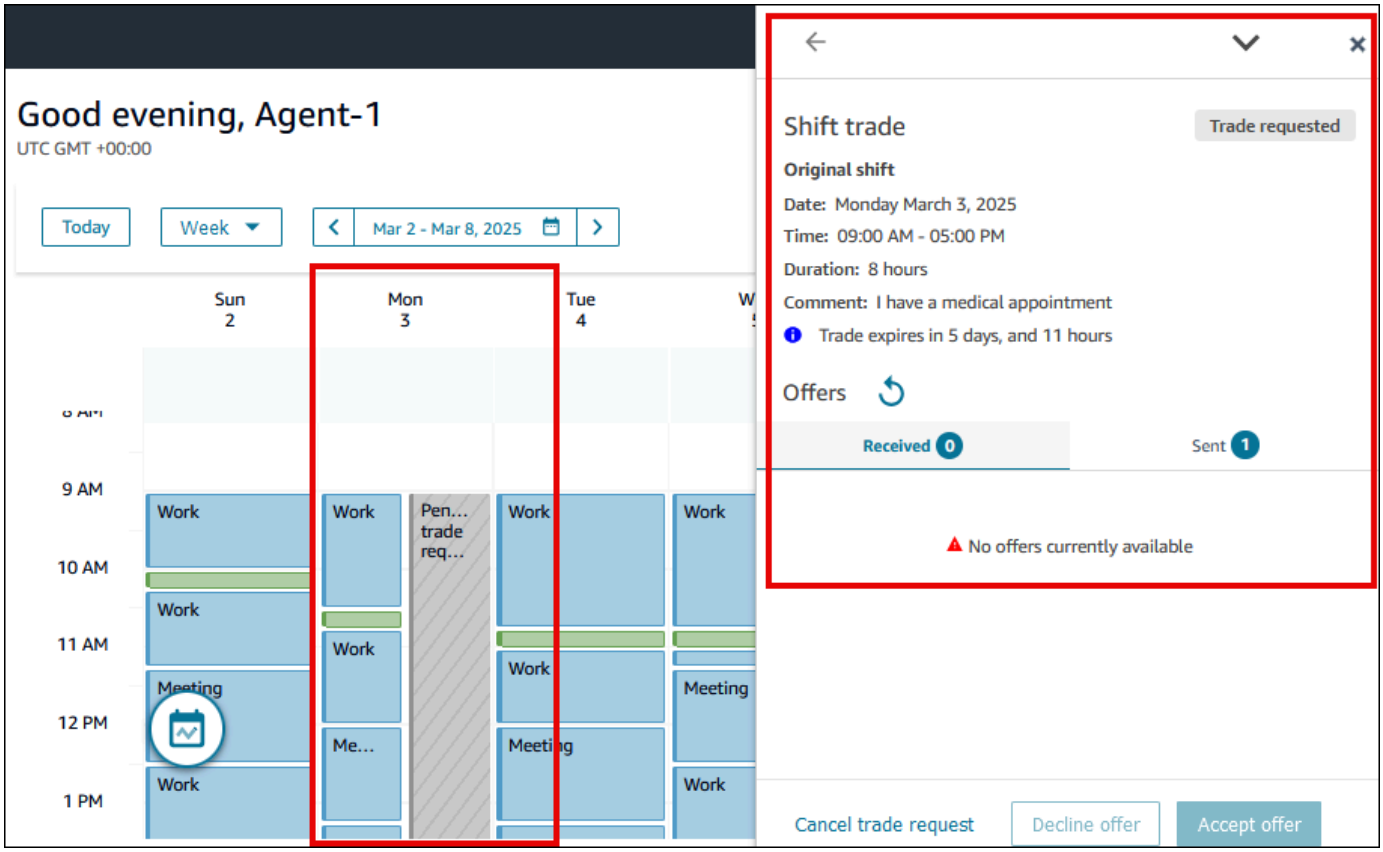
     The following image shows there's a shift offered by another agent that you can trade for your Monday March 3rd shift.



If you don't like any of the shifts that other agents are offering for trade, for example, choose **Offer trade** to add your shift to the pool, and then choose **Confirm**, as shown in the following image



3. After you offer a trade, your calendar shows a pending trade request. You can choose on that item to get the details on the right side of the pane, as shown in the following image. The image shows you have offered a shift to trade but you haven't received any offers from other agents.

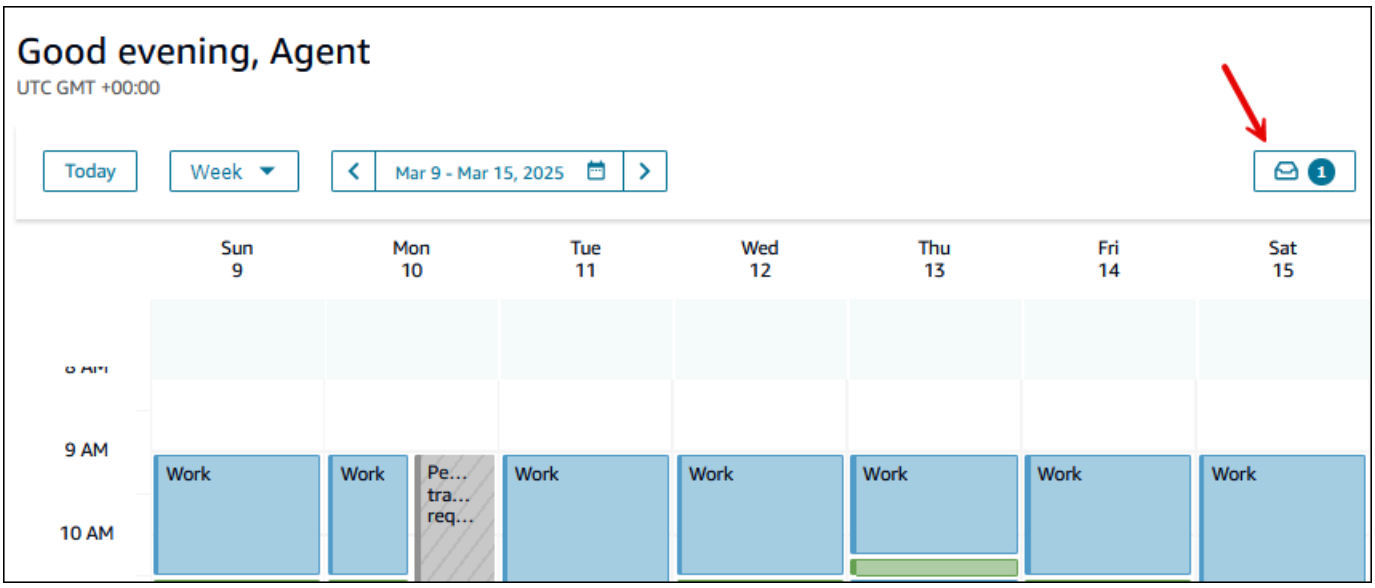


Using the **Shift trade** pane you can:

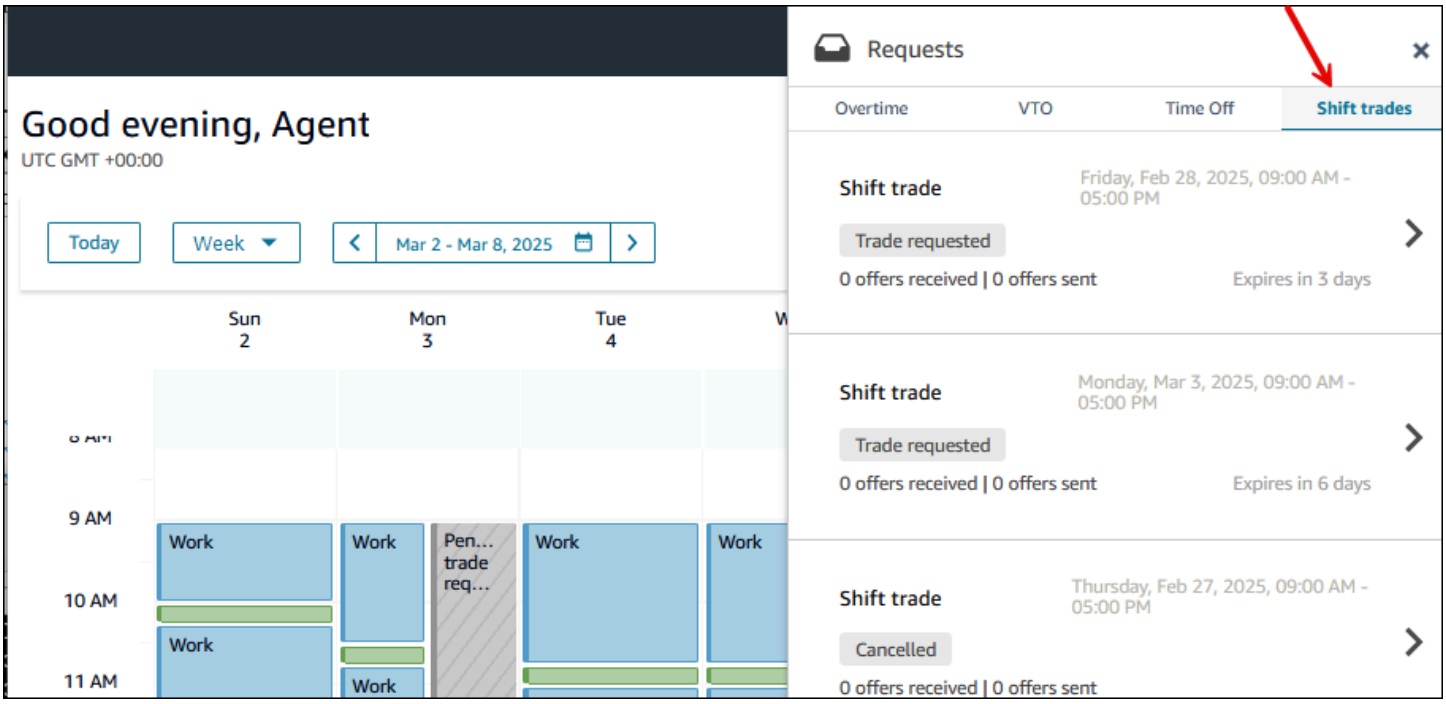
- View all the trade offers that you have received or sent.
- **Cancel trade request** any time before it has been approved (either automatically or by the supervisor).
- **Decline offer**. This declines an incoming trade request from another agent.

How agents receive and approve shift trade requests

To view trade offers, agents go to their schedule calendar, and choose or tap on the request drawer, as shown in the following image.



Then choose the **Shift trades** tab, as shown in the following image.

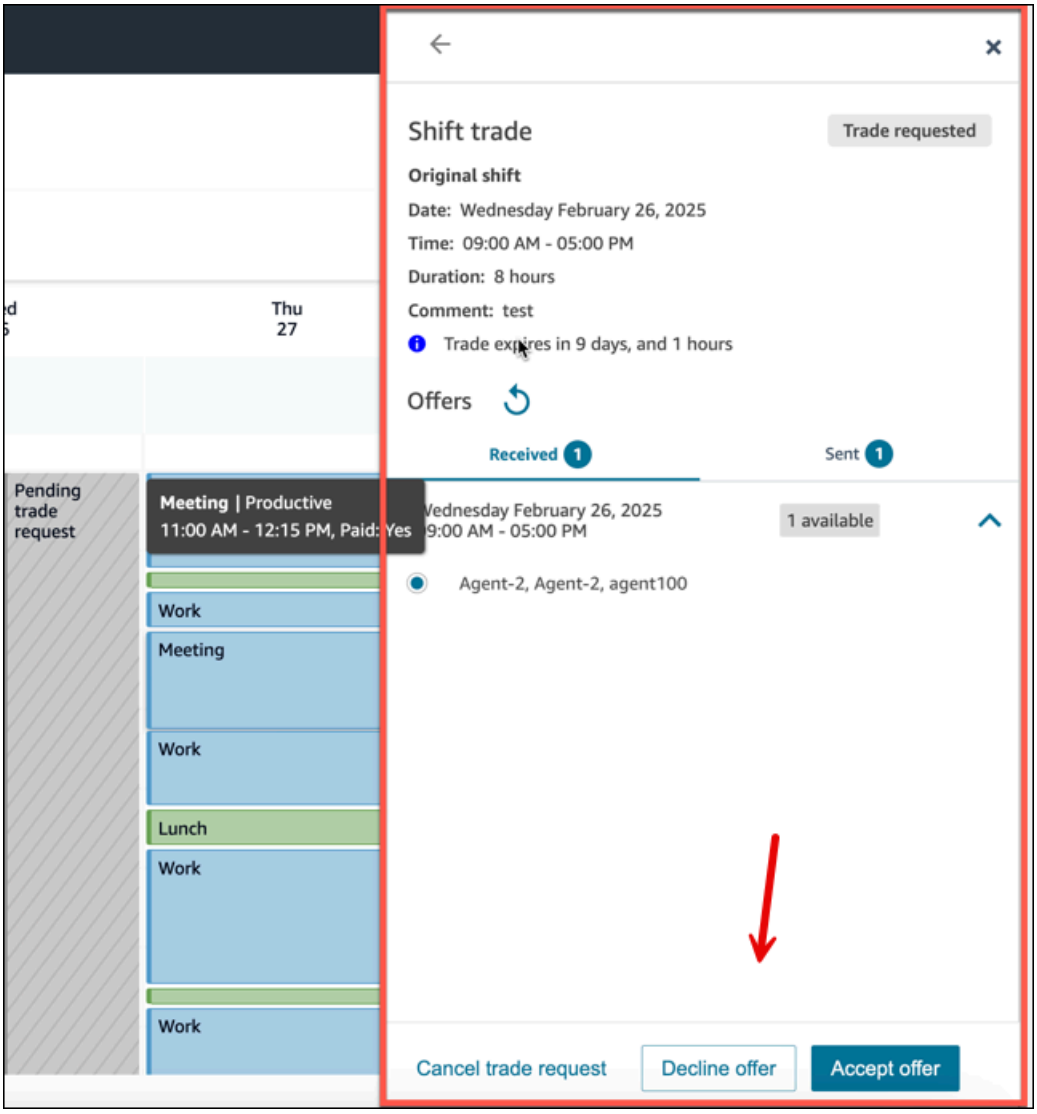


You can choose on the received trade section to review the incoming trade offers from other agents. You can then select that offer and take one of the following actions.

- **Accept offer**: Choose to accept the trade request and accept the offer.
- **Decline offer**: Choose to decline this trade request, and instead keep your offer in the pool.

- **Cancel trade request**: Choose to cancel this trade request, and remove your offer from the request pool. You can cancel a trade request at any time, even after it has gone to your supervisor for approval.

The following image shows the location of these options on the **Shift trade** pane.



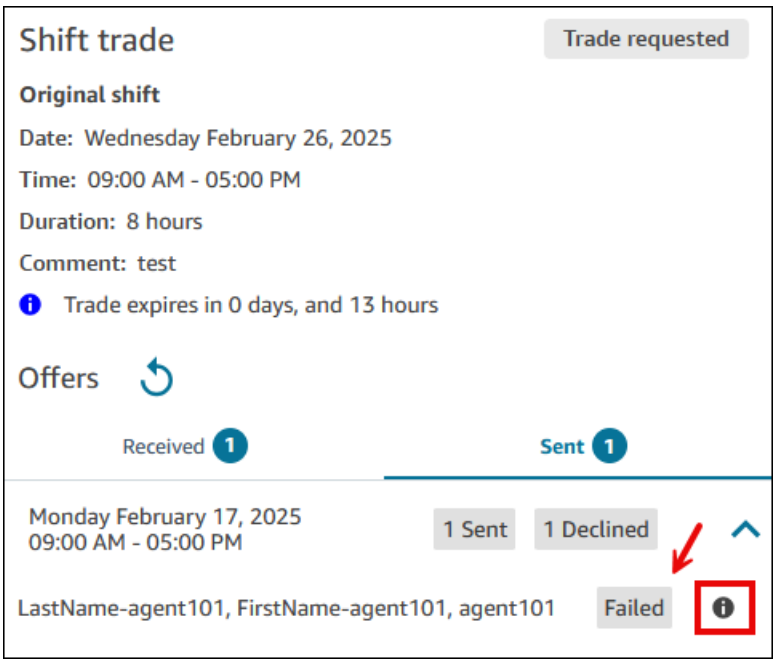
When you choose **Accept offer**, a dialog box prompts you to confirm your selection. The **Confirm** button is shown in the following image.

Expired status means you created an offer for a shift but the **Notice period** specified for your shift trade group has passed before the trade was completed. No further actions can be taken on that shift.

Why a shift trade request might be Failed

A shift trade request might have a status of **Failed**. The Info icon provides a brief description why, such as **Shift trade affects other shifts**. This means the agent already has a shift on the same day you are asking to trade.

The following image shows a **Failed** status.



How supervisors approve shift trade requests

A supervisor can manually approve, decline, or cancel any trade request that is not complete.

If the trade group is changed from Automatic to Manual at any time, all trade requests not yet approved will immediately require manual approval.

> **Tip**
>
> If agents across staffing groups want to trade shifts, both staffing group managers get the notification, and either one of them can approve the request. Approval is not required from both managers.

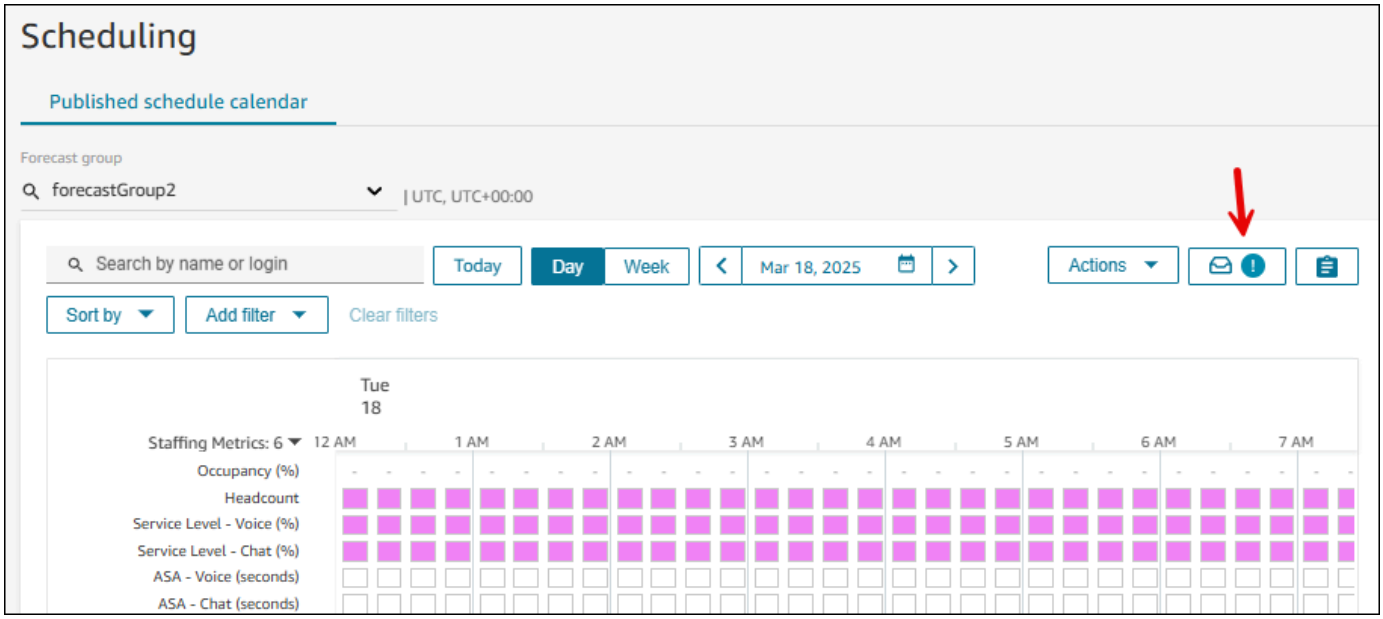
If you decline an offer, the original trade request goes back into the pool. Both agents can still trade with other agents.

If you Cancel trade request, then the agent cannot change their shift on that day.

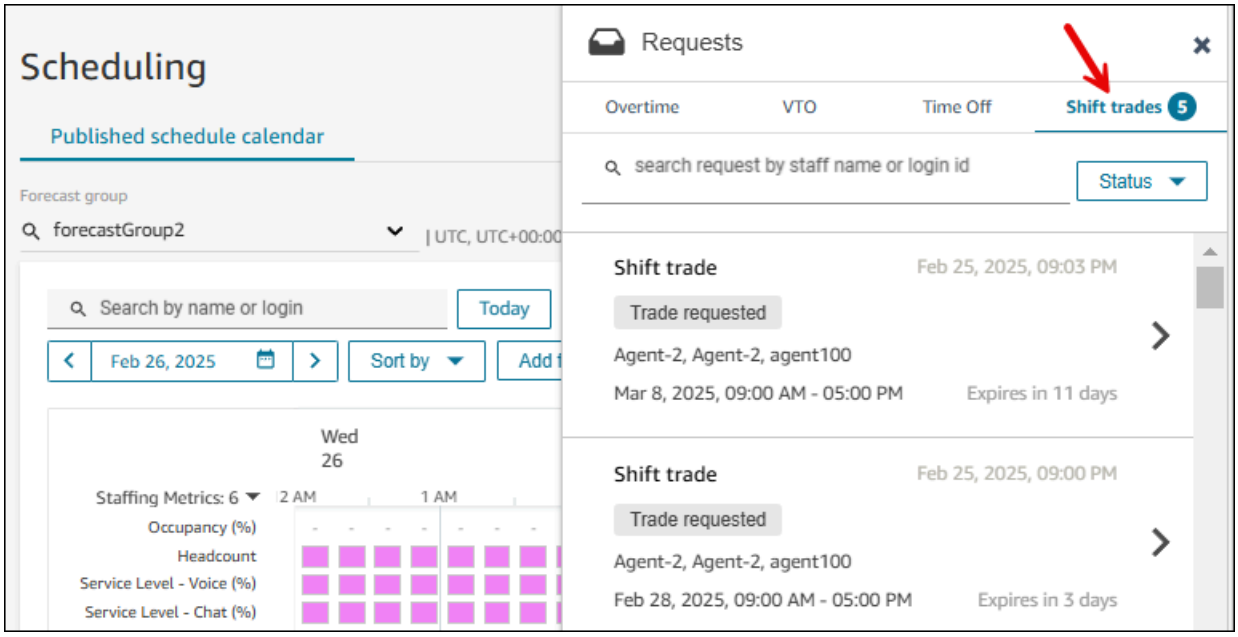
You are always prompted for a comment that is sent to the agent.

If you accidentally approve a shift trade, you then have to manually edit the shifts to undo it. This is because after a shift is traded, the older shift no longer exists.

1. To view shift trade requests, supervisors or managers view their **Published schedule calendar**. A shift trade notification appears on the request drawer icon, as shown in the following image.



2. Choose the **Shift trades** tab to view the details of the shift trade requests from all the agents you manage. The following image shows an example with current and past shift trades.



3. Approve or decline the requests. The comment you enter will be sent to the agent.

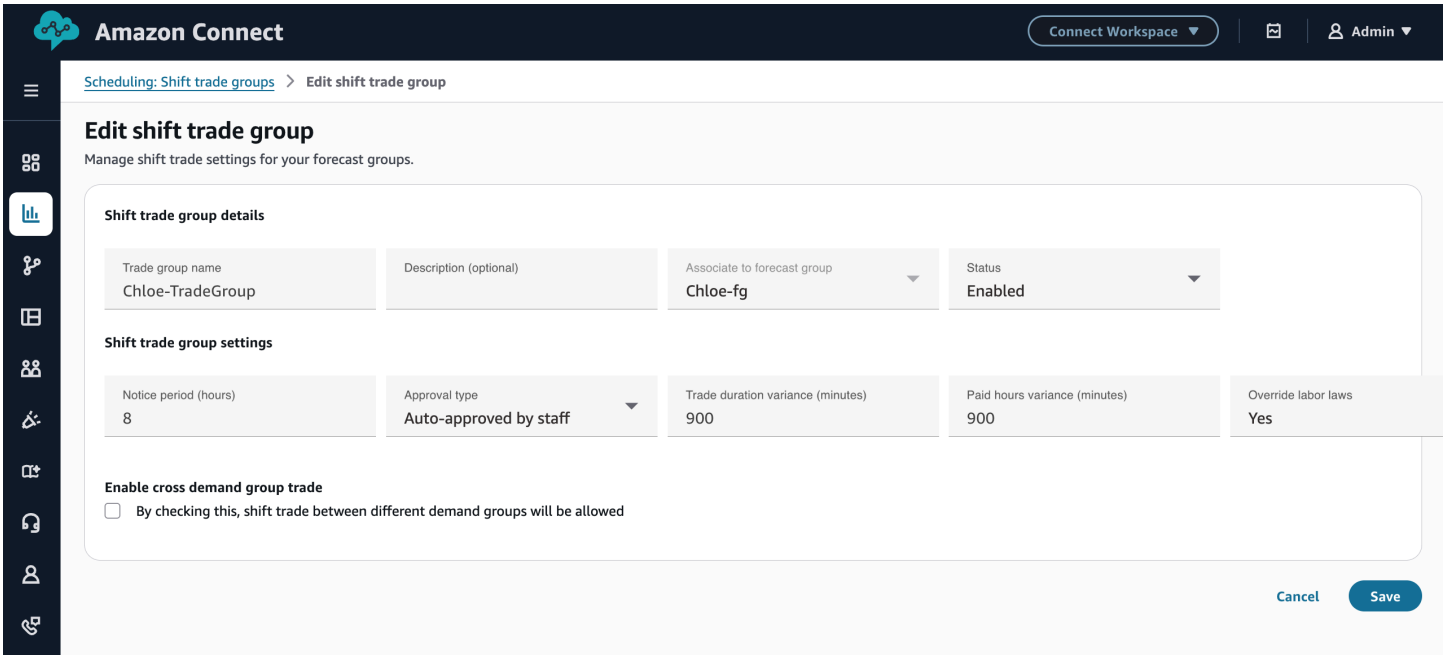
Shift exchange for multi-skill forecast groups

Shift exchanges can be allowed between agents regardless of demand group associations. This feature is disabled by default, allowing agents to only trade shifts with other agents who have identical demand group associations. When enabled, agents can exchange shifts with others regardless of demand group assignments.

For information on multi-skill, see Multi skill scheduling

To enable shift exchange regardless of demand groups

Check the option to enable cross demand group trade.



Multi skill scheduling in Connect Customer

The multi-skill feature moves beyond the previous model, which assumed that all agents could handle all queues within their line of business (Forecast Group), with a skill-aware scheduling system that reflects real-world contact center complexity. It introduces demand groups, which represent distinct work subsets within forecast groups, each comprising specialized skill requirements that are independently forecasted. Agents are scheduled exclusively for their allocated demand groups, making sure that their unique skills are deployed strategically. Multi-skilled agents can be assigned across multiple relevant demand groups, with their schedules optimized to accommodate demand variations across all assigned areas.

Important things to know

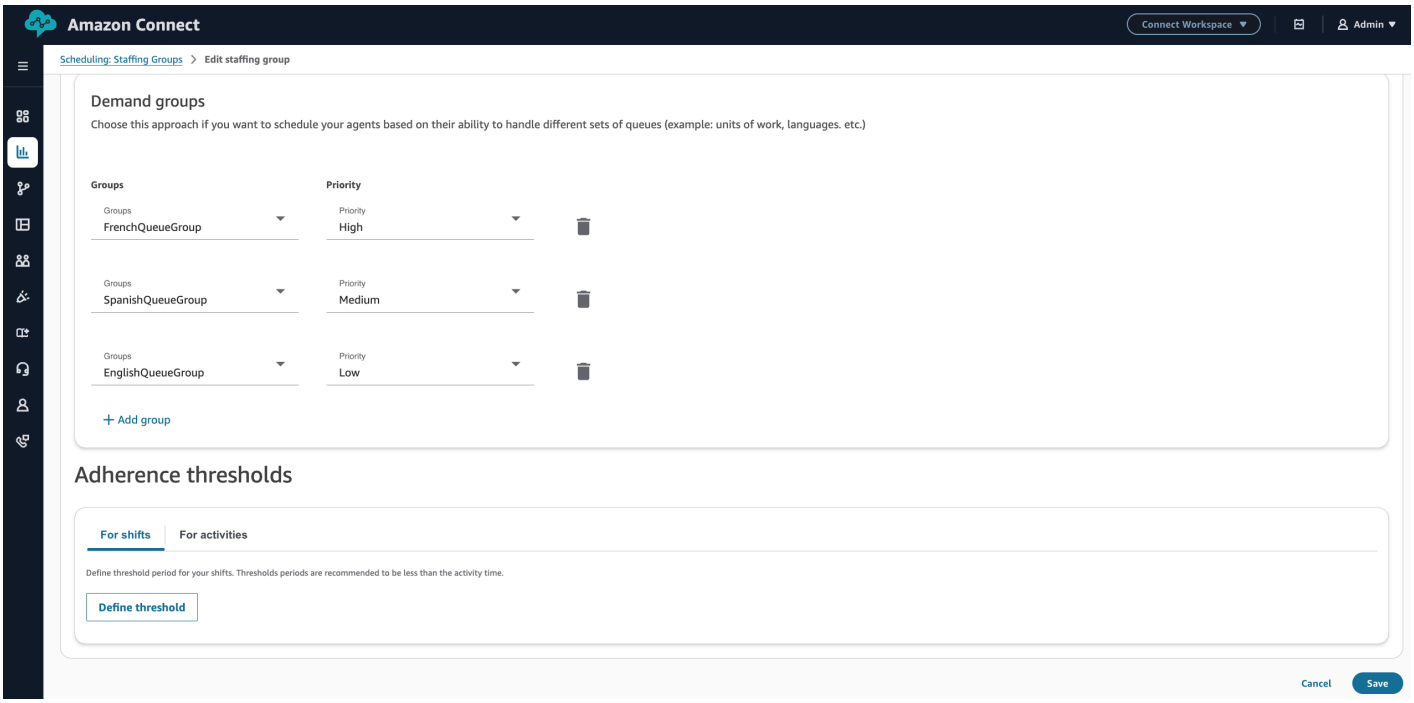
- Multi-skill scheduling requires a forecast group to have a minimum of two demand groups to be defined within the corresponding forecast group.

  For more information, see Multi skill forecasting
- Staffing Groups or agents can be associated with multiple demand groups within a forecast group.
- If a staffing group is associated with a forecast group that contains demand groups, then the staffing group must be linked to at least one of the demand groups.

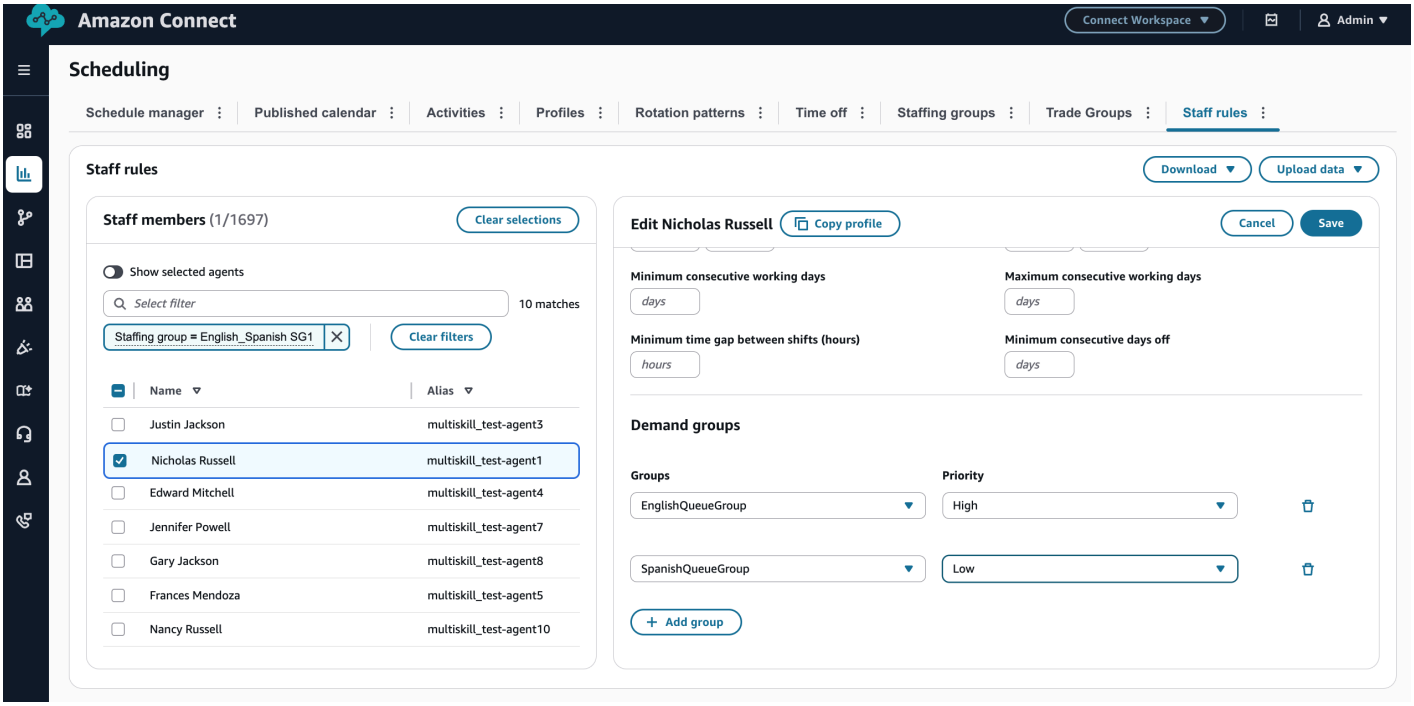
- Staffing Groups or agents can be prioritized (high/ medium/ low) for specific demand groups. A higher priority means those agents get scheduled first for that demand group.
- The scheduling system independently calculates the required agent headcount for each demand group using forecasted contact volumes, then creates agent shifts according to demand group assignments.

Assigning agents to demand groups

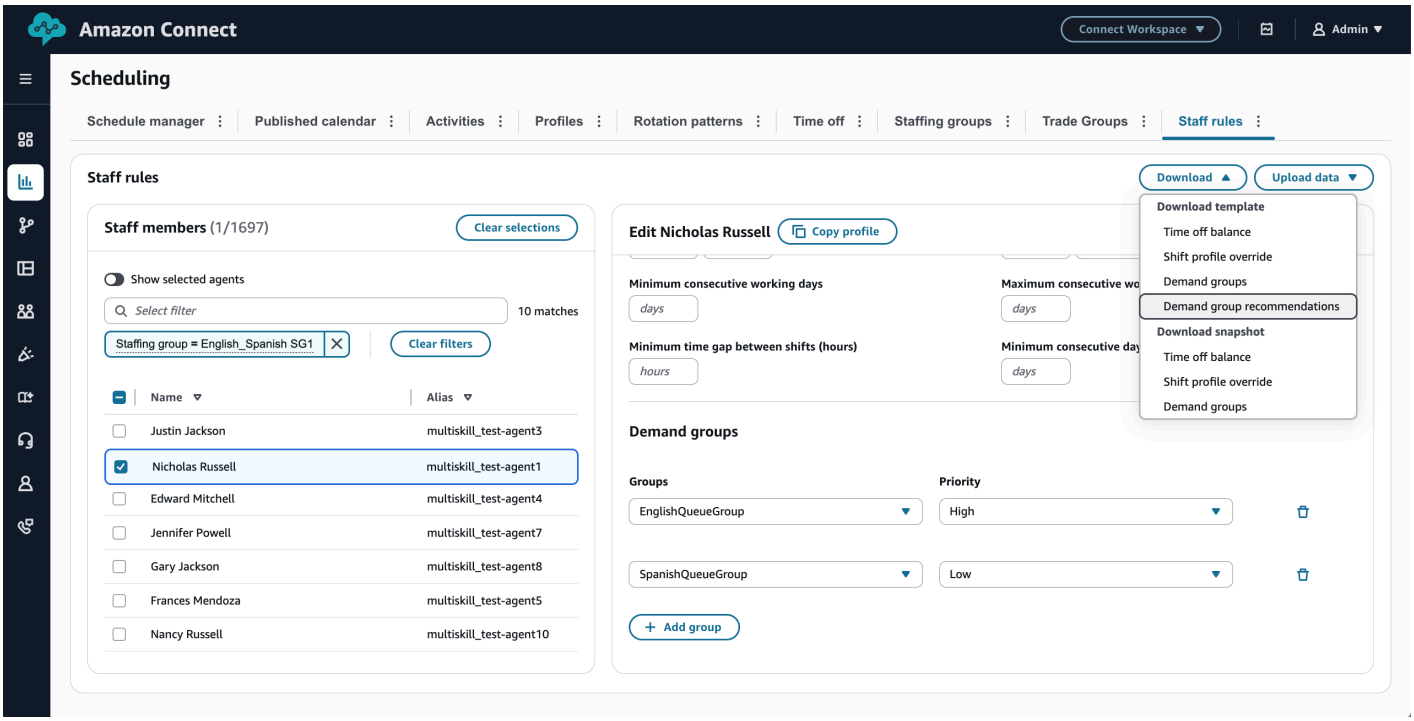
- Amazon Connect forecasting capacity planning and scheduling uses staffing groups to organize agents into teams. For details please refer to Create staffing groups and rules. After you create the staffing group, you can link it to the "forecast group", and then to the corresponding demand groups. You can set priority levels (high/ medium/ low) for each demand group. Higher priority means those agents get scheduled first for that demand group.



- Demand group assignments can be modified through the Staff Rules page, allowing for customization when agents develop additional skills or when teams consist of members with varied capabilities rather than skill-specific groupings.



- Demand groups can also be defaulted based on routing settings. The system suggests demand groups and priorities according to agent routing profiles.



- These recommendations are available for download in CSV format and can be bulk uploaded for agents. Demand group recommendations can be edited to specify agents before re-uploading.

LOGIN	FORECAST_GROUP	DEMAND_GROUP	DEMAND_GROUP_PRIORITY

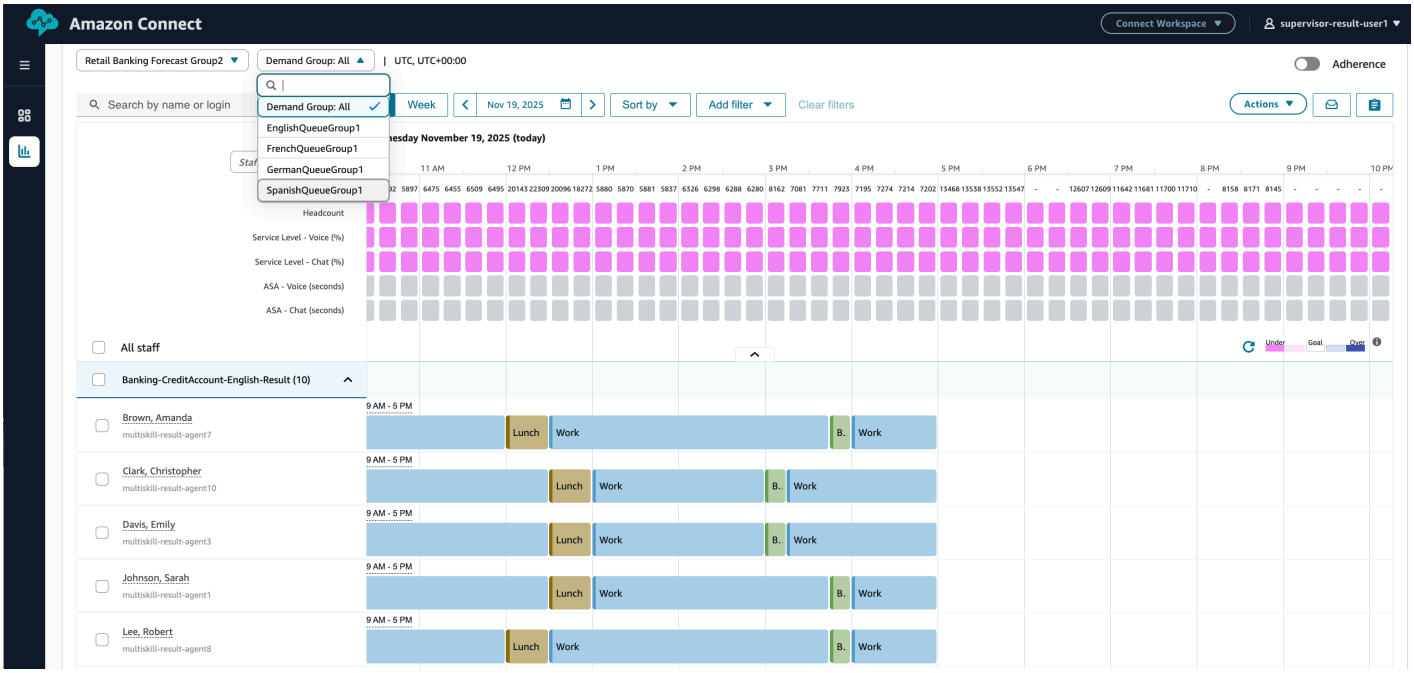
Generate and publish schedule

- Generate your schedule. For detailed configuration instructions, please refer to Generate, review, and publish a schedule.
- Amazon Connect generates a draft schedule that is hidden from agents until it is published. Schedulers can address warnings or failures and regenerate the draft schedule iteratively before publishing the final version. Amazon Connect independently calculates the required agent headcount for each demand group using forecasted contact volumes, then creates agent shifts according to demand group assignments. The calendar allows filtering by demand groups, displaying metrics and agents specific to the selected demand group.



Set up scheduling notifications in Connect Customer

You can create rules that automatically send notifications when schedule changes occur. These rules use the Rules engine and are configured under the **Scheduling** category. You can set up notifications for three types of scheduling events.

The following list describes the notification event types:

New schedule is published

Triggers when a scheduler publishes a schedule. You can target specific forecast groups, staffing groups, or agents.

Published schedule is updated

Triggers when a published schedule is modified, such as when shifts are added, removed, edited, copied, or replaced. You can target specific forecast groups, staffing groups, agents, or shift activities. At least one of forecast group, staffing group, agents, or shift activities is required.

Time-off request status is updated

Triggers when a time-off request is created or its status changes. You can target specific forecast groups, staffing groups, agents, or time-off activities. At least one of forecast group, staffing group, agents, or time-off activities is required.

When a rule is triggered, it can perform one of the following actions:

- Send an email notification
- Create a task in Connect Customer
- Generate an event

For email notifications, you can configure the following recipient types:

- Supervisors of agents affected by the scheduling change
- The specific agents whose schedules were affected
- Manually selected users

You can also exclude specific supervisors or agents from receiving notifications.

To create a scheduling notification rule

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit** and **Rules**. For more information, see Assign permissions.
2. On the navigation menu, choose **Analytics and optimization**, **Rules**.
3. Choose **Create a rule**, and then select **Scheduling**.
4. For **Event source**, choose one of the following: **New schedule is published**, **Published schedule is updated**, or **Time-off request status is updated**.
5. Configure the conditions for the rule. Depending on the event source, you can specify forecast groups, staffing groups, agents, shift activities, or time-off activities.
6. Under **Actions**, choose the action to perform when the rule is triggered: **Send email notification**, **Create task**, or **Generate an EventBridge event**.
7. If you chose **Send email notification**, configure the recipients. You can choose **Supervisors**, **Agents**, or select specific users. Optionally, exclude specific supervisors or agents.
8. Choose **Save** to save the rule as a draft, or **Save and publish** to activate it.

Time off management in Connect Customer

With Connect Customer time off management capabilities, you can manage agent time off requests that comply with pre-configured regional labor and business rules.

Administrators or managers with the appropriate security profile permissions can configure the time off settings. Connect Customer automatically approves or rejects requests depending on how you've configured both the time off rules and the daily maximum allowed time off hours.

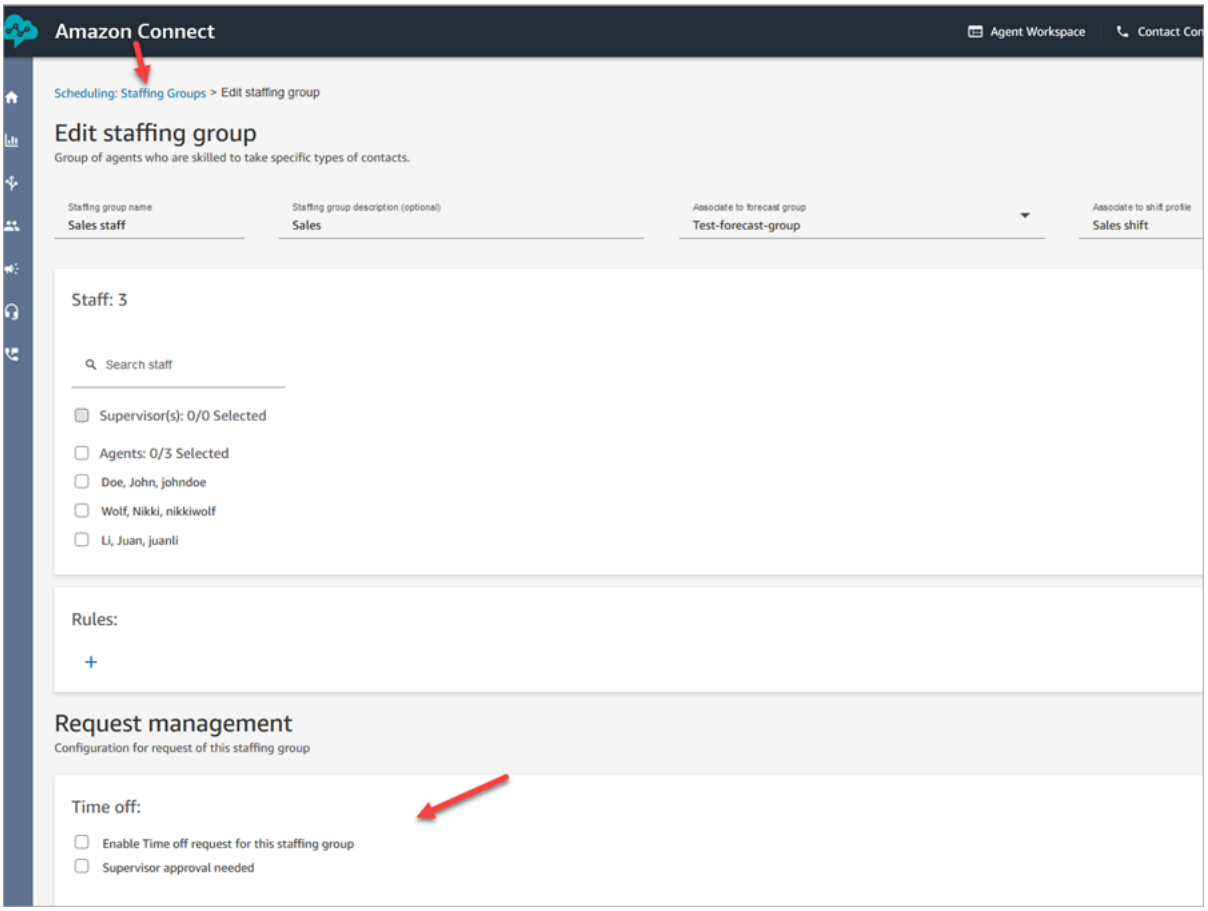
Supervisors or managers with permissions can view agent time off requests and override automatically approved or rejected time off.

Topics

- Enable time off for Connect Customer contact center agents
- Set group allowance for time off in Connect Customer
- Create a time off request in Connect Customer
- Import an agent's time off balance to Connect Customer
- Manager and Agent view request drawer in Connect Customer
- Update or cancel a time off request in Connect Customer
- Time off event stream

Enable time off for Connect Customer contact center agents

You enable time off management for each staffing group. The following image shows the **Request management** section of the **Edit staffing group** page where you configure time off settings.



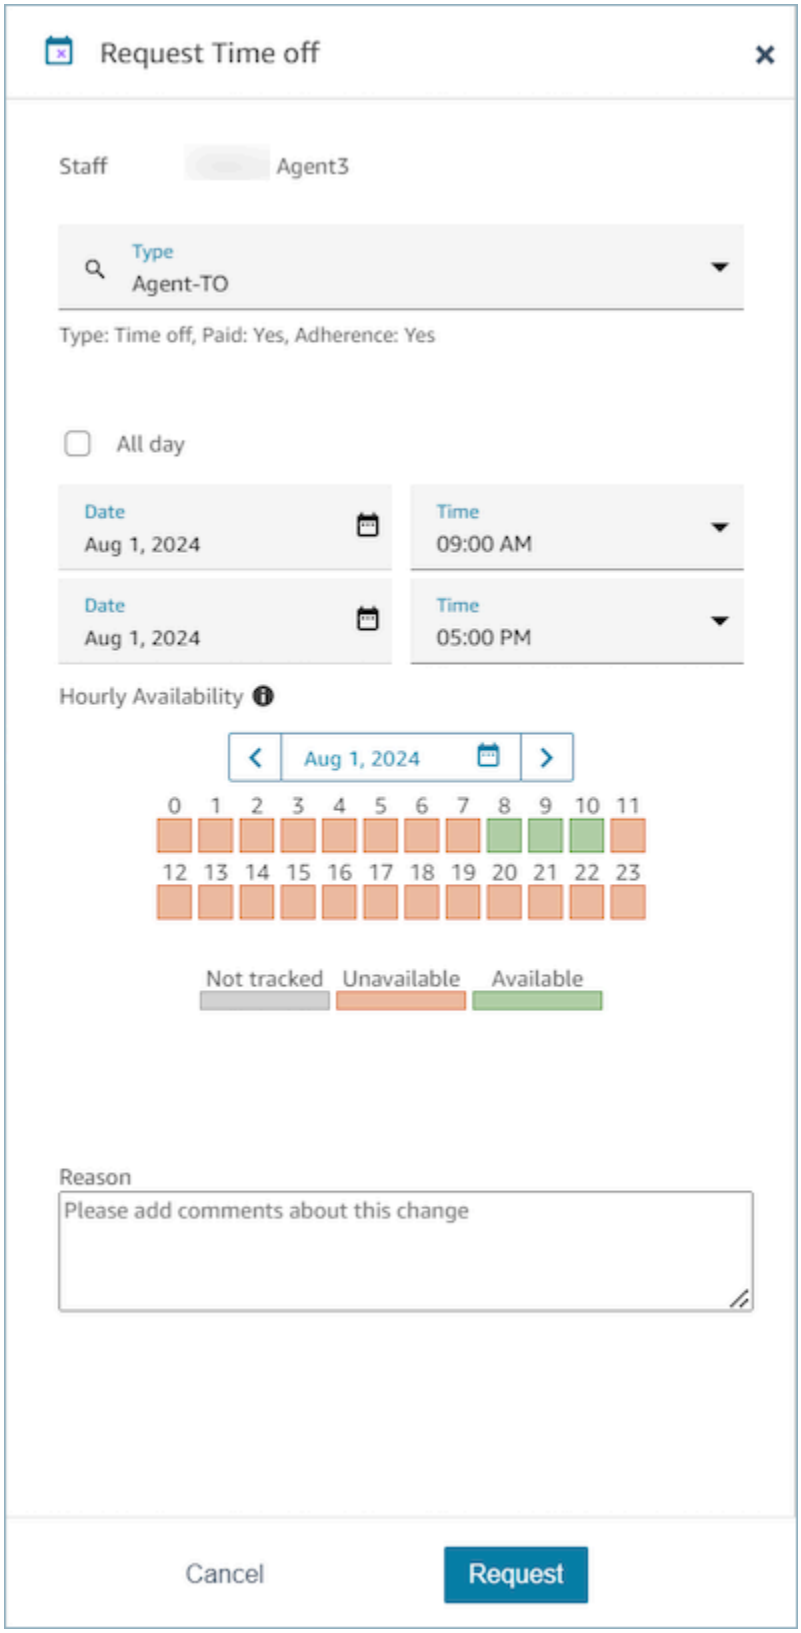
Choose from the following options:

- **Enable Time off request for this staffing group**: This option enables the time off management feature for this group of agents and supervisors. Time offs are automatically approved or rejected based on the availability of time off allowance.

  After you choose this option:

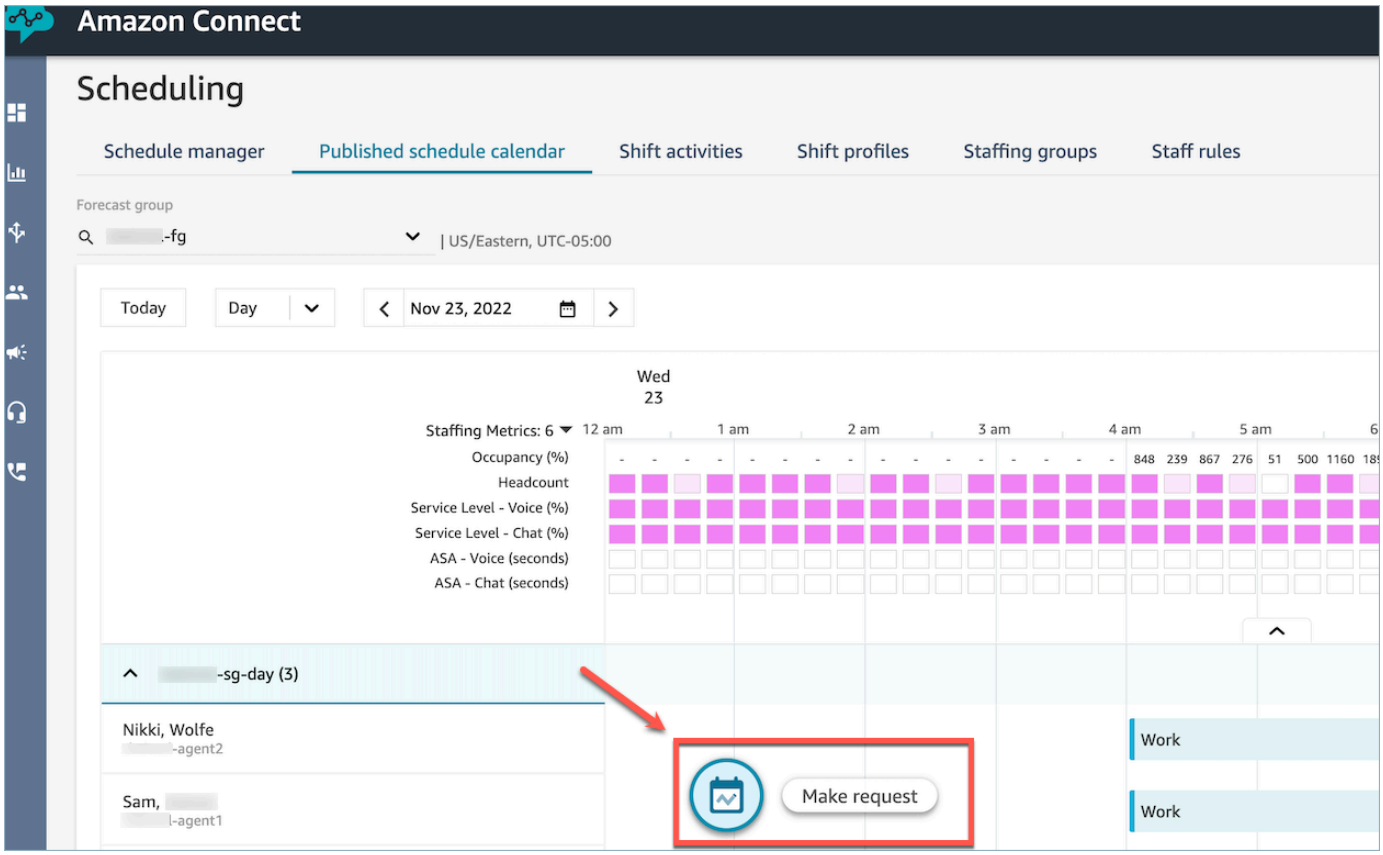
  - Agents can see the **Time off** widget on the agent workspace. (Agents also require the **Agent application schedule calendar - Edit** security profile permission to see the widget.)

    The following image shows an example of the **Time off** widget on the agent workspace.



- Supervisors can see the **Make request** button on the **Published schedule calendar** page. Pending and completed requests are visible in the request drawer.

The following image shows the location of the **Make request** button on the **Published schedule calendar** page.



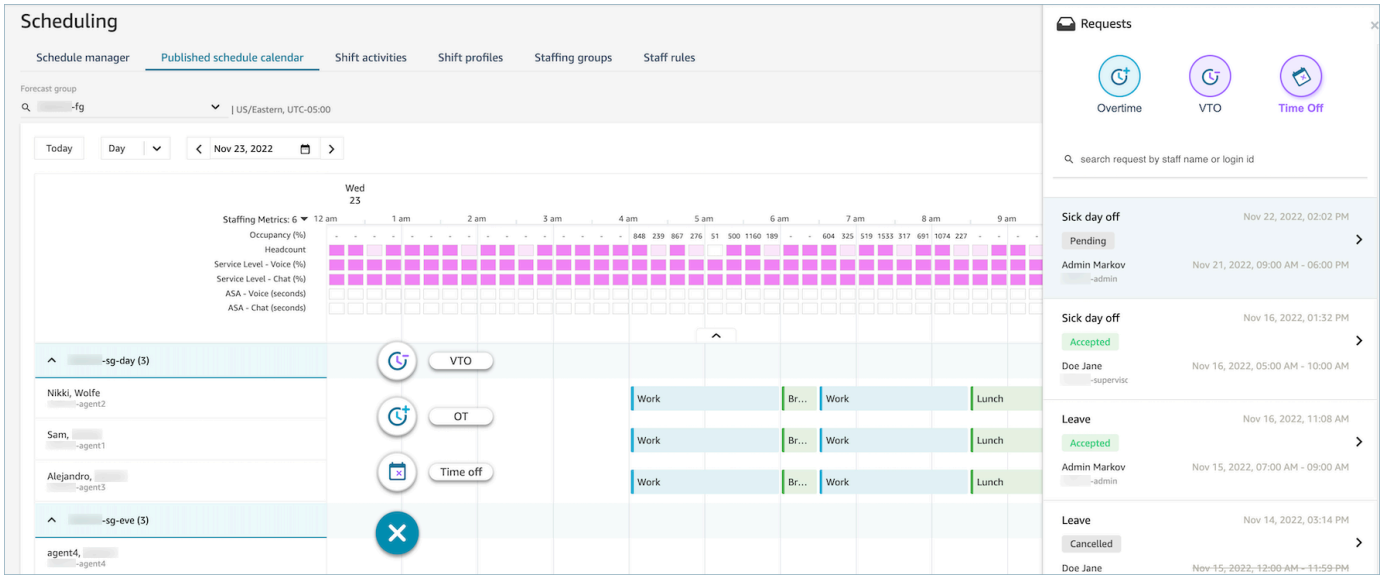
- **Supervisor approval needed**: Choose this option if supervisors need to review every timeoff request, regardless of available balances. Supervisors will need to manually approve or decline all agent time off requests before they are added to the schedule.

  If this option is **not** selected for the staffing group, then a request that meets **both** of the following criteria is auto-approved:

  - The request is within the agent's available time off balance.
  - The request is within the group allowance set by the business for the specified time period.

  Requests that are not auto-approved are displayed as follows:

  - Supervisor drawer: Requests are listed for manual approval. The supervisor has the option to choose **Override time off rules** to override any allowances configured for the agent or group allowance. The following image shows a list of time off requests in the supervisor drawer.



- Agent application: Requests are displayed as **Awaiting Approval**.

Assign security profile permissions to agents so they can request time off

The agent's security profile needs to include the following permissions so they can access the **Time off** widget on their schedule:

- **Agent Applications - Agent application schedule calendar - Edit**

If the agent has only **View** permissions, the **Time off** widget does not appear in the agent schedule.

For more information about the agent's experience, see Agent initiated time off request.

Set group allowance for time off in Connect Customer

Managers can set the maximum time off hours that agents combined can take within the Forecast Group: by hour, for each calendar day, for specific time off activities.

You use a .csv file to quickly specify time off allowances at a hourly level, for up to 27 months. For example, you might specify Vacation, Personal time off, Casual, and other time off types that you specified when you created shift activities.

> **Tip**
>
> **IT admins**: For the endpoints to add to your proxy exception list for this feature, see Allow upload of time-off balances and allowances in Connect Customer scheduling.

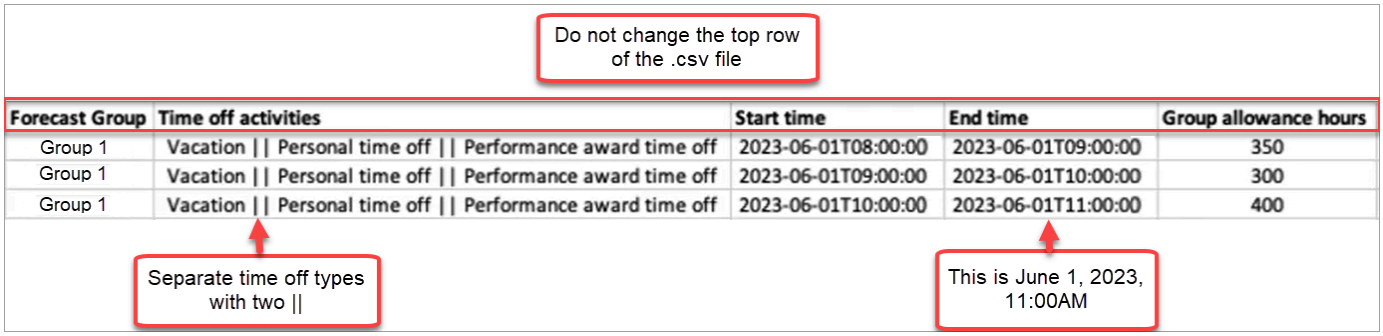
Topics

- Download the time off .csv template
- Download time off for a forecast group
- Import group allowance .csv file
- Example of using the time off allowances feature

Download the time off .csv template

1. On the **Scheduling** page, choose the **Time off** tab.
2. On the **Download** dropdown menu, choose **Download template**.

   The following image shows an example .csv template that contains valid data.



3. When you add your time off data to the template, note the following:

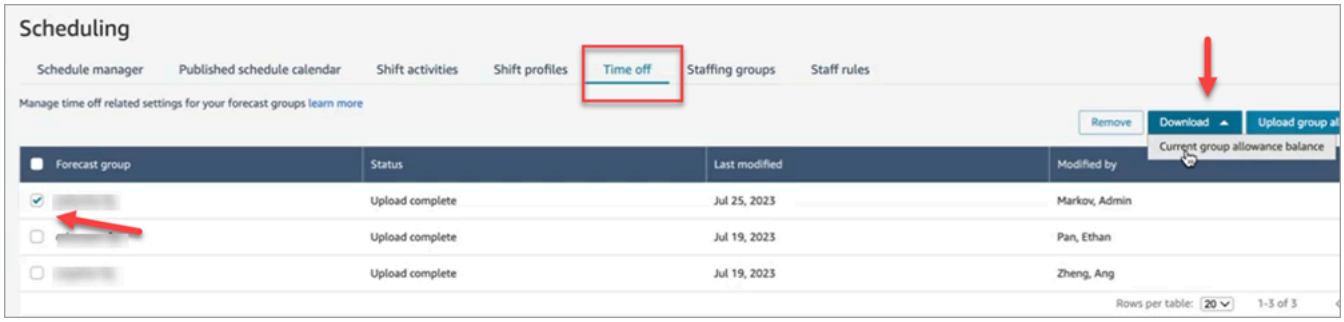
   - Do not change the top row of the .csv file template.
   - In the **Time off activities** column, separate multiple activities with two pipes **||**.
   - Connect Customer interprets the **Start time** and **End time** values in the .csv file as UTC and stores them as-is. Connect Customer converts these UTC times to the local time zone for display in the Published Calendar and when agents apply for time off. If your instance uses a time zone that observes Daylight saving time (DST), enter the timestamps in UTC to avoid display offsets. For example, to show an allowance window of `08:00`–`17:00` BST (UTC+1), enter `07:00`–`16:00` in the .csv file.

- The **Start time** and **End time** must have a one-hour duration and set as multiples of 15 minutes. If they do not meet these criteria, the validation will fail when you attempt to upload your .csv file. The following example shows the error message that you might encounter:

  ```
  Column START_TIME value [2023-08-15T05:01:00] is not a multiple of 15
  minutes from top of the hour, such as HH:00, HH:15, HH:30 and HH:45
  ```

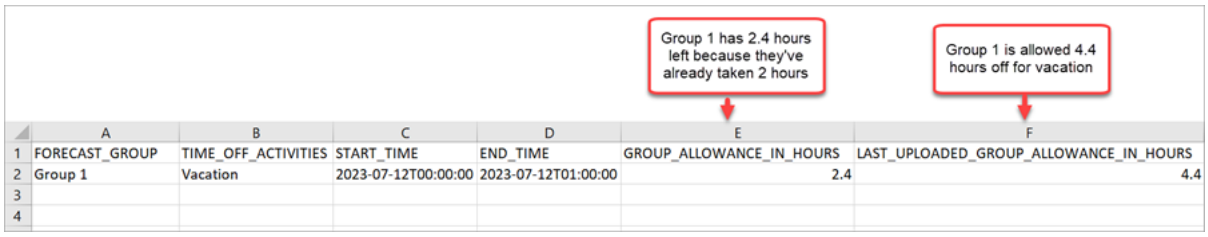
Download time off for a forecast group

1. On the **Scheduling** page, choose the **Time off** tab.
2. Choose one or more forecast groups that you want in the download csv file.
3. On the **Download** dropdown menu, choose **Current group allowance balance**, as shown in the following image.



The .csv file includes the data that was last uploaded to Connect Customer. For example, the following image shows the download time off allowance .csv file.

- **LAST_UPLOADED_GROUP_ALLOWANCE_IN_HOURS**: The last upload for Group 1 was 4.4 hours of vacation.
- **GROUP_ALLOWANCE_IN_HOURS** shows they have 2.4 hours remaining in their allowance, they've already used 2 hours.



Import group allowance .csv file

You can upload multiple csv files for group allowance, Connect Customer will combine them into a single csv file when you download it. If the same combination of forecast group, time off activities, and datetime exists in multiple files, most recent uploaded file will override the data from previous uploads. For example, you can upload one csv file with group allowance for all of 2026 that has non-zero allowance until June 2026 and zero allowance from July to December 2026. This will prevent all time-off bookings for second half of 2026. Then at a later date you can upload another csv file that contains non-zero allowances for July to December 2026, thus opening up these dates for agents to request time-offs.

For the maximum file size that you can upload, see *File size per upload of time off group allowance data* in Forecasting, capacity planning, and scheduling feature specifications.

1. On the **Scheduling** page, choose the **Time off** tab.
2. Choose the Forecast group the group allowance applies to, and then choose **Upload group allowance**. Connect Customer does the following:
   - Validates the data and provides details if there are errors.
   - Prompts you for confirmation that you want to upload the data.
   - Uploads the file and displays a confirmation message when complete.

Example of using the time off allowances feature

For example, your business provides time off in December. Here's how you might use the time off allowances feature:

- Managers can allow a group of agents to take *casual leave* and *regular P.T.O* that add up to a maximum of 12 hours on December 20th, from 9AM to 9PM.
- They can automatically decline those types of time off requests on December 22nd by giving a value of `0` - Zero hours.
- Adding value `0` allows them to specify blocked days. Connect Customer ignores a group allowance check if no value is specified.

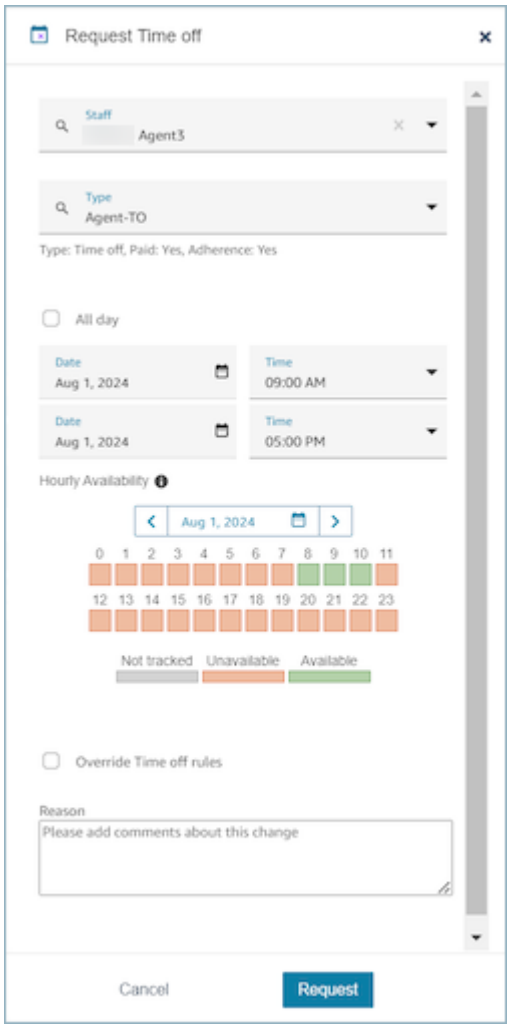
This allows the workforce managers to balance an agent's personal time off needs with business headcount needs.

Create a time off request in Connect Customer

Time off requests can be created by supervisors, managers, or agents in the published schedule. Once created, time off requests are visible in both published and draft schedules. Edits to time off requests can only be done in published schedules.

Supervisor or manager initiated time off request

1. Supervisors or managers can create a time off request by choosing the requests icon and then selecting **Request Time off**.



2. Select **Staff** and the time off **Type**. To select a time off range, you can either select **All day** or select specific start and end date times. Select **Override time off rules** if you wish to override the system and allow time off while dismissing group allowance and other rules specified in Staff, Staffing Group or Shift profile rules. Enter a **Reason** and choose **Request**.
3. **Hourly Availability**

- **Hourly Availability** shows if there is adequate allowance for the time-off activity during that day.
- **Not tracked** implies no hourly availability has been uploaded for that hour. **Not available** implies all available allowance has been used for that hour. Available implies there is time-off allowance available for that hour.

4. The request will enter a *pending* state to allow the system to analyze existing rules (even thought rules checks are overridden) and will display a list of any rule failures.
5. The agent will see the pending request in their schedule UI and will receive an in-app notification next to the **Request** icon which displays as an inbox icon at the top right above the metrics view. This allows the agent to view the request details under the **Time off** tab.
6. After the rules validation completes, the time off request status of **Approved** or **Rejected** will be displayed in both the agent and supervisor views.

> **Tip**
>
> When Connect Customer evaluates time off requests, it factors in the Forecast group allowance for time off and the individual agent's allowance for time off, if they've been specified.

Agent initiated time off request

Agents can go to the schedule calendar view and choose the floating icon to create a time off request. The request drawer opens and allows the agent to enter details related to their time off request.

Import an agent's time off balance to Connect Customer

You can import or export a .csv file of an agent's time off balance. For example, you might download the time off balance from your HR system and then upload it to Connect Customer.

Connect Customer uses the time off balance to automatically approve or decline time off requests based on the agent's available net balance.

For the maximum file size that you can upload, see *File size per upload of agent time off data* in Forecasting, capacity planning, and scheduling feature specifications.

> **Tip**
>
> **IT admins**: For the endpoints to add to your proxy exception list for this feature, see Allow upload of time-off balances and allowances in Connect Customer scheduling.

1. Log in to the Connect Customer admin website with an account that has security profile permissions for **Scheduling**, **Schedule manager - Edit**, or **Scheduling**, **Time off balance - Edit**.

   For more information, see Assign permissions.
2. On the Connect Customer navigation menu, select **Analytics and optimization**, **Scheduling**.
3. On the **Scheduling** page, choose the **Staff Rules** tab.
4. Choose **Download template** and store the .csv file on your desktop. It looks similar to the following image.

	A	B	C
1	Login	Time off activity name	Time off balance in hours
2	[redacted]	Vacation	180.9
3		Sick day	60.5
4		Vacation	230
5		Sick day	120

5. Add data or make changes to the .csv file as needed and then save to your desktop with a new file name.

> **Tip**
>
> To delete an agent's time-off balance, upload a blank value in the time-off balance hours column for that agent.

6. Choose **Upload data** to upload the .csv file. Connect Customer does the following:

   - Validates the data and provides details if there are errors.
   - Prompts you for confirmation that you want to upload the data.
   - Uploads the file and displays a confirmation message when complete.

After the .csv file is successfully uploaded, Connect Customer checks the available time off balance when time off requests are submitted. If there is enough time off balance it approves the request. Otherwise, the request is declined.

- The time off balance for the requested time off type must be equal to or greater than the duration of the requested time off.

Download snapshot

Choose **Download snapshot** to download the full set of the last uploaded time off balance and the net time off balance as of the time of download.

How the system calculates time off deductions

When a staff's time off is approved, the following logic is used to calculate how many hours are deducted from both the staff's time off balance and the group allowance balance:

- If the approved time off period overlaps with one or more staff shifts, then:
  - The system derives the deductible time off hours by taking the total number of overlapped hours for shift activities that have the setting **Deduct from time off balance** as **Yes**.
- If the approved time off period does not have staff shifts that overlap because the schedule for that time period has not been published yet, then:
  - The system would check if the staff is scheduled to work on that day based on the shift profile **Day** (check-box) setting.
    - If the staff is not scheduled to work on this day, or if the approved time off is outside of the configured shift profile time window, then no time off hours will be deducted.
    - If the staff is scheduled to work on that specific day, the system determines the effective shift length based on the configured shift profile. If the shift length is not explicitly set in the profile, the system defaults to the minimum value between the maximum working hours defined in the **Staff Rules** for that staff and the shift window duration specified in

the shift profile, effectively setting the effective shift length. In the event that there is no **Maximum working hours** defined for the staff, the system resorts to the shift window duration assigned within the staff's specific shift profile.

- Based on this effective shift duration, the system would then determine which shift activity group would be used to schedule shifts, and then subtract the duration of all shift activities in this group which have the setting **Deduct from time off balance** as **Yes**.

Time off deduction logic examples

Workforce managers and supervisors can specify which shift activities, in addition to default work activities, will be counted towards their agents' time-off balance. The following highlights an example of this feature:

There are two time offs configured:

- Vacation time - activity name: VACAY_SK
- Sick time - activity name: SICK_SK

Agent 1 has a vacation (VACAY_SK) balance of 30 hours.

Agent 2 has a sick (SICK_SK) balance of 12 hours.

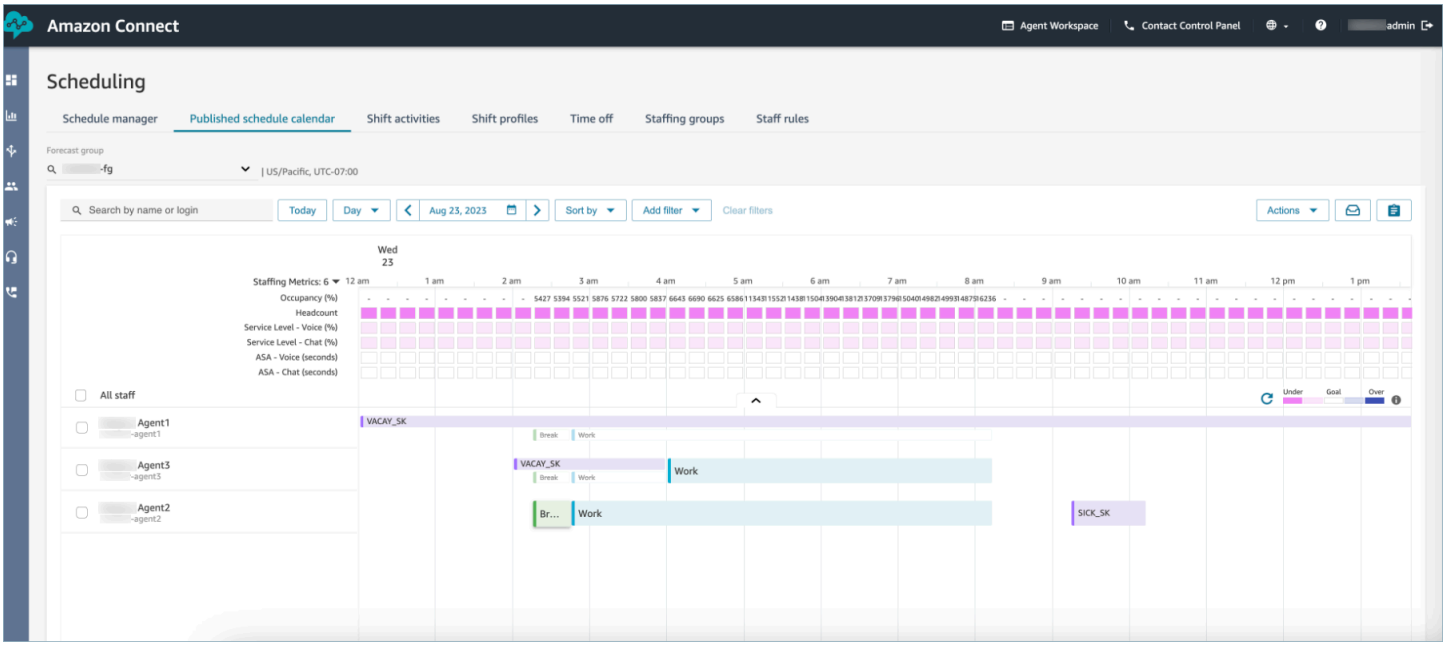
Agent 3 has a vacation (VACAY_SK) balance of 15 hours.

Agent 1, 2 and 3 have a 6-hour shift. In these shifts, there is a 30 minute **Break** activity for which **Deduct from time off balance** is set to **No**.

Scenarios

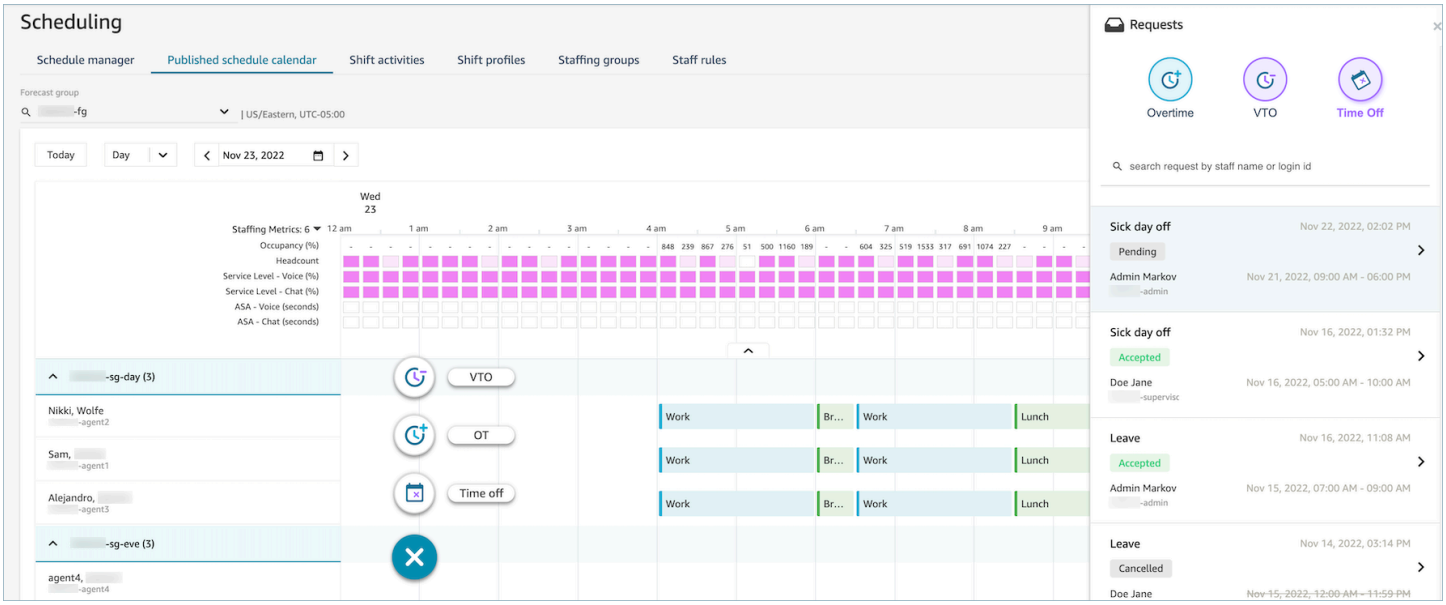
- Agent 1 requested an all-day time off (VACAY_SK). Once time off is approved, the system will deduct 5 hours 30 minutes from the current time off balance of 30 hours. 30 minutes for the **Break** activity will not be deducted because the shift activity flag **Deduct from time off balance** is set to **No**. The net balance after time off deduction will become 24 hours and 30 minutes.
- Agent 2 requested time off outside of their shift hours (between **9:15 am** – **10:15 am**). In this case, given the request is outside of the planned schedule, the system will not deduct from the agent's time off balance.
- Agent 3 requested time off between **2 am** to **4am**, partially outside of their shift and partially overlapping the shift. The **Deduct from time off balance Break** activity falls within the time off

request. In this scenario, the system will deduct 1 hour 15 minutes for the duration between **2:45 am** to **4:00 am**. The vacation balance for agent 3 would now be 13 hours and 45 minutes.



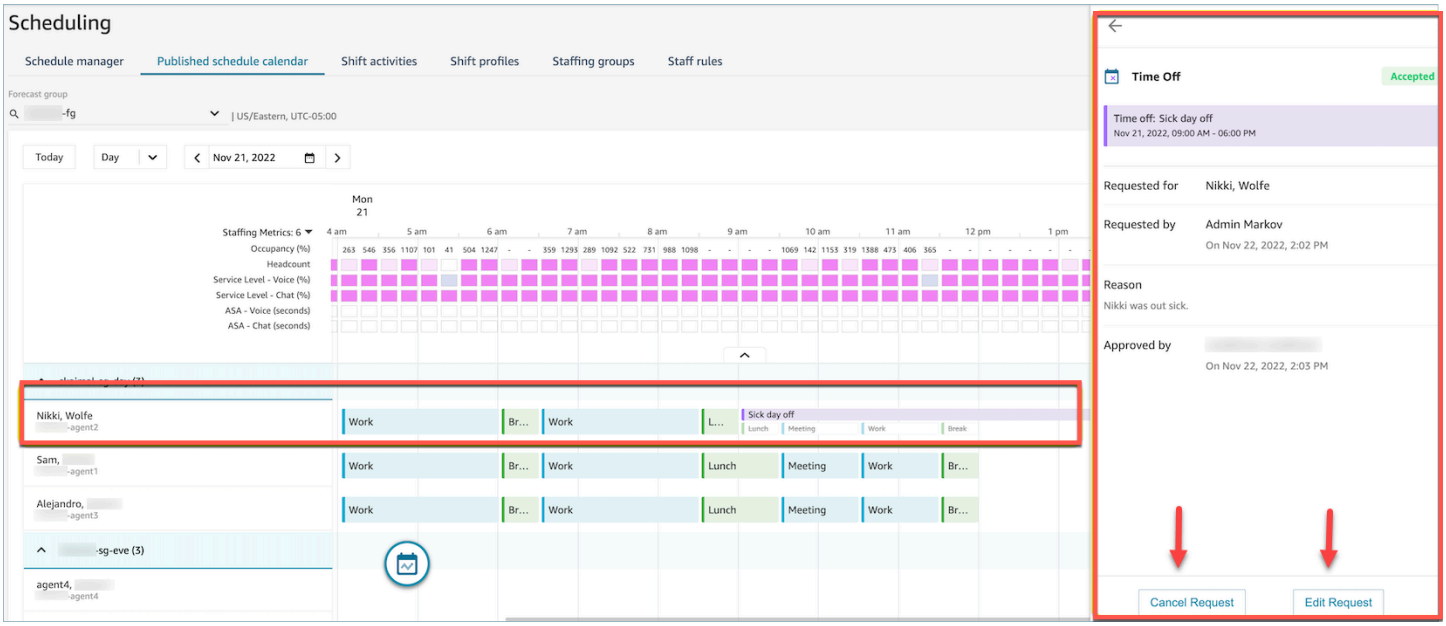
Manager and Agent view request drawer in Connect Customer

At any time supervisors can go to the request drawer under the time off tab and search for an agent by first name, last name or login ID to view all time off requests for a specific agent.

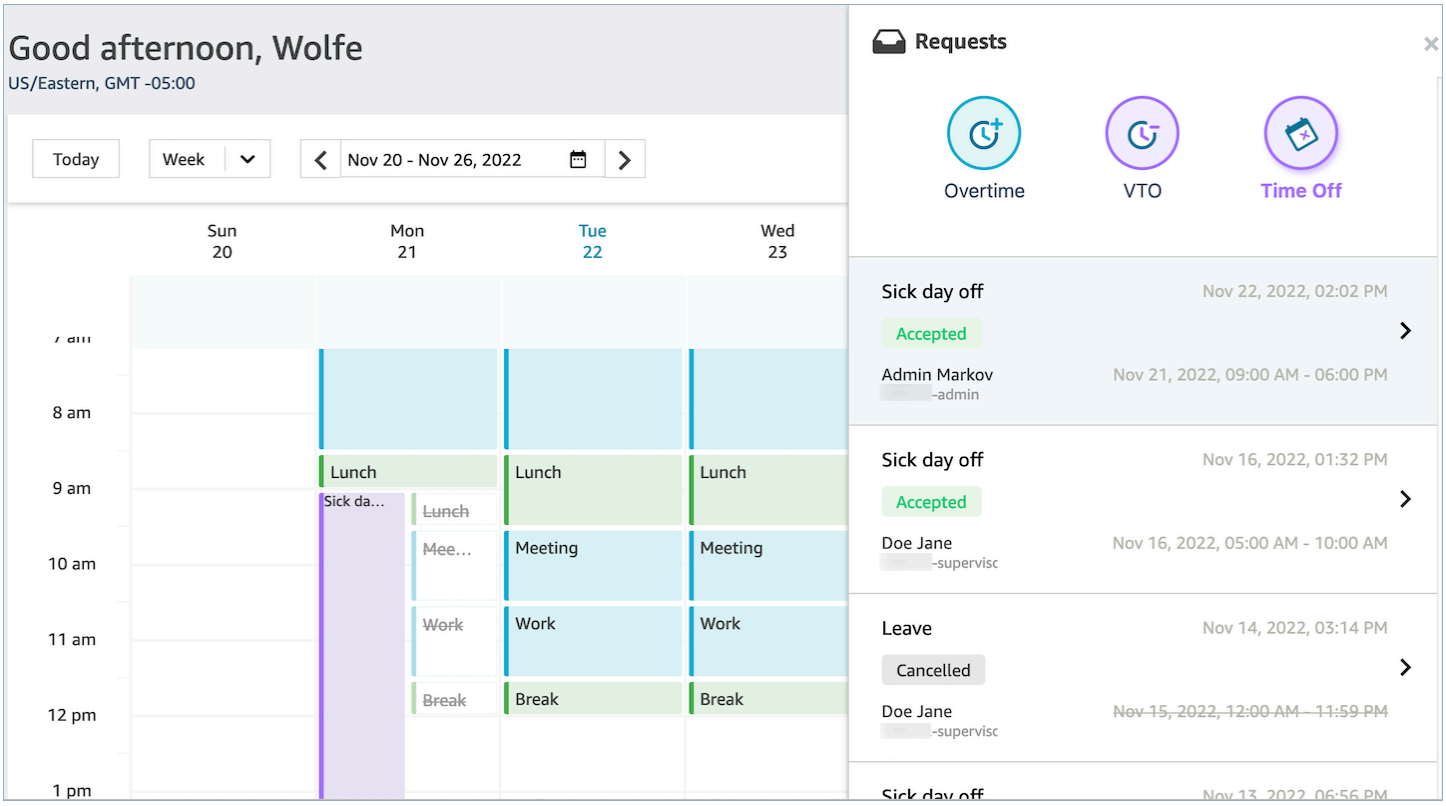


Update or cancel a time off request in Connect Customer

A supervisor can cancel or edit a time off request by choosing the **Cancel Request** or **Edit Request** buttons at the bottom of the request drawer window. The following image shows the time off requests from Nikki Wolfe.



An agent will see the updated time off status in their calendar and request drawer. The following image shows the status of Nikki Wolfe's time off requests. Her requests for Sick day off were Accepted.



Time off event stream

You can use time off events to integrate Connect Customer scheduling with external HR systems, for example, to drive leave-approval workflows. Connect Customer publishes a time off event to EventBridge each time an agent's time off request changes status, directly to your account's default event bus.

Each event uses the following source and detail-type values.

- Source: `aws.connect`
- Detail-type: `Amazon Connect Time Off Event`

Connect Customer emits an event when a time off request transitions to one of the following statuses, or when a published field on the request changes:

`AWAITING_APPROVAL`

The request has been submitted and is awaiting approval.

`APPROVED`

The request has been approved and added to the schedule.

`REJECTED`

The request was rejected.

`CANCELLED`

The request was cancelled.

Delivery is at-least-once, so the same event can be delivered more than once. Each event includes an `eventId` value that is stable across retries and redeliveries of the same change. Deduplicate on `eventId`. Do not deduplicate on the envelope `id` field, which EventBridge regenerates for each delivery.

The following example shows a time off event payload:

```

        "effectiveTimeOffHours": 1.5,
        "isAllDayTimeOff": false,
        "createdTimestamp": "2026-05-15T10:30:00.000Z",
        "lastUpdatedTimestamp": "2026-05-15T10:30:00.000Z"
    }
}
```

The following table describes the fields in the `detail` object of the event.

Field	Description
`eventId`	A unique, stable identifier for the event. Use this value to deduplicate events.
`instanceArn`	The ARN of the Connect Customer instance.
`timeoffId`	The identifier of the time off request.
`agentArn`	The ARN of the agent that the time off request is for.
`staffingGroupArn`	The ARN of the staffing group. This field is omitted when the request has no staffing group.
`forecastGroupArn`	The ARN of the forecast group.
`shiftActivityArn`	The ARN of the shift activity.
`timeoffStatus`	The status of the time off request: `AWAITING_APPROVAL` , `APPROVED`, `REJECTED`, or `CANCELLED` .
`timeoffStartTimestamp`	The start of the time off period, in UTC ISO-8601 format with millisecond precision.
`timeoffEndTimestamp`	The end of the time off period, in UTC ISO-8601 format with millisecond precision.

Field	Description
`effectiveTimeOffHours`	The number of time off hours for the request. This field is omitted until the request is approved, so it doesn't appear on `AWAITING_APPROVAL` events or on requests rejected before approval.
`isAllDayTimeOff`	Whether the request is for the entire day.
`createdTimestamp`	When the time off request was created, in UTC ISO-8601 format with millisecond precision.
`lastUpdatedTimestamp`	When the time off request was last updated, in UTC ISO-8601 format with millisecond precision.

The envelope `resources` array contains both the instance ARN and the agent ARN, so you can filter EventBridge rules at instance or agent granularity.

Overtime management for call center agents in Connect Customer

Simultaneously achieving Service Level (SL), Average Speed of Answer (ASA), and cost targets requires matching supply (# of agents) and demand (# of contacts * handle time). Overtime (OT) and Voluntary Time Off (VTO) are two mechanisms that the contact center management team can deploy to achieve both targets. OT allows handling a contact surge or agent shortages without the need to hire more employees while VTO allows handling a low volume contact period without the expenses of employees in an idle state.

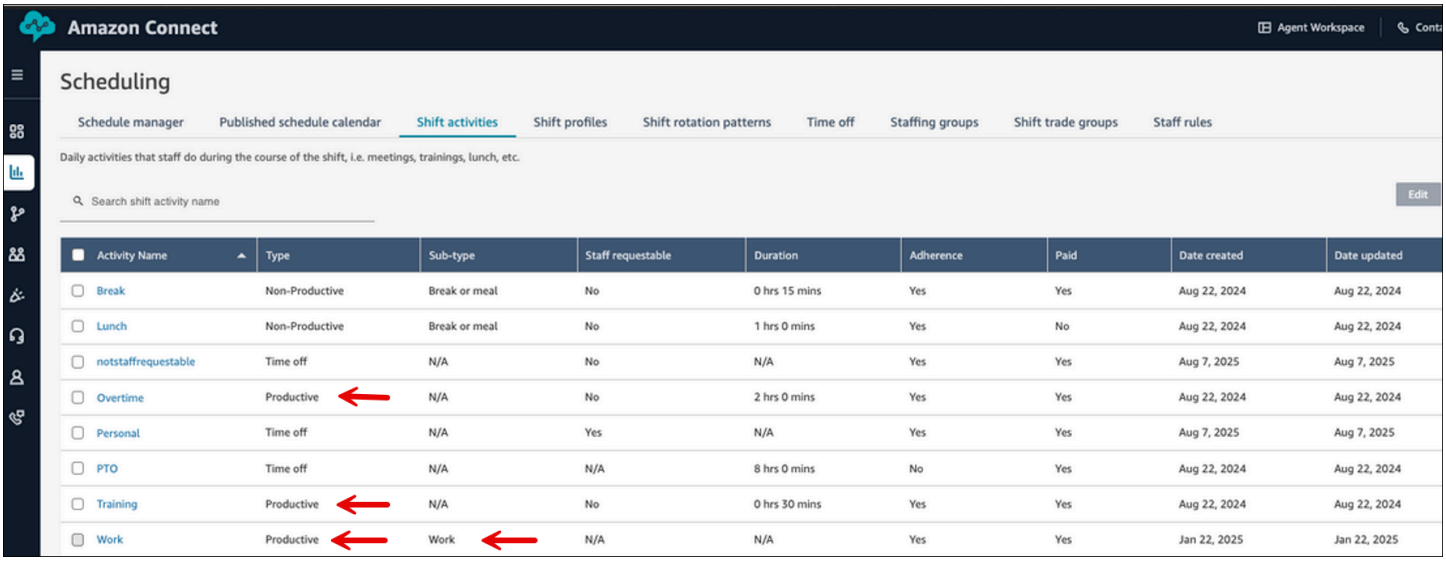
Topics

- Create overtime slots for contact center agents in Connect Customer
- Contact center agent ability to accept or decline overtime in Connect Customer
- Connect Customer contact center supervisor ability to override approval for overtime and time off
- Overtime for multi-skill forecast groups

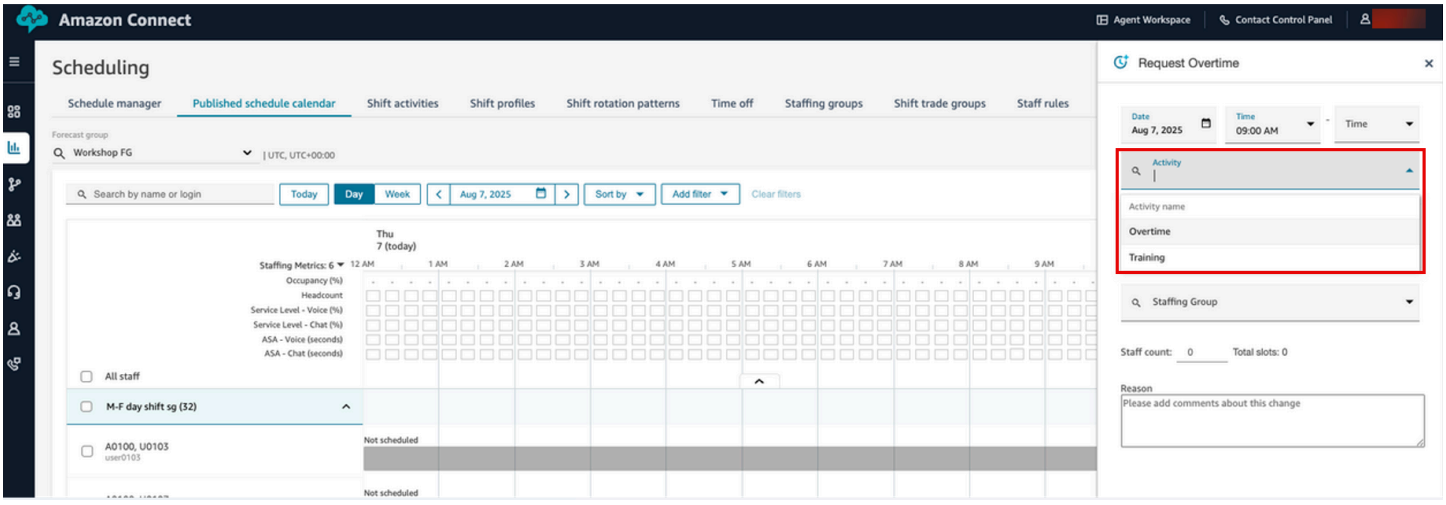
Create overtime slots for contact center agents in Connect Customer

You can create overtime slots for specific activities. This feature applies to activities that aren't the **Work** sub-type. Activities with the **Work** sub-type are not available in the Activity list dropdown where a user requests overtime.

For example, the following image shows three different **Productive** shifts: Overtime, Training, and Work. The activity named Work has the sub-type **Work**.



The following image shows that while requesting Overtime, in the Activity dropdown, only Overtime and Training activities are shown. The productive activity Work with the sub-type **Work** is not shown.

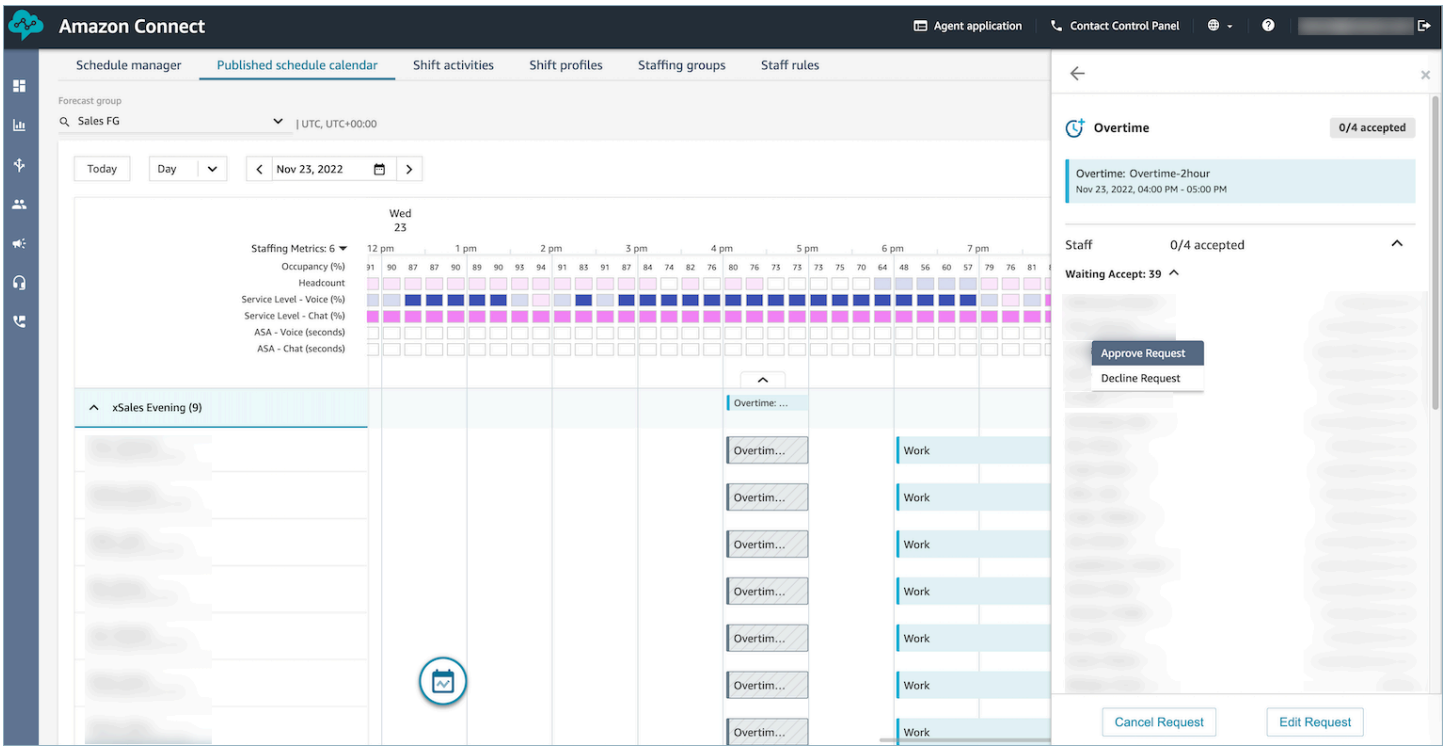


To create overtime slots

1. Choose the **Make Request** button in the **Published schedule calendar** UI and select **OT**.
2. A supervisor or manager enters the date and time range for overtime.
3. Select the productive activity from the Activity list.
4. Select by Staffing group or by Staff rules.
   - Staffing Groups send a notification to all agents regarding availability of overtime slots. Agents are approved based on a first come, first served model.
   - Staff rules allow supervisors to select specific agents to send overtime notifications to.
5. Select the number of required overtime slots.
6. Provide the reason for requesting overtime in the **Reason** text box. Agents can view the reason before accepting or declining the overtime request.
7. Choose **Request**.

Contact center agent ability to accept or decline overtime in Connect Customer

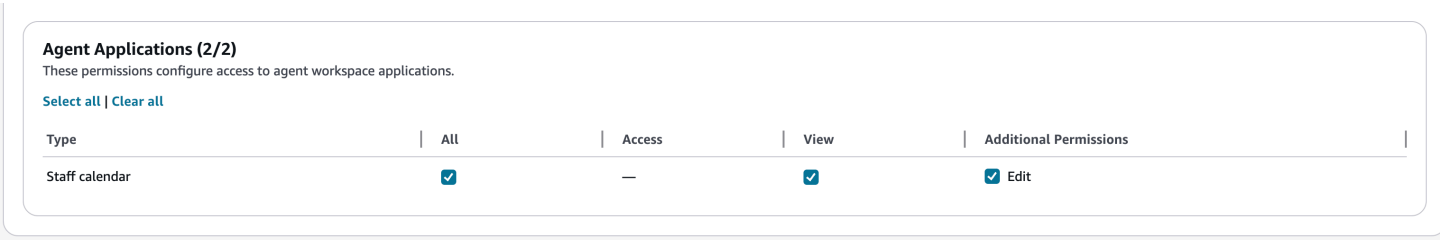
The following image shows pending Overtime requests in the agent calendars. Managers and agents can see overtime requests.



Agents can accept or decline overtime in the Agent application schedule calendar.

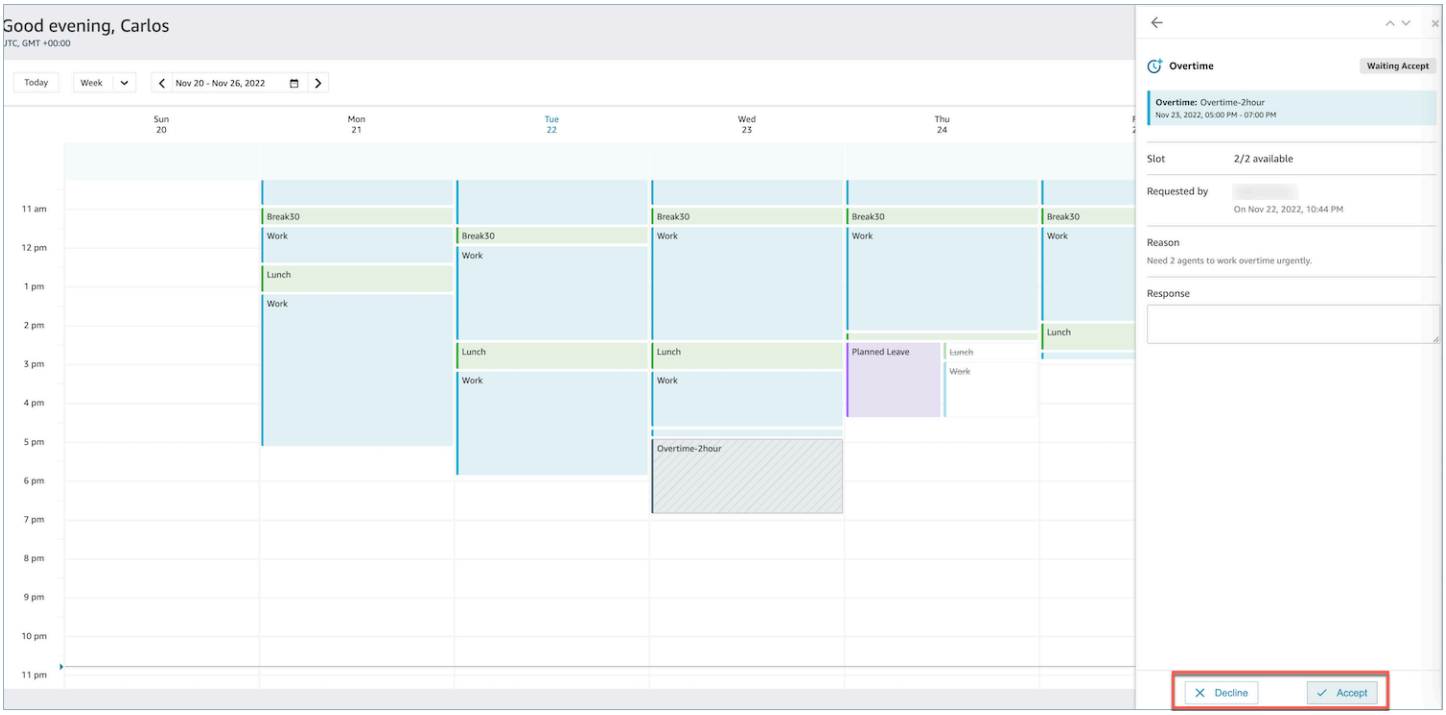
Required security profile permissions

To accept or decline the request, an agent must have **Agent application schedule calendar - Edit** permissions in their security profile. This permission is shown in the following image of Agent Applications permissions on the security profiles page.



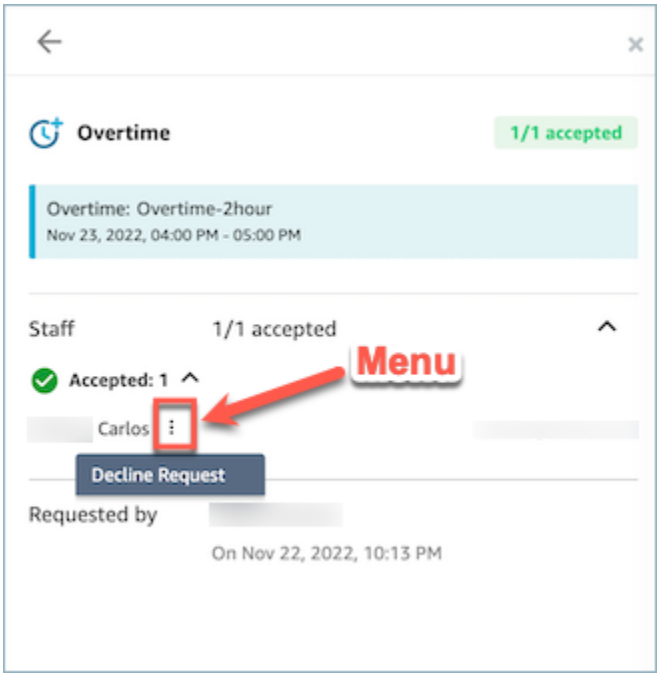
Accept and Decline overtime buttons for agents

The following image shows the Accept and Decline buttons.



Connect Customer contact center supervisor ability to override approval for overtime and time off

Managers can override the system approval for OT/VTO and force decline a request by choosing on the vertical ellipsis next to the agent name. This option is shown in the following image of the **Overtime** pane.



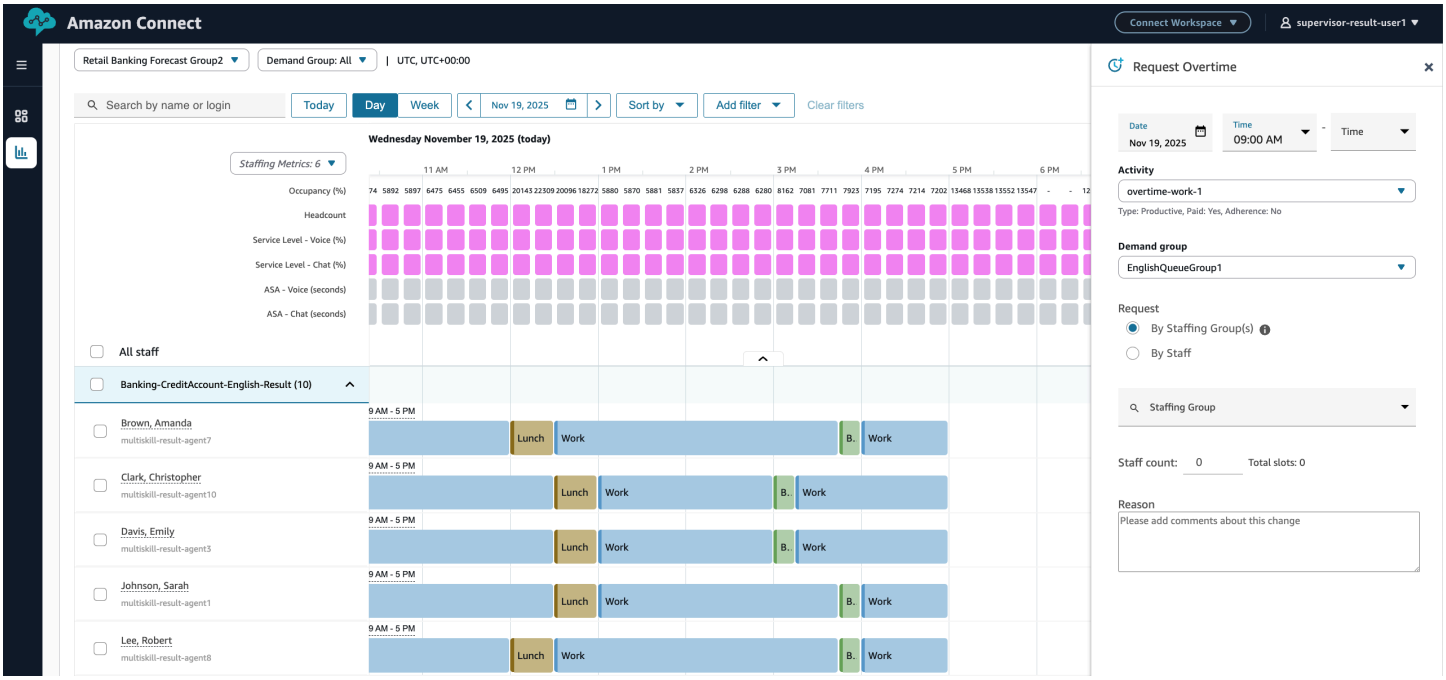
Overtime for multi-skill forecast groups

Supervisors and Managers can restrict over time slots to specific demand groups.

For information on multi-skill, see Multi skill scheduling

To use the feature

Mention the demand group while requesting for overtime. Only agents who are associated with the demand group will be approved for over time slots



Manage contact center agent shortages during a contact surge

Simultaneously achieving Service Level (SL), Average Speed of Answer (ASA), and cost targets requires matching supply (# of agents) and demand (# of contacts * handle time).

Overtime (OT) and Voluntary Time Off (VTO) are two mechanisms that the contact center management team can deploy to achieve both targets.

OT allows handling a contact surge or agent shortages without the need to hire more employees while VTO allows handling a low volume contact period without the expenses of employees in an idle state.

Topics

- Create Voluntary time off slots for agents in your contact center
- How contact center agents accept or decline a time off request
- How a supervisor overrides system approval of an agent's time off request
- Voluntary time off for multi-skill forecast groups

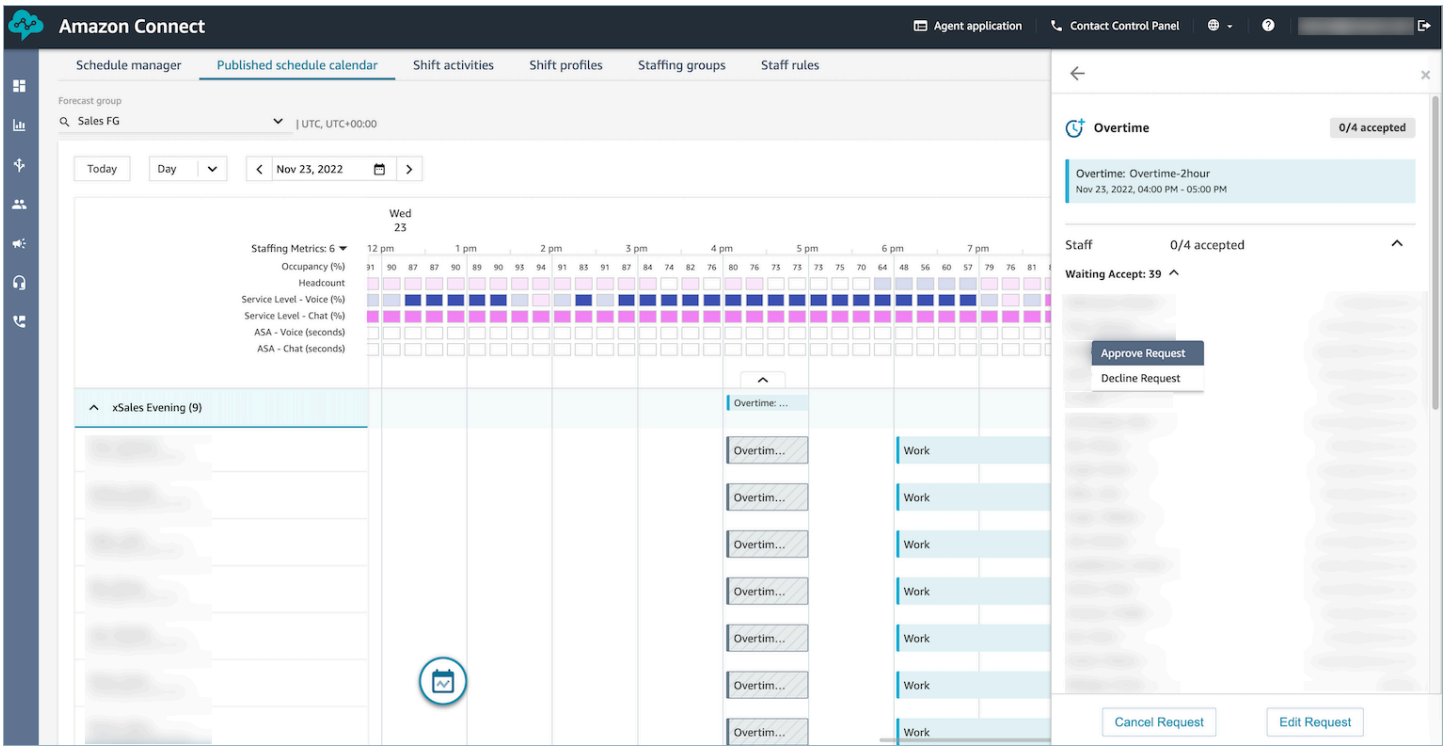
Create Voluntary time off slots for agents in your contact center

1. Choose the **Make Request** button in the Published schedule calendar UI and select **VTO**.

2. A supervisor or manager enters the date and time range for voluntary time off.
3. Select the productive activity from the Activity list.
4. Select by Staffing group or by Staff rules.
   - Staffing Groups send notifications to all agents regarding the availability of overtime slots. Agents are approved based on a first come, first served model.
   - Staff rules allow supervisors to select specific agents to send overtime notifications to.
5. Select the number of required voluntary time off slots.
6. Provide the reason for requesting voluntary time off in the **Reason** text box. Agents will be able to view the reason before accepting or declining the overtime request.
7. Choose **Request**

How contact center agents accept or decline a time off request

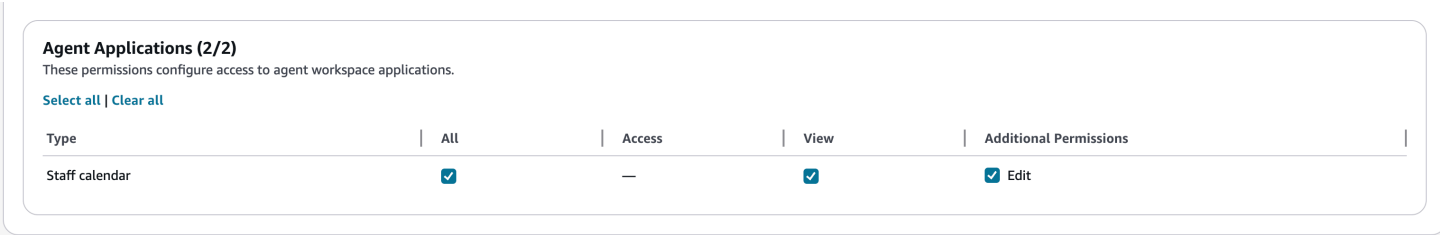
The contact center manager and agents will see the pending voluntary time off requests in the agent calendars.



Agents can accept or decline voluntary time off (VTO) in the Agent application schedule calendar. To do this, agents need **Edit** security profile permissions. For more information about security profile permissions, see Update security profiles.

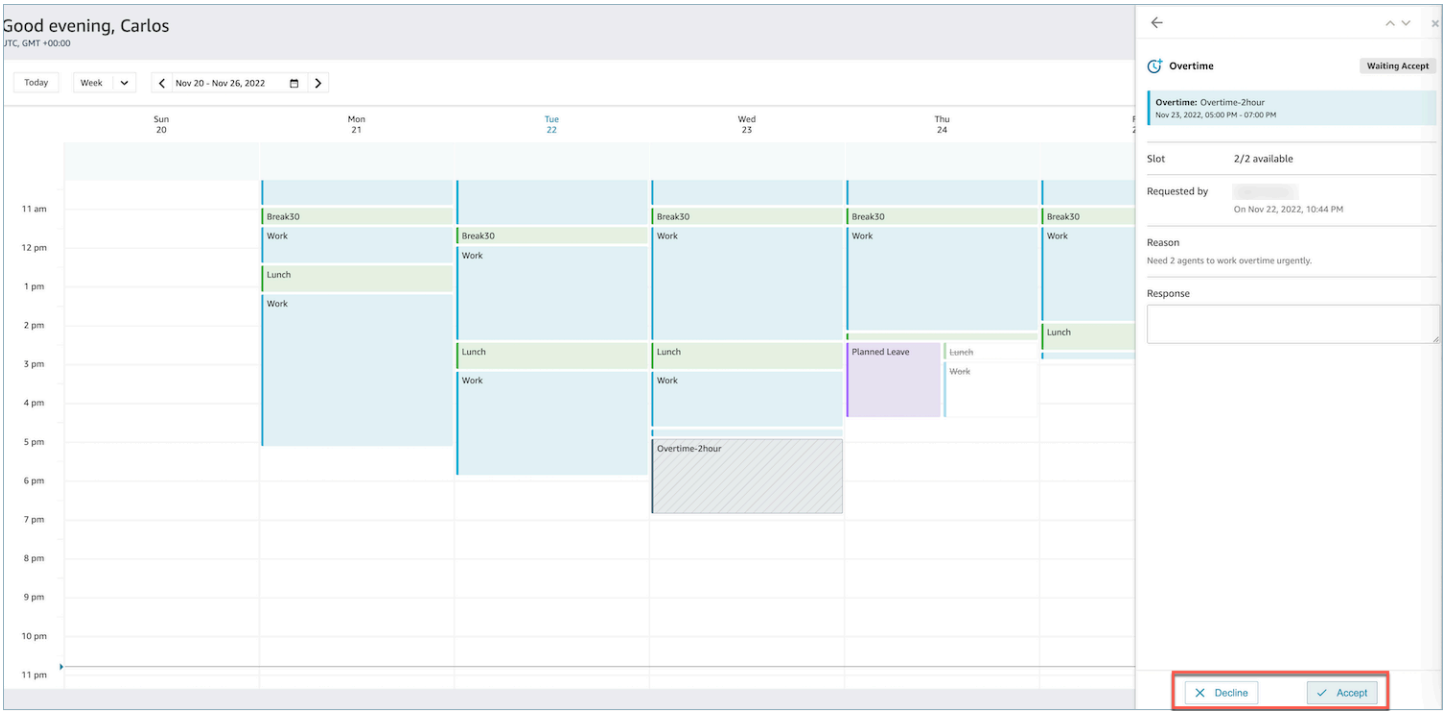
Required security profile permissions

To accept or decline the request, an agent must have **Agent application schedule calendar - Edit** permissions in their security profile. This permission is shown in the following image of Agent Applications permissions on the security profiles page.



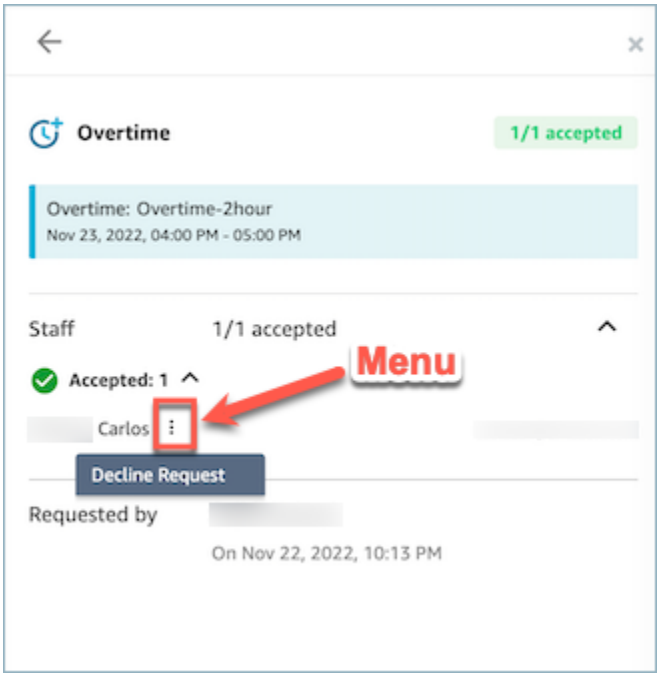
Accept and Decline buttons for agents

The following image shows the **Accept** and **Decline** buttons on the agent workspace.



How a supervisor overrides system approval of an agent's time off request

Managers can override the system approval for OT/VTO and force Decline a request by choosing the vertical ellipses next to the agent name. This option is shown in the following image of the **Overtime** pane.



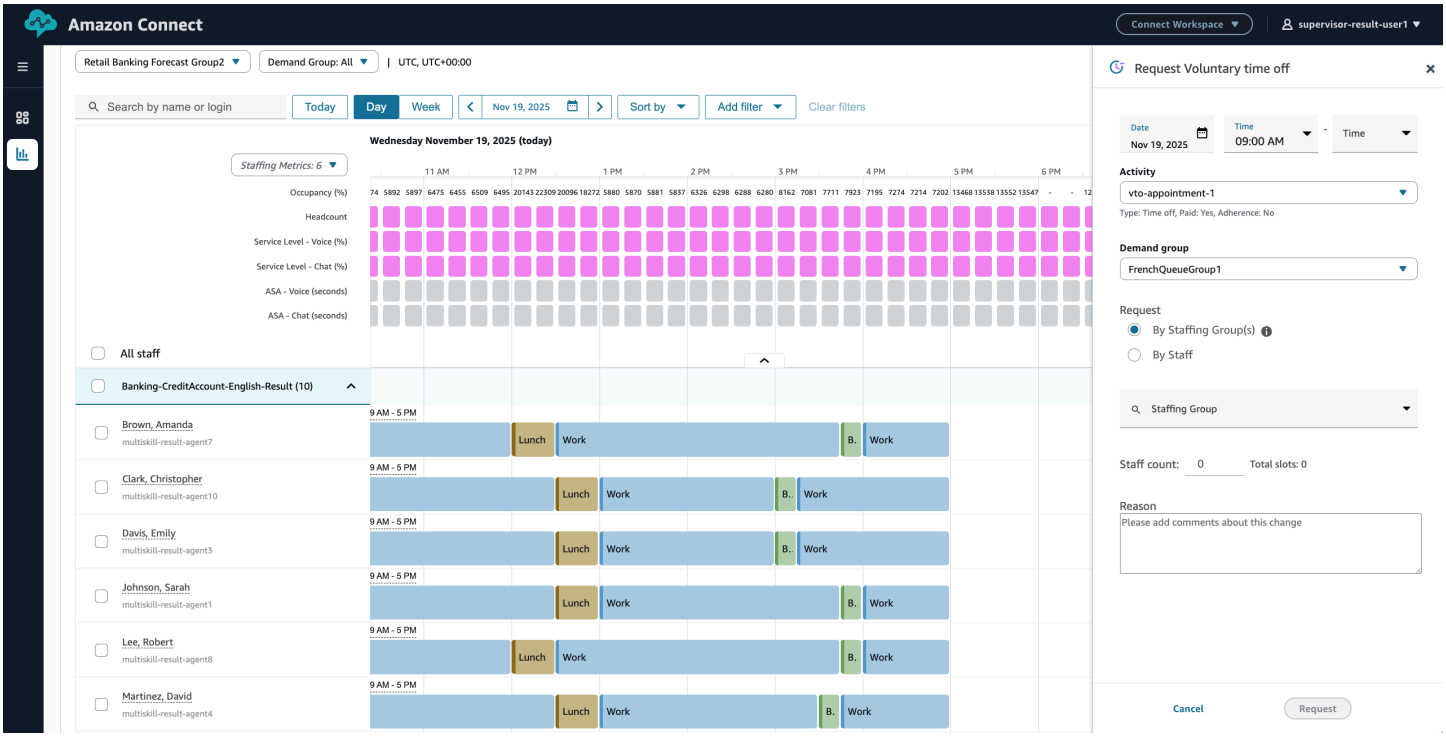
Voluntary time off for multi-skill forecast groups

Supervisors and Managers can restrict voluntary time off slots to specific demand groups

For information on multi-skill, see Multi skill scheduling

To use the feature

Mention the demand group while requesting for voluntary time off. Only agents who are associated with the demand group will be approved for voluntary time off slots



Schedule Adherence for agent productivity in Connect Customer

Contact center supervisors or managers track schedule adherence to understand when agents are following the schedule that you have created. This helps make sure you achieve your service level targets, while improving agent productivity and customer satisfaction.

Before you begin, note the following:

1. Schedule Adherence requires that schedules are created and published. For more information, see Scheduling in Connect Customer.
2. Make sure you have the right permissions to access metrics and scheduling information. For more information about the required permissions, see Assign permissions.

Topics

- How adherence is determined

- Where you can view schedule adherence
- Monitor adherence with thresholds

- Set up schedule adherence notifications
- What happens when ....
- Schedule Adherence metrics in Connect Customer
- Real-time Schedule Adherence in Connect Customer
- Examples of Agent Adherence calculations in Connect Customer
- Examples of adherence thresholds for agent shifts in Connect Customer

How adherence is determined

Connect Customer begins generating schedule adherence automatically as soon as a published schedule starts that has shift activities where `Adherence = yes`.

Adherence for a given shift activity is determined using the **Default** or **Custom** methods.

- The **Default** method uses the Productive/Non-productive flag on shift activities.

  An agent is considered adherent when they are scheduled for Productive activities and have the "Available" status, or when they are scheduled for Non-Productive activities and have the "Offline" status or any custom status.

  For example, when an agent is scheduled for the Productive activity "Back-office work" and their status in Connect Customer is "Offline," they are considered non-adherent to their schedule.
- With the **Custom** method, you can map specific shift activities to agent statuses for determining adherence.

  An agent is adherent when their current status matches any of the mapped statuses for their scheduled activity.

  For example, if you map the "Back-office work" activity to both the "Back-office work" and "Offline" statuses, an agent is considered adherent when they are in either of these statuses during their scheduled "Back-office work" activity. Any unmapped agent status (such as "Available" in this example) is considered non-adherent.

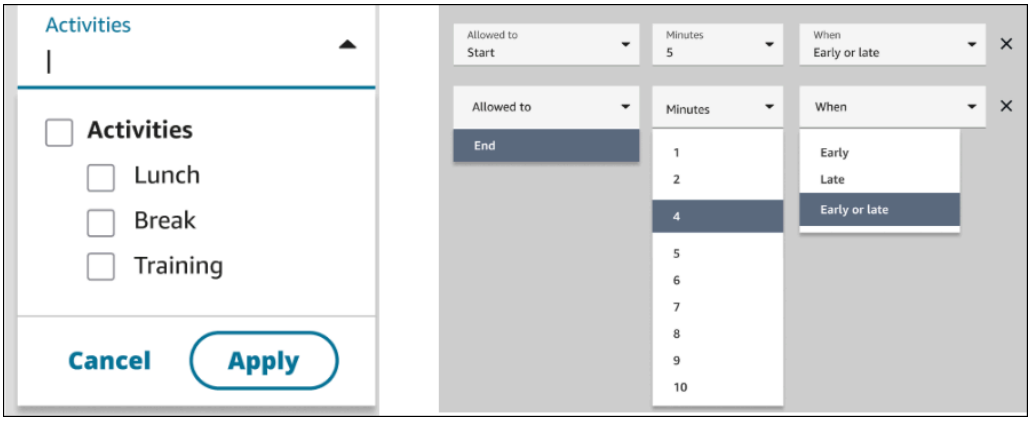
If an agent has no schedule, their adherence status will be marked as "Unscheduled" to indicate the absence of a defined schedule for that time period.

For examples that show how Adherent and Non-adherent time are calculated, see Examples of Agent Adherence calculations.

You can configure adherence thresholds for individual activities like Break, Training, and Lunch using the following activity threshold settings:

- **Allowed to:** Choose whether the threshold applies to activity Start or End time.
- **Minutes:** Select the threshold duration (1-10 minutes).
- **When:** Specify if agents can be Early, Late, or Early or late while remaining adherent.

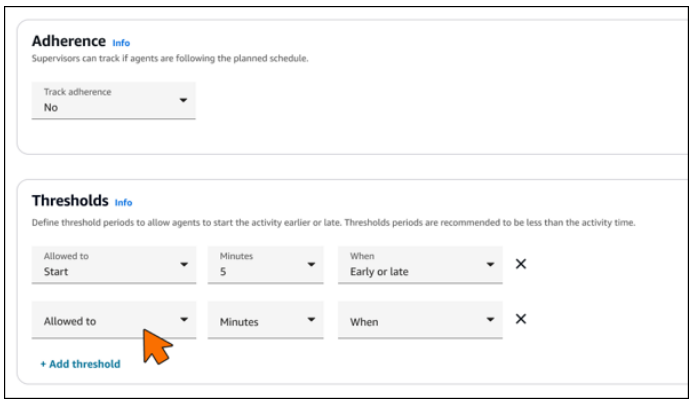
Each activity can have its own threshold configuration to accommodate different operational needs. For example, you might configure a 5-minute early/late threshold for breaks to accommodate agents who are finishing customer interactions. The following two images show these options.



Configure adherence thresholds

Complete the following steps to configure activity-based thresholds.

1. In Connect Customer admin website, navigate to **Schedule Management**, **Shift Activities.**
2. Select an activity, and then choose **Edit**.
3. On the **Add shift activity** page, under **Adherence**, set **Track adherence** to **Yes**.



4. In the **Thresholds** section, choose **Define thresholds**.
5. Configure the following options:
   - **Start Early/Late**: How many minutes before/after scheduled time an agent can start.
   - **Allowable variance**: Minutes allowed to extend or reduce the activity.

Staffing group threshold configuration

You can configure specific thresholds for activities within a staffing group. Complete the following steps.

1. In Connect Customer admin website, navigate to **Scheduling**, **Staffing Groups**.
2. Select a staffing group.
3. Under **Adherence Settings**, you can:
   - Select which activities to override (Break, Training, Lunch)
   - Configure specific thresholds for the selected activities:
     - **Allowed to**: Start or End time
     - **Minutes**: 1-10 minutes
     - **When**: Early, Late, or Early or late
   - Apply the changes only to selected activities within the staffing group.

You can see which thresholds are active in the **Queue and agent performance** dashboard's **Using thresholds** status.

Important

- The maximum threshold value is 10 minutes.
- Each activity can have its own threshold settings.
- Thresholds apply to all agents assigned to the staffing group.
- Changes to thresholds apply to future adherence calculations only.

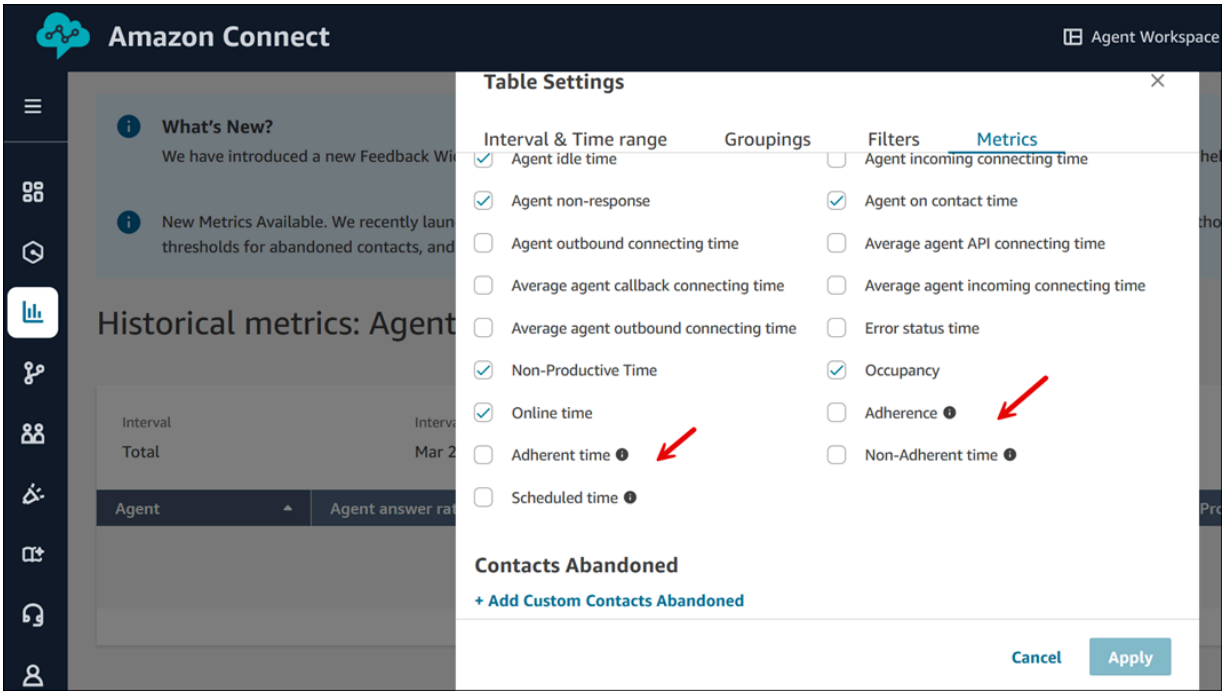
Where you can view schedule adherence

Real-time and historical metrics reports

You can view Schedule Adherence metrics on the **Historical metrics** and **Real-Time metrics** pages. The Schedule Adherence metrics are:

- Adherent time
- Adherence
- Scheduled time
- Non-adherent time

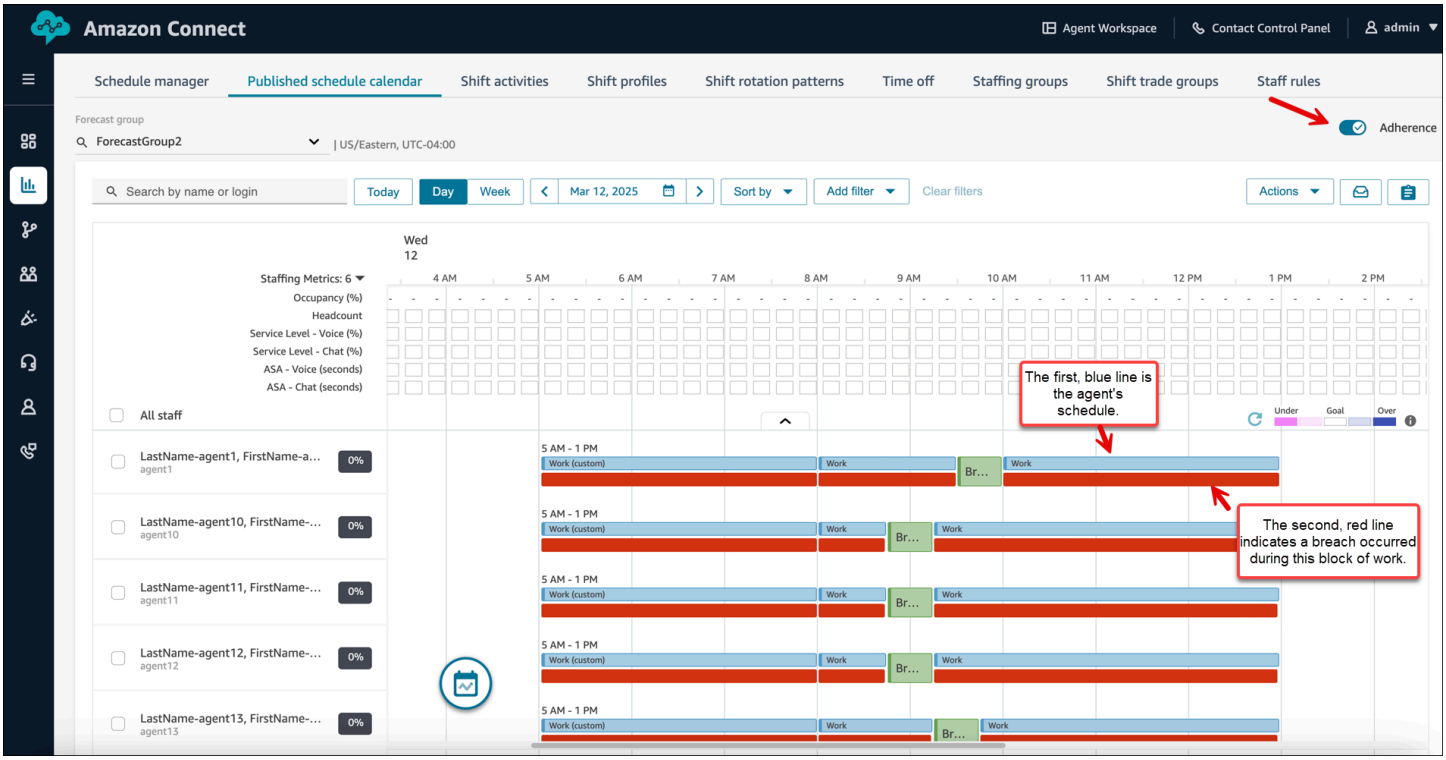
The following image shows an example of choosing Schedule Adherence metrics to appear in a historical metrics report.



Published calendar view

You can also view schedule adherence data in a calendar view. This view provides a visual and intuitive representation of adherence breaches by agent and day, for up to 30 days in the past, alongside their shifts. With this visualization, you can immediately spot adherence breaches across your team, prioritize the most critical incidents, compare with past agent behavior, and take steps to address concerns with the agent. For more information, see How supervisors view published schedules.

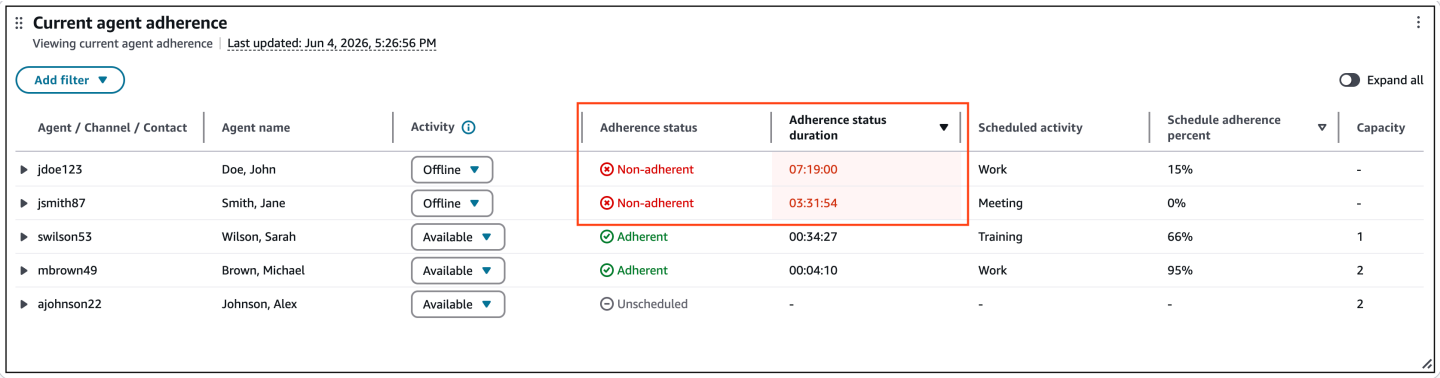
The following image shows an example of adherence on a calendar view.



Queue and agent performance dashboard

Real-time agent adherence is available in the **Agent adherence** widget on the Queue and agent performance dashboard. This widget provides detailed agent adherence information that you can filter and sort. It also provides conditional formatting to help you proactively manage and optimize workforce performance.

The following image shows an example of the **Agent adherence** widget. The red highlight is conditional formatting applied on the **Adherence status duration**.



Adherence threshold reports

The **Queue and agent performance** dashboard includes threshold-specific information:

- Visual indicators for agents operating within thresholds
- Remaining threshold time available
- Threshold use percentage
- Option to toggle between strict and threshold-based adherence views

Historical reports can display:

- Adherence percentage with and without thresholds
- Time spent within configured thresholds
- Threshold use patterns

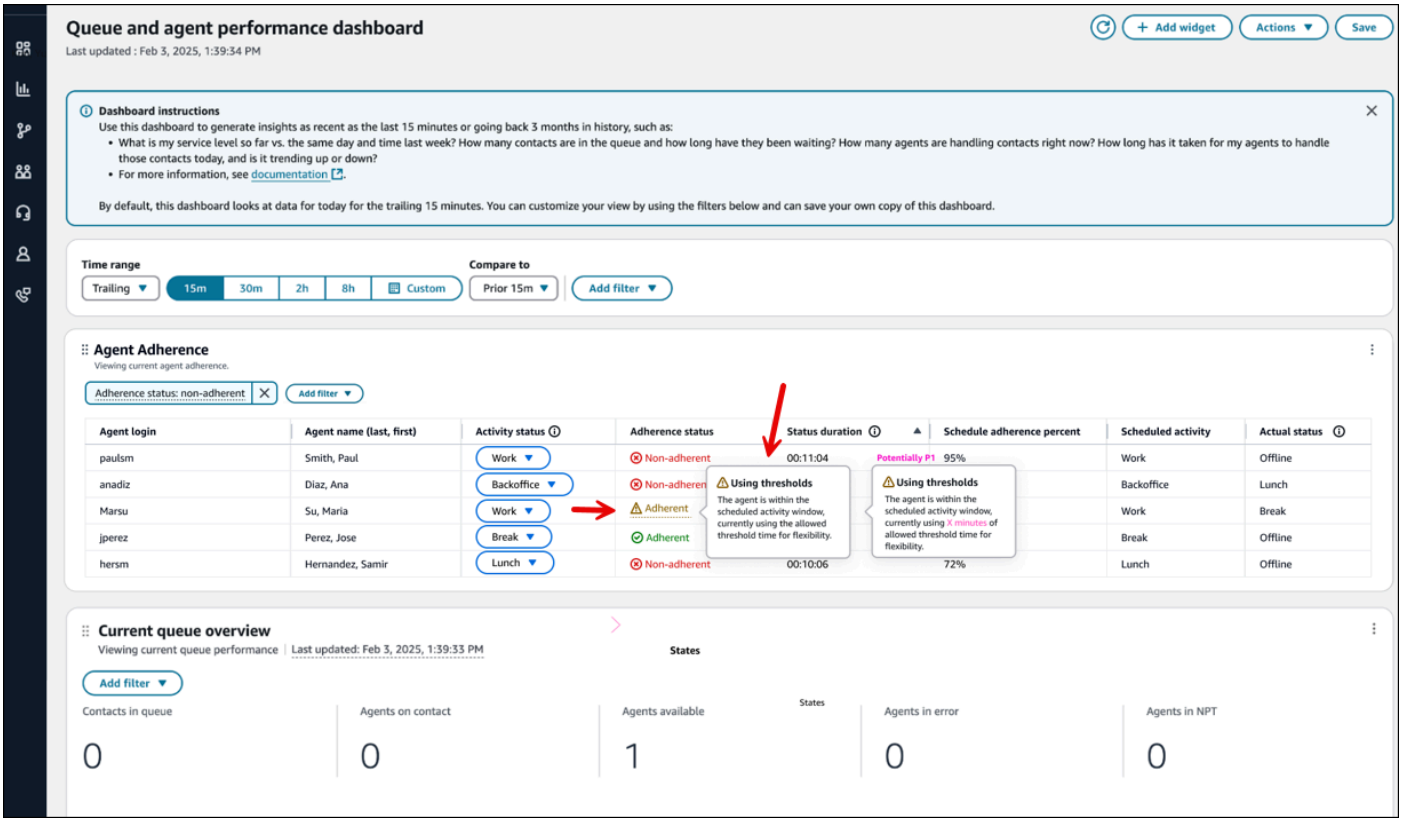
Monitor adherence with thresholds

In the **Queue and agent performance** dashboard, the **Agent Adherence** widget shows how agents are performing against configured thresholds:

- The **Adherence status** column shows:
  - Non-adherent (red indicator)
  - Using thresholds (yellow warning icon) - indicates the agent is operating within configured threshold windows
  - Adherent (green indicator)
- The **Status duration** column shows how long an agent has been in their current adherence state.
- The **Schedule adherence percent** shows the adherence calculation taking thresholds into account.

You can pause on the **Using thresholds** indicator to see details about the threshold being used.

The following image shows an example **Queue and agent performance** dashboard, with an **Adherent** status, and the **Using thresholds** message. One message is general, the other message shows X minutes as a placeholder for what would be your adherence threshold.



Set up schedule adherence notifications

You can use conversational analytics rules to configure notifications to be sent when agents are out of adherence.

1. In the Connect Customer admin website, navigate to **Analytics and Optimization**, **conversational analytics**, **Rules**, and then choose **Create a rule**, **Real-time metrics**.
2. For **When**, choose **There is an update in agent metrics** from the dropdown list.
3. Select **Trailing window of time** and then select the following metric:

   - Adherence: >= or <= X%
   - Non-adherent time: >= or <= X seconds

   For example, in trailing 15 minutes, if adherence for a certain group of agents is <= 80%, then take one of these actions: **Create a task**, **Generate EventBridge event**, or **Send email**.
4. Choose **Next**.
5. Specify the action to take, choose **Next**, and then choose **Save**.

For more information about creating rules, see Create alerts on real-time metrics.

What happens when ....

- **An agent starts working before their schedule starts**

  If an agent does not have a schedule, their adherence status will be marked as "Unscheduled" to indicate the absence of a defined schedule for that time. This means that if an agent starts working 5 minutes before or 5 minutes after their schedule, it will not count against their adherence. However, if they decide to leave work 5 minutes early because they started 5 minutes early, they would be considered non-adherent for that 5 minute interval.
- **An agent flips to offline when they are supposed to be a non-productive state**

  This would be considered non-adherent because the agent state is offline, rather than Non-Productive Time.
- **An agent leaves training to answer contacts because of high contact volume**

  In this scenario, the agent would be marked as non-adherent. However, if leaving training is intended, you can adjust the schedule retroactively and adherence will be re-calculated with the new shift.
- **A historical schedule is changed**

  If an agent's schedule is changed within the last 30 days from the current date (not the date of the schedule), adherence is re-calculated with the new schedule. With this re-calculation, you can make real-time adjustments to an agent's shift and correctly evaluate their adherence.
- **An agent starts an activity within the configured threshold**
  - The agent is considered adherent.
  - Their status shows **Using thresholds** in the dashboard.
  - The time spent within the threshold counts as adherent time.
  - The adherence percentage calculation includes time within configured thresholds.

Schedule Adherence metrics in Connect Customer

This section describes the metrics used when calculating Historical Schedule Adherence.

The following Scheduling metrics are available on the Real-time and Historical metrics reports. Use these metrics to track when agents are following the schedule that you have created. For

instructions about how add these metrics to your report, see How to create a historical metrics report.

These metrics are available in AWS Regions only where Forecasting & agent scheduling is available.

Adherence

This metric measures the percentage of time that an agent correctly follows their schedule.

Adherence is calculated as Adherent time divided by the sum of Adherent time and Non-adherent time. Scheduled time is not used in this calculation.

When adherence thresholds are configured, time that an agent is adherent outside their scheduled shift counts toward Adherent time. As a result, Adherent time plus Non-adherent time can be greater than Scheduled time. The Adherence percentage cannot be derived from Scheduled time.

Metric type: String

- Min value: 0.00%
- Max value: 100.00%

Metric category: Agent activity-driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AGENT_SCHEDULE_ADHERENCE`

How to access using the Connect Customer admin website:

- Historical metrics reports: Adherence
- Dashboard: Queue and agent performance dashboard, Adherence

Notes:

- Any time you change the schedule, Schedule Adherence is re-calculated up to 30 days in the past from the current date (not the date of the schedule), if schedules are changed.

Adherent time

This metric measures the total time an agent adhered to their schedule.

Metric type: String

Metric category: Agent activity-driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AGENT_ADHERENT_TIME`

How to access using the Connect Customer admin website:

- Historical metrics reports: Adherent time
- Dashboard: Queue and agent performance dashboard, Adherent time

Non-adherent time

This metric measures the total time an agent did not adhere to their schedule.

Metric type: String (*hh:mm:ss*)

Metric category: Agent activity-driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AGENT_NON_ADHERENT_TIME`

How to access using the Connect Customer admin website:

- Historical metrics reports: Non-Adherent time
- Dashboard: Queue and agent performance dashboard, Non-adherent time

Scheduled time

This metric measures the total time an agent was scheduled (either for productive or non-productive time) and *Adherence* for those shifts was set to `Yes`.

Metric type: String

Metric category: Agent activity-driven metric

How to access using the Connect Customer API:

- GetMetricDataV2 API metric identifier: `AGENT_SCHEDULED_TIME`

How to access using the Connect Customer admin website:

- Historical metrics reports: Scheduled time
- Dashboard: Queue and agent performance dashboard, Scheduled time

Using thresholds

This status indicates an agent is operating within configured adherence thresholds rather than exact scheduled times.

Threshold duration

The amount of time an agent has been operating within their configured threshold window.

Real-time Schedule Adherence in Connect Customer

> **Note**
>
> The real-time adherence data might take up to 4 minutes to refresh. It captures the complete duration of adherence or non-adherence.

You can access real-time agent adherence metrics in the following areas on the Connect Customer admin website:

- **Agent schedule adherence** table

  Select this table from the Real-time metrics page or from within an existing report. This table has the same functionality as an existing agents table, but with the additional metrics listed below.

  By default, this table filters to show non-adherent agents. To view all agents or agents who are not currently scheduled, adjust the filters in the table settings.

- Current agent adherence widget on the **Queue and agent performance** dashboard.

  This widget provides detailed agent adherence information that you can filter and sort. It also provides conditional formatting to help you proactively manage and optimize workforce performance.

The list of agents displayed on the Queue and agent performance dashboard refreshes as new agents come online. To refresh the list of agents on the Real-time metrics page, refresh the page.

Following is a list of the real-time agent adherence metrics.

Real-Time agent adherence status

This metric indicates whether an agent is adherent or non-adherent in near real-time. For a definition of schedule adherence, see Schedule Adherence.

Scheduled status

This metric indicates name of the activity from the published schedule for an agent. If an agent is not scheduled, **Scheduled status** is blank.

Agent adherence duration

This metric measures the amount of time an agent is adherent or non-adherent. When an agent changes between non-adherent or adherent, this metric resets because it represents the current amount of time.

Agent adherence percentage

This metric measures the percentage of time an agent is adherent to their schedule. For a definition of adherence, see Adherence.

Examples of Agent Adherence calculations in Connect Customer

This topic shows two examples that illustrate how Adherent time and Non-adherent time are calculated in Connect Customer. It also includes two examples that show adherence with thresholds, one within a shift and one at the start and end of a shift.

Example 1

The schedule: Agent A is scheduled to work from 8:00 to 11:00.

What the agent does: Agent A begins working at 7:30 and then takes a break from 10:30 to 11:00.

Their adherence:

- From 7:30 to 8:00 Agent A is neither adherent nor non-adherent because this time is outside the schedule. The adherence calculation does not include unscheduled time.
- From 8:00 to 10:30 Agent A is adherent and from 10:30 to 11:00 they are non-adherent because:
  - Their status was "Break" when it should have been "Available" because they were scheduled for "Work" and the "Work" activity is mapped to only the "Available" status.

This means that Agent A's Adherence was 83%. Adherence was calculated as follows:

- (Total Adherent time 150 minutes / (Total Adherent time 150 minutes + Total Non-adherent time 30 minutes))

Example 2

The schedule: Agent B is scheduled to work from 9:00 to 10:30. They are scheduled to go on "Break" from 10:30 to 11:00, and then go to a team meeting from 11:00 to 12:00.

What the agent does: Agent B begins working at 9:00 and ends up working until 10:45. Then they set their status as "Break" at 10:45 and forget to switch it to "Team Meeting" at 11. They leave their status as "Break" from 10:45 to 12:00.

Their adherence:

- From 9:00 to 10:30 Agent B was adherent but from 10:30 to 10:45 they were non-adherent because:
  - They were scheduled for "Break," which was mapped to the "Break" status, but their actual status was "Available."
- They were also non-adherent from 11:00 to 12:00 because:
  - They were scheduled for the team meeting activity which maps to the "Team Meeting" status, but their actual status was "Break."

This means that Agent B's adherence was 58%. Adherence was calculated as follows:

- (Total Adherent time: 105 minutes / (Total Adherent time: 105 minutes + Total Non-adherent time: 75 minutes))

Example: Adherence with thresholds

The schedule: Agent C is scheduled for a break at 10:00 AM

Configured threshold: 5 minutes early/late allowed for break activity

What the agent does:

- Starts break at 10:03 AM (3 minutes late).
- Returns from break at scheduled time.

Their adherence:

- Agent remains adherent because starting break 3 minutes late falls within the configured 5-minute threshold.
- The "Using thresholds" status would be displayed during this period.

Example: Adherence with thresholds at the start and end of a shift

The schedule: Agent D is scheduled to work from 8:00 AM to 4:00 PM, a total of 480 minutes, including a 30-minute lunch at 11:30 AM.

Configured threshold: 5 minutes early/late allowed at the start and end of the shift.

What the agent does:

- Becomes available at 7:55 AM, 5 minutes before the shift starts.
- Stays available until 11:45 AM, 15 minutes into their scheduled lunch, then takes lunch from 11:45 AM until 12:00 PM as scheduled.
- Stays available until 4:05 PM, 5 minutes after the shift ends.

Their adherence:

- The 5 minutes before the shift and the 5 minutes after it are adherent, because both fall within the configured threshold. Neither period is scheduled time.
- The 15 minutes of lunch during which the agent stayed available are non-adherent.

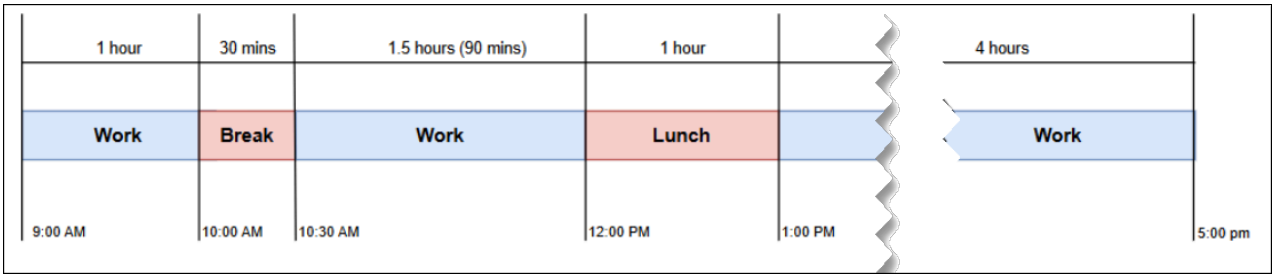
The metrics for this agent are:

- Scheduled time: 480 minutes. The 10 minutes of threshold time are not included, because they are outside the scheduled shift.
- Adherent time: 475 minutes. This is the 465 adherent minutes inside the shift plus the 10 threshold minutes outside it.
- Non-adherent time: 15 minutes.
- Adherence: 96.94%, calculated as (Adherent time 475 minutes / (Adherent time 475 minutes + Non-adherent time 15 minutes)).

In this example, Adherent time plus Non-adherent time is 490 minutes, which is greater than the Scheduled time of 480 minutes. Adherence is always calculated from Adherent time and Non-adherent time. Dividing Adherent time by Scheduled time does not produce the Adherence percentage shown.

Examples of adherence thresholds for agent shifts in Connect Customer

Assume a shift that starts at 9:00 AM and ends at 5:00 PM with a 30-minute break and a 1-hour lunch. This arrangement is shown in the following image of the shift profile.



Also assume that the activities are set up as shown in the following Activity setup table.

Activity setup

	START (Min)		END (Min)	
	EARLY	LATE	EARLY	LATE
Work	5	7	10	15
Break	-	5	5	-
Lunch	-	10	10	-

Use Case 1: Agent Group 1 has been set up to use the shift profile shown in the previous image, with no overrides. As a result, agents assigned to Agent Group 1 will have the following tolerances for schedule adherence.

Agent Group 1, Adherence thresholds with NO shift overrides

	START			END		
	EARLY	**AT**	**LATE**	**EARLY**	**AT**	**LATE**
Work	8:55 AM	9:00 AM	9:07 AM	9:50 AM	10:00 AM	10:15 AM
Break	-	10:00 AM	10:05 AM	10:25 AM	10:30 AM	-
Work	10:25 AM	10:30 AM	10:37 AM	11:50 AM	12:00 PM	12:15 PM
Lunch	-	12:00 PM	12:10 PM	12:50 PM	1:00 PM	-
Work	12:55 PM	1:00 PM	1:07 PM	4:50 PM	5:00 PM	5:15 PM

Use Case 2: Agent Group 2 has been set up to use the shift profile in the previous image. The administrator has set up a shift profile override as shown in the following table.

Agent Group 2, Shift profile is overridden

	START (Min)		END (Min)	
	EARLY	**LATE**	**EARLY**	**LATE**
Shift	10	7	-	10

As a result of these overrides, agents assigned to Agent Group 2 will have the following tolerances for schedule adherence.

Agent Group 2, Adherence thresholds with shift overrides

	START			END		
	EARLY	**AT**	**LATE**	**EARLY**	**AT**	**LATE**
Shift	**8:50 AM**	**9:00 AM**	**9:07 AM**	**-**	**5:00 PM**	**5:10 PM**
Work	**8:50 AM**	9:00 AM	**9:07 AM**	9:50 AM	10:00 AM	10:15 AM
Break	**-**	10:00 AM	10:05 AM	10:25 AM	10:30 AM	-
Work	10:25 AM	10:30 AM	10:37 AM	11:50 AM	12:00 PM	12:15 PM
Lunch	-	12:00 PM	12:10 PM	12:50 PM	1:00 PM	-
Work	**12:50 PM**	1:00 PM	**1:07 PM**	**4:50 PM**	5:00 PM	**5:10 PM**

The bold cells are changed due to the override. The cells are overridden because:

- **Shift start:** Originally set to start at 9:00 AM, however, it can start 10 minutes early or 7 minutes late. As a result, for Agent Group 2, the shift can start at:
  - 8:50 AM (10 minutes early)
  - 9:07 AM (7 minutes late)
  - 9:00 AM (set time)
- **Shift end:** Originally set to end at 5:00 PM, however, due to the override setup, it still needs to end at 5:00 PM or it could end 10 minutes later. As a result, for Agent Group 2, the shift needs to end at:
  - 5:00 PM (as set in the original shift profile)
  - 5:10 PM (10 minutes late)
- The first and the last activities within the shift are impacted due to the shift profile override in place. This impact is as follows:
  - **First Activity: Work.** The Work adherence tolerance is overridden by the shift profile override. As a result:
    - Start time: Can start early at 8:50 AM or start late at 9:07 AM
    - End time: Can use the override at the Agent Group 2 level and end at 5:00 PM or at 5:10 PM

- **Last Activity: Work.** The Work adherence tolerance is overridden by the shift profile override. As a result:
  - Start time: Can start early at 12:50 PM or start late at 1:07 PM
  - End time: Can end 10 mins early at 4:50 PM or end late at 5:10 PM

Migration from non multi-skill to multi-skil

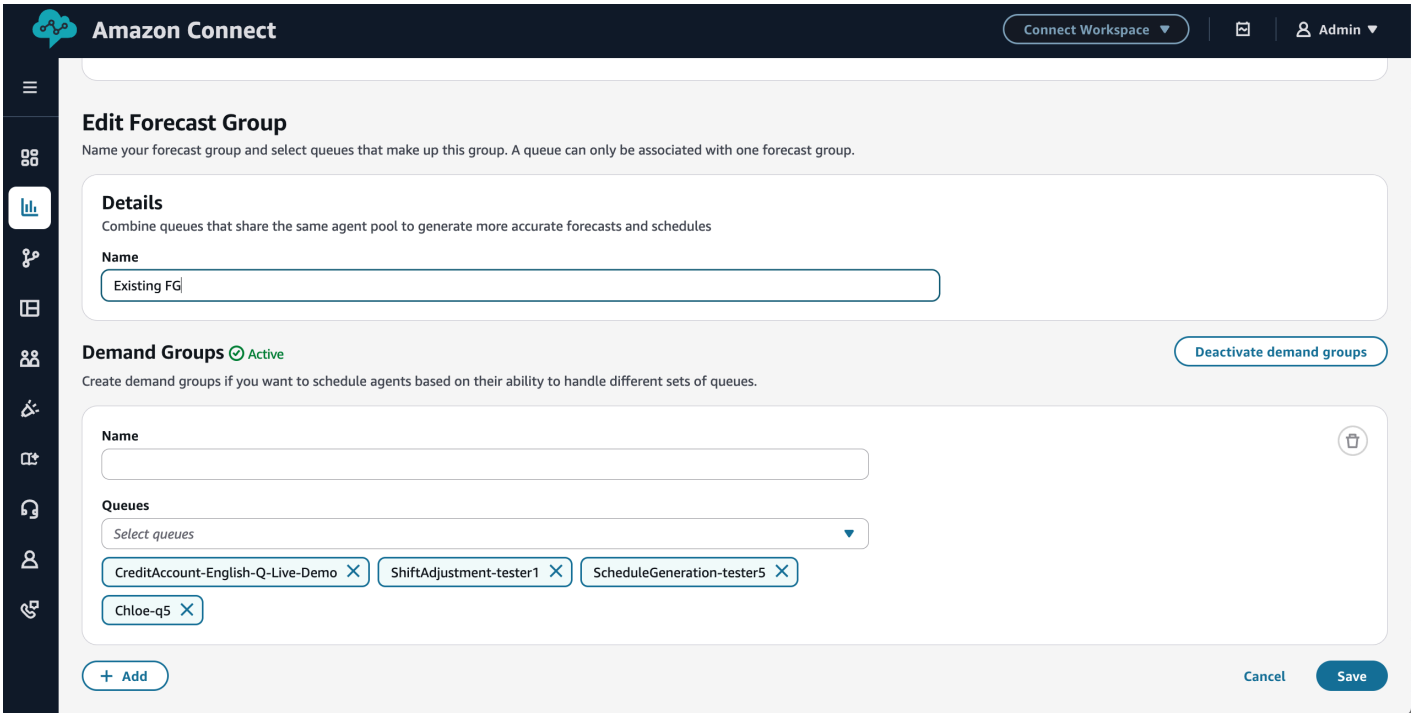
When upgrading from non multi-skill to multi-skill in Amazon Connect forecasting capacity planning and scheduling, you might fall into two possible categories: either you have existing large forecast groups and need to create demand groups for independent agent scheduling, or you have multiple small forecast groups that require consolidation into a single forecast group. Both scenarios are detailed below.

Enabling multi-skill in an existing forecast group

- Log in to the Amazon Connect admin website with an account that has security profile permissions for **Analytics, Forecasting - Edit**

  For more information, see Assign permissions
- Navigate to the forecast group you wish to change.
- Activate demand groups and notice the queues automatically move into a new demand group.

  For more information, see Multi skill forecasting

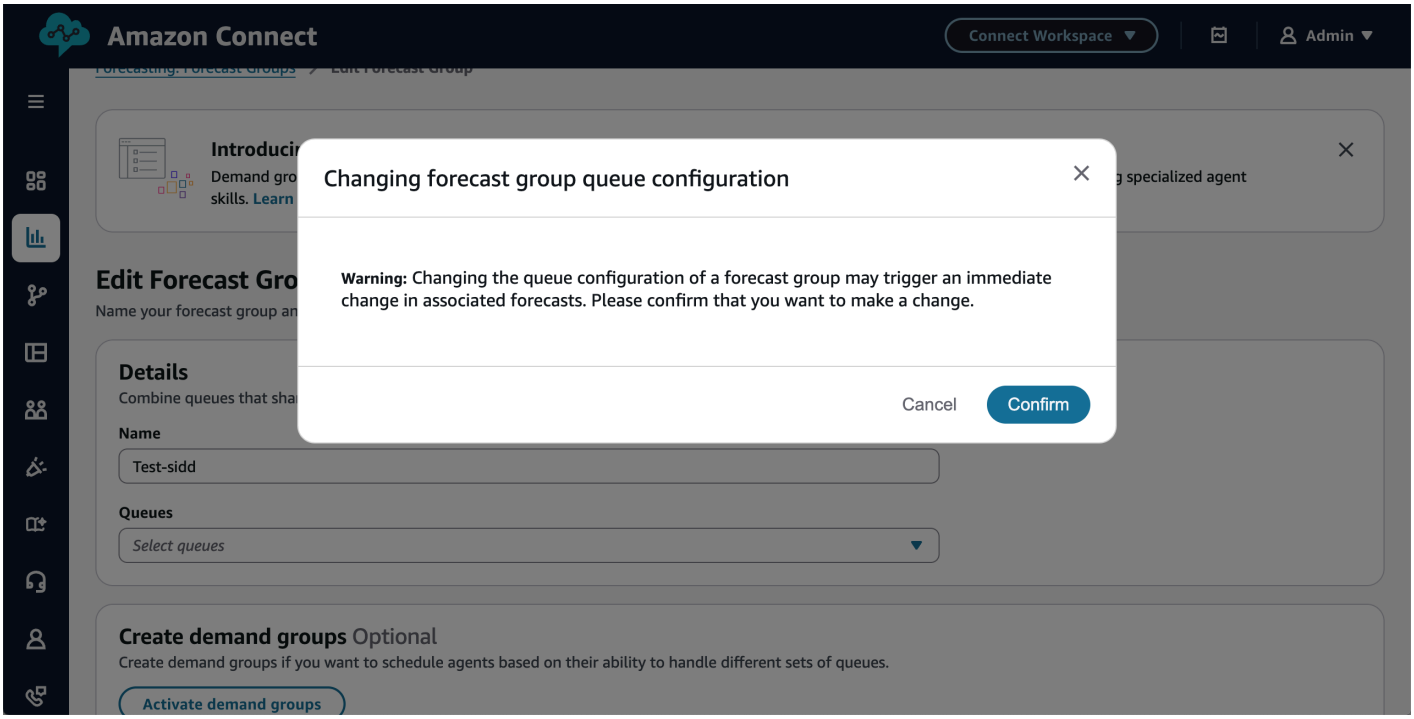


- You might now create additional demand groups and move queues accordingly.

Consolidating multiple forecast groups

- Log in to the Amazon Connect admin website with an account that has security profile permissions for **Analytics, Forecasting - Edit**

  For more information, see Assign permissions
- Create your new forecast group.
- Go to old forecast groups and remove all queues.



- Go back to new forecast group and create demand groups.

  For more information, see Multi skill forecasting
- Add corresponding queues to the demand groups.
- Download group allowance from all forecast groups, consolidate offline and add to new forecast group.

  For more information, see Set group allowance for time off
- Direct all applicable staffing groups to the new forecast group and link them with corresponding demand groups. Note that each staffing group connected to your new forecast group must be associated with at least one demand group.
- Create necessary trade groups as trade groups are not carried forward o between forecast groups.

Private optimization APIs for Connect Customer forecasting, capacity planning, and scheduling

Connect Customer forecasting, capacity planning, and scheduling uses the following private API resources as actions in its IAM policy:

- `connect:BatchAssociateAnalyticsDataSet`. Grants access permissions and associates the specified datasets for the specified Connect Customer instance with the specified AWS account.
- `connect:BatchDisassociateAnalyticsDataSet`. Revokes access permissions and disassociates the specified datasets for the specified Connect Customer instance with the specified AWS account.

If you remove these actions from the preview role policy, the forecasting, capacity planning, and scheduling features won't work.

Use real-time caller authentication with Voice ID in Connect Customer

Note

End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Connect Customer Voice ID provides real-time caller authentication and fraud risk detection which make voice interactions in contact centers more secure and efficient. Voice ID uses machine learning to verify the identity of genuine customers by analyzing a caller's unique voice characteristics. This allows contact centers to use an additional security layer that doesn't rely on the caller answering multiple security questions, and makes it easy to enroll and verify customers without changing the natural flow of their conversation. Voice ID also offers real-time detection of fraudsters who frequently target your contact center, thereby reducing losses due to fraud.

With Connect Customer Voice ID you can:

- Passively enroll customers for voice authentication without requiring them to repeat a particular word or phrase.
- Migrate customers into Voice ID by enrolling them in batch.
- Verify the enrolled customer's identity by analyzing their unique voice characteristics.
- Detect fraudsters from a watchlist that you have created.
- Detect voice spoofing.

How Voice ID works

Customer enrollment

1. When a customer calls for the first time, the agent confirms the identity of the caller by using existing security measures, such as asking for mother's maiden name or a one-time passcode (OTP) delivered by SMS. This makes sure that only genuine customers are enrolled in Voice ID.
2. Voice ID starts listening to the customer's speech after the contact has encountered the Set Voice ID block, where Voice ID is enabled. Voice ID listens to the call until one of the following happens:
   - It gets enough audio to evaluate the speaker for authentication, fraud, and enroll the speaker (if requested). This is 30 seconds of customer speech, excluding silence.
   - The call ends.
3. Voice ID then creates the enrollment voiceprint. A voiceprint is a mathematical representation that implicitly captures unique aspects of an individual's voice such as speech rhythm, pitch, intonation, and loudness.

   The caller does not need to say or repeat any specific phrases to enroll in Voice ID.

Customer authentication

1. When the enrolled customer calls back in, they are verified through an interaction with an IVR, or during their interaction with an agent.

   By default Voice ID is configured to require 10 seconds of a caller's speech to authenticate, which can be done as part of a typical customer interaction in the IVR or with the agent (such as "what's your first and last name?" and "what are you calling about?"). You can adjust the amount of required speech using the Authentication response time property in the Set Voice ID block.
2. Voice ID uses the audio to generate the caller's voiceprint and compares it with the enrolled voiceprint corresponding to the claimed identity, and returns an authentication result.

For more information about the agent's experience, see Enroll callers in Voice ID in the Contact Control Panel (CCP).

How much speech is needed for enrollment and authentication

- Enrollment: 30 seconds of customer net speech (speech that excludes any silence) to create a voiceprint and enroll a customer.
- Verification: By default, 10 seconds of customer net speech to verify that the voice belongs to the claimed identity. The speech can be from interacting with an IVR or an agent. You can adjust the amount of required speech using the Authentication response time property in the Set Voice ID.

Batch enrollment

You can get a jump start on using biometrics by batch enrolling customers who have already consented for biometrics. Using stored audio recordings in your S3 bucket, and a JSON input file that provides the speaker identifier and a link to the audio recordings, you can invoke the Voice ID batch APIs.

For more information, see Batch enrollment in Connect Customer Voice ID using audio data from prior calls.

Known fraudster detection

There are a few steps to setting up the real-time detection of fraudsters:

1. Create a new watchlist for storing known fraudsters. Or, use the default watchlist that is created when Voice ID is enabled.
2. Register fraudsters to the new watchlist or the default watchlist.
3. In the Set Voice ID block, specify which watchlist you want to use.

When one of the fraudsters from the watchlist that is specified in the flow calls your contact center, Voice ID analyzes the call audio to return a risk score and outcome. This score indicates how closely the caller's voiceprint matches that of the fraudster's in the watchlist. Voice ID requires 10 seconds of audio to evaluate the call audio for fraud risk from known fraudsters.

Default watchlist

When the Voice ID domain is created, Voice ID creates a default fraudster watchlist for that domain. The name and description of the default fraudster watchlist is encrypted using the KMS key that is provided in the domain and saved in Voice ID.

If you don't provide the fraudster watchlistId for fraud detection or fraudster registration, Voice ID uses the default fraudster watchlist.

You cannot update the metadata of the default fraudster watchlist, but you can associate or disassociate fraudsters from it.

> **Note**
>
> If your Voice ID domain was created before March 2023, when fraudster watchlists was launched: a default watchlist was created and all existing fraudsters have been placed in it.

Voice spoofing detection

1. When a prospective fraudster tries to spoof caller audio using audio playback or synthesized speech, Voice ID returns a risk score and outcome to indicate the how likely it is that the voice is spoofed.
2. Voice spoofing is only enabled when you enable the fraud detection feature in your contact flow. Voice spoofing scores are not returned when only speaker authentication is enabled.
3. Voice ID requires 10 seconds of audio to evaluate the call audio for fraud risk from voice spoofing.

What data is stored?

Voice ID stores audio files of the speaker's voice, voiceprints, and speaker identifiers. This data is encrypted using a KMS key that you provide.

If you enable detection of fraudsters in a watchlist, Voice ID also stores the fraudster audio and voiceprints. For more information, see Data handled by Connect Customer.

Amazon Connect Customer Voice ID end of support

After careful consideration, we decided to end support for Amazon Connect Customer Voice ID, effective May 20, 2026. Amazon Connect Customer Voice ID will no longer accept new customers beginning May 20, 2025. As an existing customer with an account signed up for the service before May 20, 2025, you can continue to use Amazon Connect Customer Voice ID features. After May 20, 2026, you will no longer be able to use Amazon Connect Customer Voice ID.

This page provides instructions and best practices for Connect Customer IT administrators and users to transition Voice ID to alternate solutions to meet your business needs. This might include solutions from AWS Partners available on the AWS Marketplace, such as Pindrop®, or do-it-yourself solutions with AWS End User Messaging SMS.

Do-it-yourself solutions with AWS End User Messaging SMS

You can improve contact center security by enabling One-Time-Pin (OTP) based authentication for your contact center with AWS End User Messaging SMS. You can reference a solution example for enabling OTPs using AWS End User Messaging SMS to create one for your contact center. For more information about this solution, see the following blog post: Build a Secure One-Time Password Architecture with AWS. For more information about AWS End User Messaging SMS, see What is AWS End User Messaging SMS?

Managing your Voice ID data

You can get information about all your Voice ID domains in your AWS accounting using the Voice ID `ListDomains` API in conjunction with the `DescribeDomain` API. For more information about managing your Connect Customer Voice ID domains, see Manage Connect Customer Voice ID domains.

For a specific Voice ID domain, you can download data about enrolled callers using the `ListSpeakers` API and registered fraudsters using `ListFraudsters` API. For more information about speaker and fraudster management, see Connect Customer Voice ID speaker, watchlist, and fraudster management APIs. You can make sure that all your customer data on Voice ID is deleted by using the Voice ID `DeleteDomain` API. You need to perform this operation for every Voice ID domain in every AWS Region and every account.

Voice ID domains in Connect Customer Voice ID

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

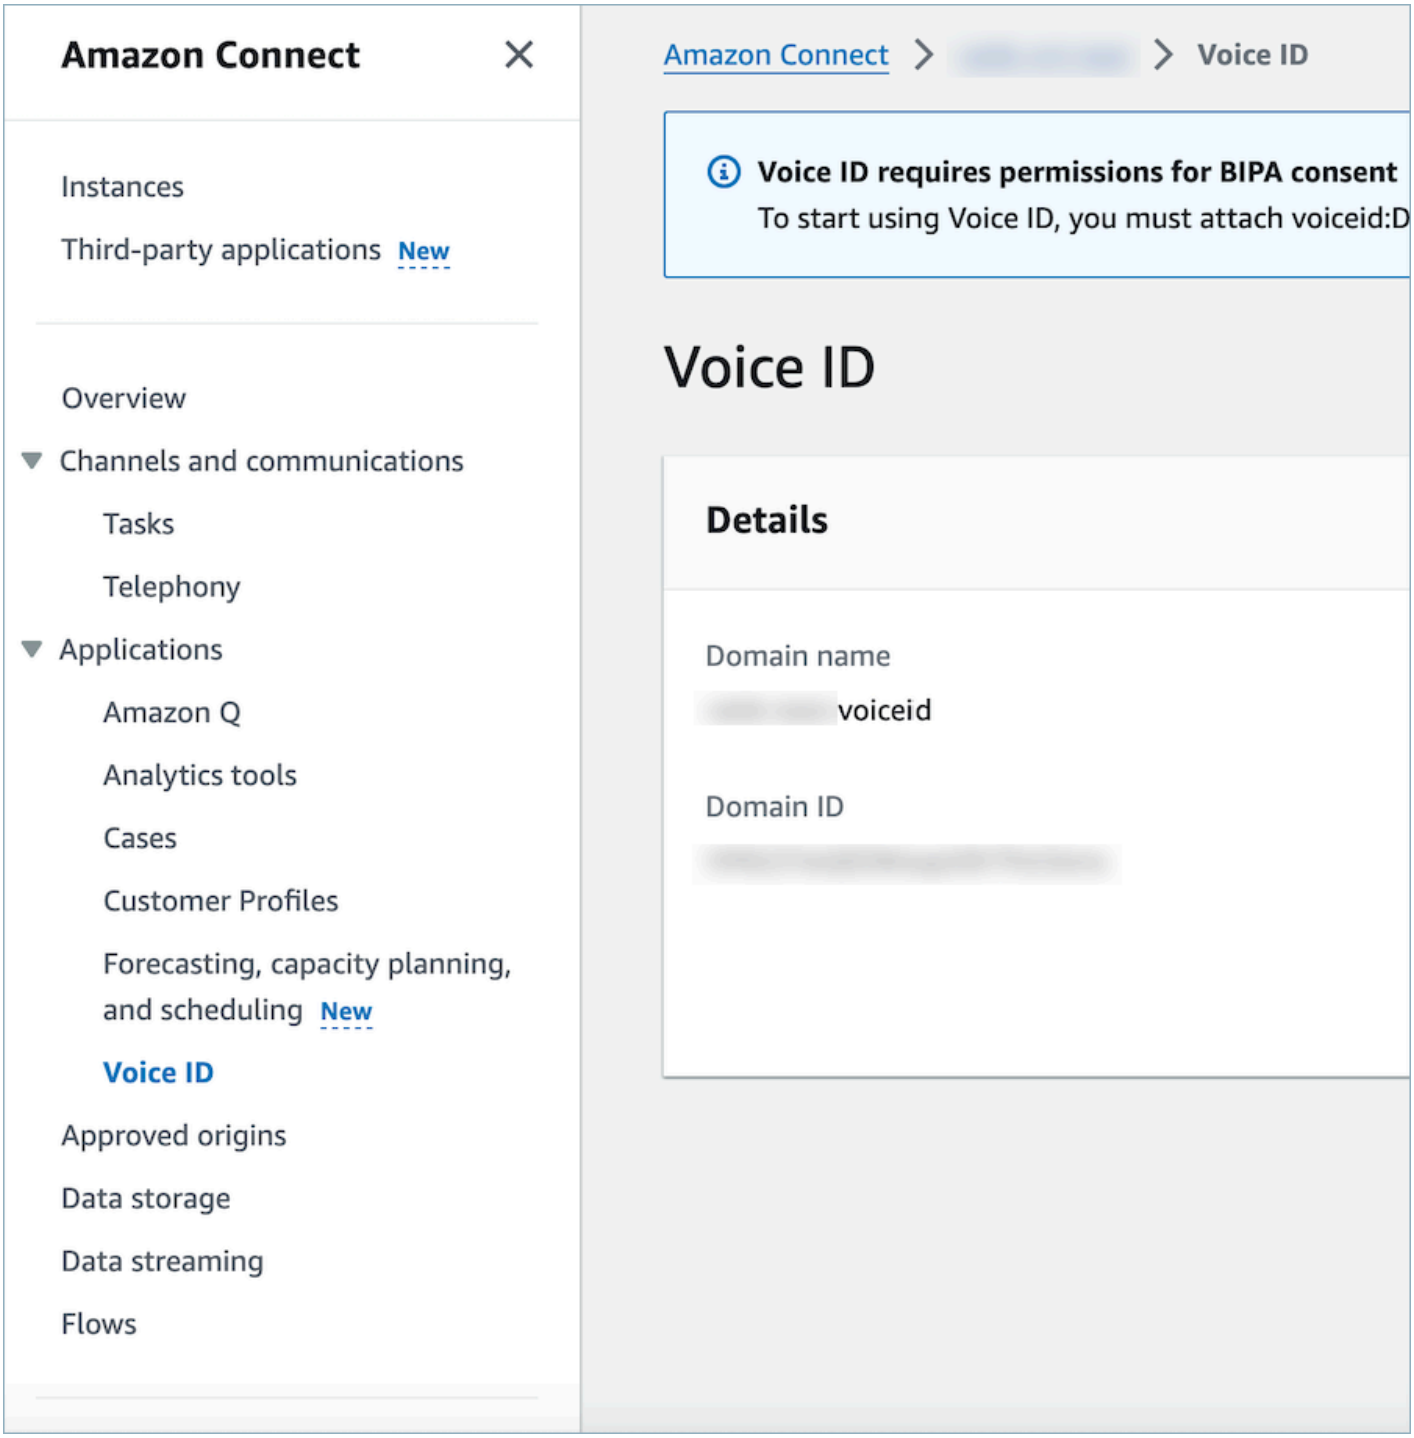
When you enable Connect Customer Voice ID, you create a Voice ID domain: a container for all Voice ID data, such as speaker identifiers (which serves as the customer identifier), the voiceprints, the customer audio that was used for creating the enrollment voiceprints, and the enrollment statuses (enrolled, opted out) associated with the speaker identifiers. For detection of fraudsters in a watchlist, the Voice ID domain stores the fraudster identifiers, voiceprints, and audio used for creating the voiceprints.

Following are guidelines for creating Voice ID domains:

- Each Connect Customer instance can be associated with only one Voice ID domain.
- Each Voice ID domain can be associated with multiple Connect Customer instances. With a shared Voice ID domain, you can use the same stored customer data across multiple Connect Customer instances.
- You can create multiple domains, but they don't share customer data between each other.
- We recommend creating a new Voice ID domain to associate with a Connect Customer instance when:
  - You are enabling Voice ID for the first time on your account in an AWS Region.
  - You want to make sure that you isolate the Voice ID domains used for your test and production environments.
- We recommend using an existing Voice ID domain when:
  - You want to use the same set of enrolled callers and fraudsters across different Connect Customer instances (that might belong to different customer service teams)
  - You want to use the same test environment across different test Connect Customer instances.

> **Note**
>
> Only existing Voice ID domains in the same Region in your Connect Customer account can be shared across Connect Customer instances in that Region.

- You can change the association of your Connect Customer instance from your current domain to a new domain at any time, by choosing a different domain.
- To delete a Voice ID domain, use the DeleteDomain Voice ID API. `DeleteDomain` soft deletes the domain. Connect Customer waits 30 days before completely erasing the domain data. During this period, Voice ID; is disabled for all the Connect Customer instances it is associated with. To restore a domain during this window, submit an Support ticket and provide the domain ID. You can find the domain ID on the Voice ID section of the Connect Customer console, as shown in the following example:



Deleting a Voice ID domain deletes all stored customer data, such as audio recordings, voiceprints, and speaker identifiers, as well as any fraudster watchlists that you managed.

Enrollment status

Voice ID stores three different enrollment status for a speaker: `ENROLLED`, `OPTED_OUT` and `EXPIRED`. You can recall these speaker status using Connect Customer Voice ID APIs and using contact flow blocks to take appropriate action.

- `ENROLLED`: When you enroll a new caller is enrolled into Voice ID, Voice ID creates a new voiceprint and set the speaker status as `ENROLLED`. Even if you re-enroll the same caller into Voice ID, the status stays as `ENROLLED`.
- `OPTED_OUT`: If a caller does not provide consent to enroll into biometrics, you can opt out the caller (in the Contact Control Panel) or using APIs. Voice ID creates a new entry for this caller and set the speaker's status `OPTED_OUT`. Voice ID does not generate any voiceprint or store any audio recording for the speaker. Future enrollment requests for this speaker is rejected unless their entry is deleted.
- `EXPIRED`: If a caller's voiceprint has not been accessed or refreshed for 3 years, Voice ID changes the status to `EXPIRED`, and you are no longer able to perform authentications for this caller. You can re-enroll the caller again or delete the caller from Voice ID.

Expired speakers

For BIPA compliance, Voice ID automatically expires speakers that have not been accessed for enrollment, re-enrollment, or successful authentication for three years.

To view a speaker's last access, look at the `lastAccessedAt` attribute that is returned by the `DescribeSpeaker` and `ListSpeakers` APIs.

If you try to use the `EvaluateSesssion` API to authenticate an expired speaker, a `SPEAKER_EXPIRED` authentication decision is returned.

To use the expired speaker again, they must be re-enrolled.

Speaker and fraudster identifiers

Voice ID uses speaker identifiers to refer to and retrieve the voiceprints in a Voice ID domain. We recommend that you use identifiers that do not contain an Personally Identifiable Information (PII) in the identifiers.

Voice ID creates two fields to refer to a caller:

- `CustomerSpeakerId`: A identifier provided by the customer. It can be between 1-256 characters and can only contain: **a-z**, **A-Z**, **0-9**, **-** and **_**
- `GeneratedSpeakerId`: A unique 22-character alphanumeric string that Voice ID creates and returns at the time of enrollment of the caller.

Connect Customer Voice ID speaker APIs accept either form of speaker identifiers, but only emit `GeneratedSpeakerId` in the Voice ID event streams and contact records. If you want to re-record the caller to redo the voiceprint, you can enroll the caller with the same `CustomerSpeakerId`.

Similarly, Voice ID creates unique fraudster identifiers called `GeneratedFraudsterID` for every fraudster that you add to a watchlist in the domain. Voice ID returns the fraudster identifier if a fraudster is detected in a call when performing fraud risk detection.

Get started enabling Voice ID in Connect Customer

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Before you begin

Before you get started, complete the following tasks.

Tasks

- Grant the required permissions
- Decide how to name your Voice ID domain
- Create an AWS KMS key to encrypt data stored in the domain

Grant the required permissions

You must grant the required permissions to users, groups, or roles. For more information, see AmazonConnectVoiceIDFullAccess.

Access to Voice ID APIs using the Contact Control Panel (CCP) is disabled by default.

Decide how to name your Voice ID domain

When you enable Voice ID, you are prompted to provide a friendly domain name that's meaningful to you such as your organization name, for example, *Voice ID-ExampleCorp*.

Create an AWS KMS key to encrypt data stored in the domain

When you enable Voice ID, you are prompted to create or provide an AWS KMS key. It encrypts the customer data stored by Voice ID such as audio files, voiceprints, and the speaker identifiers.

Step-by-step instructions for creating these KMS keys are provided in Step 2: Create a new Voice ID domain and encryption key.

Data at rest—specifically, freeform fields that you provide plus audio files/voiceprints—are encrypted under the KMS key you choose. Your customer managed key is created, owned, and managed by you. You have full control over the KMS key (AWS KMS charges apply).

When making calls to Voice ID for anything other than `CreateDomain` or `UpdateDomain`, the user making the call requires `kms:Decrypt` permissions for the key associated with the domain. When making calls to `CreateDomain` or `UpdateDomain`, the user also requires `kms:DescribeKey` and `kms:CreateGrant` permissions for the key. When you create (or update) a Voice ID domain, it creates a grant on the KMS key so that it can be used by Voice ID asynchronous processes (such as speaker enrollment) and by the Connect Customer service-linked role during your flows. This grant includes an encryption context specifying the domain with which the key is associated. For more on grants, see Using grants in the AWS Key Management Service Developer Guide.

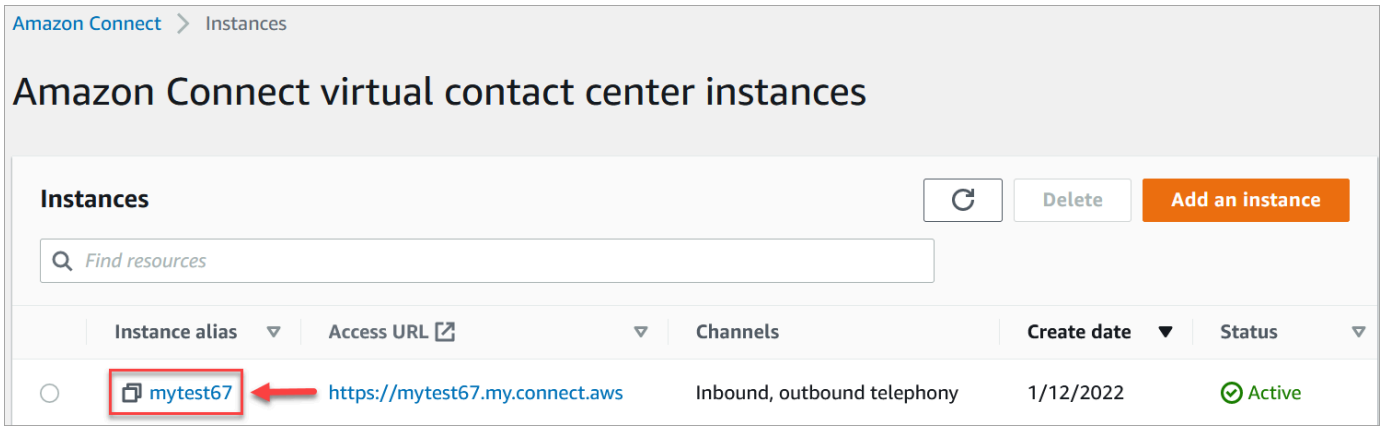
If you create a domain and associate it with one key, store some data, and then change the KMS key to a different key, an asynchronous process will be triggered to re-encrypt the old data with the new KMS key. After this process completes, all of your domain's data will be encrypted under the new KMS key, and you can safely retire the old key. For more information, see UpdateDomain.

> **Tip**
>
> You can create KMS keys or provide an existing KMS key programmatically. For more information, see Connect Customer Voice ID APIs.

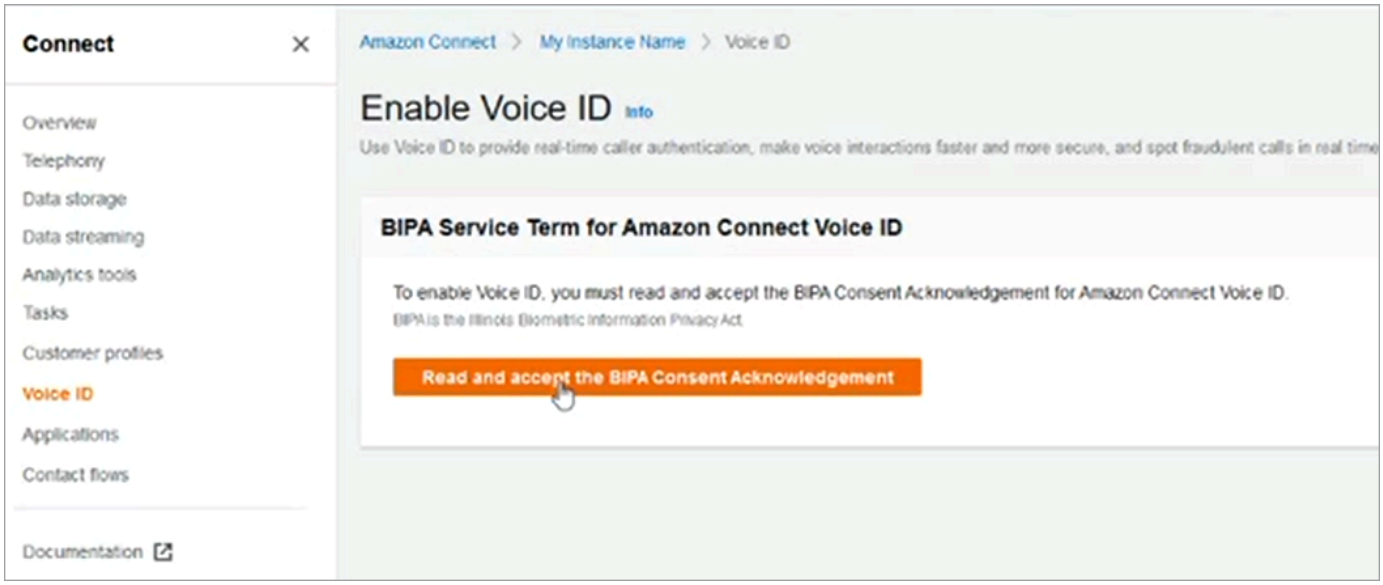
Step 1: Read the BIPA Consent Acknowledgement

Reading the Biometric Privacy Act (BIPA) Consent Acknowledgement is a requirement to enable Voice ID. You need to do this once per account, across all Regions. You cannot do this step by using APIs. For more information about BIPA, see this Wikipedia article: Biometric Information Privacy Act.

1. Open the Connect Customer console at https://console.aws.amazon.com/connect/.
2. On the instances page, choose the instance alias. The instance alias is also your **instance name**, which appears in your Connect Customer URL. The following image shows the **Connect Customer virtual contact center instances** page, with a box around the instance alias.



3. In the navigation pane, choose **Voice ID**. Read the BIPA Consent Acknowledgement, and accept if you agree.

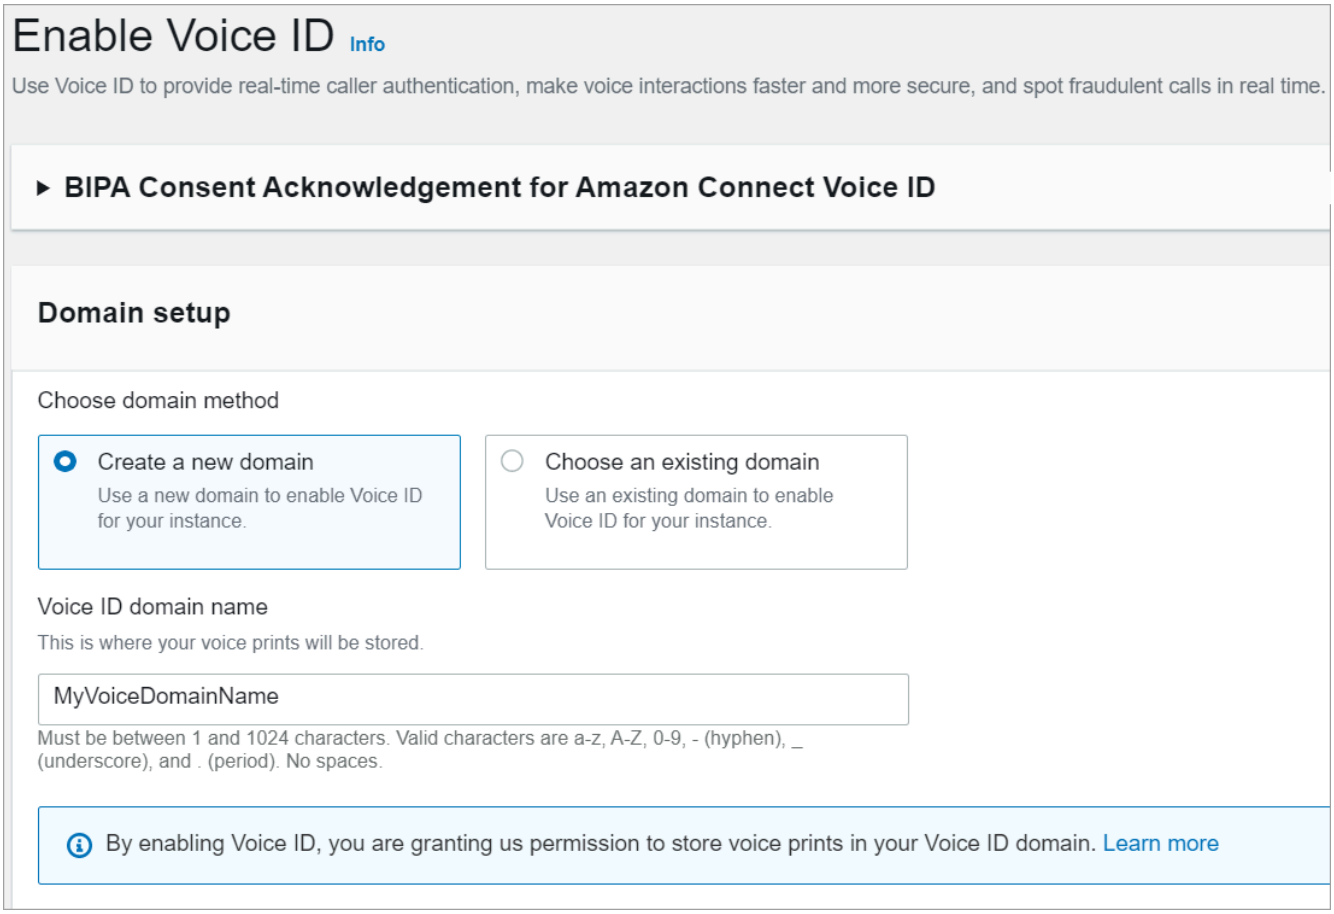


Step 2: Create a new Voice ID domain and encryption key

You can perform this step using the Connect Customer console or by using Connect Customer and Voice ID APIs.

Connect Customer console instructions

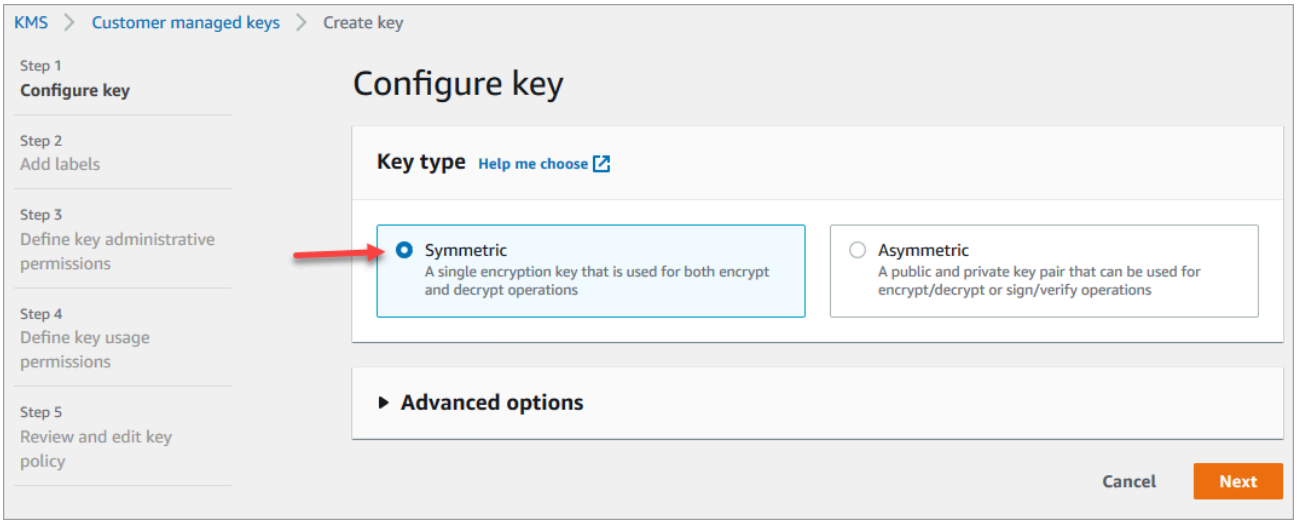
1. In the **Domain setup** section, choose **Create a new domain**.



2. In the **Domain name** box, enter a friendly name that's meaningful to you, such as your organization name, for example, *VoiceID-ExampleCorp*.
3. Under **Encryption**, create or enter your own AWS KMS key for encrypting your Voice ID domain. Following are the steps to create your KMS key key:

    1. Choose **Create KMS key**.

    
    2. A new tab in your browser opens for the Key Management Service (KMS) console. On the **Configure key** page, choose **Symmetric**, and then choose **Next**.



3. On the **Add labels** page, add a name and description for the KMS key, and then choose **Next**.
4. On the **Define key administrative permissions** page, choose **Next**.
5. On the **Define key usage permissions** page, choose **Next**.
6. On the **Review and edit key policy** page, choose **Finish**.
7. Return to the tab in your browser for the Connect Customer console, **Voice ID** page. Choose or tap in the **AWS KMS key** for the key you created to appear in a dropdown list. Choose the key you created.

4. Choose **Enable Voice ID**.

API instructions

1. Call the CreateDomain API to create a new Voice ID domain.
2. Call the CreateIntegrationAssociation API to associate the Voice ID domain with the Connect Customer instance.
   - Pass the ARN of the Voice ID domain just created into the `IntegrationArn` parameter. For `IntegrationType` use `VOICE_ID`.

You've enabled Voice ID for your instance. The following has been created:

- Your Voice ID domain and a default fraudster watchlist that will hold your fraudsters.

- A managed Amazon EventBridge rule in your account. This rule is used to ingest Voice ID events for creating contact records related to Voice ID. Additionally, Connect Customer adds Voice ID permissions to the service-linked role for Connect Customer.

Next, in Step 3 you configure how you want Voice ID to work in your flow.

Step 3: Configure Voice ID in your contact flow

In this step you add the required blocks to your flow and configure how you want Voice ID to work.

- Play prompt: Add this block before the Set Voice ID block to stream audio properly. You can edit it to include a simple message such as "Welcome."
- Set Voice ID: After the Play prompt block, add the Set Voice ID block. It should be at the start of a call. Use this block to start streaming audio to Connect Customer Voice ID to verify the caller's identity, as soon as the call is connected to a flow.

  In **Set Voice ID** block you configure the authentication threshold, response time, fraud threshold, and fraudster watchlist to be used for known fraudster detection.
- Set contact attributes: Use to pass the `CustomerId` attribute to Voice ID. The `CustomerId` might be a customer number from your CRM, for example. You can create a Lambda function to pull the unique customer ID of the caller from your CRM system. Voice ID uses this attribute as the `CustomerSpeakerId` for the caller.

  > **Note**
  >
  > `CustomerId` can be an alphanumeric value. It supports only _ and - (underscore and hyphen) special characters. It does not need to be UUID. Since Voice ID stores biometric information for each speaker, we strongly recommend that you use an identifier that does not contain PII in the CustomerSpeakerId field. For more information, see `CustomerSpeakerId` in the Speaker data type.
- Check Voice ID: Use to check the response from Voice ID for enrollment status, voice authentication, and fraud detection, and then branch based on one of the returned statuses.

Example Voice ID flow

Caller not enrolled

1. When a customer calls for the first time, their `CustomerId` is passed to Voice ID using the Set contact attributes block.
2. Voice ID looks for `CustomerId` in its database. Since it's not there, it sends a **Not enrolled** result message. The Check Voice ID block branches based on this result, and you can decide what the next step should be. For example, you might want agents to enroll the customer in voice authentication.
3. Voice ID starts listening to the customer's speech after the contact has encountered the Set Voice ID block, where Voice ID is enabled. It listens until it accummulates 30 seconds of net speech or the call ends, whichever happens first.

Caller enrolled

1. The next time the customer calls, Voice ID finds their `CustomerId` in the database.
2. Voice ID starts listening to the audio to create a voiceprint. The voiceprint that is created this time is used for authentication purposes so Voice ID can compare if the caller had been enrolled previously.
3. It compares the caller's current voiceprint with the stored voiceprint associated with the claimed identity. It returns a result based on the **Authentication threshold** property you configured in the Set Voice ID block.
4. After it evaluates the speech, it returns the message **Authenticated** if the voiceprints are similar. Or it returns one of the other statuses.
5. The contact is then routed down the appropriate branch by the Check Voice ID block.

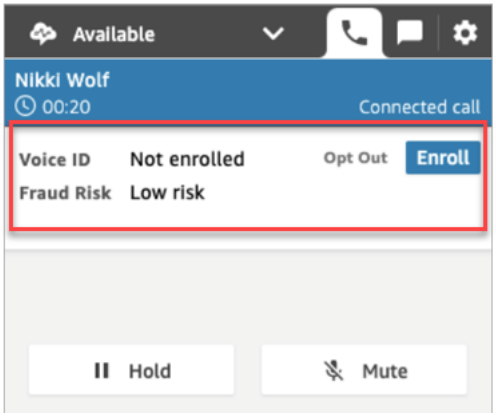
Security profile permissions for Connect Customer Voice ID

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

- To enable users to search for contacts by their Voice ID status, assign the following **Analytics and Optimization** permission to their security profile:
  - **Voice ID - attributes and search**: Enables users to search for and view Voice ID results on the **Contact detail** page.
- To grant agents access to Voice ID in the Contact Control Panel, assign the following permission in the **Contact Control Panel** group:
  - **Voice ID - Access**: Enables controls in the Contact Control Panel so agents can:
    - View authentication outcomes.
    - Opt-out or re-authenticate a caller.
    - Update `SpeakerID`.
    - View fraud detection results, rerun fraud analysis (fraud detection decision, fraud type and score).

> **Note**
>
> The functionality to enter or update the `SpeakerID` is not available with the default Voice ID widget in the CCP. To include the option for updating the `SpeakerID`, implement the `updateVoiceIdSpeakerId` Connect Customer Streams API in your custom CCP.

The following image shows an example of these controls on the CCP:



For information about how to add more permissions to an existing security profile, see Update security profiles in Connect Customer.

By default, the **Admin** security profile already has permissions to perform all Voice ID activities.

Search for and review results of Voice ID authentication

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Use the Contact search page to search for and review the results of enrollment status, voice authentication, and detection of fraudsters in a watchlist. With the required security profile permissions (**Analytics and Optimization** - **Voice ID - attributes and search - View**), you can search for Voice ID results using the following filters:

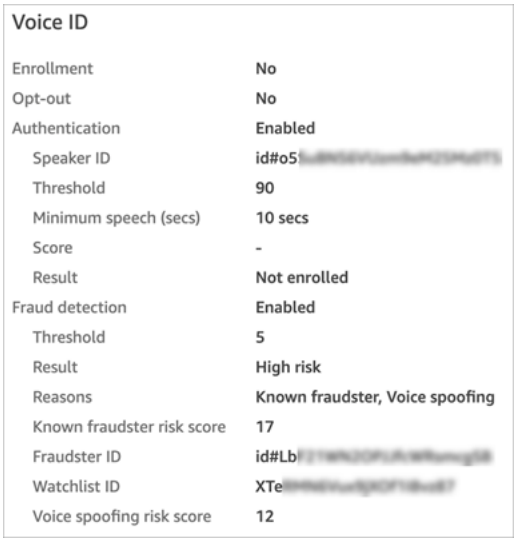
- **Speaker actions**: Use this filter to search for contacts where the caller was enrolled into Voice ID or chose to opt-out of Voice ID altogether.
- **Authentication result**: Use this filter to search for contacts where Voice ID authentication returned the following results:
  - Authenticated
  - Not authenticated
  - Opted out
  - Inconclusive
  - Not enrolled

  For example, if you want to search for all contacts where the authentication status was returned as **Not authenticated** or **Opted out**, select both these options and choose **Apply**.
- **Fraud detection result**: Use this filter to search for contacts where Voice ID fraud analysis returned the following results:
  - High risk for fraud
  - Low risk for fraud
  - Inconclusive
- **Fraud detection reason**: Use this filter to search for contacts where specific fraud risk mechanisms were detected:

- Known fraudster: the caller's voice matches a fraudster from the fraudster watchlist you have created.
- Voice spoofing: the caller is modifying their voice or is using speech synthesis to spoof the agent.

Voice ID results in a contact record

After you search for a contact, you can choose an ID to view their contact record. The following image shows an example of the fields in the Voice ID section of the contact record:



Manage Connect Customer Voice ID with the Voice ID APIs

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

To manage Voice ID programmatically, see Connect Customer Voice ID APIs.

This section explains how to perform common scenarios using the Voice ID APIs.

Topics

- Manage Connect Customer Voice ID domains
- Voice ID and Connect Customer Integration Association APIs
- Connect Customer Voice ID speaker, watchlist, and fraudster management APIs
- Batch enrollment in Connect Customer Voice ID using audio data from prior calls
- Input and output file schema for the Speaker Enrollment Job in Connect Customer Voice ID
- Create and edit a fraudster watchlist in Connect Customer Voice ID
- Input and output file schema for the Fraudster Registration Job in Connect Customer Voice ID
- Connect Customer Streams APIs to integrate Voice ID

Manage Connect Customer Voice ID domains

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Connect Customer Voice ID provides APIs for you manage Voice ID domains. You can find equivalents for Create, Describe, List, and Update in the AWS Console.

1. CreateDomain: To create a new Voice ID domain, use the `CreateDomain` Voice ID API. When the Voice ID domain is created, a default fraudster watchlist to hold your fraudsters is created at the same time.

   Note the following guidelines when using the `CreateDomain` API:

   - You can only invoke this for your account after you have acknowledged the BIPA Consent in the AWS console.
   - You must also specify the KMS key for the Voice ID domain at the time of creation.
   - After creating a Voice ID domain, use the Connect Customer association APIs to associate it with a Connect Customer instance.

2. DeleteDomain: To delete a Voice ID domain, you must invoke the `DeleteDomain` Voice ID API and provide the domain ID. If this domain was associated with a Connect Customer instance, Voice ID API calls, and Voice ID flow blocks will return runtime error. Deleting a Voice ID domain deletes all stored customer data such as audio recordings, voiceprints and speaker identifiers, as well as fraudster lists that you managed.
3. DescribeDomain: Use this API to return the name, description and encryption configuration of an existing domain identified by its `DomainID`.
4. ListDomains: Use this API to list all your Voice ID domains owned by your account in the Region.
5. UpdateDomain: To update the name and encryption configuration for a domain, you can use the `UpdateDomain` Voice ID API. This API clobbers existing attributes, and you must provide both these fields.

   When you change the KMS key associated with the Voice ID domain, following the `UpdateDomain` call your domain's existing data will be asynchronously re-encrypted under the new KMS key. You can check status of this process from your domain's `ServerSideEncryptionUpdateDetails` attribute using the `DescribeDomain` API. While this update process is in progress, you must retain your old KMS key in an accessible state, otherwise this process might fail. After this process completes, the old KMS key might be safely retired.

Voice ID and Connect Customer Integration Association APIs

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

You can use the following APIs to manage associations with Connect Customer instances. You can perform these operations on the AWS Console as well.

1. CreateIntegrationAssociation: To enable Voice ID on a Connect Customer instance, you will need to associate a Voice ID domain with a Connect Customer instance using a

`CreateIntegrationAssociation` request. You can only associate one Voice ID domain to a Connect Customer instance. If the instance is already associated with a domain, the API returns the following error:

`DuplicateResourceException` (409) - Request is trying to created a duplicate resource.

> **Note**
>
> When you enable Voice ID for a Connect Customer instance (by using either the Connect Customer console or the CreateIntegrationAssociation API), Connect Customer creates a managed Amazon EventBridge rule in your account. This rule is used to ingest Voice ID events for creating contact records related to Voice ID. Additionally, Connect Customer adds Voice ID permissions to the service-linked role for Connect Customer.

2. DeleteIntegrationAssociation: To delete an existing association between a Connect Customer instance and a Voice ID domain, you will need to call the `DeleteIntegrationAssociation` APIs along with the Connect Customer InstanceID and the `IntegrationAssociationID` returned by `CreateIntegrationAssociation`. This is a required step if you want to associate a different Voice ID domain to this Connect Customer instance. We do not recommend deleting associations in a production setup as it can cause unpredictable behavior for Voice ID in your Connect Customer instance.
3. ListIntegrationAssociations: To list all the associations between Connect Customer instance and Voice ID domains for your account in this Region, you can invoke `ListIntegrationAssociations` API.

Connect Customer Voice ID speaker, watchlist, and fraudster management APIs

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Connect Customer Voice ID includes APIs to manage speakers enrolled into a Voice ID domain and fraudsters registered in the domain. All speaker APIs, except `ListSpeakers`, accept either the `CustomerSpeakerId` or `GeneratedSpeakerId`.

Speaker management APIs

1. DescribeSpeaker: Describe a speaker's status in a domain (ENROLLED, OPTED_OUT, EXPIRED), and to map a `GeneratedSpeakerId` to a `CustomerSpeakerId`, and vice versa.
2. DeleteSpeaker: Completely remove all records for a caller/speaker from a Voice ID domain. All voiceprints and enrollment status is deleted immediately, and associated audio recordings are removed within 24 hours.
3. ListSpeakers: List all the speakers whose entries are present in a Voice ID domain. This API returns both the `CustomerSpeakerId` and `GeneratedSpeakerId` for a speaker. It returns a paginated output with the page size dictated in the API request.
4. OptOutSpeaker: Opt out a caller from a Voice ID domain. This API doesn't require the speaker to be present in Voice ID. A non-existing speaker can be opted-out using this API and Voice ID persists the opted out status and rejects future enrollment requests for this speaker. Opting out also removes voiceprints and any stored audio recordings for this caller.

Watchlist management APIs

1. CreateWatchlist: Create a watchlist that fraudsters can be a part of.
2. DeleteWatchlist: Remove a custom fraudster watchlist from the Voice ID domain. To delete a watchlist, it must be empty. That is, it must not have any fraudsters associated to it. You can use the DeleteFraudster or DisassociateFraudster APIs to remove all fraudsters from a watchlist.

   You cannot delete the default watchlist from a Voice ID domain.
3. DescribeWatchlist: Determine if it is a default fraudster watchlist, or a custom watchlist that you created, and obtain watchlist details.
4. ListWatchlists: List all the watchlists in the Voice ID domain.
5. UpdateWatchlist: Update the name and description of a custom fraudster watchlist. You cannot modify details of the default watchlist because it's managed by Voice ID.

Fraudster management APIs

1. AssociateFraudster: Associate a fraudster to a watchlist in the same domain. You can associate a fraudster to multiple watchlists in a domain.
2. DeleteFraudster: Delete a fraudster from a Voice ID domain. Deleting the fraudster removes the fraudster from all watchlists it is a part of. It also deletes all voiceprints and associated audio recordings within 24 hours.
3. DescribeFraudster: Describe a fraudster's status in the Voice ID domain.
4. DisassociateFraudster: Disassociate a fraudsters from the watchlist specified. Note that a fraudster always has to be associated with at least one fraudster watchlist; an exception is thrown if you try to disassociate a fraudster from its only watchlist.

   To remove the fraudster completely, use `DeleteFraudster`.
5. ListFraudsters: List all the fraudsters in a domain or a specific watchlist. This API also returns the watchlists the fraudster is a part of. It returns a paginated output with the page size dictated in the API request.

Batch enrollment in Connect Customer Voice ID using audio data from prior calls

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

You can get a jump start on using biometrics by batch enrolling customers who have already consented for biometrics. Using stored audio recordings in your S3 bucket, and a JSON input file that provides the speaker identifier and a link to the audio recordings, you can invoke the Voice ID batch APIs.

To enroll customers programmatically, pass the following data to the API:

1. The domain ID to specify the domain to associate recordings to.

2. The location for the output file.
3. An input file containing a list of speakers. See [Input and output file schema for the Speaker Enrollment Job in Connect Customer Voice ID].

   For each speaker the file must include:

   - A link to a call audio recording in a .wav file with 8KHz sample rate and PCM-16 encoding.
   - The corresponding `CustomerSpeakerId` for the customer.
   - A channel for the caller in the audio recording. If the audio has multiple channels, you can select only one.
4. A KMS key to use when writing the output.
5. A role that Voice ID can assume. It must have access to the S3 bucket where the audio files are stored. This role must have access to any KMS key used to encrypt the files. It must also be able to write to the specified output location and use the KMS key requested for writing the output. Specifically, it must have the following permissions:

   - `s3:GetObject` on the input bucket.
   - `s3:PutObject` on the output bucket.
   - `kms:Decrypt` on the KMS key used for input bucket's default encryption.
   - `kms:Decrypt` and `kms:GenerateDataKey` on the KMS key provided in the input which will be used for writing output file to the output bucket.

   You must have `iam:PassRole` permissions when making the call and providing the `dataAccessRole`. To enable confused deputy protection for the `dataAccessRole`, see [Connect Customer Voice ID cross-service confused deputy prevention].
6. Optionally, a fraud check skip flag in case you want to skip checks for fraud and voice spoofing on the enrollment audio.
7. Optionally, specify a fraudster watchlist that you want to perform fraud checks against. If no watchlist is specified, Voice ID uses the default fraudster watchlist for the domain.
8. Optionally, the fraud threshold in case you want to raise or lower the risk.
9. Optionally, a flag to re-enroll enrolled customers. This is useful if you want to refresh the audio recording, since the default is to ignore previously enrolled customers.

The batch enrollment returns the `CustomerSpeakerId`, `GeneratedSpeakerId`, and associated status for each entry. It stores this data in a JSON file at the output path you specify in the API.

Note

You are charged for enrolling speakers. For more information, see Connect Customer Voice ID Pricing.

Input and output file schema for the Speaker Enrollment Job in Connect Customer Voice ID

Note

End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Input file schema

Following is the schema of the input manifest file for the Speaker Enrollment Job:

```
{
  "Version": "string",
  "SpeakerEnrollmentRequests": [
      {
          "RequestId": "string",
          "SpeakerId": "string",
          "AudioSpecifications": [
              {
                  "S3Uri": "string",
                  "ChannelId": number
              }
           ]
      }
   ]
}
```

> **Note**
>
> All the fields in the schema are **required**.

Following is a description of each attribute of the input schema.

- `Version`: The version of the input schema document. Currently, this should be `1.0`.
- `SpeakerEnrollmentRequests`: List of speaker enrollment requests to be fulfilled as part of the job.
  - `RequestId`: An identifier for this speaker enrollment request. It must be unique within the input file. It is used for mapping and identifying entries in the output file.
  - `SpeakerId`: The client-provided identifier of the speaker who needs to be enrolled. You must pass the `CustomerSpeakerId` in this field. The `GeneratedSpeakerId` is not currently supported.
  - `AudioSpecifications`: The list of audio files that Voice ID can use for enrolling this speaker. Voice ID uses these audio files together to gather required amount of speech for enrollment. Currently, the maximum number of audio files allowed for an enrollment request is **10**. Each file can be a .wav file up to 20MB, containing audio with 8KHz sample rate and PCM-16 encoding.
    - `S3URI`: The Amazon S3 location of the audio file in .wav format that needs to be used for enrolling the speaker.
    - `ChannelId`: The audio channel to be used for enrolling the speaker in a multi-channel audio file. Voice ID supports audio files with up to two channels, so this value is restricted to either **0** or **1**.

Output file schema

Following is the schema of the output file generated for the Speaker Enrollment Job:

```
{
  "Version": "string",
  "Errors": [
       {
          "RequestId": "string",
          "ErrorCode": number,
          "ErrorMessage": "string"
```

```
        }
    ],
    "SuccessfulEnrollments": [
        {
           "RequestId": "string",
           "GeneratedSpeakerId": "string",
           "CustomerSpeakerId": "string",
           "EnrollmentStatus": "DUPLICATE_SKIPPED" | "NEW_ENROLLMENT" |
 "ENROLLMENT_OVERWRITE"
        }
    ]
}
```

Following is a description of each attribute of the output schema.

- `Version`: The version of the output schema document. Currently, this should be `1.0`.
- `Errors`: The list of errors for the speaker enrollment requests that failed at some point during enrollment.
- • `RequestId`: The request identifier associated with this request. This is the same as the `RequestId` specified in the input file for this request.
  - `ErrorCode`: The HTTP error code representing the type of error. Some example error scenarios are described below.

    > **Note**
    >
    > This is not an exhaustive list.

    - 400 (Bad Request Exception):
      - The input JSON file is malformed and cannot be parsed.
      - The provided audio files do not have enough speech for enrollment.
      - Fraud verification checks failed for the given speaker.
    - 402 (ServiceQuotaLimitExceededException):
      - Speaker limit exceeded.
    - 409 (Conflict Exception):
      - Conflicting action: You cannot request an enrollment for an opted out speaker.
    - 500 (Internal Failure):

    - Internal Server Error (Unexpected error on the Service-side).
  - `ErrorMessage`: A message describing the cause of the enrollment failure.
- `SuccessfulEnrollments`: The list of enrollment requests that succeeded.
  - `RequestId`: The request identifier associated with this request. This is the same as the `RequestId` specified in the input file for this request.
  - `CustomerSpeakerId`: The client-provided identifier for the speaker who was enrolled.
  - `GeneratedSpeakerId`: The service-generated identifier for the speaker who was enrolled.
  - `EnrollmentStatus`: The status of successful speaker enrollment
    - `DUPLICATE_SKIPPED`: The speaker is already enrolled, and the enrollment was skipped.
    - `NEW_ENROLLMENT`: The speaker was newly enrolled into the system.
    - `ENROLLMENT_OVERWRITE`: The speaker is already enrolled, but was re-enrolled/overwritten using the new audio.

Create and edit a fraudster watchlist in Connect Customer Voice ID

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Use the following APIs to create a fraudster watchlist and register fraudsters:

1. Use the CreateWatchlist API to create new fraudster watchlists.
2. Use the StartFraudsterRegistrationJob API for batch registration. You can register new fraudsters to the new watchlist, or register them to the default watchlist that is associated with the Voice ID domain.

When registering a new fraudster, Voice ID compares the voiceprint against all registers fraudsters in your Voice ID domain to determine if it is a duplicate of an existing fraudster.

To add fraudsters to a specified fraudster watchlist, pass the following data to the API:

1. The domain ID to specify the domain to associate recordings to.
2. An input file containing a list of fraudsters. See Input and output file schema for the Fraudster Registration Job in Connect Customer Voice ID.
3. The location for output file.
4. A KMS key to use when writing the output.
5. A role that Voice ID can assume. It must have access to the S3 bucket where the audio files are stored. This role must have access to any KMS key used to encrypt the files. It must also be able to write to the specified output location and use the KMS key requested for writing the output. Specifically, it must have the following permissions:
   - `s3:GetObject` on the input bucket.
   - `s3:PutObject` on the output bucket.
   - `kms:Decrypt` on the KMS key used for input bucket's default encryption.
   - `kms:Decrypt` and `kms:GenerateDataKey` on the KMS key provided in the input which will be used for writing output file to the output bucket.

   You must have `iam:PassRole` permissions when making the call and providing the `dataAccessRole`. To enable confused deputy protection for the `dataAccessRole`, see Connect Customer Voice ID cross-service confused deputy prevention.
6. A watchlistId to register the fraudster to. If no watchlistId is specified, fraudsters are registered to the default watchlist for that Voice ID domain.
7. The threshold for establishing the duplicate status of fraudsters.
8. A flag to ignore fraudster duplicates.

Voice ID updates the fraudster list with successful additions, and return a `GeneratedFraudsterID` associated with entry back to the same S3 location. If duplicates are identified, Voice ID returns a "duplicate" status for the entry and provides the closest matching `GeneratedFraudsterId`. After a fraudster is registered successfully, you can associate this fraudster identified by the `GeneratedFraudsterID` into a new watchlist by using the AssociateFraudster API.

Voice ID is not able to perform detection of fraudsters in a watchlist before the fraudster list is created.

For quotas for the fraudster list, see Connect Customer service quotas.

Note

You are charged for adding to the fraudster list. For more information, see Connect Customer Voice ID Pricing.

Input and output file schema for the Fraudster Registration Job in Connect Customer Voice ID

Note

End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Input file schema

Following is the schema of the input manifest file for Fraudster Registration Jobs:

```
{
 "Version": "string",
    "FraudsterRegistrationRequests": [
       {
           "RequestId": "string",
           "AudioSpecifications": [
               {
                   "S3Uri": "string",
                   "ChannelId": number
               }
           ]
       }
    ]
}
```

> **Note**
>
> All the fields in the schema are **required**.

Following is a description of each attribute of the input schema.

- `Version`: The version of the schema document. Currently, this should be `1.0`.
- `FraudsterRegistrationRequests`: List of fraudster registration requests to be fulfilled as part of the job.
  - `RequestId`: An identifier for this fraudster registration request. It must be unique within the input file. It is used for mapping and identifying entries in the output file.
  - `AudioSpecifications`: The list of audio files that Voice ID can use for registering this fraudster. Voice ID uses these audio files together to gather required amount of speech for registration. Currently, the maximum number of audio files allowed for a registration request is **10**. Each file can be a .wav file up to 20MB, containing audio with 8KHz sample rate and PCM-16 encoding.
    - `S3URI`: The Amazon S3 location of the audio file in .wav format that needs to be used for registering the fraudster.
    - `ChannelId`: The audio channel to be used for registering the fraudster in a multi-channel audio file. Voice ID supports audio files with up to two channels, so this value is restricted to either **0** or **1**.

Output file schema

Following is the schema of the output manifest file for Fraudster Registration Jobs:

```
{
 "Version": "string",
   "Errors": [
       {
          "RequestId": "string",
          "ErrorCode": number,
          "ErrorMessage": "string"
       }
   ],
   "SuccessfulRegistrations": [
       {
```

```
            "RequestId": "string",
            "GeneratedFraudsterId": "string",
            "RegistrationStatus": "DUPLICATE_SKIPPED" | "NEW_REGISTRATION",
            "FraudsterSimilarityScore": number
        }
    ]
}
```

Following is a description of each attribute of the output schema.

- `Version`: The version of the output schema document. Currently, this should be `1.0`.
- `Errors`: The list of errors for the fraudster registration requests that failed at some point during registration.
- • `RequestId`: The request identifier associated with this request. This is the same as the `RequestId` specified in the input file for this request.
  - `ErrorCode`: The HTTP error code representing the type of error. Some example error scenarios are described below.

    Note

    This is not an exhaustive list.

    - 400 (Bad Request Exception):
      - The input JSON file is malformed and cannot be parsed.
      - The provided audio files do not have enough speech for registration.
    - 402 (ServiceQuotaLimitExceededException):
      - Fraudster limit exceeded.
    - 500 (Internal Failure):
      - Internal Server Error (Unexpected error on the Service-side).
  - `ErrorMessage`: A message describing the cause of the fraudster registration failure.
- `SuccessfulRegistrations`: The list of registration requests that succeeded.
  - `RequestId`: The request identifier associated with this request. This is the same as the `RequestId` specified in the input file for this request.
- `RegistrationStatus`: The status of successful fraudster registration.

  - `DUPLICATE_SKIPPED`: The fraudster was identified as a duplicate, and the registration was skipped.
  - `NEW_FRAUDSTER`: The Fraudster was newly enrolled into the system.
- `GeneratedFraudsterId`: The service-generated identifier for the fraudster who was registered. In case the `RegistrationStatus` is `DUPLICATE_SKIPPED`, this is the identifier of the fraudster already in the domain that is the closest match to the given fraudster.
- `FraudsterSimilarityScore`: An optional field that is populated when the fraudster registration is skipped due to it being a duplicate. This represents the similarity of the given fraudster with the closest matching fraudster already existing in the domain.

Connect Customer Streams APIs to integrate Voice ID

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Use the following Connect Customer Streams APIs to integrate Voice ID into your existing agent web applications.

- `enrollSpeakerInVoiceId`: Enroll a customer to Voice ID after obtaining their consent to enroll.
- `evaluateSpeakerWithVoiceId`: Check the customer's Voice ID authentication status, and to detect fraudsters.
- `optOutVoiceIdSpeaker`: Opt out a customer from Voice ID.
- `getVoiceIdSpeakerStatus`: Describe the enrollment status of a customer.
- `getVoiceIdSpeakerId`: Get the `SpeakerID` for a customer.
- `updateVoiceIdSpeakerId`: Update the `SpeakerID` for a customer.

You can also use the Voice ID widget in the Contact Control Panel (CCP) if you don't want to build a custom agent interface. For more information about Voice ID in the CCP, see Enroll callers in Voice ID in the Contact Control Panel (CCP).

Connect Customer Voice ID event schema

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Voice ID generates events for every transaction: enrollment, authentication, or detection of fraudsters in a watchlist. Events are sent to the EventBridge default event bus.

You can create an analytics pipeline for Voice ID authentication outcomes and detection of fraudsters in a watchlist by using EventBridge to monitor Voice ID events. Using the schema available in this topic, you can configure EventBridge rules to listen and filter for Voice ID events that are relevant, and then process them through Amazon Data Firehose to store in a data warehouse of your choice.

For example, you might want near real-time tracking of Voice ID analysis. To do that, you can pull all the `Evaluate-Session` events, and get the `authenticationResult` and `fraudDetectionResult`.

Events are emitted on a best effort basis.

Common fields in the event

- `version` - The version of the event data.
- `id` - A unique identifier of the event generated by EventBridge
- `detail-type` - An identifier for the details of the event.
- `source` - The source of the event. This is always `aws.voiceid`.
- `account` - AWS account ID.

- `timestamp` - The date and time that the event was published in UTC.
- `region` - The AWS Region where the API call was made.
- `resources` - Resources used by the API call.
- `detail` - Details about the event:
  - `detail.sourceId` - A unique ID generated by Voice ID that you can use for de-duplication.
  - `detail.action` - Analogous to the API being invoked.
  - `detail.status` - Specifies the status of the action: success or failure.
  - `detail.errorInfo` - Is populated when the specified action errors out at Voice ID.

Following are the schemas for the events are that emitted.

Start Session Action

Emits events on stream start (after setup), stream end, and on failures.

```
{...commonfields
    "detail-type": "VoiceId Start Session Action",
    "detail": {
        "sourceId": String,
        "action": "START_SESSION",
        "status": String,
        "domainId": String,
        "session": {
            "sessionId": String,
            "sessionName": String,
            "authenticationConfiguration": {
                "acceptanceThreshold":Integer
            },
            "fraudDetectionConfiguration": {
                "riskThreshold":Integer,
                "watchlistId": String
            },
            "streamingConfiguration": {
                "authenticationMinimumSpeechInSeconds": Integer
            },
            "enrollmentAudioProgress": {
                "audioAggregationStatus": String,
                "audioAggregationStartedAt": "Timestamp",
                "audioAggregationEndedAt": "Timestamp"
```

```
            },
            "authenticationAudioProgress": {
                "audioAggregationStartedAt": "Timestamp",
                "audioAggregationEndedAt": "Timestamp"
            },
            "fraudDetectionAudioProgress": {
                "audioAggregationStartedAt": "Timestamp",
                "audioAggregationEndedAt": "Timestamp"
            },
            "generatedSpeakerId": String
        },
        "errorInfo": {
            "errorMessage": String,
            "errorType": String,
            "errorCode": Integer
       }
    }
}
```

Update Session Action

Emits events when the internal session update succeeds or fails.

```
{...commonfields
"detail-type": "VoiceId Update Session Action",
"detail": {
    "sourceId": String,
    "action": "UPDATE_SESSION",
    "status": String,
    "domainId": String,
    "session": {
        "sessionId": String,
        "sessionName": String,
        "authenticationConfiguration": {
            "acceptanceThreshold": Integer
        },
        "fraudDetectionConfiguration": {
            "riskThreshold": Integer,
            "watchlistId": String
        },
        "streamingConfiguration": {
            "authenticationMinimumSpeechInSeconds": Integer
        },
```

```
        "generatedSpeakerId": String
    },
    "errorInfo": {
        "errorMessage": String,
        "errorType": String,
        "errorCode": Integer
    }
}
}
```

Evaluate Session Action

Emits events when the session evaluation succeeds or fails. Reasons can be KNOWN_FRAUDSTER or VOICE_SPOOFING.

```
{...commonfields
"detail-type": "VoiceId Evaluate Session Action",
"detail": {
    "sourceId": String,
    "action": "EVALUATE_SESSION",
    "status": String,
    "domainId": String,
    "session": {
        "sessionId": String,
        "sessionName": String,
        "generatedSpeakerId": String,
        "streamingStatus": String,
        "authenticationResult": {
            "authenticationResultId": String,
            "decision": String,
            "score": Integer,
            "audioAggregationStartedAt": "Timestamp",
            "audioAggregationEndedAt": "Timestamp",
            "configuration": {
                "acceptanceThreshold": Integer
            }
        },
        "fraudDetectionResult": {
            "fraudDetectionResultId": String,
            "decision": String,
            "reasons": [String],
            "audioAggregationStartedAt": "Timestamp",
            "audioAggregationEndedAt": "Timestamp",
```

```
            "configuration": {
                   "riskThreshold": Integer
            },
            "riskDetails": {
                 "knownFraudsterRisk": {
                        "generatedFraudsterId": String,
                        "riskScore": Integer,
                        "watchlistId": String
                 },
                 "voiceSpoofingRisk": {
                       "riskScore": Integer
                 }
            }
         }
     },
     "errorInfo": {
        "errorMessage": String,
        "errorType": String,
        "errorCode": Integer
    }
}
}
```

Speaker Action

Emits events on the success or failure to opt out a speaker, delete a speaker, or enroll a speaker.

```
{...commonfields
"detail-type": "VoiceId Speaker Action",
"detail": {
    "sourceId": String,
    "domainID": String,
    "action": String,
    "status": String,
    "generatedSpeakerId": String,
    "data": {
        "enrollmentSource": String,
        "enrollmentSourceId": String,
        "enrollmentStatus": String
        },
    "errorInfo": {
        "errorMessage": String,
        "errorType": String,
```

```
        "errorCode": Integer
     }
}
}
```

Fraudster Action

Emits events when a fraudster is successfully registered or deleted.

Events are not sent when a fraudster is associated or disassociated with a watchlist.

```
{...commonfields
"detail-type": "VoiceId Fraudster Action",
"detail": {
    "sourceId": String,
    "domainID": String,
    "action": String,
    "status": String,
    "generatedFraudsterId": String,
    "watchlistIds": [String],
    "data": {
        "registrationSource": String,
        "registrationSourceId": String,

    },
    "errorInfo": {
        "errorMessage": String,
        "errorType": String,
        "errorCode": Integer
    }
}
}
```

EnrollBySession

Emits this event when an enrollment request is submitted. A `Speaker` event is emitted when the actual enrollment succeeds or fails.

```
{...commonfields
"detail-type": "VoiceId Session Speaker Enrollment Action",
"detail": {
    "sourceId": String,
```

```
    "domainId": String,
    "action": "SESSION_ENROLLMENT_REQUEST",
    "status": String,
    "sessionId": String,
    "sessionName": String,
    "errorInfo": {
        "errorMessage": String,
        "errorType": String,
        "errorCode": Integer
    }
}
}
```

StartSpeakerEnrollmentJob

Emits this event when a batch enrollment request is submitted, succeeds, or fails. A `Speaker` event is emitted for each of the individual speakers to indicate if corresponding enrollment succeeds or fails.

```
{...commonfields
"detail-type": "VoiceID Batch Speaker Enrollment Action",
"detail": {
    "sourceId": String,
    "domainId": String,
    "action": "BATCH_ENROLLMENT_REQUEST",
    "status": String,
    "batchJobId": String,
    "data": {
        "dataAccessRoleArn": String,
        "enrollmentConfig": {
            "existingEnrollmentAction": String,

        "errorMessage": String,
        "errorType": String,
        "errorCode": Integer
```

```
    }
}
}
```

Connect Customer data lake

You can use the Connect Customer data lake as a central location to query various types of data from Connect Customer. This data includes contact records, conversational analytics data, performance evaluations, and more. Data is refreshed after a record is created with a small delay for processing and should be available in less than an hour. You can use the data lake to create custom reports or run SQL queries.

For information about related API actions, see Data lake actions in the *Connect Customer API Reference*.

Topics

- Access Connect Customer data lake
- Associate tables for the Connect Customer analytics data lake
- Manage access to Resource link tables
- Data type definitions for the Connect Customer data lake
- Data retention in the Connect Customer analytics data lake

Access Connect Customer data lake

To access the data lake, you can use the AWS console, the AWS Command Line Interface or AWS CloudShell. AWS CloudShell is a browser-based, pre-authenticated shell that you can launch directly from the AWS Management Console.

There are two ways to access the analytics data lake and configure data to be shared:

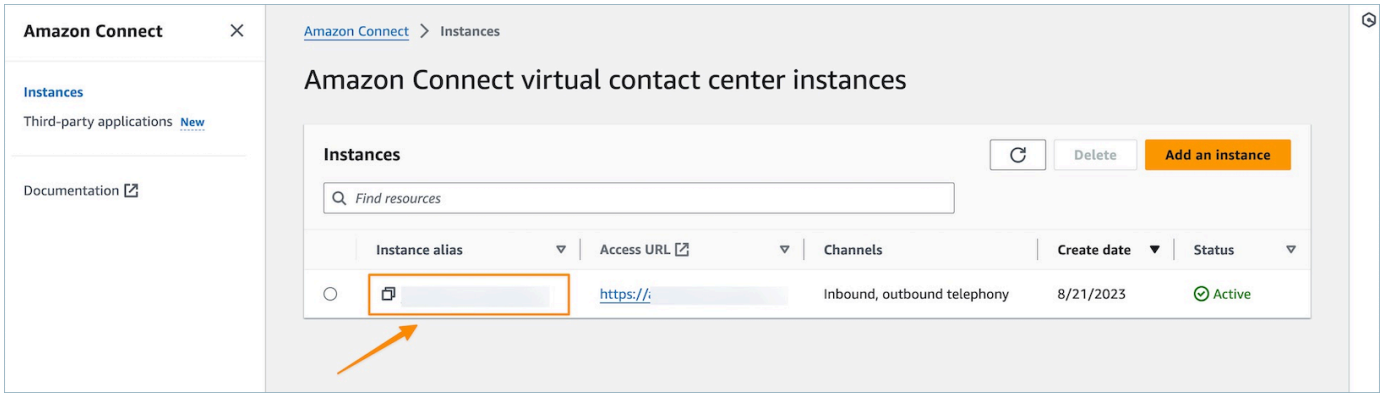
- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

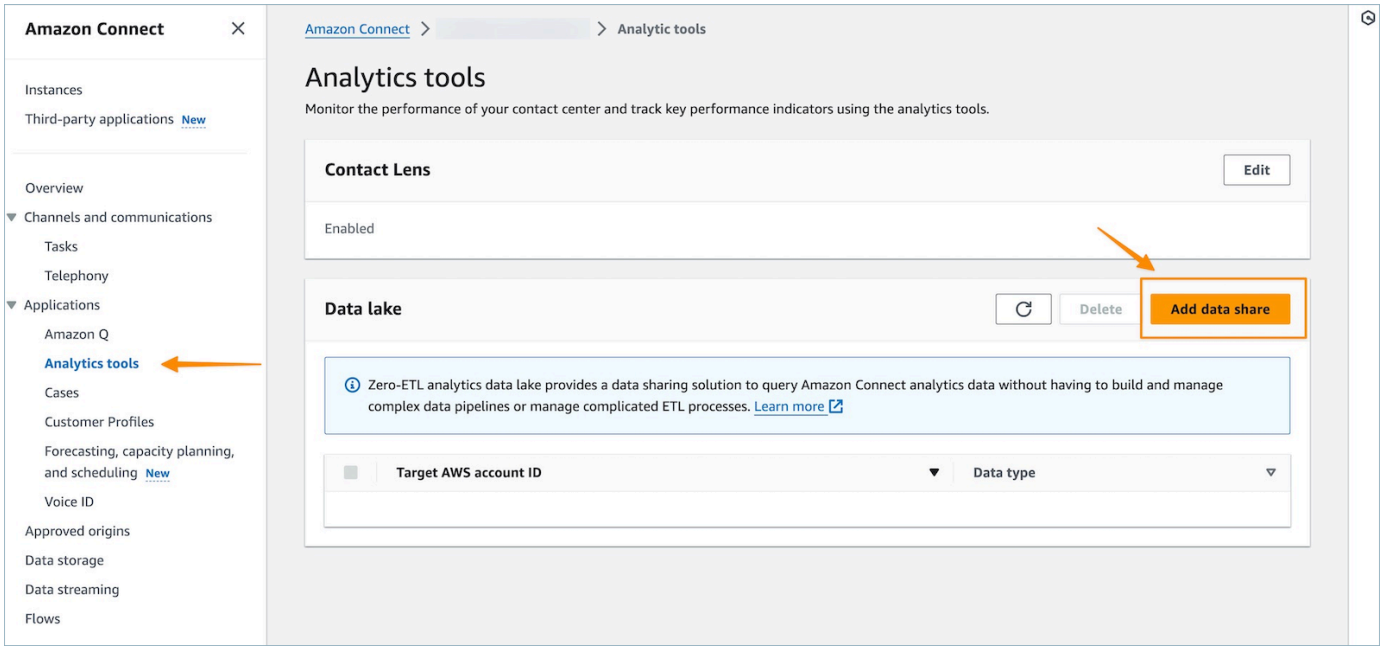
Option 1: Use the Connect Customer console

1. Open the Connect Customer console at https://console.aws.amazon.com/connect/.

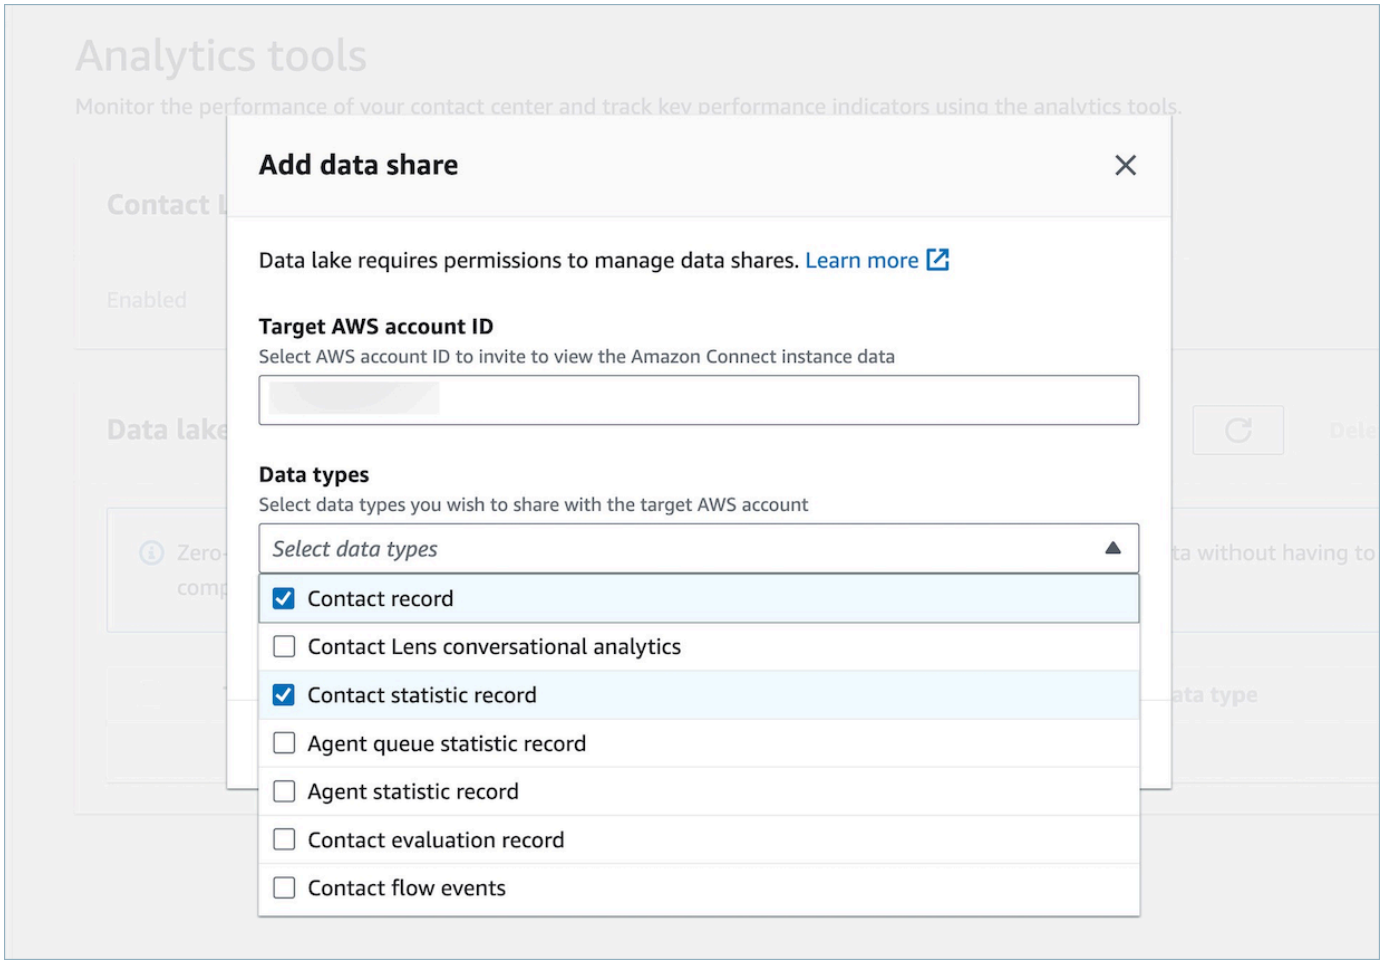
2. On the instances page, choose the instance alias. The instance alias is also your instance name, which appears in your Connect Customer URL. The following image shows the Connect Customer virtual contact center instances page, with a box around the instance alias.



3. On the left navigation menu, choose **Analytics Tools** and then choose **Add data share**.



4. For the **Target AWS account ID** specify the AWS account ID of the account from which you wish to access data (consumer). This can be the same AWS account as hosts your Connect Customer instance or a different AWS account. Select one or multiple data types you wish to access from the consumer account and select **Confirm**.



Option 2: Use CLI or CloudShell

1. Generate the `generate Association api` request file by running the `aws connect batch-associate-analytics-data-set --generate-cli-skeleton input > input_batch_association.json` command.
2. Open the JSON file in a text editor and enter the following:

   - **Instance ID** – Your Connect Customer instance ID.
   - **DataSetID** – Enter the required tables. For more information about required tables, see Associate tables for the Connect Customer analytics data lake.
   - **TargetAccountId** – Account ID to share data.

   Each value in `DataSetIds` is a data lake table name, such as `contact_record`. The following JSON file shows a subset of tables as an example. For more information about table names

that you can use as `DataSetIds`, see Data type definitions for the Connect Customer data lake.

```
{
"InstanceId": your_instance_id,
"DataSetIds": [
  "contact_record",
  "contact_flow_events",
  "contact_statistic_record",
  "contact_lens_conversational_analytics",
  "agent_queue_statistic_record",
  "agent_statistic_record",
  "contact_evaluation_record",
  "evaluation_review_record",
  "coaching_session_record"
],
"TargetAccountId": your_account_ID
}
```

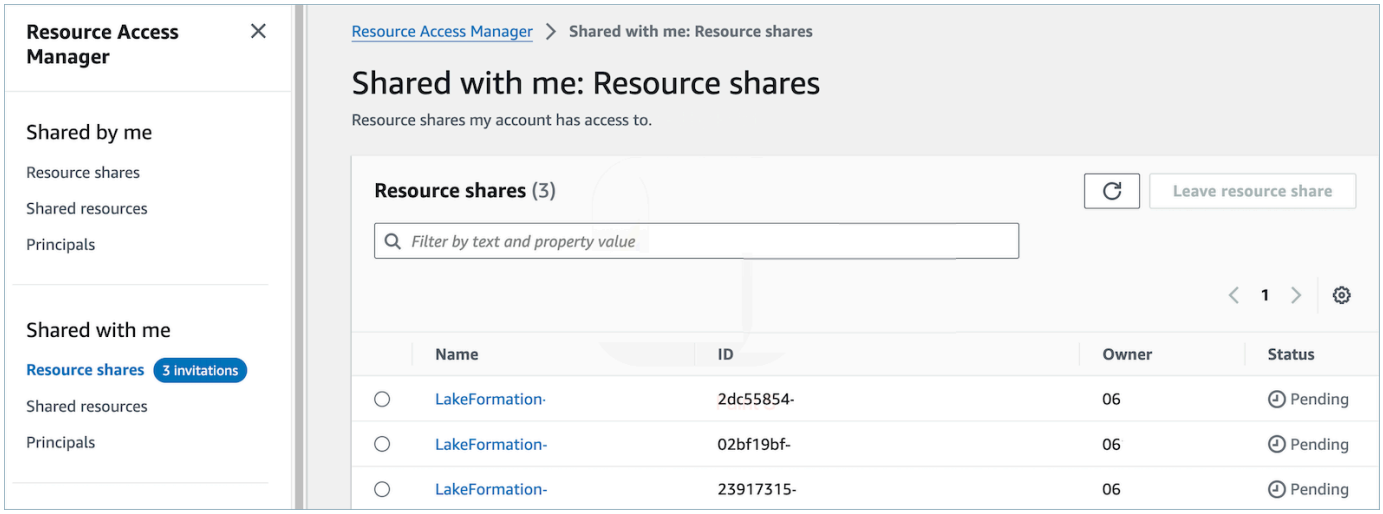
3. Associate the data lake to a single account by running the `aws connect batch-associate-analytics-data-set --cli-input-json file:///path/to/request/file` command (where this path is based on the location of the JSON file).

Associate tables for the Connect Customer analytics data lake

Configuration of data sharing creates a RAM invitation to the consumer account. RAM is a service to help you securely share resources across AWS accounts. Make sure that you have the required AWS Identity and Access Management (IAM) permissions to view and accept resource share invitations.

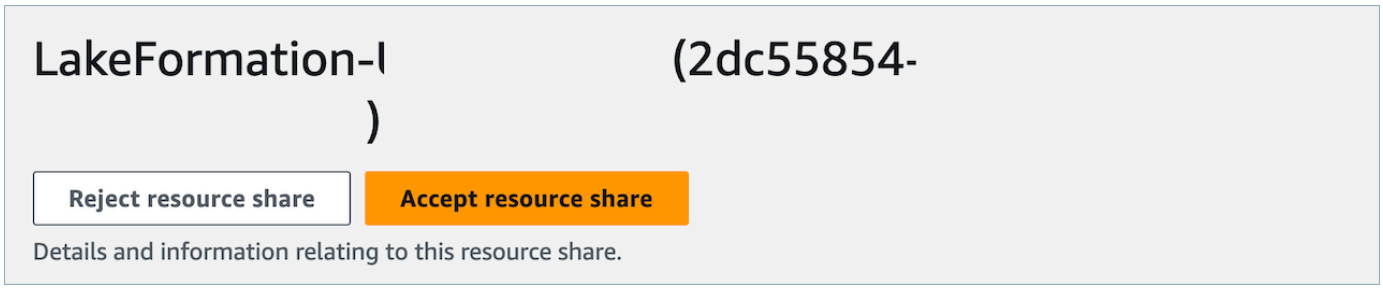
For information about the suggested IAM policies for data lake administrators, see Data lake administrator permissions.

1. Open the RAM console at https://console.aws.amazon.com/ram/.
2. Under **Shared with me** select **Resource shares**



3. Select the name of the resource share and **Accept resource share**.

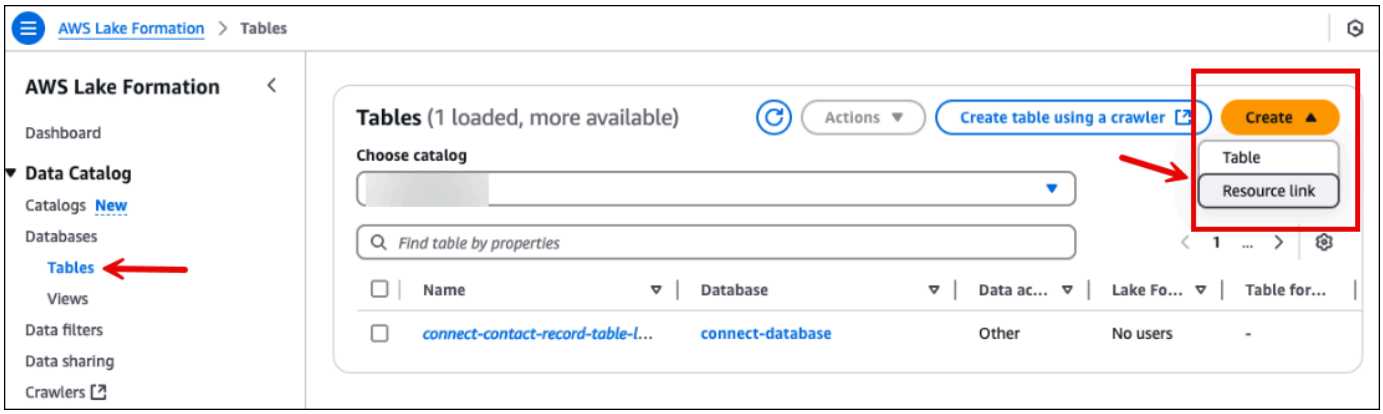
> **Important**
>
> - An initial RAM request is created only for the first share.
> - Lake Formation optimizes subsequent shares by reusing existing accepted RAM requests when possible.
> - RAM requests expire after 12 hours if not accepted.
> - For more information about RAM requests, see Accepting and rejecting resource share invitations and Optimize AWS RAM resource shares.



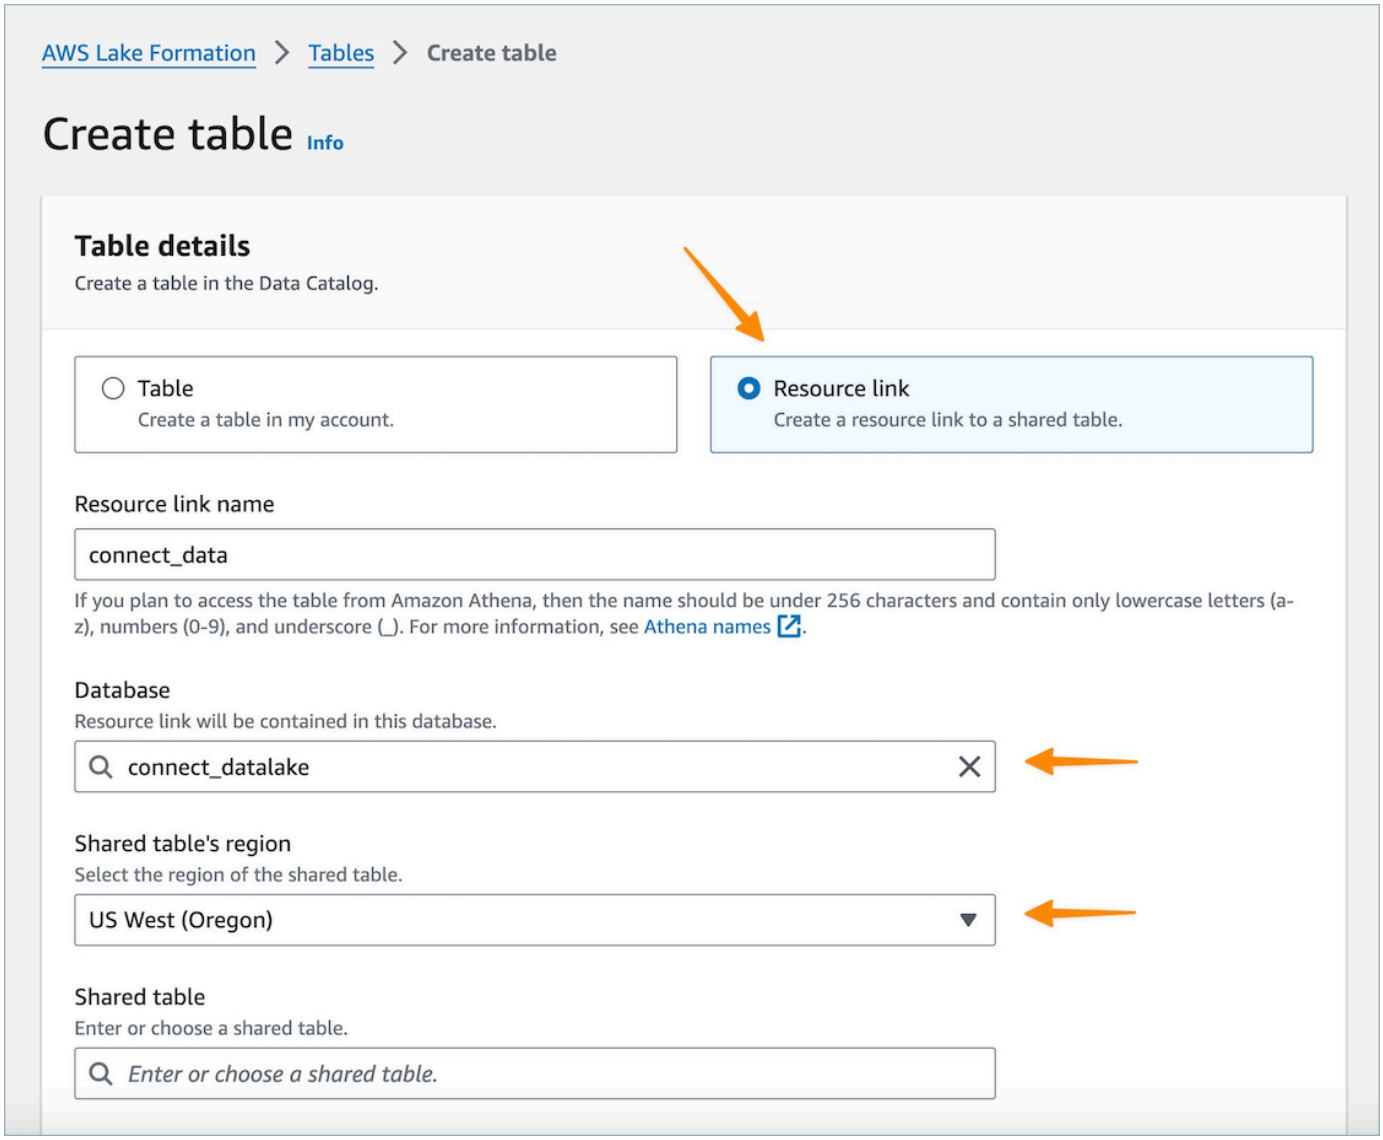
4. After the resource shares have been accepted, in the consumer account navigate to the AWS Lake Formation console at https://console.aws.amazon.com/lakeformation. To configure access to the Connect Customer data lake tables, be certain the user configuring the following resources has Data lake administrator permissions in Lake Formation. For more information, see Lake Formation personas and IAM permissions reference.

5. Either use an existing lake formation database or create a new database for the Connect Customer data lake tables. For more information, see Creating a database.

6. In the AWS Lake Formation console, choose **Tables** on the left navigation menu.



7. Select **Create table** from the upper right to create a new Resource link.



8. In the create table dialog, select the **Resource link** radio button. **Resource link name** can be any value you wish to name the linked table. For example, for the **contact record** data type you might want to define the link name as contact_record.
9. Specify the **Database** previously created from step 5.
10. In the **Shared table** choose the shared table whose RAM invite was previously accepted and you wish to map to this Resource link name. For example, select the `contact_record` shared table to map to the contact record resource link.
11. Information for the Shared table's database and owner ID will automatically be populated.
12. Choose **Create**.
13. Repeat for all data types shared to the consumer account.

14. Open the Amazon Athena console, and run a query to check if the data with the shared instance_id is provided in the request file. For example:

    `select * from database_name.linked_table limit 10.`

    Where:

    - *database_name* is the name of the database that you created in step 5.
    - *linked_table* is one of the resource link names you created in step 8.

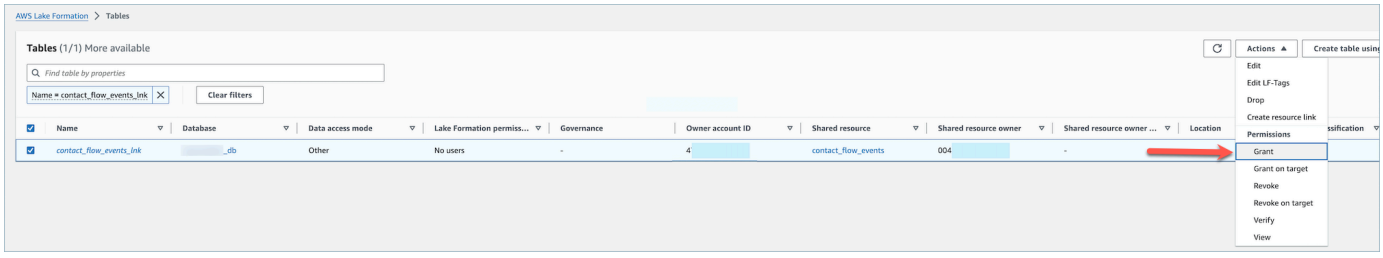
Manage access to Resource link tables

In a cross-account access scenario in Lake Formation, to grant Select permission to a user, the user has to have Describe permission on the resource link since resource links are required for integrated AWS services like Amazon Athena and Amazon Redshift, and Select permission on the shared table to have read access to the underlying resource link data. Therefore, it is a two-step grant process.

To grant resource link access to a QuickSight user, complete the following steps:

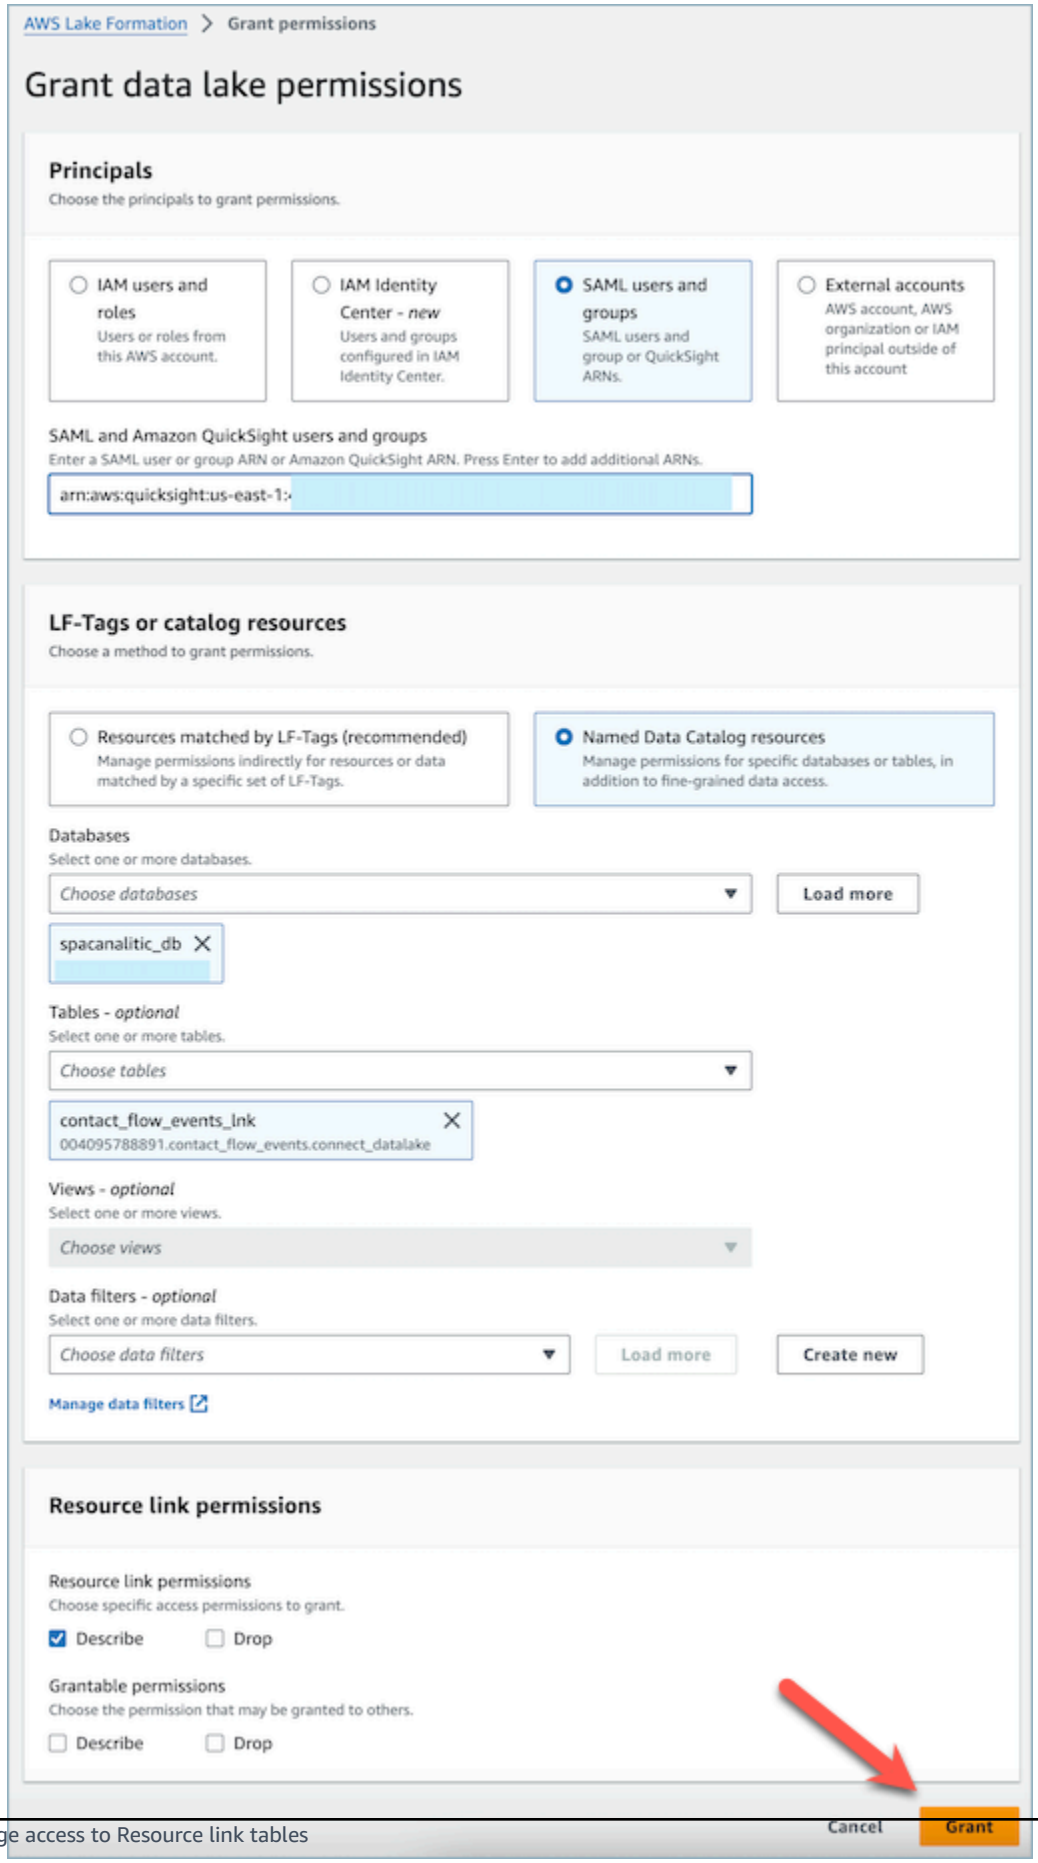
> **Note**
>
> You must repeat this process for each table individually. You cannot grant permissions to all tables in a database at once.

1. Log into the consumer account as the data lake administrator and go to the Lake Formation Console.
2. On the left navigation pane, go to Tables and select the resource link of the shared table created in the previous section.
3. Choose **Actions** and select **Grant**.



4. In the grant data permissions menu, in the Principals section, choose SAML users and groups and enter the ARN of the QuickSight user.

5. In the Table permissions section choose Describe as a table permission.
6. Choose **Grant**.



AWS Lake Formation > Grant permissions
Grant data lake permissions
Principals
Choose the principals to grant permissions.
IAM users and roles
Users or roles from this AWS account.
IAM Identity Center - new
Users and groups configured in IAM Identity Center.
SAML users and groups
SAML users and group or QuickSight ARNs.
External accounts
AWS account, AWS organization or IAM principal outside of this account
SAML and Amazon QuickSight users and groups
Enter a SAML user or group ARN or Amazon QuickSight ARN. Press Enter to add additional ARNs.

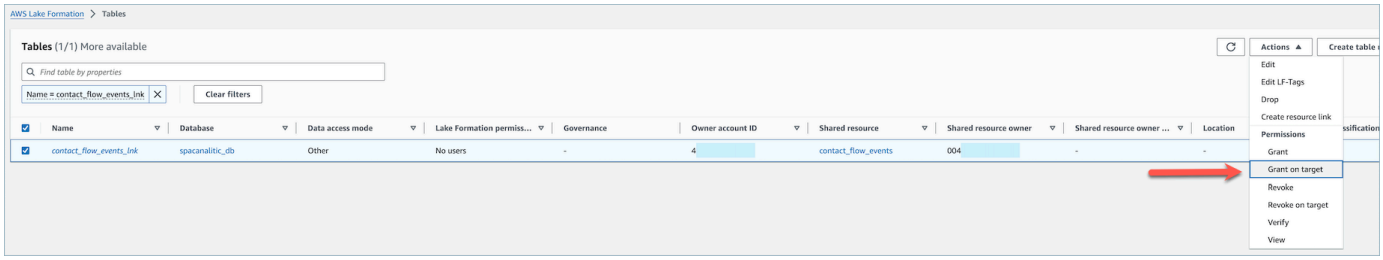
Grant

Now, the QuickSight user can see that the table exists within Quicksight's dataset console.

However, if the QuickSight user tries to preview or visualize the data at this stage, an exception will be raised since the user does not have access to the underlying data.

Now, we will grant the user read access to the data in the resource link's target, which is the table shared by Connect Customer. To do that, complete the following steps:

1. Log into the consumer account as the data lake administrator and go to the Lake Formation Console.
2. On the left navigation pane, go to **Tables** and select the resource link of the shared table created in the previous section.
3. Choose **Actions** and select **Grant on Target**.



4. In the grant data permissions menu, in the **Principals** section, choose SAML users and groups and enter the ARN of the QuickSight user.
5. In the Table permissions section choose Select as a table permission.
6. Choose **Grant**.

Grant

Grant access per table

You must grant access for each table individually. You cannot grant access to all tables in a database at once.
The database value shown in the **Grant on target** step might not match your expected database name. Use the value shown in the interface. Changing it to a different value causes the permission grant to fail.

Data type definitions for the Connect Customer data lake

This topic details the content in the Connect Customer data lake tables. Each table lists the column, type, and description of the content in the table.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Important things to know
- Agent data in the Connect Customer data lake
- Contact data in the Connect Customer data lake
- Contact analytics data in the Connect Customer data lake
- Coaching data in the Connect Customer data lake
- Customer profiles contact data in the Connect Customer data lake
- AI agent data in the Connect Customer data lake
- Flow data in the Connect Customer data lake
- Bot analytics data in the Connect Customer analytics data lake
- Cases data in the Connect Customer analytics data lake
- Configuration data in the Connect Customer data lake
- Forecasting data in the Connect Customer analytics data lake

- Outbound campaigns data in the Connect Customer data lake
- Resource tags data in the Connect Customer data lake
- Scheduling data in the Connect Customer analytics data lake
- Reference queries for the Connect Customer data lake

Important things to know

- The launch of new features results in additional to data fields or values to be added to the tables. When you develop applications that consume data lake data, we recommend that you build them to ignore the addition of new fields.
- Connect Customer delivers contact records at least once. Contact records might be delivered again for multiple reasons, such as new information arriving after initial delivery which might update the data in the record. For example, when you use the update-contact-attributes CLI command to update a contact record, Connect Customer delivers a new contact record.
- For information about data retention, see Data retention in the Connect Customer analytics data lake.

Agent data in the Connect Customer data lake

The following tables contain agent data.

Topics

- Agent queue statistic record
- Agent statistic record
- Agent event

Agent queue statistic record

Table name: `agent_queue_statistic_record`

Description: Contains queue-level statistics per agent, per interval. Tracks metrics like contacts offered, handled, handle time, and connecting times for each agent-queue combination.

Primary key: `aqsr_statistic_id, instance_id`

Partition key: `interval_start_time` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `user_id` — Joins to Agent Statistic Record, Agent Event, Contact Record (as `agent_id`), Contact Evaluation Record, users
- `queue_id` — Joins to Contact Record, Contact Statistic Record
- `routing_profile_id` — Joins to Agent Statistic Record, routing_profiles
- `agent_hierarchy_level_*_id` — Joins to agent_hierarchy_groups

Column	Type	Nullable	Description
aqsr_statistic_id	string	No	Unique ID for the AQSR record
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.
user_id	string	Yes	The identifier

Column	Type	Nullable	Description
			of the user account.
routing_profile_id	string	Yes	ID of routing profile.
agent_hierarchy_level_1_id	string	Yes	ID of level 1 Hierarchy Group.
agent_hierarchy_level_2_id	string	Yes	ID of level 2 Hierarchy Group.
agent_hierarchy_level_3_id	string	Yes	ID of level 3 Hierarchy Group.
agent_hierarchy_level_4_id	string	Yes	ID of level 4 Hierarchy Group.
agent_hierarchy_level_5_id	string	Yes	ID of level 5 Hierarchy Group.

Column	Type	Nullable	Description
interval_start_time	Timestamp	No	Timestamp of the conversation when interval started.
interval_end_time	Timestamp	No	Timestamp of the conversation when interval ended.
published_date	Timestamp	Yes	
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.
queue_id	string	Yes	The identifier of the queue.

Column	Type	Nullable	Description
channel	string	Yes	The method used to contact your contact center: VOICE, CHAT, TASK, EMAIL.

Column	Type	Nullable	Descripti on
queue_type	string	Yes	QueueType specifies the classific ation of the queue, indicatin g its intended use and behavior. Valid values for QueueType are STANDARD, which is a general-purpose queue where contacts wait before they are routed to and accepted by agents, and AGENT, which are created automatic

Column	Type	Nullable	Description
			ally for every agent user you add Connect Customer.
agent_non_response	bigint	Yes	The count of contacts routed to an agent but not answered by that agent, including contacts abandoned by the customer.
contacts_offered	bigint	Yes	

Column	Type	Nullable	Description
contacts_handled	bigint	Yes	The count of incoming customer contacts that were connected to an agent. It excludes outbound calls made by agents. It doesn't matter how the incoming contact got to the agent. It could be a customer calling your contact center. It could be a contact transferred from one agent to another. It could be

Column	Type	Nullable	Description
			a contact where the agent answered it, but then they weren't sure what to do and they transferred the contact away again. As long as the agent was connected to the incoming contact, it increments **Contacts handled**.

Column	Type	Nullable	Description
handle_time	bigint	Yes	The average time, from start to finish, that a contact was connected with an agent (average handled time). It includes talk time, hold time, After Contact Work (ACW) time, custom status time, and agent pause duration (which applies only to tasks). AHT is calculated by

Column	Type	Nullable	Description
			averaging the amount of time between the contact being answered by an agent and the conversation ending. It applies to both inbound and outbound calls.

Column	Type	Nullable	Description
agent_incoming_connecting_time	bigint	Yes	The total time between when a contact is initiated by Connect Customer reserving the agent for the contact, and the agent is connected.
agent_outbound_connecting_time	bigint	Yes	Total time between when an outbound contact is initiated by Connect Customer reserving the agent for the contact, and the agent is connected.

Column	Type	Nullable	Description
agent_callback_connecting_time	bigint	Yes	The total time between when a callback contact is initiated by Connect Customer reserving the agent for the contact, and the agent is connected.
agent_api_connecting_time	bigint	Yes	The total time between when a contact is initiated using an Connect Customer API, and the agent is connected.

Column	Type	Nullable	Description
incoming_connecting_attempts	bigint	Yes	The number of attempts initiated by Connect Customer reserving the agent for the contact for INBOUND initiation type contacts.
outbound_connecting_attempts	bigint	Yes	The number of attempts initiated by Connect Customer reserving the agent for the contact for outbound initiation type contacts.

Column	Type	Nullable	Description
callback_connecting_attempts	bigint	Yes	The number of contacts where a callback was attempted, but the customer did not pick up.
api_connecting_attempts	bigint	Yes	Used to calculate Average agent incoming connecting time.

Column	Type	Nullable	Description
contact_time_ms	bigint	Yes	The total time, in milliseconds, that the agent spent on contacts for this queue during the interval, including customer hold time and after contact work time. This does not include time spent on a contact while in a custom or Offline status.

Column	Type	Nullable	Description
agent_non_response_without_customer_abandons	bigint	Yes	The number of voice contacts routed to the agent but not answered by that agent, excluding contacts abandoned by the customer. A single contact can be counted multiple times if it is routed and missed more than once.
instance_arn	string	Yes	The ARN of the Connect Customer instance.

Column	Type	Nullable	Description
user_arn	string	Yes	The ARN of the user account.
agent_routing_profile_arn	string	Yes	The ARN of the routing profile for the agent.
queue_arn	string	Yes	ARN of the queue.
agent_hierarchy_level_1_arn	string	Yes	ARN of level 1 Hierarchy Group.
agent_hierarchy_level_2_arn	string	Yes	ARN of level 2 Hierarchy Group.
agent_hierarchy_level_3_arn	string	Yes	ARN of level 3 Hierarchy Group.
agent_hierarchy_level_4_arn	string	Yes	ARN of level 4 Hierarchy Group.

Column	Type	Nullable	Description
agent_hierarchy_level_5_arn	string	Yes	ARN of level 5 Hierarchy Group.
data_lake_last_processed_Timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Agent statistic record

Table name: `agent_statistic_record`

Description: Contains aggregate agent-level statistics per interval, including online time, idle time, on-contact time, and up to 50 custom agent state durations.

Primary key: `asr_statistic_id, instance_id`

Partition key: `interval_start_time` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `user_id` — Joins to Agent Queue Statistic Record, Agent Event, Contact Record (as `agent_id`), Contact Evaluation Record, users
- `routing_profile_id` — Joins to Agent Queue Statistic Record, routing_profiles
- `agent_hierarchy_level_*_id` — Joins to agent_hierarchy_groups

Column	Type	Nullable	Description
asr_statistic_id	string	No	Unique ID for the ASR record.
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.
user_id	string	Yes	The identifier

Column	Type	Nullable	Description
			of the user account.
routing_profile_id	string	Yes	ID of routing profile.
agent_hierarchy_level_1_id	string	Yes	ID of level 1 Hierarchy Group.
agent_hierarchy_level_2_id	string	Yes	ID of level 2 Hierarchy Group.
agent_hierarchy_level_3_id	string	Yes	ID of level 3 Hierarchy Group.
agent_hierarchy_level_4_id	string	Yes	ID of level 4 Hierarchy Group.
agent_hierarchy_level_5_id	string	Yes	ID of level 5 Hierarchy Group.

Column	Type	Nullable	Description
interval_start_time	Timestamp	No	Timestamp of the conversation when interval started.
interval_end_time	Timestamp	No	Timestamp of the conversation when interval ended.
published_date	Timestamp	Yes	
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.

Column	Type	Nullable	Description
online_time	bigint	Yes	Total time that an agent spent with their CCP set to a status other than **Offline**. This includes any time spent in a custom status. When you create a historical metrics reports, this metric can't be grouped or filtered by queue, phone number, or channels.

Column	Type	Nullable	Description
error_time	bigint	Yes	For a specific agent, the total time contacts were in an error status. This metric can't be grouped or filtered by queue.

Column	Type	Nullable	Description
non_productive_time	bigint	Yes	Total time that agents spent in a custom status. That is, their CCP status is other than **Available** or **Offline**. This metric doesn't mean that the agent was spending their time unproductively.

Column	Type	Nullable	Description
agent_idle_time	bigint	Yes	After the agent sets their status in the CCP to **Available**, this is the amount of time they weren't handling contacts + any time their contacts were in an Error state. Agent idle time doesn't include the amount of time from when Connect Customer starts routing the contact to the agent, to when agent picks up

Column	Type	Nullable	Description
			or declines the contact.

Column	Type	Nullable	Description
agent_on_contact_time	bigint	Yes	Total time that an agent spent on one or multiple contacts, including Customer hold time and After contact work time. This does **not** include time spent on a contact while in a custom status or **Offline** status. (Custom status = the agent's CCP status is other than **Available** or **Offline**. For

Column	Type	Nullable	Description
			example, Training would be a custom status).
custom_state_time_01	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_02	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_03	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_04	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_05	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_06	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_07	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_08	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_09	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_10	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_11	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_12	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_13	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_14	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_15	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_16	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_17	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_18	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_19	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_20	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_21	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_22	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_23	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_24	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_25	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_26	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_27	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_28	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_29	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_30	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_31	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_32	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_33	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_34	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_35	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_36	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_37	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_38	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_39	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_40	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_41	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_42	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_43	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_44	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_45	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_46	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_47	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_48	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
custom_state_time_49	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.
custom_state_time_50	bigint	Yes	Represents custom agent states defined by a customer. For example: Coffee_break.

Column	Type	Nullable	Description
agent_status_arn	string	Yes	The Amazon Resource Name (ARN) of the agent's current agent status (not the ARN of the agent).
agent_status_name	string	Yes	The name of the agent's current status, such as Available or a custom status like Break or Training.

Column	Type	Nullable	Description
agent_status_time_ms	bigint	Yes	The amount of time, in milliseconds, that the agent was not in an Offline state during the interval.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
user_arn	string	Yes	The ARN of the user account.
agent_routing_profile_arn	string	Yes	The ARN of the routing profile for the agent.
agent_hierarchy_level_1_arn	string	Yes	ARN of level 1 Hierarchy Group.

Column	Type	Nullable	Description
agent_hierarchy_level_2_arn	string	Yes	ARN of level 2 Hierarchy Group.
agent_hierarchy_level_3_arn	string	Yes	ARN of level 3 Hierarchy Group.
agent_hierarchy_level_4_arn	string	Yes	ARN of level 4 Hierarchy Group.
agent_hierarchy_level_5_arn	string	Yes	ARN of level 5 Hierarchy Group.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Agent event

Table name: `agent_event`

Description: Captures complete agent state snapshots including current and previous agent status, routing profile, hierarchy groups, and associated contacts for each agent event.

Primary key: `instance_id, event_id`

Partition key: `event_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables

- agent_arn — Joins to Contact Record (as agent_arn), scheduling tables (as agent_arn), users (as user_arn)
- current_routing_profile_arn — Joins to routing_profiles (as agent_routing_profile_arn)
- current_agent_hierarchy_groups_level_*_arn — Joins to agent_hierarchy_groups (as agent_hierarchy_group_arn)
- current_contacts (nested) — Joins to Contact Record (as contact_id)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the agent event.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
agent_arn	string	Yes	The ARN of the agent.

Column	Type	Nullable	Description
event_id	string	No	The unique event identifier.
event_timestamp	Timestamp	Yes	The timestamp when the event occurred.
event_type	string	Yes	The type of agent event.
version	string	Yes	The version of the agent event stream in date format.
current_agent_status_arn	string	Yes	The ARN of the current agent status.
current_agent_status_name	string	Yes	The name of the current agent status.

Column	Type	Nullable	Description
current_agent_status_start_timestamp	Timestamp	Yes	The timestamp when the current agent status started.
current_agent_status_type	string	Yes	The type classification of the current agent status.
current_next_agent_status_arn	string	Yes	The ARN of the next agent status.
current_next_agent_status_name	string	Yes	The name of the next agent status.
current_next_agent_status_enqueued_timestamp	Timestamp	Yes	The timestamp when the next agent status was enqueued.

Column	Type	Nullable	Description
current_next_agent_status_type	string	Yes	The type classification of the next agent status.
current_configuration_username	string	Yes	The username of the current agent.
current_configuration_first_name	string	Yes	The first name of the current agent.
current_configuration_last_name	string	Yes	The last name of the current agent.
current_configuration_sip_address	string	Yes	The SIP address for the agent's communication endpoint.

Column	Type	Nullable	Description
current_configuration_auto_accept	boolean	Yes	Whether the agent auto-accepts incoming contacts.
current_configuration_language_code	string	Yes	The language code for the agent's interface.
current_configuration_proficiencies	array(struct)	Yes	The agent proficiency attributes (name, value, level).
current_routing_profile_arn	string	Yes	The ARN of the current routing profile.
current_routing_profile_name	string	Yes	The name of the current routing profile.

Column	Type	Nullable	Description
current_routing_profile_concurrency	array(struct)	Yes	The current routing profile concurrency settings.
current_routing_profile_default_outbound_queue_arn	string	Yes	The ARN of the default outbound queue.
current_routing_profile_default_outbound_queue_name	string	Yes	The name of the default outbound queue.
current_routing_profile_default_outbound_queue_channels	array(string)	Yes	The channels of the default outbound queue.
current_routing_profile_inbound_queues	array(struct)	Yes	The inbound queues for the routing profile.

Column	Type	Nullable	Description
current_agent_hierarchy_groups_level_1_arn	string	Yes	The ARN of the agent hierarchy group level 1.
current_agent_hierarchy_groups_level_1_name	string	Yes	The name of the agent hierarchy group level 1.
current_agent_hierarchy_groups_level_2_arn	string	Yes	The ARN of the agent hierarchy group level 2.
current_agent_hierarchy_groups_level_2_name	string	Yes	The name of the agent hierarchy group level 2.
current_agent_hierarchy_groups_level_3_arn	string	Yes	The ARN of the agent hierarchy group level 3.

Column	Type	Nullable	Description
current_agent_hierarchy_groups_level_3_name	string	Yes	The name of the agent hierarchy group level 3.
current_agent_hierarchy_groups_level_4_arn	string	Yes	The ARN of the agent hierarchy group level 4.
current_agent_hierarchy_groups_level_4_name	string	Yes	The name of the agent hierarchy group level 4.
current_agent_hierarchy_groups_level_5_arn	string	Yes	The ARN of the agent hierarchy group level 5.
current_agent_hierarchy_groups_level_5_name	string	Yes	The name of the agent hierarchy group level 5.

Column	Type	Nullable	Description
current_contacts	array(struct)	Yes	The current contacts associated with the agent.
current_snapshot_timestamp	Timestamp	Yes	The date and time at which the agent state snapshot after the event was captured.
previous_agent_status_arn	string	Yes	The ARN of the previous agent status.
previous_agent_status_name	string	Yes	The name of the previous agent status.

Column	Type	Nullable	Description
previous_agent_status_start_timestamp	Timestamp	Yes	The timestamp when the previous agent status started.
previous_agent_status_type	string	Yes	The type classification of the previous agent status.
previous_configuration_proficiencies	array(struct)	Yes	The previous agent proficiency attributes.
previous_routing_profile_arn	string	Yes	The ARN of the previous routing profile.
previous_routing_profile_name	string	Yes	The name of the previous routing profile.

Column	Type	Nullable	Description
previous_routing_profile_concurrency	array(struct)	Yes	The previous routing profile concurrency settings.
previous_routing_profile_default_outbound_queue_arn	string	Yes	The ARN of the previous default outbound queue.
previous_routing_profile_default_outbound_queue_name	string	Yes	The name of the previous default outbound queue.
previous_routing_profile_default_outbound_queue_channels	array(string)	Yes	The channels of the previous default outbound queue.

Column	Type	Nullable	Description
previous_routing_profile_inbound_queues	array(struct)	Yes	The previous inbound queues for the routing profile.
previous_agent_hierarchy_groups_level_1_arn	string	Yes	The ARN of the previous agent hierarchy group level 1.
previous_agent_hierarchy_groups_level_1_name	string	Yes	The name of the previous agent hierarchy group level 1.
previous_agent_hierarchy_groups_level_2_arn	string	Yes	The ARN of the previous agent hierarchy group level 2.

Column	Type	Nullable	Description
previous_agent_hierarchy_groups_level_2_name	string	Yes	The name of the previous agent hierarchy group level 2.
previous_agent_hierarchy_groups_level_3_arn	string	Yes	The ARN of the previous agent hierarchy group level 3.
previous_agent_hierarchy_groups_level_3_name	string	Yes	The name of the previous agent hierarchy group level 3.
previous_agent_hierarchy_groups_level_4_arn	string	Yes	The ARN of the previous agent hierarchy group level 4.

Column	Type	Nullable	Description
previous_agent_hierarchy_groups_level_4_name	string	Yes	The name of the previous agent hierarchy group level 4.
previous_agent_hierarchy_groups_level_5_arn	string	Yes	The ARN of the previous agent hierarchy group level 5.
previous_agent_hierarchy_groups_level_5_name	string	Yes	The name of the previous agent hierarchy group level 5.
previous_contacts	array(struct)	Yes	The previous contacts associated with the agent.

Column	Type	Nullable	Description
previous_snapshot_timestamp	Timestamp	Yes	The date and time at which the agent state snapshot before the event was captured.
data_lake_last_processed_timestamp	Timestamp	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Contact data in the Connect Customer data lake

The following tables contain contact data.

Topics

- Contact record
- Contact statistic record

Contact record

Table name: `contact_record`

Description: The primary contact record containing comprehensive contact data including agent details, queue information, timestamps, device info, chat metrics, quality metrics, and contact chain references. This is the largest table in the data lake with over 100 columns.

Primary key: `instance_id, contact_id`

Partition key: `initiation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Statistic Record, Contact Lens, Contact Evaluation Record, Contact Flow Events, AI tables
- `initial_contact_id`, `previous_contact_id`, `related_contact_id`, `next_contact_id` — Self-joins for contact chains
- `agent_id` — Joins to Agent Statistic Record (as `user_id`), Agent Queue Statistic Record (as `user_id`), Agent Event (as `agent_arn`), users (as `user_id`)
- `queue_id` — Joins to Agent Queue Statistic Record, Contact Statistic Record
- `agent_routing_profile_id` — Joins to routing_profiles (as `agent_routing_profile_id`)
- `agent_hierarchy_groups_level_*_id` — Joins to agent_hierarchy_groups
- `campaign_Id` — Joins to Outbound Campaign Events (as `campaign_id`)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.
contact_id	string	No	The ID of the contact in the contact record.
initial_contact_id	string	Yes	The unique identifier for the contact associated with the first interaction between the customer and your contact center. Use

Column	Type	Nullable	Description
			the initial contact ID to track contacts between flows.
previous_contact_id	string	Yes	The unique identifier for the contact before it was transferred. Use the previous contact ID to trace contacts between flows.

Column	Type	Nullable	Description
related_contact_id	string	Yes	Each time a contact is connected to an agent, a new contact record is created. The contact records for a contact are linked together through the contactId fields: related.

Column	Type	Nullable	Description
next_contact_id	string	Yes	Each time a contact is connected to an agent, a new contact record is created. The contact records for a contact are linked together through the contactId fields: initial, next, previous.

Column	Type	Nullable	Description
channel	string	Yes	The method used to contact your contact center: VOICE, CHAT, TASK, EMAIL.
initiation_method	string	Yes	How the contact was initiated. Valid values include: INBOUND, OUTBOUND, TRANSFER, CALLBACK, QUEUE_TRANSFER, EXTERNAL_OUTBOUND, MONITOR, DISCONNECT, and API .

Column	Type	Nullable	Description
initiation_timestamp	Timestamp	Yes	The contact initiation Timestamp.
connected_to_system_timestamp	Timestamp	Yes	The Timestamp marking the date and time the customer endpoint connected to Connect Customer, in UTC time. For INBOUND, this matches InitiationTimestamp. For OUTBOUND, CALLBACK, and API, this is when the customer endpoint answers.

Column	Type	Nullable	Description
last_update_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the data lake touched a record in the data lake.
scheduled_timestamp	Timestamp	Yes	The date and time when this contact was scheduled to trigger the flow to run, in UTC time. This is supported only for the task channel.
transfer_completed_timestamp	Timestamp	Yes	The Timestamp for the completion of the transfer.

Column	Type	Nullable	Description
disconnect_timestamp	Timestamp	Yes	The contact disconnectTimestamp.
disconnect_reason	string	Yes	The reason for disconnect of the call.
queue_duration_ms	bigint	Yes	The duration that a contact spent waiting in the queue in milliseconds.
queue_dequeue_timestamp	Timestamp	Yes	The Timestamp of contacts transferred out of the queue from another queue during a **Customer queue flow**.

Column	Type	Nullable	Description
queue_enqueue_timestamp	Timestamp	Yes	The Timestamp of contacts transferred into the queue from another queue during a **Customer queue flow**.
queue_name	string	Yes	The name of the queue.
queue_arn	string	Yes	ARN of the queue.
queue_id	string	Yes	ID of the queue.

Column	Type	Nullable	Description
agent_connection_attempts	bigint	Yes	The number of times Amazon Connect Customer attempted to connect this contact with an agent.
agent_connected_to_agent_timestamp	Timestamp	Yes	The Timestamp the contact was connected to the agent.
agent_interaction_duration_ms	bigint	Yes	The total time that agents spent interacting with customers in milliseconds.

Column	Type	Nullable	Description
agent_customer_hold_duration_ms	bigint	Yes	Total time that agents and contact were on hold in milliseconds.
agent_number_of_holds	bigint	Yes	The count of contacts that were placed on hold by the agent
agent_longest_hold_duration_ms	bigint	Yes	The longest time, in whole seconds, that the customer was put on hold by the agent.
agent_after_contact_work_start_timestamp	Timestamp	Yes	The Timestamp marking the start of the **AfterContactWork** state.

Column	Type	Nullable	Description
agent_after_contact_work_end_timestamp	Timestamp	Yes	The Timestamp marking the end of the **AfterContactWork** state.
agent_after_contact_work_duration_ms	bigint	Yes	The total time that an agent spent doing ACW for a contact in milliseconds. In some businesses, also known as Call Wrap Up time.

Column	Type	Nullable	Description
attributes	map(string,string)	Yes	A contact attribute represents this data as a key-value pair. You might think of it as a field name together with the data entered into that field.
agent_username	string	Yes	The user name of the agent, as entered in their Connect Customer user account.

Column	Type	Nullable	Description
agent_arn	string	Yes	The ARN of the agent, as created in their Connect Customer user account.
agent_id	string	Yes	The ID of the agent, as created in their Connect Customer user account.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
agent_hierarchy_groups_level_1_name	string	Yes	The hierarchy name the agent is assigned to, for first level.

Column	Type	Nullable	Description
agent_hierarchy_groups_level_1_arn	string	Yes	The hierarchy ARN the agent is assigned to, for first level.
agent_hierarchy_groups_level_1_id	string	Yes	The hierarchy ID the agent is assigned to, for first level.
agent_hierarchy_groups_level_2_name	string	Yes	The hierarchy name the agent is assigned to, for second level.
agent_hierarchy_groups_level_2_arn	string	Yes	The hierarchy ARN the agent is assigned to, for second level.

Column	Type	Nullable	Description
agent_hierarchy_groups_level_2_id	string	Yes	The hierarchy ID the agent is assigned to, for second level.
agent_hierarchy_groups_level_3_name	string	Yes	The hierarchy name the agent is assigned to, for third level.
agent_hierarchy_groups_level_3_arn	string	Yes	The hierarchy ARN the agent is assigned to, for third level.
agent_hierarchy_groups_level_3_id	string	Yes	The hierarchy ID the agent is assigned to, for third level.

Column	Type	Nullable	Description
agent_hierarchy_groups_level_4_name	string	Yes	The hierarchy name the agent is assigned to, for fourth level.
agent_hierarchy_groups_level_4_arn	string	Yes	The hierarchy ARN the agent is assigned to, for fourth level.
agent_hierarchy_groups_level_4_id	string	Yes	The hierarchy ID the agent is assigned to, for fourth level.
agent_hierarchy_groups_level_5_name	string	Yes	The hierarchy name the agent is assigned to, for fifth level.

Column	Type	Nullable	Description
agent_hierarchy_groups_level_5_arn	string	Yes	The hierarchy ARN the agent is assigned to, for fifth level.
agent_hierarchy_groups_level_5_id	string	Yes	The hierarchy ID the agent is assigned to, for fifth level.
agent_routing_profile_name	string	Yes	The name of routing profile for the agent.
agent_routing_profile_arn	string	Yes	The ARN of routing profile for the agent.
agent_routing_profile_id	string	Yes	The ID of the routing profile for the agent.

Column	Type	Nullable	Description
agent_voice_enhancement_mode	string	Yes	The voice enhancement mode used by the agent. Valid values: VOICE_ISOLATION | NOISE_SUPPRESSION | NONE. A value of null indicates this mode has not yet been set for this user.
aws_contact_trace_record_format_version	string	Yes	The record format version.
campaign_Id	string	Yes	The ID associated with an outbound campaign to assist with tracking campaigns.

Column	Type	Nullable	Description
customer_endpoint_type	string	Yes	The type of the customer endpoint. Valid value is TELEPHONE_NUMBER.
customer_endpoint_address	string	Yes	The customer or external third party participant endpoint address.
transferred_endpoint_type	string	Yes	The customer or external third party participant transferred endpoint type.
transferred_endpoint_address	string	Yes	The customer or external third party participant transferred endpoint address.

Column	Type	Nullable	Description
system_endpoint_type	string	Yes	The type of the system endpoint. Valid value is TELEPHONE_NUMBER.
system_endpoint_address	string	Yes	The system endpoint type address.
recording_deletion_reason	string	Yes	If the recording was deleted, this is the reason entered for the deletion.
recording_location	string	Yes	The location, in Amazon S3, for the recording.

Column	Type	Nullable	Description
recording_status	string	Yes	The recording status. Valid values: AVAILABLE | DELETED | NULL.
recording_type	string	Yes	The recording type. Valid values: AUDIO.
answering_machine_detection_Status	string	Yes	The status of whether an answering machine was detected.
voice_id_result_authentication_result	string	Yes	The voice authentication information for the call.

Column	Type	Nullable	Description
voice_id_result_fraud_detection_watch_list_id	string	Yes	The fraud detection information for the call for watch list.
voice_id_result_speaker_id	string	Yes	The fraud detection result produced by Voice ID, processed against the current session state and streamed audio of the speaker.
voice_id_result_fraud_detection_result	string	Yes	The fraud detection result information for the call.

Column	Type	Nullable	Description
voice_id_result_fraud_detection_fraudster_Id	string	Yes	The fraud detection information for the call detecting a fraudster.
external_third_party_interaction_duration_ms	bigint	Yes	The interaction duration for external third party in milliseconds.
voice_id_result_authentication_minimum_speech_ms	bigint	Yes	The minimum authentication score required for a user to be authenticated. Values MIN 0 and MAX 100.

Column	Type	Nullable	Description
voice_id_result_authentication_score	bigint	Yes	The minimum authentication score required for a user to be authenticated. Values MIN 0 and MAX 100.
voice_id_result_authentication_score_threshold	bigint	Yes	The minimum authentication score required for a user to be authenticated. Values MIN 0 and MAX 100.

Column	Type	Nullable	Description
voice_id_result_fraud_detection_risk_score_known_fraudster	bigint	Yes	The detection of fraudsters in a watchlist score for Known Fraudster category.
voice_id_result_fraud_detection_risk_score_synthetic_speech	bigint	Yes	This score is presented as a combined risk score for Voice Spoofing.
voice_id_result_fraud_detection_risk_score_voice_spoofing	bigint	Yes	The fraud risk score based on Voice Spoofing, such as playback of audio from Text-to-Speech systems recorded audio.

Column	Type	Nullable	Description
voice_id_result_fraud_detection_score_threshold	bigint	Yes	The threshold for detection of fraudsters in a watchlist that was set in the flow for the contact.
agent_pause_duration_ms	bigint	Yes	Agent pause duration for a contact in seconds.
voice_id_result_speaker_enrolled	Boolean	Yes	**Enrolled**: The caller is enrolled in voice authentication.

Column	Type	Nullable	Description
voice_id_result_speaker_opted_out	Boolean	Yes	**Opted out**: The caller has opted out of voice authentication.
media_streams_items	array(struct(type:string))	Yes	Information about the media stream used during the contact. Valid values: AUDIO, VIDEO, CHAT.
voice_id_result_fraud_detection_reasons_items	array(string)	Yes	Contains fraud types: Known Fraudster and Voice Spoofing.
tags_references_items	map(string,string)	Yes	Adds the specified tags to the specified resource.

Column	Type	Nullable	Description
contact_details	map(string,string)	Yes	The details for the contact between agent and caller.
contact_evaluations	map(string,struct(form_id:string,evaluation_arn:string,status:string, start_timestamp:timestamp,end_timestamp:timestamp,delete_timestamp:timestamp, export_location:string))	Yes	The list with the fields and data in the evaluation form.
references	array(struct(name:string, type:string, value:string, status: string, arn: string))	Yes	Contains links to other documents that are related to a contact. Type: URL | ATTACHMENT | NUMBER | STRING | DATE | EMAIL_MESSAGE

Column	Type	Nullable	Description
email_recipients	array(struct(to_list: array(struct(display_name: string, address: string)), cc_list: array(struct(display_name: string, address: string)), from_recipient: struct(display_name: string, address: string)))	Yes	The email addresses and display names associated with an email contact, including the To recipients, the CC recipients, and the sender address.
additional_email_recipients	array(struct(to_list: array(struct(display_name: string, address: string)), cc_list: array(struct(display_name: string, address: string)), from_recipient: struct(display_name: string, address: string)))	Yes	Contains the entire list of email address and display names from the email contact.

Column	Type	Nullable	Description
agent_state_transitions	array(struct(state_start_timestamp:timestamp, state_end_timestamp:timestamp, state:string))	Yes	Information about the state transitions of the agent.
recordings	array(struct(storage_type:string,location:string,media_stream_type:string, participant_type:string,fragment_start_number:string,fragment_stop_number:string, start_timestamp:timestamp,stop_timestamp:timestamp,status:string, deletion_reason:string))	Yes	Information about a voice recording, chat transcript, or screen recording.
agent_device_platform_name	string	Yes	Name of the platform that the agent used for the call.

Column	Type	Nullable	Description
agent_device_platform_version	string	Yes	Version of the platform that the agent used for the call.
agent_device_operating_system	string	Yes	Operating system that the agent used for the call.
customer_device_platform_name	string	Yes	Name of the platform that the customer used for the call.
customer_device_platform_version	string	Yes	Version of the platform that the customer used for the call.

Column	Type	Nullable	Description
customer_device_operating_system	string	Yes	Operating system that the agent customer for the call.
disconnect_details_potential_disconnect_issue	string	Yes	Indicates the potential disconnection issues for a call. This field is not populated if the service does not detect potential issues.
last_resumed_timestamp	Timestamp	Yes	The date and time this contact was last resumed, in UTC time.

Column	Type	Nullable	Description
last_paused_timestamp	Timestamp	Yes	The date and time this contact was last paused, in UTC time.
customer_voice_activity_greeting_start_timestamp	Timestamp	Yes	The date and time that measures the beginning of the customer greeting from an outbound voice call, in UTC time.

Column	Type	Nullable	Description
customer_voice_activity_greeting_end_timestamp	Timestamp	Yes	The date and time that measures the end of the customer greeting from an outbound voice call, in UTC time.
total_pause_duration_ms	bigint	Yes	Total pause duration, including before and after the agent was connected.
total_pause_count	bigint	Yes	Total number of pauses including when the contact was not connected.

Column	Type	Nullable	Description
quality_metrics_agent_audio	struct	Yes	Information about the quality of the agent's media connection. This is a measure of how the agent sounded to the customer.
quality_metrics_customer_audio	struct	Yes	Information about the quality of the customer's media connection. This is a measure of how the customer sounded to the agent.

Column	Type	Nullable	Description
segment_attributes	map(string, string)	Yes	A set of system defined key-value pairs stored on individual contact segments using an attribute map. The attributes are standard Amazon Connect Customer attributes and can be accessed in flows. Attribute keys can include only alphanumeric, -, and _ characters.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.
chat_contact_metrics_total_messages	bigint	Yes	The number of chat messages on the contact

Column	Type	Nullable	Description
chat_contact_metrics_conversation_close_time_ms	bigint	Yes	The time it took for a contact to end after the last customer message
chat_contact_metrics_conversation_turn_count	bigint	Yes	The number of conversation turns in a chat contact
chat_contact_metrics_agent_first_response_timestamp	Timestamp	Yes	The agent first response timestamp for a chat contact.
chat_contact_metrics_agent_first_response_time_ms	bigint	Yes	The time for an agent to respond after obtaining a chat contact.

Column	Type	Nullable	Description
chat_contact_metrics_total_bot_messages	bigint	Yes	The total number of bot and automated messages on a chat contact.
chat_contact_metrics_total_bot_message_length_in_chars	bigint	Yes	The total number of characters from bot and automated messages on a chat contact.
chat_contact_metrics_multi_party	Boolean	Yes	A flag indicating whether multiparty chat or supervisor barge were enabled on this contact
chat_agent_metrics_participant_id	string	Yes	The Agent's participant id.

Column	Type	Nullable	Description
chat_agent_metrics_participant_type	string	Yes	The Agent's participant type.
chat_agent_metrics_conversation_abandon	Boolean	Yes	A flag indicating whether the chat conversation was abandoned by an Agent.
chat_agent_metrics_messages_sent	bigint	Yes	The number of chat messages sent by Agent.
chat_agent_metrics_num_responses	bigint	Yes	The number of responses sent by Agent to Customer.

Column	Type	Nullable	Description
chat_agent_metrics_message_length_in_chars	bigint	Yes	The number of chat characters sent by Agent.
chat_agent_metrics_total_response_time_ms	bigint	Yes	The total chat response time by Agent.
chat_agent_metrics_max_response_time_ms	bigint	Yes	The maximum chat response time by Agent.
chat_agent_metrics_last_message_timestamp	Timestamp	Yes	The Timestamp of last chat message by Agent.
chat_customer_metrics_participant_id	string	Yes	The Customer's participant id.
chat_customer_metrics_participant_type	string	Yes	The Customer's participant type.

Column	Type	Nullable	Description
chat_customer_metrics_conversation_abandon	Boolean	Yes	A flag indicating whether the chat conversation was abandoned by an Customer
chat_customer_metrics_messages_sent	bigint	Yes	The Number of chat messages sent by Customer.
chat_customer_metrics_num_responses	bigint	Yes	The number of responses sent by Customer.
chat_customer_metrics_message_length_in_chars	bigint	Yes	The number of chat characters sent by Customer.

Column	Type	Nullable	Description
chat_customer_metrics_total_response_time_ms	bigint	Yes	The total chat response time by Customer.
chat_customer_metrics_max_response_time_ms	bigint	Yes	The maximum chat response time by Customer.
chat_customer_metrics_last_message_timestamp	Timestamp	Yes	The Timestamp of last chat message by Customer.
q_in_connect_session_arn	string	Yes	The ARN of agent assist session.

Column	Type	Nullable	Description
ai_agents	array(struct)	Yes	The AI Agent information of the contact. Each object includes ai_use_case (string), ai_agent_version_id (string), and ai_agent_escalated (boolean).
customer_phone_number_prefix	string	Yes	The prefix of the customer phone number.

Column	Type	Nullable	Description
agent_capabilities_video	string	Yes	Indicates whether the agent's endpoint can send video. A value of SEND means video is supported.
customer_capabilities_video	string	Yes	Indicates whether the customer's endpoint can send video. A value of SEND means video is supported.

Column	Type	Nullable	Description
contact_association_id	string	Yes	A contact identifier that is common across all contacts linked by related_contact_id. This is used for email contacts in a thread.
contact_routing_queue_priority	bigint	Yes	The queue priority applied to the contact. Lower values are routed preferentially, and the default is 5.

Column	Type	Nullable	Description
contact_routing_queue_time_adjustment_ms	bigint	Yes	The adjustment applied to the contact's routing age, in milliseconds, which changes the contact's position in the queue.
customer_endpoint_display_name	string	Yes	The display name of the customer endpoint.
system_endpoint_display_name	string	Yes	The display name of the system endpoint.

Column	Type	Nullable	Description
transferred_endpoint_display_name	string	Yes	The display name of the endpoint the contact was transferred to.
disconnect_details_telemetry_inferred_reason	string	Yes	The disconnect reason inferred by Connect Customer from softphone telemetry and media data, rather than from an explicitly reported cause.

Column	Type	Nullable	Description
quality_metrics_agent_reported_issue	string	Yes	The call-quality issue self-reported by the agent, such as AUDIO_DROPPED or NO_AUDIO.
task_template_arn	string	Yes	The Amazon Resource Name (ARN) of the task template used to create the contact.
task_template_name	string	Yes	The name of the task template used to create the contact.

Column	Type	Nullable	Description
routing_criteria	array(struct)	Yes	The routing criteria associated with the contact. Each object includes an activation timestamp, index, and a list of routing steps. Each step includes a status, expiry duration, and an expression stored as a JSON string. For more information, see RoutingCriteria.

Sample queries when routing based on proficiencies

The following example query in Amazon Athena creates a view with one row for each routing criteria for each contact:

```
CREATE OR REPLACE VIEW routing_criteria AS
SELECT
    instance_id,
    aws_account_id,
    contact_id,
    instance_arn,

    rc_item.index AS routing_criteria_index,
    rc_item.activation_timestamp

FROM "contact-record-resource-link-table-name"
CROSS JOIN UNNEST(routing_criteria) AS t(rc_item)
WHERE routing_criteria IS NOT NULL;
```

The following example query in Amazon Athena creates a view with one row for each routing step for each routing criteria:

```
CREATE OR REPLACE VIEW routing_steps AS
SELECT
    instance_id,
    aws_account_id,
    contact_id,
    instance_arn,

    rc_item.index AS routing_criteria_index,
    rc_item.activation_timestamp,
    step_ordinal,
    step_item.status,
    step_item.expiry.expiry_duration_in_seconds,
    step_item.expiry.expiry_timestamp,
    step_item.expression

FROM "contact-record-resource-link-table-name"
CROSS JOIN UNNEST(routing_criteria) AS t(rc_item)
CROSS JOIN UNNEST(rc_item.steps) WITH ORDINALITY AS s(step_item, step_ordinal)
WHERE routing_criteria IS NOT NULL;
```

The following example query in Amazon Athena creates a view that extracts individual attribute conditions from routing step expressions, producing one row for each skill requirement for each step:

```
CREATE OR REPLACE VIEW routing_attribute_conditions AS

SELECT ctr.instance_id, ctr.aws_account_id, ctr.instance_arn,
       ctr.contact_id, rc.index AS routing_criteria_index, s.step_ordinal, step.status,
       step.expiry.expiry_duration_in_seconds AS expiry_duration_in_seconds,

       -- Whether this step uses a NOT (exclusion) condition.
       strpos(step.expression, '"notAttributeCondition":{') > 0 AS negated,

       CASE WHEN raw_name <> 'null'
            THEN regexp_extract(raw_name, '"([^"]+)"', 1) END AS attribute_name,
       CASE WHEN raw_value <> 'null'
            THEN regexp_extract(raw_value, '"([^"]+)"', 1) END AS attribute_value,
       CASE WHEN raw_prof <> 'null'
            THEN CAST(raw_prof AS DOUBLE) END AS proficiency_level,
       CASE WHEN raw_comp <> 'null'
            THEN regexp_extract(raw_comp, '"([^"]+)"', 1) END AS comparison_operator,

       CASE WHEN regexp_extract(raw_comp, '"([^"]+)"', 1) = 'Match'
            THEN regexp_extract_all(step.expression, '([0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]
{4}-[0-9a-f]{4}-[0-9a-f]{12})')
       END AS match_criteria_agent_ids,

       CAST(regexp_extract(step.expression, '"minProficiencyLevel":([0-9.]+)', 1) AS
 DOUBLE) AS range_min_proficiency_level,
       CAST(regexp_extract(step.expression, '"maxProficiencyLevel":([0-9.]+)', 1) AS
 DOUBLE) AS range_max_proficiency_level

FROM "contact-record-resource-link-table-name" ctr
CROSS JOIN UNNEST(ctr.routing_criteria) AS t(rc)
CROSS JOIN UNNEST(rc.steps) WITH ORDINALITY AS s(step, step_ordinal)
CROSS JOIN UNNEST(
    regexp_extract_all(step.expression, '"name":(null|"[^"]*")', 1),
    regexp_extract_all(step.expression, '"comparisonOperator":(null|"[^"]*")', 1),
    regexp_extract_all(step.expression, '"proficiencyLevel":(null|[0-9.]+)', 1),
    regexp_extract_all(step.expression, '"value":(null|"[^"]*")', 1)
) AS t2(raw_name, raw_comp, raw_prof, raw_value)

WHERE ctr.routing_criteria IS NOT NULL
```

```
  AND step.expression IS NOT NULL;
```

Contact statistic record

Table name: `contact_statistic_record`

Description: Contains pre-computed contact statistics and boolean flags for KPI calculation, including timing metrics and classification flags for contact handling, transfers, and abandonment.

Primary key: `instance_id, contact_id`

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Lens, Contact Evaluation Record, Contact Flow Events
- `queue_id` — Joins to Contact Record, Agent Queue Statistic Record
- `agent_id` — Joins to Contact Record (as `agent_id`), Agent Statistic Record (as `user_id`), Agent Queue Statistic Record (as `user_id`), users (as `user_id`)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.

Column	Type	Nullable	Description
contact_id	string	No	The ID of the contact.
channel	string	Yes	The method used to contact your contact center: VOICE, CHAT, TASK, EMAIL.
queue_id	string	Yes	ID of the queue.
agent_id	string	Yes	ID of the agent.
initiation_method	string	Yes	Values for INITIATION_METHOD: INBOUND | OUTBOUND | TRANSFER | QUEUE_TRANSFER | CALLBACK | API

Column	Type	Nullable	Description
initiation_timestamp	Timestamp	Yes	The date and time when the contact was initiated.
disconnect_timestamp	Timestamp	Yes	The contact disconnect Timestamp.
enqueue_timestamp	Timestamp	Yes	The Timestamp of contacts transferred into the queue from another queue during a **Customer queue flow**.
contact_flow_time_ms	bigint	Yes	The time a contact spent in a contact flow.

Column	Type	Nullable	Description
abandon_time_ms	bigint	Yes	The time that contacts waited in the queue before being abandoned.
queue_time_ms	bigint	Yes	The time that a contact spent waiting in the queue.
queue_answer_time_ms	bigint	Yes	The time that contacts waited in the queue before being answered by an agent.

Column	Type	Nullable	Description
handle_time_ms	bigint	Yes	The time that an agent spent on contacts. Agent interaction + Customer Hold + ACW
customer_hold_time_ms	bigint	Yes	The time that customers spent on hold after being connected to an agent.
agent_interaction_time_ms	bigint	Yes	The time that customer spent to interact with agent.

Column	Type	Nullable	Description
agent_interaction_outbound_time_ms	bigint	Yes	The time that agents spent interacting with a customer during an outbound contact.
agent_interaction_and_hold_time_ms	bigint	Yes	The time that customer spent to interact with agent and put on hold.
after_contact_work_time_ms	bigint	Yes	The time that an agent spent doing ACW for a contact.

Column	Type	Nullable	Description
after_contact_work_outbound_time_ms	bigint	Yes	The time that agents spent doing After Contact Work (ACW) for an outbound contact.

Column	Type	Nullable	Description
is_connected	bigint	Yes	A flag indicating whether `connected_to_system_timestamp` is not null. `is_connected` is populated when `connected_to_system_timestamp` is not null and is set to the date and time the customer endpoint connected to Connect Customer, in UTC time. For INBOUND, this matches InitiationTimestamp. For

Column	Type	Nullable	Description
			OUTBOUND, CALLBACK, and API, this is when the customer endpoint answers. Note that `is_handled` indicates whether the call was connected to an agent.

Column	Type	Nullable	Description
is_abandoned	bigint	Yes	A flag indicating whether a contact is abandoned. (Determined by not having been handled by an agent, not being transferred by a flow and not having a next contact.)
is_agent_hung_up_first	bigint	Yes	A flag indicating whether a contact is disconnected where the agent disconnected before the customer.

Column	Type	Nullable	Description
is_handled	bigint	Yes	A flag indicating whether the call was connected to an agent.
is_handled_incoming	bigint	Yes	A flag indicating whether a contact is an incoming contact that was handled by an agent, including inbound contacts and transferred contacts.

Column	Type	Nullable	Description
is_handled_outbound	bigint	Yes	A flag indicating whether a contact is an outbound contact that was handled by an agent.
is_callback_handled	bigint	Yes	A flag indicating whether a contact is a callback and handled by an agent.
is_api_handled	bigint	Yes	A flag indicating whether a contact is initiated using a Connect Customer API operation and handled by an agent.

Column	Type	Nullable	Description
is_put_on_hold	bigint	Yes	A flag indicating whether a contact is put on hold.
is_hold_disconnect	bigint	Yes	A flag indicating whether a contact is disconnected while the customer was on hold.
is_hold_agent_disconnect	bigint	Yes	A flag indicating whether a contact is disconnected by the agent while the customer was on hold.

Column	Type	Nullable	Description
is_hold_customer_disconnect	bigint	Yes	A flag indicating whether a contact is disconnected by the customer while the customer was on hold.
is_incoming	bigint	Yes	A flag indicating whether a contact is an incoming contacts, including inbound contacts and transferred contacts.
is_callback_contact	bigint	Yes	A flag indicating whether a contact is callback.

Column	Type	Nullable	Description
is_api_contact	bigint	Yes	A flag indicating whether a contact is initiated using a Connect Customer API operation.
is_queued	bigint	Yes	A flag indicating whether a contact is put in queue.
is_queued_and_handled	bigint	Yes	A flag indicating whether a contact is put in queue and handled by agent.
is_transferred_in	bigint	Yes	A flag indicating whether a contact is transferred in.

Column	Type	Nullable	Description
is_transferred_in_from_handled	bigint	Yes	A flag indicating whether a contact is transferred in from a contact handled by agent.
is_transferred_in_from_queued	bigint	Yes	A flag indicating whether a contact is transferred to the queue from another in a Transfer to queue contact flow.
is_transferred_out	bigint	Yes	A flag indicating whether a contact is transferred out.

Column	Type	Nullable	Description
is_transferred_out_from_handled	bigint	Yes	A flag indicating whether a contact is transferred in from a contact handled by agent.
is_transferred_out_from_queued	bigint	Yes	A flag indicating whether a contact is transferred from the queue to another queue in a Transfer to queue contact flow.
is_transferred_out_internal	bigint	Yes	A flag indicating whether a contact is transferred to an internal source.

Column	Type	Nullable	Description
is_transferred_out_external	bigint	Yes	A flag indicating whether a contact is transferred from the queue to an external source.
is_transferred_out_external_from_contact_flow	bigint	Yes	A flag indicating whether a contact is transferred to an external destination by contact flow.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Manager assist contacts

If your Connect Customer instance has manager assist enabled, manager assist contacts appear in the data lake with `channel` = `CHAT` and `initiationMethod` = `API`. These contacts have a `subType` of `connect:Assistant` and are excluded from out-of-the-box reports.

The `contact_statistic_record` table does not include a `subType` column. To exclude manager assist contacts, JOIN to `contact_record` and filter on the segment attribute, as shown in the following sample query.

Sample query to exclude manager assist contacts

The following example query excludes manager assist contacts from `contact_statistic_record` results by joining to `contact_record` and filtering on the `connect:Subtype` segment attribute:

```
-- Exclude Manager Assist contacts from contact_statistic_record queries
SELECT csr.*
FROM contact_statistic_record csr
INNER JOIN contact_record cr
ON csr.contact_id = cr.contact_id
AND csr.instance_id = cr.instance_id
WHERE cr.segment_attributes['connect:Subtype'] IS NULL
OR cr.segment_attributes['connect:Subtype'] != 'connect:Assistant'
```

Tip

You can also identify manager assist contacts by the presence of the `ai_agents` array in `contact_record`, where `ai_use_case = 'SelfService'`.

Contact analytics data in the Connect Customer data lake

The following tables contain contact analytics data.

Topics

- Conversational analytics
- Contact evaluation record
- Evaluation review record

Conversational analytics

Table name: `contact_lens_conversational_analytics`

Description: Contains Contact Lens analytics data including sentiment scores, talk and non-talk time, interruptions, talk speed, and response times for voice and chat contacts.

Primary key: `instance_id, contact_id`

Partition key: `disconnect_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Evaluation Record, Contact Flow Events, AI Agent, AI Session, AI Prompt, AI Tool

Column	Type	Nullable	Description
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.
version	string	Yes	Indicates real-time or post call/chat analysis.
instance_id	string	No	The ID of the Connect Customer instance.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
contact_id	string	No	The ID of the contact

Column	Type	Nullable	Description
			being evaluated.
channel	string	Yes	The method used to contact your contact center: VOICE, CHAT.
language_locale	string	Yes	Language used to analyze contact - AI features.
feature	string	Yes	Will always have the same value "contact_lens_conversational_analytics".
categories	array(string)	Yes	Array of categories assigned to the contact.

Column	Type	Nullable	Description
disconnect_timestamp	Timestamp	Yes	The contact disconnect Timestamp.
greeting_time_agent_ms	bigint	Yes	First response time of agents on chat, indicating how quickly they engage with customers after joining the chat.

Column	Type	Nullable	Description
non_talk_time_total_ms	bigint	Yes	Total non-talk time in a voice conversation. Non-talk time refers to the combined duration of hold time and periods of silence exceeding 3 seconds, during which neither the agent nor the customer is engaged in conversation.

Column	Type	Nullable	Description
talk_time_total_ms	bigint	Yes	Time that was spent talking during a voice contact across either the customer or the agent.
talk_time_agent_ms	bigint	Yes	Time that was spent talking during a voice contact by the agent.
talk_time_customer_ms	bigint	Yes	Time that was spent talking during a voice contact by the customer.

Column	Type	Nullable	Description
total_conversation_duration_ms	bigint	Yes	The total time from the start of the conversation until the last word spoken by either the agent or the customer.
talk_speed_agent_wpm	float	Yes	Words per minute spoken by the agent.
talk_speed_customer_wpm	float	Yes	Words per minute spoken by the customer.
interruptions_time_total_ms	bigint	Yes	Amount of time agent or customer were speaking at the same time.

Column	Type	Nullable	Description
interruptions_time_agent_ms	bigint	Yes	Amount of time the agent spoke while the customer was already speaking.
interruptions_time_customer_ms	bigint	Yes	Amount of time the customer spoke while the agent was already speaking.
interruptions_total_count	bigint	Yes	Count of times interruptions were detected during a conversation.

Column	Type	Nullable	Description
interruptions_agent_count	bigint	Yes	Count of time an agent interruption was detected during a conversation
interruptions_customer_count	bigint	Yes	Count of times a customer interruption was detected during a conversation

Column	Type	Nullable	Description
sentiment_overall_score_agent	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is overall sentiment score for the agent during the call. The overall sentiment score is the average of the scores assigned during each portion of the call.

Column	Type	Nullable	Description
sentiment_overall_score_customer	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is overall sentiment score for customer during the call. The overall sentiment score is the average of the scores assigned during each portion of the call.

Column	Type	Nullable	Description
sentiment_interaction_score_customer_with_agent	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is sentiment score of customer with agent.

Column	Type	Nullable	Description
sentiment_interaction_score_customer_without_agent	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is sentiment score of customer without the agent.

Column	Type	Nullable	Description
sentiment_end_score_agent	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is sentiment score for agent at the end of the call.

Column	Type	Nullable	Description
sentiment_end_score_customer	float	Yes	A sentiment score is an analysis of text, and a rating of whether it includes mostly positive, negative, or neutral language. This is sentiment score for customer at the end of the call.
response_time_average_agent_ms	bigint	Yes	For chat, average time to send a response after the customers last message.

Column	Type	Nullable	Description
response_time_average_customer_ms	bigint	Yes	For chat, average time to send a response after the agents last message.
response_time_maximum_agent_ms	bigint	Yes	For chat, maximum time to send a response after the customers last message.
response_time_maximum_customer_ms	bigint	Yes	For chat, maximum time to send a response after the customers last message.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Contact evaluation record

Table name: `contact_evaluation_record`

Description: Stores contact evaluation data at the form, section, and question level, including scores, answers, and generative AI automation results for quality management.

Primary key: `evaluation_id, item_reference_id, instance_id`

Partition key: `initiation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables

- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens, Contact Flow Events
- `user_id` — Joins to Agent Statistic Record, Agent Queue Statistic Record, Agent Event, users
- `evaluator_id` — Joins to Agent Statistic Record, Agent Event, users (as `user_id`)
- `queue_id` — Joins to Contact Record, Contact Statistic Record, Agent Queue Statistic Record

Column	Type	Nullable	Description
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.
evaluation_id	string	No	primary key, ID of the

Column	Type	Nullable	Description
			evaluation to disambiguate multiple evaluations done of the call with the same form (by different evaluators).
item_reference_id	string	No	primary key - might represent form/ section/ sub-section/ question depending on type.

Column	Type	Nullable	Description
item_type	string	Yes	Defines "Form/Section/sub-section/question or indicates a deleted record.
contact_id	string	Yes	The ID of the contact being evaluated.
evaluation_submitted_timestamp	Timestamp	Yes	Timestamp when contact was evaluated.
score	double	Yes	Score in percentage value for forms/sections/questions.

Column	Type	Nullable	Description
weighted_score	double	Yes	Score adding up to 100% of form, for example, 2 sections - one of 80, other out of 20.
automatic_fail	Boolean	Yes	Boolean to indicate if automatic fail was applied.
evaluator_id	string	Yes	user_ID of evaluator.
numeric_answer	double	Yes	Value for question where answer type is numeric.
answer_reference_id	string	Yes	for single select answer type.

Column	Type	Nullable	Description
to_delete	Boolean	Yes	Set to true if Form/Section/sub-section/question was deleted.
disconnect_timestamp	Timestamp	Yes	The contact disconnect Timestamp.
initiation_timestamp	Timestamp	Yes	The contact initiation Timestamp.
user_id	string	Yes	The user_id of person being evaluated.
queue_id	string	Yes	The queue_id of queue which contact was handled from.

Column	Type	Nullable	Description
channel	string	Yes	The method used to contact your contact center: VOICE, CHAT, TASK, EMAIL.
contact_aggregation_timestamp	Timestamp	Yes	Timestamp used for building aggregated agent, queue and weekly aggregation tables.

Column	Type	Nullable	Description
evaluated_contact_with_status	string	Yes	The connection status of the evaluated contact at the time of evaluation. Valid Values: disconnected | notDisconnected. `disconnected` indicates the evaluated contact had ended (a disconnect timestamp exists). `notDisconnected` indicates the evaluated contact was still active at

Column	Type	Nullable	Description
			the time of evaluation (no disconnect timestamp).

Column	Type	Nullable	Description
evaluation_source	string	Yes	Indicates the origin of the evaluation process. This field indicates whether the evaluation was performed manually, with the assistance of automation or entirely automatically (without human review before submission). Assistance of automation encompasses pre-

Column	Type	Nullable	Description
			configured automation to answer a question (for example, auto-filling an answer based on a conversational analytics category) or asking AI for assistance while evaluating the contact.

Column	Type	Nullable	Description
resubmitted	Boolean	Yes	Indicates whether the evaluation has been resubmitted. This field helps quickly identify evaluations which were resubmitted to perform audits of the evaluation process.

Column	Type	Nullable	Description
evaluation_type	string	Yes	Helps distinguish between different types of evaluations, such as standard evaluations and calibration evaluations. This provides the ability to only include relevant types of evaluations while performing analysis, for example, only standard evaluations should be used to calculate the aggregate

Column	Type	Nullable	Description
			d score of an agent.
calibration_session_id	string	Yes	Holds a unique identifier for a calibration session. This field is essential for identifying evaluations associated with a calibration session.

Column	Type	Nullable	Description
item_title	string	Yes	Column captures the title of the form item. This can be a form, section, subsection or question title depending on `item_type`.

Column	Type	Nullable	Description
form_version	string	Yes	Indicates the version number of the evaluation form used. This field helps identify different versions of the evaluation form for analysis and reporting.
acknowledgement_status	string	Yes	Acknowledgement status of the evaluation. Valid values: `ACKNOWLEDGED |UNACKNOWLEDGED`

Column	Type	Nullable	Description
acknowledger_id	string	Yes	`user_id` of the person who acknowledged the evaluation.
evaluation_acknowledged_timestamp	Timestamp	Yes	Timestamp when the evaluation was acknowledged.
acknowledger_comment	string	Yes	Comment left by the user who acknowledged the evaluation.

Column	Type	Nullable	Description
item_disabled	Boolean	Yes	The itemDisabled column indicates whether the item is in the disabled state at the time of submission from a condition defined in the evaluation form.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.
multi_select_answer_reference_ids	array(string)	Yes	Value for question where answer type is multi-select.

Column	Type	Nullable	Description
date_time_answer	Timestamp	Yes	Value for question where answer type is dateTime.
answer_option	string	Yes	The selected answer option text for a single-select answer type.
multi_select_answer_options	array(string)	Yes	The selected answer option text for a multi-select answer type.
item_note	string	Yes	The note text added to the evaluation item.

Column	Type	Nullable	Description
original_evaluator_id	string	Yes	The user_ID of the evaluator who originally submitted the evaluation.
evaluated_participant_role	string	Yes	The role of the evaluated contact participant.
evaluated_participant_id	string	Yes	The ID of the evaluated contact participant.
is_sampled	Boolean	Yes	Whether the evaluation was created by a sampling job.

Column	Type	Nullable	Description
is_reviewed	Boolean	Yes	Indicates that the evaluation was reviewed.
automation_gen_ai_text_answer	string	Yes	The generative AI-generated answer for an evaluation question where the answer type is text.
automation_gen_ai_answer_reference_id	string	Yes	The reference ID of the generative AI-generated answer for an evaluation question where the answer type is single select.

Column	Type	Nullable	Description
automation_gen_ai_answer_justification	string	Yes	The justification provided by generative AI for its automated evaluation answer.
is_automation_answer_accepted	Boolean	Yes	Indicates whether the generative AI-generated answer was accepted and used as the final answer for the evaluation question.
earned_points	bigint	Yes	The total points earned for a question, section, or form.

Column	Type	Nullable	Description
max_base_point	bigint	Yes	The maximum base points that can be earned for a question, section, or form, excluding bonus points.
performance_category	string	Yes	The performance category for a question, section, or form. Valid values: NEEDS_IMPROVEMENT | EXCEEDS_EXPECTATION.

Column	Type	Nullable	Description
evaluation_measurement_scope	string	Yes	The type of metric. Valid values: `BUSINESS_OUTCOME` . Null when the evaluation does not include a business outcome metric.

Column	Type	Nullable	Description
evaluation_measurement_name	string	Yes	The name of the business outcome metric. Valid values: `CSAT`, `CHURN_PROPENSITY`, `SELF_SERVICE_SUCCESS`, `PARTIAL_SELF_SERVICE_SUCCESS`, `SALE_SUCCESS`. Null when the evaluation form question is not associated with a business outcome metric. Not all evaluation forms include

Column	Type	Nullable	Description
			questions for every metric.
evaluation_measurement_score	double	Yes	The score for the associated business outcome metric. Range: 0.0 to 5.0. Null when the evaluation form question is not associated with a business outcome metric.

Sample queries for business outcome metrics

The following example query in Amazon Athena returns business outcome evaluation scores by metric:

```
SELECT
    evaluation_measurement_name,
    AVG(evaluation_measurement_score) AS avg_score,
    COUNT(*) AS evaluation_count
FROM "contact-evaluation-record-resource-link-table-name"
WHERE instance_id = 'your-instance-id'
    AND evaluation_measurement_scope = 'BUSINESS_OUTCOME'
```

```
    AND evaluation_submitted_timestamp >= TIMESTAMP 'start-date'
    AND evaluation_submitted_timestamp < TIMESTAMP 'end-date'
GROUP BY evaluation_measurement_name
ORDER BY evaluation_measurement_name;
```

The following example query in Amazon Athena joins business outcome scores with customer segments:

```
SELECT
    cp.lifetime_value_segment,
    cer.evaluation_measurement_name,
    AVG(cer.evaluation_measurement_score) AS avg_score,
    COUNT(*) AS evaluation_count
FROM "contact-evaluation-record-resource-link-table-name" cer
JOIN "customer-profiles-contact-event-resource-link-table-name" cp
    ON cer.instance_id = cp.instance_id
    AND cer.contact_id = cp.contact_id
WHERE cer.instance_id = 'your-instance-id'
    AND cer.evaluation_measurement_scope = 'BUSINESS_OUTCOME'
    AND cer.evaluation_submitted_timestamp >= TIMESTAMP 'start-date'
    AND cer.evaluation_submitted_timestamp < TIMESTAMP 'end-date'
GROUP BY cp.lifetime_value_segment, cer.evaluation_measurement_name
ORDER BY cp.lifetime_value_segment, cer.evaluation_measurement_name;
```

For information about creating evaluation forms with business outcome metrics that generate the scores stored in the `evaluation_measurement_score` column, see Create an evaluation form.

Evaluation review record

Table name: `evaluation_review_record`

Description: Stores evaluation review lifecycle data, capturing who requested a review of a contact evaluation, who reviewed it, and the outcome, for quality management auditing and reporting.

Primary key: `evaluation_review_id, contact_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables

- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens, Contact Evaluation Record, Contact Flow Events
- `evaluation_id` — Joins to Contact Evaluation Record
- `evaluator_id`, `requested_by_user_id`, `review_created_by_user_id`, `reviewed_by_user_id` — Join to users (as `user_id`)

The following table describes the columns in the `evaluation_review_record` table.

Column	Type	Nullable	Description
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.

Column	Type	Nullable	Description
instance_arn	string	Yes	The Amazon Resource Name (ARN) of the Connect Customer instance.
evaluation_review_id	string	No	Primary key, unique identifier for the evaluation review.
contact_id	string	No	Primary key, the ID of the contact associated with the evaluation review.
evaluation_id	string	Yes	The ID of the evaluation being reviewed.

Column	Type	Nullable	Description
evaluation_form_id	string	Yes	The ID of the evaluation form used for the evaluation.
evaluation_form_title	string	Yes	The title of the evaluation form used for the evaluation.
requested_by_user_id	string	Yes	The user ID of the person who requested the review.
requested_timestamp	Timestamp	Yes	Timestamp when the review was requested.
review_created_by_user_id	string	Yes	The user ID of the reviewer who created the review.

Column	Type	Nullable	Description
reviewed_by_user_id	string	Yes	The user ID of the reviewer who completed the review.
creation_timestamp	Timestamp	Yes	Timestamp when the review was created.
last_modified_timestamp	Timestamp	Yes	Timestamp when the review was last modified.

Column	Type	Nullable	Description
outcome	string	Yes	The outcome of the review. Valid values: APPROVED | DECLINED. APPROVED means the reviewer changed the evaluation answers; DECLINED means the answers were not changed. Null while the review is in progress.

Column	Type	Nullable	Description
evaluator_id	string	Yes	The user ID of the person who originally submitted the evaluation.
requester_comment	string	Yes	Comment left by the agent requesting the review.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Sample queries for evaluation reviews

The following example query in Amazon Athena returns the number of evaluation reviews by outcome. A review without an outcome is still in progress:

```
SELECT
    COALESCE(outcome, 'IN_PROGRESS') AS review_status,
    COUNT(*) AS review_count
FROM "evaluation-review-record-resource-link-table-name"
WHERE instance_id = 'your-instance-id'
    AND creation_timestamp >= TIMESTAMP 'start-date'
    AND creation_timestamp < TIMESTAMP 'end-date'
GROUP BY COALESCE(outcome, 'IN_PROGRESS')
```

```
ORDER BY review_status;
```

The following example query in Amazon Athena returns the percentage of completed reviews with an APPROVED outcome for each evaluator who submitted the original evaluation:

```
SELECT
    evaluator_id,
    COUNT(*) AS completed_reviews,
    CAST(COUNT_IF(outcome = 'APPROVED') AS DOUBLE) / COUNT(*) * 100.0 AS approved_pct
FROM "evaluation-review-record-resource-link-table-name"
WHERE instance_id = 'your-instance-id'
    AND outcome IS NOT NULL
    AND creation_timestamp >= TIMESTAMP 'start-date'
    AND creation_timestamp < TIMESTAMP 'end-date'
GROUP BY evaluator_id
ORDER BY approved_pct DESC;
```

The following example query in Amazon Athena returns the average time, in hours, from the review request to the last update of a completed review:

```
SELECT
    AVG(date_diff('second', requested_timestamp, last_modified_timestamp)) / 3600.0
        AS avg_review_completion_hours
FROM "evaluation-review-record-resource-link-table-name"
WHERE instance_id = 'your-instance-id'
    AND outcome IS NOT NULL
    AND creation_timestamp >= TIMESTAMP 'start-date'
    AND creation_timestamp < TIMESTAMP 'end-date';
```

For information about how agents request reviews of their evaluations, see Request reviews of performance evaluations.

Coaching data in the Connect Customer data lake

The following table contains coaching data.

Coaching session record

Table name: `coaching_session_record`

Description: Stores coaching session and topic data, including lifecycle timestamps, acknowledgements, feedback, and goal outcomes.

Primary key: `instance_id, coaching_session_id, record_type, record_id`

Partition key: `session_created_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `coaching_session_id` — Joins to Coaching Session Record
- `participant_user_id`, `coach_user_id`, `created_by_user_id`, `last_modified_by_user_id` — Join to users (as `user_id`)
- `evaluation_form_item_reference_id`, `evaluation_form_version` — Join to Contact Evaluation Record (as `item_reference_id`, `form_version`)

Column	Type	Nullable	Description
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.
aws_account_id	string	No	The ID of the AWS account that

Column	Type	Nullable	Description
			owns the Connect Customer instance.
instance_arn	string	No	The Amazon Resource Name (ARN) of the Connect Customer instance.
coaching_session_id	string	No	The unique identifier of the coaching session.
record_type	string	No	The row type. Valid values: `SESSION_PARTICIPANT` , `TOPIC`.

Column	Type	Nullable	Description
record_id	string	No	The participant user ID for `SESSION_PARTICIPANT` rows or the topic ID for `TOPIC` rows.
to_delete	Boolean	No	Indicates that the record was deleted.
session_created_timestamp	Timestamp	No	Timestamp when the coaching session was created.
session_last_modified_timestamp	Timestamp	No	Timestamp when the coaching session was last modified.

Column	Type	Nullable	Description
session_title	string	Yes	The customer-provided title of the coaching session.
session_status	string	Yes	The session state. Valid values: `SHARED`, `COMPLETE`.
session_location	string	Yes	The customer-provided location of the coaching session.
created_by_user_id	string	Yes	The Connect Customer user ID of the person who created the coaching session.

Column	Type	Nullable	Description
last_modified_by_user_id	string	Yes	The Connect Customer user ID of the person who last modified the coaching session.
session_scheduled_timestamp	Timestamp	Yes	Timestamp scheduled for the coaching session.
session_due_timestamp	Timestamp	Yes	Timestamp by which the coaching session is due.
session_shared_timestamp	Timestamp	Yes	Timestamp when the coaching session was shared with the participant.

Column	Type	Nullable	Description
session_completion_timestamp	Timestamp	Yes	Timestamp when the coach completed the coaching session.
session_follow_up_timestamp	Timestamp	Yes	Timestamp selected for follow-up measurement of topic metrics.
participant_user_id	string	Yes	The Connect Customer user ID of the participant.
participant_acknowledgement_timestamp	Timestamp	Yes	Timestamp when the participant acknowledged the coaching session.

Column	Type	Nullable	Description
participant_acknowledgement_comment	string	Yes	Comment provided when the participant acknowledged the coaching session.
coach_user_id	string	Yes	The Connect Customer user ID of the coach assigned to the session.
coach_acknowledgement_timestamp	Timestamp	Yes	Timestamp when the coach acknowledged the coaching session.
coach_acknowledgement_comment	string	Yes	Comment provided when the coach acknowledged the coaching session.

Column	Type	Nullable	Description
session_feedback	string	Yes	The customer-provided feedback recorded for the coaching session.
completed_after_due_date	Boolean	Yes	Indicates whether the session was completed after `session_due_timestamp` .

Column	Type	Nullable	Description
all_goals_status	string	Yes	The aggregate goal status of the coaching session. Valid values: `MET`, `NOT_MET`. Null when the outcome cannot be determined.
label	string	Yes	The customer-provided label of the coaching topic.
topic_source	string	Yes	The origin of the topic. Valid values: `CUSTOM`, `EVALUATION_FORM` .

Column	Type	Nullable	Description
topic_type	string	Yes	The topic classification. Valid values: `STRENGTH`, `OPPORTUNITY` . Null when the topic is unclassified.
scoring_mode	string	Yes	The evaluation-form scoring mode for the topic. Valid values: `PERCENTAGE` , `POINTS_BASED` .
metric_at_creation	double	Yes	The topic metric captured when the coaching session was created.

Column	Type	Nullable	Description
goal_metric	double	Yes	The target metric value for the topic.
metric_at_completion	double	Yes	The topic metric collected at session completion.
metric_at_follow_up	double	Yes	The topic metric collected at follow-up.
goal_status	string	Yes	The topic's goal status. Valid values: `MET`, `NOT_MET`. Null when the outcome cannot be determined.

Column	Type	Nullable	Description
evaluation_form_id	string	Yes	The ID of the evaluation form associated with the topic.
evaluation_form_version	bigint	Yes	The version of the evaluation form associated with the topic.
evaluation_form_item_reference_id	string	Yes	The hierarchical path of the evaluation-form item, including the form ID, with components separated by |.

Column	Type	Nullable	Description
evaluation_form_item_title	string	Yes	The title of the evaluation-form item associated with the topic.
evaluation_form_item_type	string	Yes	The type of the referenced evaluation-form item. Valid values: `QUESTION`, `SECTION`, `FORM`.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	No	Timestamp of the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Sample queries

The following example query in Amazon Athena lists shared coaching sessions that are past due:

```
SELECT
    coaching_session_id,
    session_title,
    coach_user_id,
    participant_user_id,
    session_due_timestamp
FROM "coaching-session-record-resource-link-table-name"
WHERE instance_id = 'instance-id'
    AND to_delete = false
    AND record_type = 'SESSION_PARTICIPANT'
    AND session_status = 'SHARED'
    AND session_due_timestamp < CURRENT_TIMESTAMP
```

```
ORDER BY session_due_timestamp;
```

The following example query in Amazon Athena ranks evaluation-form topics by the number of completed coaching sessions:

```
SELECT
    evaluation_form_id,
    evaluation_form_version,
    evaluation_form_item_reference_id,
    MAX(evaluation_form_item_title) AS topic_title,
    COUNT(DISTINCT coaching_session_id) AS coaching_session_count
FROM "coaching-session-record-resource-link-table-name"
WHERE instance_id = 'instance-id'
    AND to_delete = false
    AND record_type = 'TOPIC'
    AND topic_source = 'EVALUATION_FORM'
    AND session_status = 'COMPLETE'
    AND session_completion_timestamp >= TIMESTAMP 'start-date'
    AND session_completion_timestamp < TIMESTAMP 'end-date'
GROUP BY evaluation_form_id, evaluation_form_version, evaluation_form_item_reference_id
ORDER BY coaching_session_count DESC;
```

The following example query in Amazon Athena compares topic metrics for sessions completed during a time range:

```
SELECT
    coaching_session_id,
    record_id AS topic_id,
    label,
    topic_source,
    scoring_mode,
    metric_at_creation,
    goal_metric,
    metric_at_completion,
    metric_at_follow_up,
    goal_status
FROM "coaching-session-record-resource-link-table-name"
WHERE instance_id = 'instance-id'
    AND to_delete = false
    AND record_type = 'TOPIC'
    AND session_status = 'COMPLETE'
    AND session_completion_timestamp >= TIMESTAMP 'start-date'
    AND session_completion_timestamp < TIMESTAMP 'end-date'
```

```
ORDER BY coaching_session_id, topic_id;
```

Customer profiles contact data in the Connect Customer data lake

The following table contains customer profiles contact data.

Topics

- Customer profiles contact event

Customer profiles contact event

Table name: `customer_profiles_contact_event`

Description: Contains a snapshot of Customer Profiles data for each contact at disconnect time, including calculated attribute values (orders total price value and call count) and segment memberships (lifetime value tier and repeat caller status). One record is created per contact.

Primary key: `instance_id, event_id`

Partition key: `initiation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Evaluation Record, Contact Lens, Contact Flow Events, AI Agent, AI Session

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
event_id	string	No	The ID of the

Column	Type	Nullable	Description
			customer profiles contact event.
aws_account_id	string	No	The ID of the AWS account that owns the contact.
instance_arn	string	No	The ARN of the Connect Customer instance.
contact_id	string	No	The ID of the contact this snapshot is associated with.
profile_id	string	No	The Customer Profile ID associated with this contact at disconnect time.

Column	Type	Nullable	Description
domain_name	string	No	The Customer Profiles domain identifier.
initiation_timestamp	Timestamp	No	The contact initiation Timestamp. Used as partition key. Never changes after creation.
disconnect_timestamp	Timestamp	Yes	The contact disconnect Timestamp.
event_timestamp	Timestamp	No	Timestamp when this snapshot record was generated or last updated.

Column	Type	Nullable	Description
orders_total_price_sum	double	Yes	The sum of order values associated with the customer profile.
call_count	bigint	Yes	The number of distinct calls a customer has made in the configured time period (7 days by default, which you can update in Customer Profiles).

Column	Type	Nullable	Description
lifetime_value_segment	array(string)	No	Lifetime value segment memberships at disconnect time. Possible values: `_default_lifetime_value_high`, `_default_lifetime_value_medium`, `_default_lifetime_value_low`.

Column	Type	Nullable	Description
repeat_caller_segment	array(string)	No	Repeat caller segment memberships at disconnect time. Possible values: `_default_repeat_caller` , `_default_non_repeat_caller` .
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp showing the last time the data lake processed the record. Cannot reliably be used to determine data freshness.

Things to know

- One record is expected per contact at disconnect time.

- The `initiation_timestamp` is the partition key and never changes, even if the record is updated. Use this field for efficient time range queries.
- Segment columns (`lifetime_value_segment` and `repeat_caller_segment`) contain the segment names the customer matched at disconnect time. These are separate columns to support independent filtering and grouping in analytics.
- Default segment thresholds for lifetime value can be customized by modifying the underlying calculated attributes in Customer Profiles.

Sample queries

The following example query in Amazon Athena returns customer profiles contact events for a specific instance:

```
SELECT
    contact_id,
    profile_id,
    orders_total_price_sum,
    call_count,
    lifetime_value_segment,
    repeat_caller_segment,
    disconnect_timestamp
FROM "customer-profiles-contact-event-resource-link-table-name"
WHERE instance_id = 'your-instance-id'
    AND initiation_timestamp >= TIMESTAMP 'start-date'
    AND initiation_timestamp < TIMESTAMP 'end-date'
ORDER BY initiation_timestamp DESC;
```

The following example query in Amazon Athena joins customer profiles data with contact records:

```
SELECT
    cr.contact_id,
    cr.agent_username,
    cr.queue_name,
    cr.agent_interaction_duration_ms,
    cp.lifetime_value_segment,
    cp.repeat_caller_segment,
    cp.orders_total_price_sum
FROM "contact-record-resource-link-table-name" cr
JOIN "customer-profiles-contact-event-resource-link-table-name" cp
    ON cr.instance_id = cp.instance_id
    AND cr.contact_id = cp.contact_id
```

```
WHERE cr.instance_id = 'your-instance-id'
    AND cr.initiation_timestamp >= TIMESTAMP 'start-date'
    AND cr.initiation_timestamp < TIMESTAMP 'end-date';
```

AI agent data in the Connect Customer data lake

The following tables contain ai agent data.

Topics

- AI Agent
- AI Agent Knowledge Base
- AI Prompt
- AI Session
- AI Tool

AI Agent

Table name: `ai_agent`

Description: Tracks AI Agent invocation events, including invocation success, latency, conversation turns, and helpfulness ratings for each AI agent interaction within a contact.

Primary key: `ai_agent_event_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens, Contact Evaluation Record, Contact Flow Events

- `ai_session_id` — Joins to AI Session, AI Prompt, AI Tool, AI Agent Knowledge Base
- `assistant_id` — Joins to AI Session, AI Prompt, AI Tool

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect instance.
instance_id	string	No	The ID of the Connect instance.
contact_id	string	Yes	The ID of the contact.
ai_agent_id	string	Yes	The Id of the requested AI Agent.
ai_agent_version	string	Yes	The version of

Column	Type	Nullable	Description
			the requested AI Agent.
ai_agent_event_id	string	No	Id of the event.
aws_account_id	string	Yes	The ID of the AWS account where AI Assistant is used.
assistant_id	string	Yes	The ID of the AI Assistant.

Column	Type	Nullable	Description
ai_session_id	string	Yes	The ID of AI-Agent session.
creation_timestamp	bigint	Yes	The timestamp of the event is created in the data lake.
update_timestamp	bigint	Yes	The timestamp of the event is updated in the data lake.

Column	Type	Nullable	Description
ai_use_case	string	Yes	The use case of the AI agent.
ai_agent_type	string	Yes	The type of the requested AI Agent.
ai_agent_name	string	Yes	The name of the requested AI Agent.
ai_agent_arn	string	Yes	The Arn of the requested AI Agent.

Column	Type	Nullable	Description
invocation_success	bool	Yes	A boolean field which indicates whether the invocation of the AI agent has been successful or not.
invocation_latency_ms	float	Yes	The invocation latency of the AI Agent in the evaluated contact.

Column	Type	Nullable	Description
conversation_turns_in_response	bigint	Yes	The number of conversation turns responded by the requested AI Agent.
response_helpful	int	Yes	The count of AI suggestions rated as helpful with a thumbs-up.

Column	Type	Nullable	Description
response_not_helpful	int	Yes	The count of AI suggestions rated as unhelpful with a thumbs-down.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestam	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data

Column	Type	Nullable	Description
			freshness.
multi_agent_selection_accuracy	double	Yes	The average accuracy score (0-1) evaluating whether the orchestrator AI agent routed tasks to the correct sub-agent. A value of 1 indicates optimal selection.

Column	Type	Nullable	Description
multi_agent_context_fidelity	double	Yes	A score (0-1) evaluating whether the AI agent provided accurate and complete context to the downstream agent during collaboration.

Column	Type	Nullable	Description
multi_agent_orchestration_mode	string	Yes	The collaboration mode used for multi-agent interaction. Valid values: DELEGATE, HANDOFF.
parent_ai_agent_id	string	Yes	The ID of the parent (orchestrator) AI agent that initiated the collaboration.

Column	Type	Nullable	Description
is_collaborator	boolean	Yes	Indicates whether this AI agent participated in a multi-agent interaction. True for both the orchestrator and its sub-agents.

AI Agent Knowledge Base

Table name: `ai_agent_knowledge_base`

Description: Records knowledge base reference events, tracking which knowledge content was retrieved and used during AI Agent interactions.

Primary key: `ai_agent_knowledge_base_event_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens
- `ai_session_id` — Joins to AI Session, AI Agent, AI Prompt, AI Tool
- `ai_agent_id` — Joins to AI Agent

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect instance.
aws_account_id	string	Yes	The identifer of the AWS account that owns Connect AI Assistant.
instance_id	string	No	The ID of the Connect

Column	Type	Nullable	Description
			instance.
contact_id	string	Yes	The ID of the specific contact .
knowledge_content_id	string	Yes	The ID of the referenced knowledge content.
ai_agent_type	string	Yes	The type of the requested AI Agent.
ai_agent_knowledge_base_event_id	string	No	The ID of the knowledge base reference event.

Column	Type	Nullable	Description
assistant_id	string	Yes	The ID of the Amazon Connect AI Assistant.
ai_session_id	string	Yes	The ID of AI Agent session.
creation_timestamp	string	Yes	The instant the data lake event was created.

Column	Type	Nullable	Description
update_timestamp	string	Yes	The instant the data lake event was last modified.
ai_agent_id	string	Yes	The ID of requested AI Agent.
ai_agent_name	string	Yes	The name of the requested AI Agent.
ai_agent_version	string	Yes	The version number of the requested AI Agent.

Column	Type	Nullable	Description
ai_agent_arn	string	Yes	The ARN of the requested AI Agent.
knowledge_base_id	string	Yes	The ID of the referenced knowledge base.
knowledge_base_name	string	Yes	The name of the referenced knowledge base.
knowledge_content_reference	string	Yes	The title of the referenced knowledge content.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	timestamp	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data

Column	Type	Nullable	Description
			freshness.

AI Prompt

Table name: `ai_prompt`

Description: Tracks AI Prompt invocation events, including model usage, token counts, latency, and invocation success for each prompt call within an AI session.

Primary key: `ai_prompt_event_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens
- `ai_session_id` — Joins to AI Session, AI Agent, AI Tool
- `ai_agent_id` — Joins to AI Agent

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
aws_account_id	string	Yes	The customer

Column	Type	Nullable	Description
			AWS account ID.
instance_id	string	No	The ID of the Connect Customer instance.
contact_id	string	Yes	The ID of the contact.
ai_prompt_id	string	Yes	The ID of the requested AI-prompt.
ai_prompt_version	string	Yes	The version of the requested AI-prompt.

Column	Type	Nullable	Description
ai_prompt_event_id	string	No	The ID of the event.
assistant_id	string	Yes	The identifier of the AI Assistant.
ai_session_id	string	Yes	The ID of AI-Agent session.
creation_timestamp	bigint	Yes	The timestamp when the event is created in the data lake.

Column	Type	Nullable	Description
update_timestamp	bigint	Yes	The timestamp when the event is updated in the data lake.
ai_agent_type	string	Yes	The type of the requested AI Agent.
ai_agent_name	string	Yes	The name of the requested AI Agent.

Column	Type	Nullable	Description
ai_agent_id	string	Yes	The Id of the requested AI Agent.
ai_agent_version	string	Yes	The version number of the requested AI Agent.
ai_agent_arn	string	Yes	The Arn of the requested AI Agent.
ai_prompt_type	string	Yes	The type of the invoked AI Prompt.

Column	Type	Nullable	Description
ai_prompt_name	string	Yes	The name of the invoked AI Prompt.
ai_prompt_arn	string	Yes	The arn of the invoked AI Prompt.
model_id	string	Yes	The name of the llm model associated to the AI Prompt.

Column	Type	Nullable	Description
invocation_success	boolean	Yes	A boolean field which indicates whether the invocation of the prompt has been successful or not.
invocation_latency_ms	float	Yes	The invocation latency of the AI Prompt in the evaluated contact.

Column	Type	Nullable	Description
input_token	bigint	Yes	The input token of the AI Prompt in the evaluated contact.
output_token	bigint	Yes	The output token of the AI Prompt in the evaluated contact.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestam	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data

Column	Type	Nullable	Description
			freshness.

AI Session

Table name: `ai_session`

Description: Contains session-level AI metrics, including proactive intent detection, invocation counts, handoff status, and quality scores (goal success, faithfulness, completeness) for each AI session.

Primary key: `ai_session_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens
- `ai_session_id` — Joins to AI Agent, AI Prompt, AI Tool, AI Agent Knowledge Base

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
instance_id	string	No	The ID

Column	Type	Nullable	Description
			of the Connect Customer instance.
contact_id	string	Yes	The ID of the contact.
ai_session_id	string	No	The ID of the AI-Agent session.
aws_account_id	string	Yes	The customer AWS account ID.
assistant_id	string	Yes	The identifier of the agent assist assistant.

Column	Type	Nullable	Description
creation_timestamp	bigint	Yes	The timestamp when the event is created in the data lake.
update_timestamp	bigint	Yes	The timestamp when the event is updated in the data lake.

Column	Type	Nullable	Description
proactive_intents_detected	bigint	Yes	The number of proactive intents (customer queries) detected during the AI session for an Agent Assistance use case.

Column	Type	Nullable	Description
proactive_intents_engaged	bigint	Yes	The number of proactive intents (customer queries) engaged in the AI session for an Agent Assistance use case.

Column	Type	Nullable	Description
proactive_intents_answered	bigint	Yes	The number of proactive intents (customer queries) answered in the AI session for an Agent Assistance use case.
ai_agent_invocation_count	bigint	Yes	The number of AI Agent invocations in the AI session.

Column	Type	Nullable	Description
ai_agent_invocation_success_count	bigint	Yes	The number of successful AI Agent invocations in the AI session.

Column	Type	Nullable	Description
is_handed_off	boolean	Yes	A boolean field which indicates whether the AI agent has handed off to the human agent during the AI session.

Column	Type	Nullable	Description
avg_conversation_turns_in_response	float	Yes	The average number of conversation turns in response of AI Agent invocation.

Column	Type	Nullable	Description
goal_success_rate	double	Yes	A double between 0 and 1 that evaluates whether the Orchestration AI agent successfully resolved the customer issue.

Column	Type	Nullable	Description
faithfulness_score	double	Yes	A double between 0 and 1 that evaluates if the Orchestration AI agent's response is faithful to the conversational context, including messages and tool call results.

Column	Type	Nullable	Description
completeness_score	double	Yes	A double between 0 and 1 that evaluates if the Orchestration AI agent's response fully addresses all parts of customer requests.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestam	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data

Column	Type	Nullable	Description
			freshness.

AI Tool

Table name: `ai_tool`

Description: Tracks AI Tool invocation events, including tool selection accuracy, parameter accuracy, utilization accuracy, and invocation latency for each tool call within an AI session.

Primary key: `ai_tool_event_id, instance_id`

Partition key: `creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens
- `ai_session_id` — Joins to AI Session, AI Agent, AI Prompt
- `ai_agent_id` — Joins to AI Agent

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect instance.
aws_account_id	string	Yes	The identifier

Column	Type	Nullable	Description
			of the AWS account that owns Connect AI Assistant.
instance_id	string	No	The ID of the Connect instance.
contact_id	string	Yes	The ID of the contact .
ai_agent_id	string	Yes	The ID of requested AI Agent.

Column	Type	Nullable	Description
ai_tool_id	string	Yes	The ID of requested AI tool.
ai_tool_event_id	string	No	The ID of the AI Tool invocation event.
assistant_id	string	Yes	The ID of the Connect Customer AI Assistant.
ai_session_id	string	Yes	The ID of AI Agent session.

Column	Type	Nullable	Description
creation_timestamp	bigint	Yes	The instant the data lake event was created.
update_timestamp	bigint	Yes	The instant the data lake event was last modified.
ai_agent_type	string	Yes	The type of the requested AI Agent.
ai_agent_name	string	Yes	The name of the requested AI Agent.

Column	Type	Nullable	Description
ai_agent_version	string	Yes	The version number of the requested AI Agent.
ai_agent_arn	string	Yes	The ARN of the requested AI Agent.
ai_tool_type	string	Yes	The type of the invoked AI tool.
ai_tool_name	string	Yes	The name of the invoked AI tool.

Column	Type	Nullable	Description
ai_tool_arn	string	Yes	The ARN of the invoked AI tool.
invocation_success	boolean	Yes	A boolean field which indicates whether the invocation of the tool has been successful or not.

Column	Type	Nullable	Description
invocation_latency_ms	float	Yes	The invocation latency for AI tool calling.

Column	Type	Nullable	Description
ai_tool_parameter_accuracy	double	Yes	A double between 0 and 1 that evaluates whether the AI agent provided the correct tool parameters, where 1 indicates correct tool parameters.

Column	Type	Nullable	Description
ai_tool_selection_accuracy	double	Yes	A double between 0 and 1 that evaluates whether the AI agent selected the correct tool, where 1 indicates correct tool selection.

Column	Type	Nullable	Description
ai_tool_utilization_accuracy	double	Yes	A double between 0 and 1 that evaluates whether the AI agent correctly utilized the tool, where 1 indicates perfect use.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestam	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data

Column	Type	Nullable	Description
			freshness.

Flow data in the Connect Customer data lake

The following tables contain flow data.

Topics

- Contact flow events
- Connect test case execution results

Contact flow events

Table name: `contact_flow_events`

Description: Records contact flow execution events, tracking flow traversal including start and end timestamps, flow outcomes, and transitions between flows and queues.

Primary key: `event_id, instance_id`

Partition key: `start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record, Contact Statistic Record, Contact Lens, Contact Evaluation Record
- `flow_resource_id` — Joins to flow configuration data
- `next_queue_resource_id` — Joins to Contact Record (as `queue_id`), Agent Queue Statistic Record (as `queue_id`)

Column	Type	Nullable	Description
instance_id	string	No	The identifier of the Connect Customer instance. You can find the instance ID in the Amazon Resource Name (ARN) of the instance.
event_id	string	No	The ID of the contact as it interacts with the flow.
aws_account_id	string	No	The ID of the AWS account that owns the contact.
instance_arn	string	No	The ARN of the Connect Customer instance.
contact_id	string	No	The ID of the contact in the contact record.
flow_resource_id	string	No	Flow Id
module_resource_id	string	No	Module Id
resource_version	string	No	Version of the contact flow used.
resource_type	string	No	Can be flow or module.
channel	string	No	The method used to contact your contact center: VOICE, CHAT, TASK, EMAIL.

Column	Type	Nullable	Description
start_timestamp	Timestamp	No	Date and time of the start event in unix epoch, UTC
end_timestamp	Timestamp	No	Date and time of the end event in unix epoch, UTC.
next_flow_resource_id	string	No	Next contact flow resourceId.
next_queue_resource_id	string	No	Next queue resourceId.
next_resource_type	string	No	It can be flow or queue.
flow_language_version	string	No	Flow language version.
flow_outcome	string	No	This will contain the system defined and custom outcomes.
sub_type	string	No	This field can be used to show channel subtype. For example, connect:Guide or connect:SMS or connect:Email.
flow_type	string	No	Connect Customer includes a set of nine flow types. For more information, see Choose a flow type.

Column	Type	Nullable	Description
initiation_method	string	No	Every contact in your Connect Customer contact center is initiated by one of the following methods: Inbound, Outbound, Transfer, Callback, API, Queue Transfer, Disconnect.
resource_published_timestamp	Timestamp	No	"Creation" or "revision " date of the flow itself.
data_lake_last_processed_timestamp	Timestamp	No	The Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Connect test case execution results

Table name: `connect_test_case_execution_results`

Description: Stores test case execution results including status, outcomes, failure reasons, and associated contacts for Connect test automation.

Primary key: `connect_test_case_resource_arn, connect_test_case_execution_start_timestamp, connect_test_case_execution_id`

Partition key: `connect_test_case_execution_start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `connect_test_case_associated_initial_contact_id` — Joins to Contact Record (as `contact_id`)
- `connect_test_case_initiating_flow_id` — Joins to Contact Flow Events (as `flow_resource_id`)

Connect Test Case Execution Results

Column	Type	Nullable	Description
instance_id	string	Yes	The identifier of the Amazon Connect instance
instance_arn	string	Yes	The ARN of the Amazon Connect instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the contact.

Column	Type	Nullable	Description
connect_test_case_resource_arn	string	No	Primary Key - The ARN of the Test Case.
connect_test_case_resource_name	string	Yes	The name of the Test Case.
connect_test_case_execution_start_timestamp	timestamp	No	Primary Key - The start time of simulated execution.
connect_test_case_execution_end_timestamp	timestamp	Yes	The end time of simulated execution.

Column	Type	Nullable	Description
connect_test_case_status	string	Yes	Current state of Test. Values: Scheduled, InProgress, Completed, Aborted, Failed
connect_test_case_result	string	Yes	The final result of Test execution. Values: Passed, Failed, Skipped, Aborted
connect_test_case_execution_id	string	No	Primary Key - The unique identifier for Test execution.

Column	Type	Nullable	Description
connect_test_case_failure_reasons	array(string)	Yes	The reasons for failed Test.
connect_test_case_type	string	Yes	The type of Test executed. Values: ExperienceTest, FlowTest, BotTest
connect_test_case_execution_method	string	Yes	The method of starting Test execution. Values: Manual, API, Scheduled, ContactRuleTriggered, FlowPublishTriggered

Column	Type	Nullable	Description
connect_test_case_execution_channel	string	Yes	The channel of simulated interaction. Values: Chat, Voice, Campaign, Task, Email
connect_test_case_execution_channel_subtype	string	Yes	The channel subtype of simulated interaction. Values: SMS, WhatsApp
connect_test_case_associated_initial_contact_id	string	Yes	Initial contact ID to start Test.

Column	Type	Nullable	Description
connect_test_case_associated_contact_ids	array(string)	Yes	List of contact IDs created as part of Test.
connect_test_case_initiating_flow_id	string	Yes	First resource ID Test Execution started with.
record_creation_timestamp	timestamp	Yes	The time of record creation

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Bot analytics data in the Connect Customer analytics data lake

This topic details the content in the Connect Customer data lake bot tables. The tables list the column, type, and description of the content.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Bot conversations
- Bot intents
- Bot slots

Bot conversations

Table name: `bot_conversations`

Description: Records bot conversation sessions including conversation outcomes, turn counts, and associated flow and contact context for Lex bot interactions.

Primary key: `instance_id, event_id`

Partition key: `bot_conversation_start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `contact_id` — Joins to Contact Record
- `flow_resource_id` — Joins to Contact Flow Events
- `bot_originating_request_id`, `bot_session_id` — Joins to bot_intents

Column	Type	Nullable	Description
event_id	String	No	This is the primary key of the table. This will be a hash of originating request identifier and session identifier.
bot_originating_request_id	String	Yes	A unique identifier for a specific bot request.
bot_session_id	String	Yes	The identifier of the user session that is having the conversation.
aws_account_id	String	Yes	The identifier of the AWS account that

Column	Type	Nullable	Description
			owns the contact.
instance_arn	String	Yes	The ARN of the Connect Customer instance.
instance_id	String	No	The identifier of the Connect Customer instance.
invoking_resource_type	String	Yes	Can be flow or module.
flow_resource_id	String	Yes	Flow identifier.
module_resource_id	String	Yes	Module identifier.
invoking_resource_start_timestamp	Timestamp	Yes	Time at which flow started.

Column	Type	Nullable	Description
parent_flow_resource_id	String	Yes	Flow Id from which the module was invoked from. This field will only be populated for modules.
contact_id	String	Yes	The identifier of the contact.
flow_action_id	String	Yes	Identifier for action that was executed. An Action is a single step of a flow's run.
invoking_resource_published_timestamp	Timestamp	Yes	"Creation" or "revision" date of the flow itself.

Column	Type	Nullable	Description
flow_type	String	Yes	Connect Customer includes a set of nine flow types. For more information, see Choose a flow type.
channel	String	Yes	The method used to contact your contact center: VOICE, CHAT, TASK.
sub_type	String	Yes	This subtype for the contact. For example, connect:Guide or connect:SMS.

Column	Type	Nullable	Description
initiation_method	String	Yes	Indicates how the contact was initiated.
flow_language_version	String	Yes	Flow language version.
invoking_resource_version	String	Yes	Version of the contact flow used.
bot_id	String	Yes	The identifier of the bot.
bot_alias_id	String	Yes	The alias identifier of the bot that the session was held with.
bot_version	String	Yes	The version of the bot that the session was held with.

Column	Type	Nullable	Description
bot_locale	String	Yes	Language configuration of the bot.
bot_conversation_start_timestamp	Timestamp	Yes	The Timestamp marking the start of the conversation with the bot.
bot_conversation_end_timestamp	Timestamp	Yes	The Timestamp marking the end of the conversation with the bot.
bot_conversation_outcome	String	Yes	The final state of the conversation. Values: Success | Failure | Dropped

Column	Type	Nullable	Description
bot_number_of_conversation_turns	Number	Yes	The number of turns that the session took.
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Bot intents

Table name: `bot_intents`

Description: Records intent-level outcomes for bot conversations, tracking intent names, levels, and resolution status for each bot interaction turn.

Primary key: `instance_id, event_id`

Partition key: `bot_conversation_start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `bot_originating_request_id`, `bot_session_id` — Joins to bot_conversations
- `bot_originating_request_id`, `bot_session_id`, `bot_intent_name`, `bot_intent_level` — Joins to bot_slots
- `contact_id` — Joins to Contact Record

Column	Type	Nullable	Description
event_id	String	No	This is the primary key of the table. This will be a hash of originating request identifier, session identifier, intent name, and intent level.
bot_originating_request_id	String	Yes	A unique identifier for a specific

Column	Type	Nullable	Description
			bot request.
bot_session_id	String	Yes	The identifier of the user session that is having the conversation.
aws_account_id	String	Yes	The identifier of the AWS account that owns the contact.
instance_arn	String	Yes	The ARN of the Connect Customer instance.
instance_id	String	No	The identifier of the Connect Customer instance.

Column	Type	Nullable	Description
invoking_resource_type	String	Yes	Can be flow or module.
flow_resource_id	String	Yes	The flow identifier.
module_resource_id	String	Yes	The module identifier.
invoking_resource_start_timestamp	Timestamp	Yes	The time when the flow started.
parent_flow_resource_id	String	Yes	The flow identifier where the module was invoked. This field is only be populated for modules.
contact_id	String	Yes	The identifier of the contact.

Column	Type	Nullable	Description
flow_action_id	String	Yes	The identifier of the flow block (action) that invoked the bot, where an action is a single step of a flow's run.
invoking_resource_published_timestamp	Timestamp	Yes	The "creation" or "revision" date of the flow itself.
flow_type	String	Yes	The type of flow. Connect Customer includes a set of nine flow types. For more information, see Choose a flow type.

Column	Type	Nullable	Description
channel	String	Yes	The method used to contact your contact center: VOICE, CHAT, TASK.
sub_type	String	Yes	The subtype for the contact. For example, connect:Guide or connect:SMS.
initiation_method	String	Yes	How the contact was initiated.
flow_language_version	String	Yes	The flow language version.

Column	Type	Nullable	Description
invoking_resource_version	String	Yes	Version of the contact flow used.
bot_id	String	Yes	The identifier of the bot.
bot_alias_id	String	Yes	The alias identifier of the bot that the session was held. with
bot_version	String	Yes	The version of the bot that the session was held with.
bot_locale	String	Yes	The language configuration of the bot.

Column	Type	Nullable	Description
bot_conversation_start_timestamp	Timestamp	Yes	The Timestamp marking the start of the conversation with the bot.
bot_conversation_end_timestamp	Timestamp	Yes	The Timestamp marking the end of the conversation with the bot.
bot_intent_name	String	Yes	The name of the intent.
bot_intent_level	Number	Yes	The number of intents up to and including the requested path.

Column	Type	Nullable	Description
bot_intent_outcome	String	Yes	The end state of the intent. Value of Success, Failed, Switched, or Dropped.
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Bot slots

Table name: `bot_slots`

Description: Records slot-level outcomes for bot intent fulfillment, tracking slot resolution status and retry counts for each slot within an intent.

Primary key: `instance_id, event_id`

Partition key: `bot_conversation_start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `bot_originating_request_id`, `bot_session_id`, `bot_intent_name`, `bot_intent_level` — Joins to bot_intents
- `bot_originating_request_id`, `bot_session_id` — Joins to bot_conversations
- `contact_id` — Joins to Contact Record

Column	Type	Nullable	Description
event_id	String	No	This is the primary key of the table. This will be a hash of originating request identifier, session identifier, intent name, intent level, slot

Column	Type	Nullable	Description
			name, and slot level.
bot_originating_request_id	String	Yes	A unique identifier for a specific bot request
bot_session_id	String	Yes	The identifier of the user session that is having the conversation.
aws_account_id	String	Yes	The identifier of the AWS account that owns the contact.
instance_arn	String	Yes	The ARN of the Connect Customer instance.

Column	Type	Nullable	Description
instance_id	String	No	The identifier of the Connect Customer instance.
invoking_resource_type	String	Yes	Can be flow or module.
flow_resource_id	String	Yes	Flow identifier.
module_resource_id	String	Yes	Module identifier.
invoking_resource_start_timestamp	Timestamp	Yes	Time at which flow started.
parent_flow_resource_id	String	Yes	Flow identifier from which the module was invoked from. This field will only be populated for modules.

Column	Type	Nullable	Description
contact_id	String	Yes	The identifier of the contact.
flow_action_id	String	Yes	The identifier of the flow block (action) that invoked the bot, where an action is a single step of a flow's run.
invoking_resource_published_timestamp	Timestamp	Yes	"Creation" or "revision" date of the flow itself.

Column	Type	Nullable	Description
flow_type	String	Yes	Connect Customer includes a set of nine flow types. For more information, see Choose a flow type.
channel	String	Yes	The method used to contact your contact center: VOICE, CHAT, TASK.
sub_type	String	Yes	This subtype for the contact. For example, connect:Guide or connect:SMS.

Column	Type	Nullable	Description
initiation_method	String	Yes	Indicates how the contact was initiated.
flow_language_version	String	Yes	Flow language version.
invoking_resource_version	String	Yes	Version of the contact flow used.
bot_id	String	Yes	The identifier of the bot.
bot_alias_id	String	Yes	The alias identifier of the bot that the session was held with.
bot_version	String	Yes	The version of the bot that the session was held with.

Column	Type	Nullable	Description
bot_locale	String	Yes	Language configuration of the bot.
bot_conversation_start_timestamp	Timestamp	Yes	The Timestamp marking the start of the conversation with the bot.
bot_conversation_end_timestamp	Timestamp	Yes	The Timestamp marking the end of the conversation with the bot.
bot_intent_name	String	Yes	The name of the intent.

Column	Type	Nullable	Description
bot_intent_level	Number	Yes	The number of intents up to and including the requested path.
bot_slot_name	String	Yes	The name of the slot.
bot_slot_level	Number	Yes	The number of slots up to and including the requested path.
bot_slot_outcome	String	Yes	The end state of the slot. Values of Success, Failed, Dropped, or Retry.

Column	Type	Nullable	Description
bot_slot_retry_count	Number	Yes	The number of times the bot tried to elicit a response from the user for the slot.
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Cases data in the Connect Customer analytics data lake

This topic details the content in the Connect Customer data lake cases tables. The tables list the column, type, and description of the content.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Case events
- Case related item events

Case events

Table name: `case_events`

Description: Records case lifecycle events (created, updated, deleted), including case metadata, status changes, template information, and custom field values for Connect Cases.

Primary key: `instance_id, event_id`

Partition key: `event_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `case_id` — Joins to case_related_item_events (as `associated_case_id`)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect

Column	Type	Nullable	Description
			Customer instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the case.
event_id	string	No	The unique ID of the case event.
case_id	string	Yes	The ID of the case.
event_timestamp	Timestamp	Yes	The timestamp when the event occurred, in UTC.
changed_field_ids	array(string)	Yes	The list of field IDs that were modified in this event.

Column	Type	Nullable	Description
event_type	string	Yes	The type of event. Valid values: CASE.CREATED, CASE.UPDATED, CASE.DELETED.
performed_by_iam_principal	string	Yes	The IAM principal ARN of the entity that triggered the event.
performed_by_user_arn	string	Yes	The ARN of the user that performed the action.
performed_by_custom_entity	string	Yes	The custom entity that performed the action.

Column	Type	Nullable	Description
cases_domain_arn	string	Yes	The ARN of the Connect Customer Cases domain.
template_id	string	Yes	The ID of the case template used to create the case.
template_name	string	Yes	The name of the case template. This value is empty if the template has been deleted.

Column	Type	Nullable	Description
last_updated_user	string	Yes	The last user who updated the case. This references the `last_updated_user` system field value.
reference_number	string	Yes	The human-readable reference number for the case. This references the `reference_number` system field value.
status	string	Yes	The status of the case. This references the `status` system field value.

Column	Type	Nullable	Description
assigned_user	string	Yes	The ARN of the user assigned to the case. This references the `assigned_user` system field value.
assigned_queue	string	Yes	The ARN of the queue assigned to the case. This references the `assigned_queue` system field value.

Column	Type	Nullable	Description
case_reason	string	Yes	The reason for opening the case. This references the `case_reason` system field value.
case_title	string	Yes	The title of the case. This references the `title` system field value.
case_summary	string	Yes	The summary of the case. This references the `summary` system field value.

Column	Type	Nullable	Description
customer_profile_arn	string	Yes	The ARN of the customer profile associated with the case. This references the `customer_id` system field value.
created_timestamp	Timestamp	Yes	The timestamp when the case was created, in UTC. This references the `created_datetime` system field value.

Column	Type	Nullable	Description
last_updated_timestamp	Timestamp	Yes	The timestamp when the case was last updated, in UTC. This references the `last_updated_datetime` system field value.
next_sla_breach_timestamp	Timestamp	Yes	The timestamp of the next SLA breach deadline, in UTC. This references the `next_sla_breach_datetime` system field value.

Column	Type	Nullable	Description
last_closed_timestamp	Timestamp	Yes	The timestamp when the case was last closed, in UTC. This references the `last_closed_datetime` system field value.
last_reopened_timestamp	Timestamp	Yes	The timestamp when the case was last reopened, in UTC. This references the `last_reopened_datetime` system field value.

Column	Type	Nullable	Description
custom_fields	array(struct)	Yes	An array of objects containing custom field data associated with the case. Each object includes the field id, field_name, and a type-specific value field (string_value, double_value, boolean_value, or timestamp_value).

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Sample queries

The following example query in Athena creates a view that flattens custom fields from the case events table:

```
CREATE VIEW case_events_flattened AS
SELECT
    ce.event_id,
    ce.case_id,
    ce.event_timestamp,
    ce.event_type,
    ce.instance_id,
    -- ... other system fields
    -- Flattened custom fields
```

```
    cf.id AS custom_field_id,
    cf.field_name AS custom_field_name,
    CASE
        WHEN cf.string_value IS NOT NULL THEN 'string'
        WHEN cf.double_value IS NOT NULL THEN 'double'
        WHEN cf.timestamp_value IS NOT NULL THEN 'timestamp'
        WHEN cf.boolean_value IS NOT NULL THEN 'boolean'
        ELSE 'unknown'
    END AS custom_field_type,
    cf.string_value AS custom_field_string_value,
    cf.double_value AS custom_field_double_value,
    -- Cast milliseconds to timestamp
    CAST(from_unixtime(cf.timestamp_value / 1000.0) AS TIMESTAMP) AS
 custom_field_timestamp_value,
    cf.boolean_value AS custom_field_boolean_value
FROM "case_events resource link table name" ce
CROSS JOIN UNNEST(ce.custom_fields) AS t(cf)
```

The following example creates a view that returns the latest state for each case:

```
CREATE OR REPLACE VIEW latest_case_state AS
SELECT *
FROM (
    SELECT *,
        ROW_NUMBER() OVER (
            PARTITION BY case_id, instance_id
            ORDER BY event_timestamp DESC
        ) AS rn
    FROM "case_events resource link table name"
) t
WHERE rn = 1;
```

Case related item events

Table name: `case_related_item_events`

Description: Records events for items related to cases, including comments, contacts, file attachments, SLA tracking, and custom related items.

Primary key: `instance_id, event_id`

Partition key: `event_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `associated_case_id` — Joins to case_events (as `case_id`)
- `contact_id` — Joins to Contact Record

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS account that owns the related item.
event_id	string	No	The unique ID of the related item event.
related_item_id	string	Yes	The ID of the related item.
event_timestamp	Timestamp	Yes	The timestamp when the event occurred, in UTC.

Column	Type	Nullable	Description
event_type	string	Yes	The type of event. Valid values: CASE.RELATED_ITEM.CREATED, CASE.RELATED_ITEM.UPDATED, CASE.RELATED_ITEM.DELETED.
performed_by_iam_principal	string	Yes	The IAM principal ARN of the entity that triggered the event.
performed_by_user_arn	string	Yes	The ARN of the user who performed the action.
performed_by_custom_entity	string	Yes	The custom entity identifier that performed the action.

Column	Type	Nullable	Description
cases_domain_arn	string	Yes	The ARN of the Connect Customer Cases domain.
associated_case_id	string	Yes	The ID of the case that this related item is associated with.
related_item_type	string	Yes	The type of related item. Valid values: comment, file, sla, connect, contact, custom.
created_timestamp	Timestamp	Yes	The timestamp when the related item was created, in UTC.

Column	Type	Nullable	Description
comment_body	string	Yes	The body text of the comment.
comment_content_type	string	Yes	The content type of the comment body. For example, Text/Plain.
related_case_id	string	Yes	The ID of the related case.
contact_channel	string	Yes	The communication channel of the contact. For example, VOICE, CHAT, TASK, EMAIL.
contact_id	string	Yes	The ID of the contact.

Column	Type	Nullable	Description
file_arn	string	Yes	The ARN of the file attachment.
sla_name	string	Yes	The name of the SLA.
sla_status	string	Yes	The current status of the SLA. For example, active, overdue, met, notmet.
sla_target_timestamp	Timestamp	Yes	The timestamp of the target deadline for the SLA, in UTC.

Column	Type	Nullable	Description
sla_type	string	Yes	The type of SLA metric being tracked. For example, CaseField.
sla_completion_timestamp	Timestamp	Yes	The timestamp when the SLA was completed, in UTC.
sla_target_field_id	string	Yes	The ID of the field that the SLA is targeting.
sla_target_field_values	array(string)	Yes	The target field values for the sla_target_field_id in order for the SLA to be completed.

Column	Type	Nullable	Description
custom_related_item_fields	array(struct)	Yes	An array of objects containing custom field data associated with the related item. Each object includes the field id, field_name, and a type-specific value field (string_value, double_value, boolean_value, or timestamp_value).

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Configuration data in the Connect Customer data lake

This topic details the content in the Connect Customer data lake configuration tables. The tables list the column, type, and description of the content.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Agent Hierarchy Groups
- Routing profiles
- Users

Agent Hierarchy Groups

Table name: `agent_hierarchy_groups`

Description: Dimension table containing the hierarchy group definitions for organizing agents, including group names, ARNs, and active status.

Primary key: `agent_hierarchy_group_id`

Join keys:

- `instance_id` — Joins to all tables
- `agent_hierarchy_group_id` — Joins to users table, Agent Statistic Record and Agent Queue Statistic Record (as `agent_hierarchy_level_*_id`)

Column	Type	Nullable	Description
instance_id	string	Yes	The ID of the Connect Customer instance.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS

Column	Type	Nullable	Description
			account that owns the contact.
agent_hierarchy_group_id	string	No	The identifier of the hierarchy group for the user.
agent_hierarchy_group_arn	string	Yes	The ARN of the hierarchy group.
agent_hierarchy_group_name	string	Yes	The name of the hierarchy group.
last_modified_region	string	Yes	The AWS Region where this resource was last modified.
last_modified_timestamp	timestamp	Yes	The Timestamp when this resource was last modified.

Column	Type	Nullable	Description
is_active	Boolean	Yes	Whether the agent hierarchy group exists or has been deleted.
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Routing profiles

Table name: `routing_profiles`

Description: Dimension table containing routing profile configurations, including profile name, default outbound queue, and availability timer settings.

Primary key: `agent_routing_profile_id`

Join keys:

- `instance_id` — Joins to all tables
- `agent_routing_profile_id` — Joins to users table, Agent Statistic Record and Agent Queue Statistic Record (as `routing_profile_id`)

Column	Type	Nullable	Description
agent_routing_profile_id	string	No	The identifier of the routing profile.
agent_routing_profile_arn	string	Yes	The ARN of the routing profile.
routing_profile_name	string	Yes	The name of the routing profile.
instance_id	string	Yes	The ID of the Connect Customer instance.
instance_arn	string	Yes	The ARN of the

Column	Type	Nullable	Description
			Connect Customer instance.
agent_availability_timer	string	Yes	Whether agents with this routing profile will have their routing order calculated based on *longest idle time* or *time since their last inbound contact*.
default_outbound_queue_id	string	Yes	The default outbound queue for the routing profile.
routing_profile_description	string	Yes	Description of the routing profile.

Column	Type	Nullable	Description
last_modified_region	string	Yes	The AWS Region where this resource was last modified.
last_modified_timestamp	Timestamp	Yes	The Timestamp when this resource was last modified.
is_active	Boolean	Yes	Whether the agent exists or has been deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Users

Table name: `users`

Description: Master dimension table for agent data containing user identity, contact information, hierarchy assignments, routing profile, security profiles, and phone configuration.

Primary key: `user_id`

Join keys:

- `instance_id` — Joins to all tables
- `user_id` — Joins to Contact Record (as `agent_id`), Agent Statistic Record, Agent Queue Statistic Record, Contact Evaluation Record

- `user_arn` — Joins to Agent Event (as `agent_arn`), scheduling tables (as `agent_arn`)
- `agent_routing_profile_id` — Joins to routing_profiles
- `agent_hierarchy_group_id` — Joins to agent_hierarchy_groups

Column	Type	Nullable	Description
user_id	string	No	The identifier of the user account.
user_arn	string	Yes	The ARN of the user account.
directory_user_id	string	Yes	The identifier of the user account in the directory used for identity management.
agent_hierarchy_group_id	string	Yes	The identifier of the hierarchy group for the user.
agent_hierarchy_group_arn	string	Yes	The identifier of level 1

Column	Type	Nullable	Description
			hierarchy group for the user.
agent_hierarchy_group_level_1_id	string	Yes	The identifier of level 1 hierarchy group for the user.
agent_hierarchy_group_level_2_id	string	Yes	The identifier of level 2 hierarchy group for the user.
agent_hierarchy_group_level_3_id	string	Yes	The identifier of level 3 hierarchy group for the user.
agent_hierarchy_group_level_4_id	string	Yes	The identifier of level 4 hierarchy group for the user.

Column	Type	Nullable	Description
agent_hierarchy_group_level_5_id	string	Yes	The identifier of level 5 hierarchy group for the user.
agent_email	string	Yes	The user's email address.
agent_secondary_email	string	Yes	The user's secondary email address.
first_name	string	Yes	The first name of the agent.
last_name	string	Yes	The last name of the agent.
mobile	string	Yes	The user's mobile number.

Column	Type	Nullable	Description
agent_username	string	Yes	The user name of the agent, as entered in their Connect Customer user account.
instance_id	string	Yes	The ID of the Connect Customer instance.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
agent_routing_profile_id	string	Yes	The ID of the routing profile for the agent.
agent_routing_profile_arn	string	Yes	The ARN of the routing profile for the agent.

Column	Type	Nullable	Description
agent_security_profile_ids	array<string>	Yes	The IDs of the security profiles for the user.
agent_security_profile_arns	array<string>	Yes	The ARNs of the security profiles for the user.
last_modified_region	string	Yes	The AWS Region where this resource was last modified.
last_modified_timestamp	Timestamp	Yes	The Timestamp when this resource was last modified.
after_contact_work_time_limit	int	Yes	The After Call Work (ACW) timeout setting, in seconds.

Column	Type	Nullable	Description
auto_accept	Boolean	Yes	The Auto accept setting.
desk_phone_number	string	Yes	The phone number for the user's desk phone.
phone_type	string	Yes	The phone type.
is_active	Boolean	Yes	Whether the agent exists or has been deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Column	Type	Nullable	Description
agent_voice_enhancement_mode	string	Yes	The voice enhancement mode used by the agent. Valid values: VOICE_ISOLATION | NOISE_SUPPRESSION | NONE. A value of null indicates this mode has not yet been set for this user.

Forecasting data in the Connect Customer analytics data lake

This topic details the content in the Connect Customer data lake forecasting tables. Each table lists the column, type, and description of the content in the table.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Important things to know
- Forecast groups table
- Long-term forecasts table
- Short-term forecasts table
- Intraday forecasts table
- Demand group table
- Demand group definitions table

Important things to know

- You can use the tables described in this topic to access published forecasts data in the data lake.
- The Forecast groups table stores versioned records. A new version is created when forecast group details are changed, for example, adding or removing queues from the forecast group. You can get the latest record using the highest value of forecast_group_version.
- You can join the Forecast groups table to the Long-term and Short-term forecasts tables by using the following columns: forecast_group_arn and forecast_group_version.

Forecast groups table

Table name: `forecast_groups`

Description: Defines forecast groups that organize queues and channels for demand forecasting, using versioning for change tracking.

Primary key: `instance_id, forecast_group_arn, forecast_group_version`

Join keys:

- `instance_id` — Joins to all tables
- `forecast_group_arn, forecast_group_version` — Joins to long_term_forecasts, short_term_forecasts
- `forecast_group_arn` — Joins to staffing_group_forecast_groups

Column	Type	Nullable	Description
instance_id	String	No	The identifier of the Connect Customer instance.
forecast_group_arn	String	No	The ARN of the forecast group.
forecast_group_version	Number	No	The version of the forecast group. A new version is created every time a change is made to a forecast group, for example, addition of new queues.
forecast_group_name	String	Yes	The name of the forecast group.

Column	Type	Nullable	Description
instance_arn	String	Yes	The ARN of the Connect Customer instance.
is_deleted	Boolean	Yes	Whether the forecast group is deleted.
last_updated_timestamp	String	Yes	The epoch Timestamp in milliseconds when the last time the forecast group was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp for the last time the data lake processed the record. This can include transformation and backfill processes. This field cannot be used to determine reliably data freshness.

Long-term forecasts table

Table name: `long_term_forecasts`

Description: Contains long-term (daily interval) forecast data including contact volume and average handle time predictions, with support for customer-applied overrides.

Primary key: `instance_id, long_term_forecast_id`

Join keys:

- `instance_id` — Joins to all tables
- `forecast_group_arn, forecast_group_version` — Joins to forecast_groups

- queue_id — Joins to Agent Queue Statistic Record

Column	Type	Nullable	Description
instance_id	String	No	The ID of the Connect Customer instance
long_term_forecast_id	String	Yes	Unique Identifier of the forecast data row. Key is hash of multiple values: instanceId, forecastGroupId, forecastGroupVersion, forecastType, queueId, channel, forecastStarttime, creationTime.
forecast_group_arn	String	Yes	The ARN of the

Column	Type	Nullable	Description
			forecast group.
forecast_group_version	Number	Yes	The version of the forecast group.
interval	String	Yes	Time interval of the forecast data. For example, Daily for long term forecast data.
queue_id	String	Yes	The ID of the queue for the forecast.
channel	String	Yes	The channel of the forecast. For example, VOICE.

Column	Type	Nullable	Description
forecast_interval_start_time	Timestamp	Yes	The start time of the time interval for this forecast data row.
creation_timestamp	Timestamp	Yes	The date and time when this forecast is first computed or published.
computed_time	Timestamp	Yes	The date and time when this forecast is computed.
published_time	Timestamp	Yes	The date and time when this forecast is published. This value is null until the forecast has been published.

Column	Type	Nullable	Description
timezone	String	Yes	The timezone of the forecast, for example, UTC.
is_published	Boolean	Yes	Whether this forecast is published or not.
average_handle_time	Number	Yes	The average handle time metric value of the forecast data row.
contact_volume	Number	Yes	The contact volume metric value of the forecast data row.

Column	Type	Nullable	Description
average_handle_time_override	Number	Yes	The customer applied override value of the average handle time metric.
contact_volume_override	Number	Yes	The customer applied override value of the contact volume metric value.
instance_arn	String	Yes	The ARN of the Connect Customer instance of the forecast.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp for the last time the data lake processed the record. This can include transformation and backfill processes. This field cannot be used to determine reliably data freshness.

Short-term forecasts table

Table name: `short_term_forecasts`

Description: Contains short-term (15-minute interval) forecast data including contact volume and average handle time predictions, with support for customer-applied overrides.

Primary key: `instance_id, short_term_forecast_id`

Join keys:

- `instance_id` — Joins to all tables
- `forecast_group_arn, forecast_group_version` — Joins to forecast_groups

- queue_id — Joins to Agent Queue Statistic Record

Column	Type	Nullable	Description
instance_id	String	No	The ID of the Connect Customer instance.
short_term_forecast_id	String	Yes	Unique Identifier of the forecast data row. Key is hash of multiple values: instanceId, forecastGroupId, forecastGroupVersion, forecastType, queueId, channel, forecastStarttime, creationTime.
forecast_group_arn	String	Yes	The ARN of the

Column	Type	Nullable	Description
			forecast group for the forecast data row.
forecast_group_version	Number	Yes	The version of the forecast group.
interval	String	Yes	Time interval of the forecast data row. For example, FIFTEEN_MINUTES for short term 15 minutes forecast data row.
queue_id	String	Yes	The ID of the queue for the forecast.

Column	Type	Nullable	Description
channel	String	Yes	The channel of this forecast, for example, VOICE.
forecast_interval_start_time	Timestamp	Yes	The start time of the time interval for this forecast data row.
creation_timestamp	Timestamp	Yes	The date and time when this forecast is first computed or published.
computed_time	Timestamp	Yes	The date and time when this forecast is computed.

Column	Type	Nullable	Description
published_time	Timestamp	Yes	The date and time when this forecast is published. This value is null until the forecast has been published.
is_published	Boolean	Yes	Whether this forecast is published or not.
average_handle_time	Number	Yes	The average handle time metric value of the forecast data row.

Column	Type	Nullable	Description
contact_volume	Number	Yes	The contact volume metric value of the forecast data row.
average_handle_time_override	Number	Yes	The customer applied override value of the average handle time metric.
contact_volume_override	Number	Yes	The customer applied override value of the contact volume metric value.

Column	Type	Nullable	Description
instance_arn	String	Yes	The ARN of the Connect Customer instance of the forecast.
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp for the last time the data lake processed the record. This can include transformation and backfill processes. This field cannot be used to determine reliably data freshness.

Intraday forecasts table

Table name: `intraday_forecasts`

Description: Contains intraday forecast data including forecasted contact volume, average handle time, queue answer time, and effective agent staffing for real-time workforce adjustments.

Primary key: `instance_id, intraday_forecast_id`

Partition key: `forecast_interval_start_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `queue_arn` — Joins to Agent Queue Statistic Record (through queue ARN and ID mapping)

Column	Type	Nullable	Description
intraday_forecast_id	string	No	Unique identifier of this intraday forecast data.
aws_account_id	string	Yes	The identifier of the AWS account that owns the Intraday Forecast.
instance_id	string	No	The identifier of the Connect Customer instance. You can

Column	Type	Nullable	Description
			find the instance ID in the Amazon Resource Name (ARN) of the instance.
instance_arn	string	Yes	Instance ARN of the Connect Customer instance.
channel	string	Yes	The method used to contact your contact center.
queue_arn	string	Yes	The Amazon Resource Name of the queue.
forecast_interval_start_timestamp	Timestamp	Yes	Start Timestamp of the forecast interval.

Column	Type	Nullable	Description
creation_timestamp	Timestamp	Yes	When the forecast was computed in forecasting system.
average_handle_time	Double	Yes	Forecasted metric data: average handle time.
average_queue_answer_time	Double	Yes	Forecasted metric data: average queue answer time.
contact_volume	Double	Yes	Forecasted metric data: contact volume.
effective_agent_staffing	Double	Yes	Forecasted metric data: effective agent staffing.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Demand group table

Table name: `demand_group`

Description: Defines demand groups that represent specific queue-channel combinations for capacity planning, associating demand targets with forecast groups.

Primary key: `instance_id, demand_group_arn, demand_group_version`

Join keys:

- `instance_id` — Joins to all tables
- `forecast_group_arn` — Joins to forecast_groups (as `forecast_group_arn`)

- `demand_group_arn, demand_group_version` — Joins to demand_group_definitions
- `demand_group_arn` — Joins to staffing_group_demand_group, staff_demand_group

Column	Type	Nullable	Description
instance_id	string	No	The identifier of the Connect Customer instance.
demand_group_arn	string	No	The ARN of the demand group.
demand_group_version	Long	No	The version of the demand group. A new version is created every time a change is made to a demand group, for example, addition of new queues.

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
demand_group_name	string	Yes	Name of the demand group.
forecast_group_arn	string	Yes	The ARN of the forecast group.
is_deleted	Boolean	Yes	Whether the demand group is deleted.
last_updated_timestamp	Timestamp	Yes	Timestamp when the demand group was last created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Demand group definitions table

Table name: `demand_group_definitions`

Description: Defines the queue and channel combinations that make up each demand group, mapping specific workload types to demand allocation targets.

Primary key: `instance_id, demand_group_definition_id`

Join keys:

- `instance_id` — Joins to all tables
- `demand_group_arn, demand_group_version` — Joins to demand_group

- `queue_id` — Joins to Agent Queue Statistic Record

Column	Type	Nullable	Description
instance_id	string	No	The identifier of the Connect Customer instance.
demand_group_definition_id	string	No	Unique Identifier for the demandGroup definition row.
demand_group_arn	string	Yes	The ARN of the demand group.
demand_group_version	Long	Yes	The version of the demand group. A new version is created every time a change is made to a demand

Column	Type	Nullable	Description
			group, for example, addition of new queues.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
queue_id	string	Yes	ID of the queue that is part of the demand group.
channel	string	Yes	The channel of the queue-and-channel combination that belongs to the demand group.

Column	Type	Nullable	Description
is_deleted	Boolean	Yes	Whether the demand group is deleted.
last_updated_timestamp	Timestamp	Yes	Timestamp when the demand group was last created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Outbound campaigns data in the Connect Customer data lake

This topic details the content in the Connect Customer data lake outbound campaign events table. The table lists the column, type, and description of the content.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Outbound campaign events

Table name: `outbound_campaign_events`

Description: Records outbound campaign lifecycle events across voice, email, and SMS channels, including delivery attempts, campaign outcomes, and recipient interactions.

Primary key: `campaign_event_id, instance_id`

Partition key: `campaign_event_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `campaign_id` — Joins to Contact Record (as `campaign_Id`)
- `profile_id` — Joins to Customer Profiles (external)

Column	Type	Nullable	Description
account_profile_id	String	Yes	Specifies the profile identifier for an account-based profile in Customer Profiles.
instance_id	String	No	The identifier of the Connect Customer instance.

Column	Type	Nullable	Description
instance_arn	String	Yes	The ARN of the Connect Customer instance.
aws_account_id	String	Yes	The identifier of the AWS account that owns the outbound campaign.
campaign_id	String	Yes	The identifier for the outbound campaign.
campaign_name	String	Yes	The name of the outbound campaign.

Column	Type	Nullable	Description
campaign_initiation_type	String	Yes	The campaign initiation method selected for the outbound campaign. For example: CUSTOMER_SEGMENT, CUSTOMER_EVENT.
campaign_execution_timestamp	Timestamp	Yes	The Timestamp indicating the start of each campaign execution. Multiple Timestamps can exist for campaigns that run repeatedly.

Column	Type	Nullable	Description
campaign_event_id	String	No	The unique identifier for each outbound campaign event.
campaign_event_category	String	Yes	The category of the outbound campaign event, used to group individual event types into higher-level classes such as delivery receipt, campaign send, orchestration, and campaign action events.

Column	Type	Nullable	Description
campaign_event_type	String	Yes	The specific outbound campaign event type. Campaign events: • TARGETED: The recipient was identified and included as part of the audience to target for the campaign. • CAMPAIGN_EXPIRED: The send request is successfully attempted but expired due to insuffici

Column	Type	Nullable	Description
			ent resources. The system will automatically retry when sufficient resources are available. • CAMPAIGN_FAILURE_PERMANENT: The send request encountered an unknown error, invalid parameter, or insufficient permissions. There are no systematic retries.

Column	Type	Nullable	Descripti on
			• CAMPAIGN_ SUCCESS: The send request is successfu l and Connect Customer will attempt to deliver the campaign to the recipient . • DROPPED_C AMPAIGN_E NDED: The targeted profile was dropped from the campaign because the campaign ended before a communica

Column	Type	Nullable	Description
			tion attempt. • DROPPED_DELIVERY_ERROR: The targeted profile was dropped because of a user configuration error. Examples include improper channel configurations or an incorrect message template. • DROPPED_DELIVERY_FAILURE: The targeted profile was dropped

Column	Type	Nullable	Description
			because we didn't receive delivery confirmation following three 60-minute waiting periods. • DROPPED_INVALID_CONTACT_TYPE: The targeted profile was dropped because the contact type specified in the engagement preference were incorrectly

Column	Type	Nullable	Description
			configured. • DROPPED_INVALID_ENGAGEMENT_PREFERENCE: The targeted profile was dropped because the engagement preferences were incorrectly configured. • DROPPED_INVALID_TARGET: The targeted profile was dropped because it was invalid or was

Column	Type	Nullable	Description
			deleted during execution • DROPPED_LIMIT_BREACHED: The targeted profile was dropped because the configured campaign communication limits were exceeded. • DROPPED_MISSING_CHANNEL: The targeted profile was dropped from the campaign because they

Column	Type	Nullable	Description
			were missing channel endpoint (such as email or phone number) • DROPPED_MISSING_TIMEZONE: The targeted profile was dropped from the campaign because a contact timezone could not be determined as configured in the campaign. This might also occur if Connect

Column	Type	Nullable	Description
			Customer is unable to estimate a timezone. • DROPPED_ALREADY_IN_PROGRESS: The targeted profile was dropped because it was in another campaign execution that is still in progress. • DROPPED_REJECTED: The targeted profile was dropped because of a delivery error,

Column	Type	Nullable	Description
			throttling error, or any unexpected customer error. • DROPPED_EXPIRED: The targeted profile was dropped because the provided expiration time has passed. • DROPPED_NO_SEND_TIME: The targeted profile was dropped from the campaign because a valid send

Column	Type	Nullable	Description
			time could not be determined within the campaign's configured active communication time. • LAMBDA_INVOCATION_SUCCESS: The targeted profile was successfully sent to the specified Lambda Function and Outbound Campaigns received a valid response.

Column	Type	Nullable	Description
			• LAMBDA_INVOCATION_FAILURE: The function invocation failed, including Lambda function errors or malformed responses. Email events: • Delivery: The message is delivered. • Send: Connect Customer accepted the message and attempted to

Column	Type	Nullable	Description
			deliver it. • Reject: Connect Customer detected malware and rejected the message. • Bounce: An issue related to the email or server prevented Connect Customer from deliverin g the message. • DeliveryD elay: A temporary error occurred that delayed the delivery

Column	Type	Nullable	Description
			of the message. Connect Customer systematically reattempts message delivery. • Open: The message is received and the recipient opened it. • Click: The message is received and the recipient clicked a link in it. • Complaint: The message is received

Column	Type	Nullable	Description
			but the recipient marked it as spam. SMS events: • TEXT_DELIVERED: The message is delivered to the specified location. • TEXT_SUCCESSFUL: The message is successfully accepted by the recipient's carrier. • TEXT_QUEUED: The message is

Column	Type	Nullable	Description
			queued and ready to be delivered to the recipient. • TEXT_PENDING: The message hasn't yet been delivered. • TEXT_BLOCKED: The recipient's device or carrier is blocking SMS messages. • TEXT_TTL-EXPIRED: The SMS message couldn't be delivered within the

Column	Type	Nullable	Description
			specified time frame. • TEXT_CARRIER_UNREACHABLE: An issue with the mobile network prevented the message from being delivered. This error is usually temporary. You can try to send the message again later. • TEXT_INVALID: The destination phone number

Column	Type	Nullable	Description
			is not valid. • TEXT_INVALID_MESSAGE: The body of the SMS message is invalid. For example: message doesn't meet the content or format requirements; and can't be delivered. • TEXT_CARRIER_BLOCKED: The carrier has blocked delivery of this message. This

Column	Type	Nullable	Description
			often occurs when the carrier identifies the contents of the message as unsolicited or malicious. • TEXT_UNREACHABLE: The recipient's device is currently unreachable or unavailable. For example, the device might be powered off, or might be disconnec

Column	Type	Nullable	Description
			ted from the network. You can try to send the message again later. • TEXT_SPAM: The mobile carrier identified the contents of the message as spam and blocked delivery. • TEXT_UNKNOWN: An error occurred that prevented the delivery of the message. This

Column	Type	Nullable	Description
			error is usually temporary. You can try to send the message again later. Telephony events: • AMD_DISABLED: Answering machine detection is disabled. • INITIATED: An outbound call was initiated or transferred. • CONNECTED_TO_SYSTEM: The contact has

Column	Type	Nullable	Description
			established media (for example, it was answered by a person or by voicemail). This event is generated for any of the Answering MachineDetectionStatus codes. • CONTACT_DATA_UPDATED: One or more of the following contact properties were updated on an outbound call:

Column	Type	Nullable	Description
			user-defined attributes and tags, routing criteria is updated or step is expired, or if conversational analytics is enabled for a given contact. • QUEUED: An outbound call is queued to be assigned to an agent. • CONNECTED_TO_AGENT: An outbound call is

Column	Type	Nullable	Description
			connected to an agent. WhatsApp events: • delivered: The WhatsApp message was successfully delivered to the recipient. • failed: The WhatsApp message could not be delivered to the recipient. • read: The recipient opened and

Column	Type	Nullable	Description
			read the WhatsApp message. Web notification events: • WEB_NOTIFICATION_DELIVERED: The web notification was successfully delivered to the recipient's browser. • WEB_NOTIFICATION_ENGAGED: The recipient clicked or otherwise engaged with the web notification.

Column	Type	Nullable	Description
			• WEB_NOTIFICATION_DISMISSED: The recipient dismissed or closed the web notification. • WEB_NOTIFICATION_CHAT_STARTED: The recipient started a chat from the web notification. • WEB_NOTIFICATION_CHAT_ENGAGED: The recipient engaged in a chat that was started from the web

Column	Type	Nullable	Description
			notification.
campaign_event_timestamp	Timestamp	Yes	The Timestamp indicating when the outbound campaign event occurred.
delivery_attempt_id	String	Yes	The identifier for the outbound communication delivery attempt.

Column	Type	Nullable	Description
channel	String	Yes	The method used to contact your contact center. For example: VOICE, CHAT, EMAIL, NOTIFICATION. This field might be blank for campaign events when this value is not applicable.

Column	Type	Nullable	Description
subtype	String	Yes	The outbound campaign delivery mode used to contact the campaign recipient. For example: connect:Email, connect:SMS, connect:Telephony, connect:WhatsApp, connect:WebNotification. **Note**: Telephony includes both the Agent Assisted Voice, Automated Voice delivery modes.

Column	Type	Nullable	Description
			This field might be blank for campaign events when this value is not applicable.
profile_id	String	Yes	The unique identifier of a Connect Customer Customer Profile. **Note**: This attribute is only available when you use segmentation capabilities offered with Connect Customer Customer Profiles.

Column	Type	Nullable	Description
campaign_segment_arn	String	Yes	The ARN of a segment of users. **Note**: This attribute is only available when you use segmentation capabilities offered with Connect Customer Customer Profiles.
campaign_url_link_click	String	Yes	The URL link clicked by the outbound campaign recipient. This attribute is applicable to email campaigns.

Column	Type	Nullable	Description
web_notification_type	String	No	The type of web notification delivered to the recipient. This attribute is applicable to web notification campaigns.

Column	Type	Nullable	Description
device_type	String	No	The type of device on which the recipient received the web notification (for example, desktop, mobile). This attribute is applicable to web notification campaigns.

Column	Type	Nullable	Description
device_model	String	No	The model of the device on which the recipient received the web notification. This attribute is applicable to web notification campaigns.
browser_name	String	No	The name of the browser in which the recipient received the web notification. This attribute is applicable to web notification campaigns.

Column	Type	Nullable	Description
campaign_is_final_status	Boolean	Yes	Set to `True` if this is the final state of the message. There are intermediate message statuses and it can take up to 72 hours for the final state to be received. This attribute is applicable to SMS campaigns.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.
lambda_function_arn	String	Yes	The Lambda Function ARN invoked by Outbound Campaigns.

Column	Type	Nullable	Description
lambda_invocation_result	String	Yes	The result of the Lambda Function invocation attempt. Set to SUCCESS: Outbound Campaigns successfully invoked the Lambda function and received a response, including function errors and malformed responses. Set to ERROR: Outbound Campaigns failed to invoke the Lambda function or couldn't confirm

Column	Type	Nullable	Description
			successful invocation (for example, timeout).
orchestration_event_context_subtype	String	Yes	Provides additional granularity for outbound campaign events indicating the specific reason a target was not reached.

Resource tags data in the Connect Customer data lake

The following table contains resource tag data.

Resource tags

Table name: `amazon_connect_resource_tags`

Description: Tracks tag changes on Connect resources using a slowly changing dimension (SCD) pattern. Each tag modification creates a new record, enabling tag history analysis.

Primary key: `instance_id, aws_account_id, resource_arn, record_creation_timestamp`

Partition key: `record_creation_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `resource_arn` — Joins to any Connect resource ARN (agents, queues, flows, and so on)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	No	The ID of the AWS account that owns the resource.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
record_creation_timestamp	Timestamp	No	The timestamp when tags changed on the resource.
resource_arn	string	No	The ARN of the Connect

Column	Type	Nullable	Description
			Customer resource.
tags	map(string,string)	Yes	The tags associated with the Connect Customer resource.
data_lake_last_processed_timestamp	Timestamp	Yes	The timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Scheduling data in the Connect Customer analytics data lake

This topic details the content in the Connect Customer data lake scheduling tables. The tables list the column, type, and description of the content.

There are two ways to access the analytics data lake and configure data to be shared:

- Option 1: Use the Connect Customer console
- Option 2: Use CLI or CloudShell

If you are unable to access the scheduling tables by using Option 1, try using Option 2.

Topics

- Staff scheduling profile
- Shift activities
- Shift profiles
- Staffing groups
- Staffing groups - Forecast groups
- Staffing groups - Supervisors
- Staff shifts
- Staff shift activities
- Staff timeoff balance changes
- Staff timeoffs
- Staff timeoff intervals
- Staff demand group
- Staffing groups demand group
- Staff shift activity allocation
- Schedule metrics
- Schedule goals
- Shift rotation patterns
- Shift rotation steps
- Data schema
- Sample queries

Staff scheduling profile

Table name: `staff_scheduling_profile`

Description: Contains agent scheduling configuration including staffing group assignment, shift profile or rotation pattern assignment, and scheduling validity window.

Primary key: `instance_id, agent_arn, staff_scheduling_profile_version`

Join keys:

- `instance_id` — Joins to all tables
- `agent_arn` — Joins to Agent Event, Contact Record, staff_shifts, staff_timeoffs, users (as `user_arn`)
- `staffing_group_arn` — Joins to staffing_groups, staffing_group_forecast_groups, staffing_group_supervisors
- `shift_profile_arn` — Joins to shift_profiles
- `shift_rotation_pattern_arn` — Joins to shift_rotation_patterns

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
agent_arn	string	No	The ARN of the Agent.
staff_scheduling_profile_version	bigint	No	The Staff Scheduling Profile Version.

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
staffing_group_arn	string	Yes	The ARN of the Staffing Group to which the Agent is assigned.
start_timestamp	Timestamp	Yes	StartTimestamp for the Agent configured in Staff Rules (schedules are generated only after this Timestamp).

Column	Type	Nullable	Description
end_timestamp	Timestamp	Yes	EndTimestamp for the Agent configured in Staff Rules (schedules are not generated beyond this Timestamp).
shift_profile_arn	string	Yes	The ARN of the Shift Profile assigned to the Agent in Staff Rules. Mutually exclusive with Shift Rotation Pattern.

Column	Type	Nullable	Description
shift_rotation_pattern_arn	string	Yes	The ARN of the Shift Rotation Pattern assigned to the Agent in Staff Rules. Mutually exclusive with Shift Profile.
shift_rotation_start_step_id	bigint	Yes	The step ID where the Agent begins in the assigned Shift Rotation Pattern.
timezone	string	Yes	Timezone configured for the Agent.

Column	Type	Nullable	Description
is_deleted	Boolean	Yes	Set to True if the Agent is deleted. Else set to False.
last_updated_by	string	Yes	The ARN of the user who updated the Staff Scheduling Profile.
last_updated_timestamp	Timestamp	Yes	Timestamp when the Staff Scheduling Profile was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Shift activities

Table name: `shift_activities`

Description: Defines the types of activities that can be assigned within shifts, including activity type (productive, non-productive, leave), adherence tracking, and paid status.

Primary key: `instance_id, shift_activity_arn, shift_activity_version`

Join keys:

- `instance_id` — Joins to all tables
- `shift_activity_arn` — Joins to staff_shift_activities, staff_timeoff_balance_changes, staff_timeoffs

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_activity_arn	string	No	The ARN of the Shift Activity.
shift_activity_version	bigint	No	The Shift Activity Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
shift_activity_name	string	Yes	Name of the Shift Activity.
type	string	Yes	Type of the Shift Activity. The possible values are: PRODUCTIVE, NON_PRODU

Column	Type	Nullable	Description
			CTIVE, and LEAVE.
sub_type	string	Yes	The sub-type of the Shift Activity. This is only valid for NON_PRODUCTIVE type activities. The possible values are: BREAK_OR_MEAL and NONE.
is_adherence_tracked	Boolean	Yes	Set to True if the Shift Activity is configured for Adherence tracking. Else set to False.

Column	Type	Nullable	Description
is_paid	Boolean	Yes	Set to True if the Shift Activity is configured as Paid. Else set to False.
is_deleted	Boolean	Yes	Set to True if the Shift Activity is deleted. Else set to False.
last_updated_by	string	Yes	The ARN of the user who created/updated the Shift Activity.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift Activity was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Shift profiles

Table name: `shift_profiles`

Description: Defines shift profile templates that can be assigned to agents, specifying the shift pattern for schedule generation.

Primary key: `instance_id, shift_profile_arn, shift_profile_version`

Join keys:

- `instance_id` — Joins to all tables
- `shift_profile_arn` — Joins to staff_scheduling_profile, shift_rotation_steps

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_profile_arn	string	No	The ARN of the Shift Profile.
shift_profile_version	bigint	No	The Shift Profile Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
shift_profile_name	string	Yes	The name of the Shift Profile.
is_deleted	Boolean	Yes	Set to True if the Shift Profile is deleted. Else set to False.
last_updated_by	string	Yes	The ARN of the

Column	Type	Nullable	Description
			user who created/updated the Shift Profile.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift Profile was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staffing groups

Table name: `staffing_groups`

Description: Defines staffing groups that organize agents for scheduling purposes, serving as the primary organizational unit for workforce management.

Primary key: `instance_id, staffing_group_arn, staffing_group_version`

Join keys:

- `instance_id` — Joins to all tables

- `staffing_group_arn` — Joins to staff_scheduling_profile, staffing_group_forecast_groups, staffing_group_supervisors, staffing_group_demand_group

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
staffing_group_arn	string	No	The ARN of the Staffing Group.
staffing_group_version	bigint	No	The Staffing Group Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
staffing_group_name	string	Yes	The name of the Staffing Group.
is_deleted	Boolean	Yes	Set to True if the Staffing Group is

Column	Type	Nullable	Description
			deleted. Else set to False.
last_updated_by	string	Yes	The ARN of the user who created/updated the Staffing Group.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Staffing Group was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staffing groups - Forecast groups

Table name: `staffing_group_forecast_groups`

Description: Maps the association between staffing groups and forecast groups, linking workforce capacity to demand forecasting.

Primary key: `instance_id, staffing_group_arn, staffing_group_version, forecast_group_arn`

Join keys:

- `instance_id` — Joins to all tables

- `staffing_group_arn, staffing_group_version` — Joins to staffing_groups
- `forecast_group_arn` — Joins to schedule_metrics, schedule_goals, staff_shift_activity_allocations

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
staffing_group_arn	string	No	The ARN of the Staffing Group.
staffing_group_version	bigint	No	The Staffing Group Version.
forecast_group_arn	string	No	The ARN of the Forecast Group associated to the Staffing Group.
instance_arn	string	Yes	The ARN of the Connect

Column	Type	Nullable	Description
			Customer instance.
is_deleted	Boolean	Yes	Set to False when the StaffingGroup-ForecastGroup association is valid.
last_updated_by	string	Yes	The ARN of the user who created/updated the Staffing Group.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Staffing Group was created/updated.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staffing groups - Supervisors

Table name: `staffing_group_supervisors`

Description: Maps supervisor associations to staffing groups, tracking which supervisors are responsible for each staffing group.

Primary key: `instance_id, staffing_group_arn, staffing_group_version, supervisor_arn`

Join keys:

- `instance_id` — Joins to all tables

- `staffing_group_arn, staffing_group_version` — Joins to staffing_groups
- `supervisor_arn` — Joins to Agent Event (as agent_arn), Contact Record (as agent_arn)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
staffing_group_arn	string	No	The ARN of the Staffing Group.
staffing_group_version	bigint	No	The Staffing Group Version.
supervisor_arn	string	No	The Agent ARN of the Supervisor associated to the Staffing Group.
instance_arn	string	Yes	The ARN of the Connect Customer instance.

Column	Type	Nullable	Description
is_deleted	Boolean	Yes	Set to False when the StaffingGroup-ForecastGroup association is valid.
last_updated_by	string	Yes	The ARN of the user who created/updated the Staffing Group.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Staffing Group was created/updated.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staff shifts

Table name: `staff_shifts`

Description: Contains individual shift instances assigned to agents, including shift start and end times and creation metadata.

Primary key: `instance_id, shift_id, shift_version`

Join keys:

- `instance_id` — Joins to all tables
- `shift_id, shift_version` — Joins to staff_shift_activities, staff_shift_activity_allocations

- `agent_arn` — Joins to staff_scheduling_profile, Agent Event, Contact Record, users (as `user_arn`)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_id	string	No	The ID of the Shift.
shift_version	bigint	No	The Shift Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
agent_arn	string	Yes	The ARN of the Agent.
shift_start_timestamp	Timestamp	Yes	The Timestamp when the Shift Starts.
shift_end_timestamp	Timestamp	Yes	The Timestamp

Column	Type	Nullable	Description
			when the Shift Ends.
created_timestamp	Timestamp	Yes	The Timestamp when the Shift was Created.
is_deleted	Boolean	Yes	Set to True if the Shift is deleted. Else set to False.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staff shift activities

Table name: `staff_shift_activities`

Description: Contains individual activity blocks within a shift, including activity start and end times, overtime flags, and activity status.

Primary key: `instance_id, shift_id, shift_version, activity_id`

Join keys:

- `instance_id` — Joins to all tables
- `shift_id, shift_version` — Joins to staff_shifts

- `activity_id` — Joins to staff_shift_activity_allocations
- `shift_activity_arn` — Joins to shift_activities

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_id	string	No	The ID of the Shift.
shift_version	bigint	No	The Shift Version.
activity_id	string	No	The ID of the Activity.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
activity_start_timestamp	Timestamp	Yes	The Timestamp when the activity starts.
activity_end_timestamp	Timestamp	Yes	The Timestamp when the

Column	Type	Nullable	Description
			activity ends.
shift_activity_arn	string	Yes	The ARN of the Shift Activity. If the shift_activity_arn is null, then it indicates 'Work' activity.
activity_status	string	Yes	Status of the Activity. This is set to INACTIVE if the activity overlaps with a timeoff.
is_overtime	Boolean	Yes	Set to True if the Activity is part of Overtime. Else set to False.

Column	Type	Nullable	Description
is_deleted	Boolean	Yes	Set to False when the Shift Activities are valid.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift was created/updated.
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staff timeoff balance changes

Table name: `staff_timeoff_balance_changes`

Description: Tracks time-off balance changes for agents, recording credits and deductions from various sources including uploads, requests, and schedule publishing.

Primary key: `instance_id, agent_arn, shift_activity_arn, timeoff_balance_version`

Partition key: `last_created_timestamp` (daily)

Join keys:

- `instance_id` — Joins to all tables
- `agent_arn` — Joins to staff_scheduling_profile, staff_shifts, Agent Event, Contact Record
- `shift_activity_arn` — Joins to shift_activities
- `timeoff_id` — Joins to staff_timeoffs

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
instance_id	string	No	The ID of the Connect Customer instance.
aws_account_id	string	Yes	The ID of the AWS account.

Column	Type	Nullable	Description
agent_arn	string	No	The ARN of the agent.
shift_activity_arn	string	No	The ARN of the Shift Activity this balance is allocated to.
timeoff_balance_version	bigint	No	The Time Off balance version, an incrementing number to denote order of changes.

Column	Type	Nullable	Description
balance_update_source	string	Yes	Source of the balance update. The possible values are TIME_OFF_BALANCE_UPLOAD, CONNECT_TIME_OFF_REQUEST, SCHEDULE_PUBLISH, CSV_TIME_OFF_BALANCE_DELETION, TIME_OFF_BALANCE_BACKFILL, SYSTEM_UPDATE
timeoff_id	string	Yes	The ID of the Time Off that caused this balance change, if one exists.

Column	Type	Nullable	Description
last_updated_by	string	Yes	The ARN of the agent who caused this balance change, if one exists.

Column	Type	Nullable	Description
balance_change_in_hours	double	Yes	Amount of Time Off balance updated through this change in hours. If this value is positive, this change is crediting Time Off balance. If this value is negative, this change is deducting Time Off balance. This value is undefined for any balance upload and deletion events.

Column	Type	Nullable	Description
remaining_balance_in_hours	double	Yes	Remaining Time Off balance hours after this change event. This value is undefined for any balance deletion event.
last_created_timestamp	Timestamp	Yes	The Timestamp when the Time Off balance change record was created.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staff timeoffs

Table name: `staff_timeoffs`

Description: Records time-off requests and approvals for agents, including status tracking through the approval workflow and effective hours.

Primary key: `instance_id, timeoff_id, agent_arn, timeoff_version`

Join keys:

- `instance_id` — Joins to all tables
- `timeoff_id, timeoff_version` — Joins to staff_timeoff_intervals

- `agent_arn` — Joins to staff_scheduling_profile, staff_shifts, Agent Event, Contact Record
- `shift_activity_arn` — Joins to shift_activities

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
timeoff_id	string	No	The ID of the Time Off.
agent_arn	string	No	The ARN of the Agent.
timeoff_version	bigint	No	The Time Off Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
timeoff_type	string	Yes	Type of Time Off. The possible values are: TIME_OFF and

Column	Type	Nullable	Description
			VOLUNTARY_TIME_OFF.
timeoff_start_timestamp	Timestamp	Yes	Timestamp when the Time Off starts.
timeoff_end_timestamp	Timestamp	Yes	Timestamp when the Time Off ends.

Column	Type	Nullable	Description
timeoff_status	string	Yes	Status of the Time Off. The possible values are: PENDING_CREATE, PENDING_UPDATE, PENDING_CANCEL, PENDING_ACCEPT, PENDING_APPROVE, PENDING_DECLINE, APPROVED, ACCEPTED, REJECTED, CANCELLED, WAITING_ACCEPT, and WAITING_APPROVE. The WAITING statuses indicate timeoff is waiting on User

Column	Type	Nullable	Description
			action. PENDING statuses indicate timeoff is waiting for system processing of a user action.
shift_activity_arn	string	Yes	The ARN of the Shift Activity used for the Timeoff.

Column	Type	Nullable	Description
effective_timeoff_hours	double	Yes	Total effective Time Off hours. Effective timeoff hours are calculated based on timeoff deduction logic. This is only set for TIME_OFF type.
last_updated_timestamp	Timestamp	Yes	Timestamp when the Time Off was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Staff timeoff intervals

Table name: `staff_timeoff_intervals`

Description: Contains the individual time intervals within a time-off request, breaking multi-day or multi-period time-off into discrete intervals with effective hours per interval.

Primary key: `instance_id, timeoff_id, timeoff_version, interval_id`

Join keys:

- `instance_id` — Joins to all tables
- `timeoff_id, timeoff_version` — Joins to staff_timeoffs

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
timeoff_id	string	No	The ID of the Time Off.
timeoff_version	bigint	No	The Time Off Version.
interval_id	string	No	The ID of the Time Off Interval.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
timeoff_interval_start_timestamp	Timestamp	Yes	Timestamp when the specific interval of Time Off starts.
timeoff_interval_end_timestamp	Timestamp	Yes	Timestamp when the specific

Column	Type	Nullable	Description
			interval of Time Off ends.
interval_effective_timeoff_hours	double	Yes	Effective Time Off hours for this specific interval of Time Off. Effective timeoff hours are calculated based on timeoff deduction logic.
last_updated_timestamp	Timestamp	Yes	Timestamp when the Time Off was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Staff demand group

Table name: `staff_demand_group`

Description: Maps agents to demand groups with priority assignments, supporting both staffing group-level defaults and agent-level overrides for demand allocation.

Primary key: `instance_id, agent_arn, demand_group_arn, staff_demand_group_version`

Join keys:

- `instance_id` — Joins to all tables
- `agent_arn` — Joins to staff_scheduling_profile, staff_shifts, Agent Event, Contact Record

- demand_group_arn — Joins to staffing_group_demand_group, staff_shift_activity_allocations

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
agent_arn	string	No	The ARN of the agent.
demand_group_arn	string	No	The ARN of the demand group.
staff_demand_group_version	Long	No	Version for this agent to demand group association
priority	string	Yes	Priority of the demand group for this agent. Can be LOW, MEDIUM or HIGH

Column	Type	Nullable	Description
instance_arn	string	Yes	The ARN of the Connect Customer instance.
is_override	Boolean	Yes	Set to 'true' if this is Agent to Demand Group association is Agent level override.
is_deleted	Boolean	Yes	Set to true if agent to demand group association is deleted.
last_updated_by	string	Yes	The ARN of the user who created/updated the Agent to Demand Group association.

Column	Type	Nullable	Description
last_updated_timestamp	Timestamp	Yes	The Timestamp when the agent to demand group association was created/updated.
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staffing groups demand group

Table name: `staffing_group_demand_group`

Description: Maps the association between staffing groups and demand groups with priority, linking organizational units to demand allocation targets.

Primary key: `instance_id, staffing_group_arn, demand_group_arn, staffing_group_demand_group_version`

Join keys:

- `instance_id` — Joins to all tables
- `staffing_group_arn` — Joins to staffing_groups, staff_scheduling_profile
- `demand_group_arn` — Joins to staff_demand_group, staff_shift_activity_allocations

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
staffing_group_arn	string	No	The ARN of the Staffing Group.
demand_group_arn	string	No	The ARN of the demand group.
staffing_group_demand_group_version	Long	No	Version for this Staffing

Column	Type	Nullable	Description
			Group to Demand Group association
priority	string	Yes	Priority of the Demand Group for this Staffing Group. Can be LOW, MEDIUM or HIGH
instance_arn	string	Yes	The ARN of the Connect Customer instance.
is_deleted	Boolean	Yes	Set to true if the staffing group to demand group association is deleted.

Column	Type	Nullable	Description
last_updated_by	string	Yes	The ARN of the user who created/updated the Staffing Group to Demand Group association.
last_updated_timestamp	Timestamp	Yes	Timestamp when the staffing group to demand group association was created/updated/deleted.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Staff shift activity allocation

Table name: `staff_shift_activity_allocations`

Description: Records the percentage allocation of shift activities to demand groups, enabling proportional assignment of agent capacity across multiple demand groups within a single activity.

Primary key: `instance_id, shift_id, shift_version, activity_id, demand_group_arn`

Join keys:

- `instance_id` — Joins to all tables

- `shift_id, shift_version` — Joins to staff_shifts, staff_shift_activities
- `activity_id` — Joins to staff_shift_activities
- `demand_group_arn` — Joins to staff_demand_group, staffing_group_demand_group
- `forecast_group_arn` — Joins to staffing_group_forecast_groups (as forecast_group_arn)

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_id	string	No	The ID of the shift.
shift_version	Long	No	The Shift Version.
activity_id	string	No	The ID of the activity.
demand_group_arn	string	No	The ARN of the demand group.
instance_arn	string	Yes	The ARN of the Connect Customer instance.
forecast_group_arn	string	Yes	The ARN of the

Column	Type	Nullable	Description
			forecast group.
allocation_percentage	double	Yes	Percentage allocation of the Activity to the Demand Group.
is_deleted	Boolean	Yes	Set to False when the StaffingGroup-ForecastGroup association is valid.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Staffing Group was created/updated.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot be used to determine reliably data freshness.

Schedule metrics

Table name: `schedule_metrics`

Description: Contains schedule performance metrics by interval, including required versus scheduled agent counts, occupancy, service level percentage, and average speed of answer.

Primary key: `instance_id, metric_id, interval_start_timestamp`

Join keys:

- `instance_id` — Joins to all tables

- `entity_arn` — Joins to staffing_group_forecast_groups (as forecast_group_arn), staff_demand_group (as demand_group_arn)

Column	Type	Nullable	Description
instance_id	string	No	The ARN of the Amazon Connect instance.
instance_arn	string	Yes	The ID of the Amazon Connect instance.
metric_id	string	No	Unique identifier for the metric value
aws_account_id	string	Yes	The ID of the AWS account.
entity_type	string	Yes	Denotes whether the metric is for a forecast group or demand group.

Column	Type	Nullable	Description
entity_arn	string	Yes	Arn of the forecast group or demand group
channel	string	Yes	Denotes the media channel like Voice, chat. If the row contains metrics that are not channel level, then it's populated as ALL
interval_start_timestamp	timestamp	No	Timestamp denoting the start of the interval
required_agent_count	float	Yes	Denotes the required agents count

Column	Type	Nullable	Description
scheduled_agent_count	float	Yes	Denotes the scheduled agents count
scheduled_occupancy	float	Yes	Denotes the occupancy percentage
scheduled_service_level_percentage	float	Yes	Denotes the projected service level percentage based on scheduled headcount
service_level_seconds	integer	Yes	Denotes the service level seconds

Column	Type	Nullable	Description
scheduled_average_speed_of_answer	float	Yes	Denotes the projected average speed of answer in seconds based on scheduled headcount
is_deleted	boolean	Yes	Denotes whether the metric is deleted
last_updated_timestamp	timestamp	Yes	The Timestamp when the metric record was created.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.
projected_average_time_to_complete	float	Yes	Denotes the average time to complete in hours
projected_backlog	integer	Yes	Denotes the backlog items

Column	Type	Nullable	Description
unplanned_shrinkage_percentage	float	Yes	Denotes the unplanned shrinkage percentage applied to the interval. This field is populated only when the channel is ALL.
required_agent_count_with_shrinkage	float	Yes	Denotes the required agent count adjusted for unplanned shrinkage. This field is populated only when the channel is ALL.

Column	Type	Nullable	Description
scheduled_agent_count_with_shrinkage	float	Yes	Denotes the scheduled agent count adjusted for unplanned shrinkage. This field is populated only when the channel is ALL.
scheduled_occupancy_with_shrinkage	float	Yes	Denotes the occupancy percentage adjusted for unplanned shrinkage. This field is populated only when the channel is ALL.

Column	Type	Nullable	Description
projected_service_level_percentage_with_shrinkage	float	Yes	Denotes the projected service level percentage based on scheduled headcount adjusted for unplanned shrinkage. This field is not populated when the channel is ALL.

Column	Type	Nullable	Description
projected_average_speed_of_answer_with_shrinkage	float	Yes	Denotes the projected average speed of answer in seconds based on scheduled headcount adjusted for unplanned shrinkage. This field is not populated when the channel is ALL.

Column	Type	Nullable	Description
projected_average_time_to_complete_with_shrinkage	float	Yes	Denotes the average time to complete in hours adjusted for unplanned shrinkage. This field is not populated when the channel is ALL.
projected_backlog_with_shrinkage	integer	Yes	Denotes the backlog items adjusted for unplanned shrinkage. This field is not populated when the channel is ALL.

Schedule goals

Table name: `schedule_goals`

Description: Stores service level goals for scheduling, including target service level percentage, service level seconds, and average speed of answer for forecast or demand groups.

Primary key: `instance_id, goal_id`

Join keys:

- `instance_id` — Joins to all tables
- `entity_arn` — Joins to staffing_group_forecast_groups (as forecast_group_arn), staff_demand_group (as demand_group_arn)

Column	Type	Nullable	Description
instance_id	string	No	The ARN of the Amazon Connect instance.
instance_arn	string	Yes	The ID of the Amazon Connect instance.
goal_id	string	No	Unique identifier for the goal value
aws_account_id	string	Yes	The ID of the AWS account.

Column	Type	Nullable	Description
entity_type	string	Yes	Denotes whether the goal is for a forecast group or demand group.
entity_arn	string	Yes	Arn of the forecast group or demand group
channel	string	Yes	Denotes the media channel like Voice, chat.
start_date_timestamp	timestamp	Yes	Timestamp denoting start of the goal
end_date_timestamp	timestamp	Yes	Timestamp denoting end of the goal

Column	Type	Nullable	Description
goal_service_level_percentage	float	Yes	Denotes the goal service level percentage
goal_service_level_seconds	integer	Yes	Denotes the service level seconds
goal_average_speed_of_answer	float	Yes	Denotes the average speed of answer in seconds
is_deleted	boolean	Yes	Denotes whether the goal is deleted
last_updated_timestamp	timestamp	Yes	The Timestamp when the goals record was created.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	timestamp	Yes	Timestamp, which shows the last time the data lake processed the record. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.
goal_average_time_to_complete	float	Yes	Denotes the average time to complete in hours.

Shift rotation patterns

Table name: `shift_rotation_patterns`

Description: Defines shift rotation pattern configurations that cycle agents through different shift profiles over time, with a configurable start date.

Primary key: `instance_id, shift_rotation_pattern_arn, shift_rotation_pattern_version`

Join keys:

- `instance_id` — Joins to all tables
- `shift_rotation_pattern_arn, shift_rotation_pattern_version` — Joins to shift_rotation_steps
- `shift_rotation_pattern_arn` — Joins to staff_scheduling_profile

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_rotation_pattern_arn	string	No	The ARN of the Shift Rotation Pattern.
shift_rotation_pattern_version	bigint	No	The Shift Rotation Pattern Version.
instance_arn	string	Yes	The ARN of the Connect Customer instance.

Column	Type	Nullable	Description
shift_rotation_pattern_name	string	Yes	The name of the Shift Rotation Pattern.
start_date	string	Yes	The start date of the Shift Rotation Pattern in `yyyy-mm-dd` format.
is_deleted	Boolean	Yes	Set to True if the Shift Rotation Pattern is deleted. Else set to False.
last_updated_by	string	Yes	The ARN of the user who created/updated/deleted the Shift Rotation Pattern.

Column	Type	Nullable	Description
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift Rotation Pattern was created/updated/deleted.
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Shift rotation steps

Table name: `shift_rotation_steps`

Description: Defines the individual steps within a shift rotation pattern, each associating a shift profile with a duration in weeks (up to 52 steps per rotation).

Primary key: `instance_id, shift_rotation_pattern_arn, shift_rotation_pattern_version, step_id`

Join keys:

- `instance_id` — Joins to all tables
- `shift_rotation_pattern_arn, shift_rotation_pattern_version` — Joins to shift_rotation_patterns
- `shift_profile_arn` — Joins to shift_profiles

Column	Type	Nullable	Description
instance_id	string	No	The ID of the Connect Customer instance.
shift_rotation_pattern_arn	string	No	The ARN of the Shift Rotation Pattern.
shift_rotation_pattern_version	bigint	No	The Shift Rotation Pattern Version.

Column	Type	Nullable	Description
step_id	bigint	No	The ID of the step within the Shift Rotation Pattern. Steps are numbered sequentially (1, 2, 3, ... up to 52).
instance_arn	string	Yes	The ARN of the Connect Customer instance.
shift_profile_arn	string	Yes	The ARN of the Shift Profile associated with the rotation step.
duration	bigint	Yes	The duration of the rotation step in weeks.

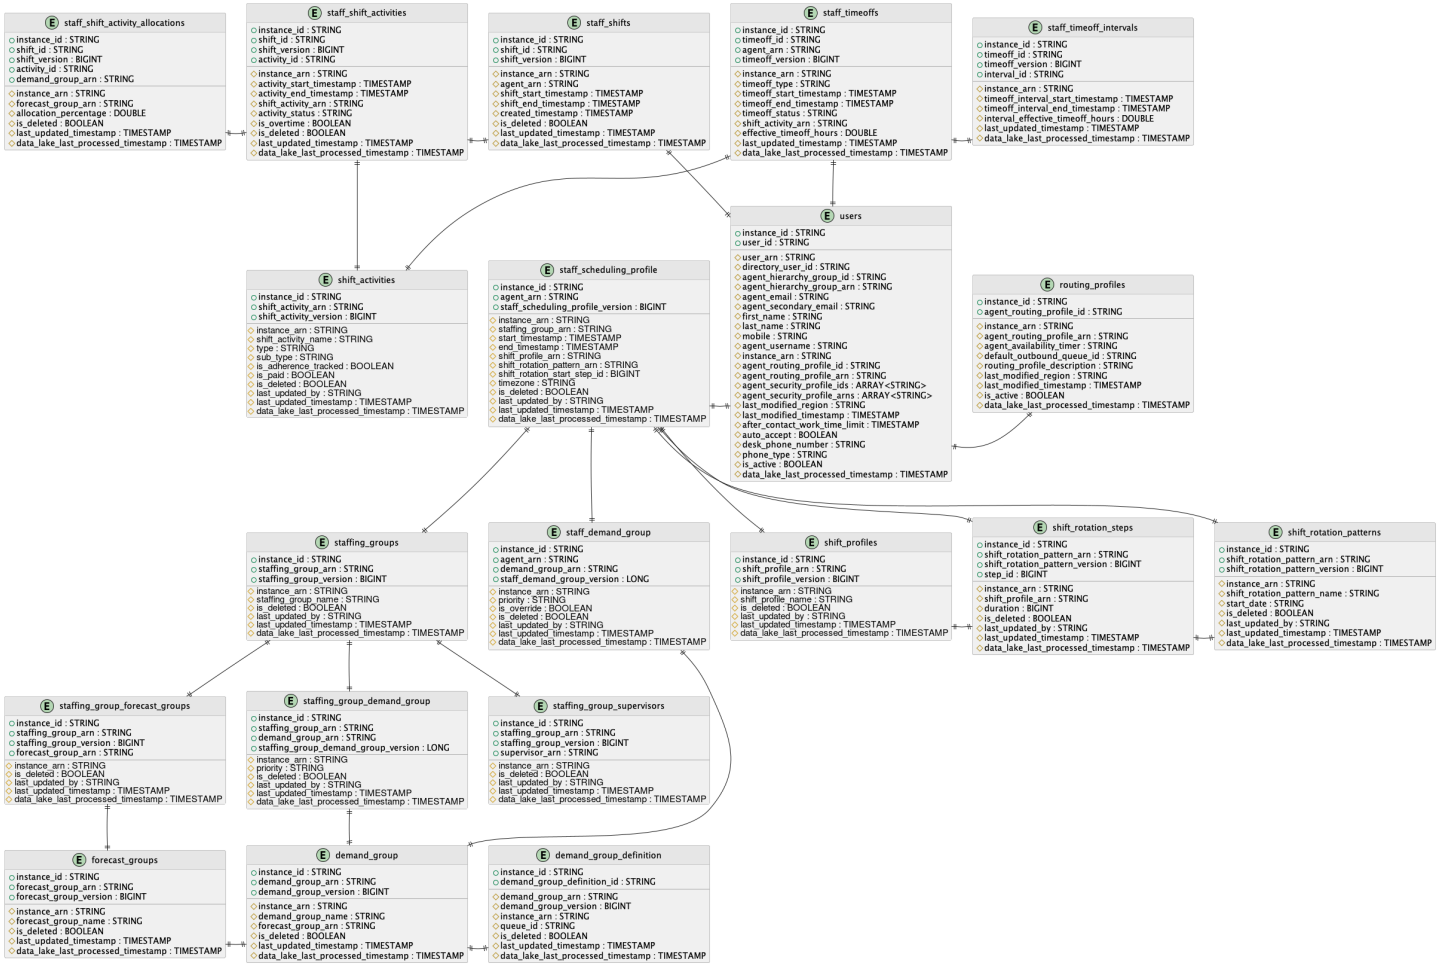
Column	Type	Nullable	Description
is_deleted	Boolean	Yes	Set to False when the Shift Rotation Step is valid.
last_updated_by	string	Yes	The ARN of the user who created/updated the Shift Rotation Pattern.
last_updated_timestamp	Timestamp	Yes	The Timestamp when the Shift Rotation Pattern was created/updated.

Column	Type	Nullable	Description
data_lake_last_processed_timestamp	Timestamp	Yes	The Timestamp, which shows the last time the record was touched by the data lake. This can include transformation and backfill. This field cannot reliably be used to determine data freshness.

Data schema

Following is an entity relationship diagram that shows the structure and relationships between scheduling tables in the Connect Customer data lake.

Each table displays its primary keys and attributes with their data types. The diagram illustrates how these tables relate to each other through foreign key relationships, providing a comprehensive view of the scheduling data model.



Sample queries

1. Query to get all the Scheduled Shift Activities of the Agents working on a specific Forecast Group

```
SELECT * FROM agent_scheduled_shift_activities_view
where forecast_group_name = 'AnyDepartmentForecastGroup'
```

Complete the following steps to create `agent_scheduled_shift_activities_view` mentioned above.

Step 1: Create a view to get supervisor names

```
CREATE OR REPLACE VIEW "latest_supervisor_names_view" AS
SELECT
  staffing_group_arn
, array_agg(supervisor_name ORDER BY supervisor_name ASC) supervisor_names
FROM
```

```
  (
   SELECT
     s.staffing_group_arn
   , CONCAT(u.first_name, ' ', u.last_name) supervisor_name
   FROM
     ((
      SELECT
        staffing_group_arn
      , supervisor_arn
      FROM
        (
         SELECT
           *
         , RANK() OVER (PARTITION BY staffing_group_arn ORDER BY staffing_group_version
 DESC) recency
         FROM
           staffing_group_supervisors
         WHERE (instance_id = 'YourAmazonConnectInstanceId')
      )  t
      WHERE (recency = 1)
   )  s
   INNER JOIN USERS u ON (s.supervisor_arn = u.user_arn))
)
GROUP BY staffing_group_arn
```

Step 2: Create a view to get the staffing group and forecast group associated with an agent

```
CREATE OR REPLACE VIEW "latest_agent_staffing_group_forecast_group_view" AS
WITH
  latest_staff_scheduling_profile AS (
   SELECT
     agent_arn
   , staffing_group_arn
   , last_updated_timestamp
   FROM
     (
      SELECT
        *
      , RANK() OVER (PARTITION BY agent_arn ORDER BY staff_scheduling_profile_version
 DESC) recency
      FROM
        staff_scheduling_profile
      WHERE ((instance_id = 'YourAmazonConnectInstanceId') AND (is_deleted = false))
```

```
   )  t
   WHERE (recency = 1)
)
, latest_staffing_groups AS (
   SELECT
     staffing_group_name
   , staffing_group_arn
   FROM
     (
      SELECT
        *
      , RANK() OVER (PARTITION BY staffing_group_arn ORDER BY staffing_group_version
 DESC) recency
      FROM
        staffing_groups
      WHERE (instance_id = 'YourAmazonConnectInstanceId')
   )  t
   WHERE (recency = 1)
)
, latest_forecast_groups AS (
   SELECT
     forecast_group_arn
   , forecast_group_name
   FROM
     (
      SELECT
        *
      , RANK() OVER (PARTITION BY forecast_group_arn ORDER BY forecast_group_version
 DESC) recency
      FROM
        forecast_groups
      WHERE (instance_id = 'YourAmazonConnectInstanceId')
   )  t
   WHERE (recency = 1)
)
, latest_staffing_group_forecast_groups AS (
   SELECT
     staffing_group_arn
   , forecast_group_arn
   FROM
     (
      SELECT
        *
```

```
      , RANK() OVER (PARTITION BY staffing_group_arn ORDER BY staffing_group_version
 DESC) recency
      FROM
        staffing_group_forecast_groups
      WHERE (instance_id = 'YourAmazonConnectInstanceId')
   )  t
   WHERE (recency = 1)
)
SELECT
  ssp.agent_arn
, U.agent_username AS username
, U.agent_routing_profile_id AS routing_profile_id
, CONCAT(u.first_name, ' ', u.last_name) agent_name
, fg.forecast_group_arn
, fg.forecast_group_name
, sg.staffing_group_arn
, sg.staffing_group_name
FROM
 latest_staff_scheduling_profile ssp
INNER JOIN latest_staffing_groups sg ON ssp.staffing_group_arn = sg.staffing_group_arn
INNER JOIN latest_staffing_group_forecast_groups sgfg ON ssp.staffing_group_arn =
 sgfg.staffing_group_arn
INNER JOIN latest_forecast_groups fg ON fg.forecast_group_arn = sgfg.forecast_group_arn
INNER JOIN USERS u ON ssp.agent_arn = u.user_arn
```

Step 3: Get the latest Shift activities

```
CREATE OR REPLACE VIEW "latest_shift_activities_view" AS
SELECT
  shift_activity_arn
, shift_activity_name
, shift_activity_version
, type
, sub_type
, is_adherence_tracked
, is_paid
, last_updated_timestamp
FROM
  (
   SELECT
     *
   , RANK() OVER (PARTITION BY shift_activity_arn ORDER BY shift_activity_version DESC)
 recency
```

```
   FROM
     shift_activities
   WHERE (instance_id = 'YourAmazonConnectInstanceId')
)  t
WHERE (recency = 1)
```

Step 4: Create a view to get the agent scheduled shift activities

```
CREATE OR REPLACE VIEW "agent_scheduled_shift_activities_view" AS
WITH
  latest_staff_shifts AS (
   SELECT
     agent_arn
   , shift_id
   , shift_version
   , shift_start_timestamp
   , shift_end_timestamp
   , created_timestamp
   , last_updated_timestamp
   , data_lake_last_processed_timestamp
   , recency
   FROM
     (
      SELECT
        RANK() OVER (PARTITION BY shift_id ORDER BY shift_version DESC) recency
      , *
      FROM
        staff_shifts sa
      WHERE (instance_id = 'YourAmazonConnectInstanceId')
   )  t
   WHERE ((recency = 1) AND (is_deleted = false))
)
SELECT
  asgfg.forecast_group_name
, array_join(sn.supervisor_names, ',') supervisor_names
, s.agent_arn
, u.first_name
, u.last_name
, asgfg.staffing_group_name
, ssa.activity_id
, (CASE WHEN (ssa.shift_activity_arn IS NULL) THEN COALESCE(sa.shift_activity_name,
 'Work') ELSE sa.shift_activity_name END) shift_activity_name
, s.shift_start_timestamp
```

```
, s.shift_end_timestamp
, (CASE WHEN (ssa.shift_activity_arn IS NULL) THEN COALESCE(sa.type, 'PRODUCTIVE') ELSE
 sa.type END) type
, (CASE WHEN (ssa.shift_activity_arn IS NULL) THEN COALESCE(sa.is_paid, true) ELSE
 sa.is_paid END) is_paid
, ssa.activity_start_timestamp
, ssa.activity_end_timestamp
, ssa.last_updated_timestamp
, ssa.data_lake_last_processed_timestamp
, u.agent_username as username
, u.agent_routing_profile_id as routing_profile_id
FROM
  staff_shift_activities ssa
INNER JOIN latest_staff_shifts s ON s.shift_id = ssa.shift_id AND s.shift_version =
 ssa.shift_version
INNER JOIN USERS u ON s.agent_arn = u.user_arn
INNER JOIN latest_agent_staffing_group_forecast_group_view asgfg ON s.agent_arn =
 asgfg.agent_arn
LEFT JOIN latest_shift_activities_view sa ON sa.shift_activity_arn =
 ssa.shift_activity_arn
INNER JOIN latest_supervisor_names_view sn ON sn.staffing_group_arn =
 asgfg.staffing_group_arn
WHERE (ssa.is_deleted = false) AND (COALESCE(ssa.activity_status, ' ') <> 'INACTIVE')
 AND (ssa.instance_id = 'YourAmazonConnectInstanceId')
```

2. Query to get all the time off requests of the Agents in a specific Forecast Group

`SELECT * FROM agent_timeoff_report_view where forecast_group_name = 'AnyDepartmentForecastGroup'`

Use the following query to create `agent_timeoff_report_view` mentioned above.

```
CREATE OR REPLACE VIEW "agent_timeoff_report_view" AS
WITH latest_staff_timeoffs AS (
        SELECT t1.*,
            CAST((t1.effective_timeoff_hours * 60) AS INT)
 total_effective_timeoff_minutes
        FROM (
                SELECT RANK() OVER (
                        PARTITION BY timeoff_id
                        ORDER BY timeoff_version DESC
                    ) recency,
                    agent_arn,
```

```
                    timeoff_id,
                    shift_activity_arn,
                    timeoff_status,
                    timeoff_version,
                    effective_timeoff_hours,
                    timeoff_start_timestamp,
                    timeoff_end_timestamp,
                    last_updated_timestamp,
                    data_lake_last_processed_timestamp
                FROM staff_timeoffs
                WHERE (
                        instance_id = 'YourAmazonConnectInstanceId'
                    )
            ) t1
        WHERE (recency = 1)
    )
SELECT asgfg.forecast_group_name,
    to.agent_arn,
    asgfg.agent_name,
    asgfg.staffing_group_name,
    asgfg.username,
    sa.shift_activity_name,
    to.timeoff_start_timestamp,
    to.timeoff_end_timestamp,
    to.timeoff_status,
    array_join(sn.supervisor_names, ',') AS supervisor_names,
    sa.is_paid,
    to.last_updated_timestamp,
    to.data_lake_last_processed_timestamp,
    u.agent_routing_profile_id AS routing_profile_id,
    to.timeoff_id,

    to.shift_activity_arn,
    to.total_effective_timeoff_minutes
FROM latest_staff_timeoffs to
    INNER JOIN latest_agent_staffing_group_forecast_group_view asgfg ON asgfg.agent_arn
 = to.agent_arn
    INNER JOIN latest_shift_activities_view sa ON sa.shift_activity_arn =
 to.shift_activity_arn
    INNER JOIN latest_supervisor_names_view sn ON sn.staffing_group_arn =
 asgfg.staffing_group_arn
    INNER JOIN users u ON u.user_arn = to.agent_arn
```

Reference queries for the Connect Customer data lake

This topic provides Athena SQL queries (Trino engine v3) for calculating common Connect Customer metrics from data lake tables. All queries use double-quoted identifiers and assume a `connect_datalake` database name. Adjust the database name to match your Glue catalog configuration.

Replace `<YOUR_INSTANCE_ID>` in each query with your Connect Customer instance ID.

Topics

- Contact and queue metrics
- Agent performance metrics
- Chat metrics
- Conversational analytics metrics
- AI agent metrics
- Flow metrics
- Evaluation metrics
- Outbound campaign metrics
- Cases metrics
- Bot metrics
- Common query patterns
- Agent schedule adherence (activity-level)
- Best practices

Contact and queue metrics

Abandonment rate

Definition: Percentage of contacts disconnected by the customer while in queue. Callbacks excluded.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
```

```
    CAST(SUM("is_abandoned") AS DOUBLE)
        / NULLIF(SUM("is_queued"), 0) * 100.0 AS "abandonment_rate_pct"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id"
ORDER BY "abandonment_rate_pct" DESC;
```

Contacts abandoned

Definition: Count of contacts disconnected by the customer while waiting in queue.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_abandoned") AS "contacts_abandoned"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Contacts abandoned in X seconds

Definition: Count of contacts abandoned within X seconds of being enqueued.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM(
        CASE WHEN "is_abandoned" = 1
             AND "queue_time_ms" <= 30000
             THEN 1 ELSE 0 END
    ) AS "contacts_abandoned_in_30s"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Average queue abandon time

Definition: Average time contacts waited in queue before abandoning.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    AVG("abandon_time_ms") / 1000.0 AS "avg_queue_abandon_time_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "is_abandoned" = 1
  AND "abandon_time_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Average queue answer time

Definition: Average time contacts waited in queue before being answered by an agent.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    AVG("queue_answer_time_ms") / 1000.0 AS "avg_queue_answer_time_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "is_handled" = 1
  AND "queue_answer_time_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Service level

Definition: Count and percentage of contacts answered within X seconds.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM(CASE WHEN "is_handled" = 1 AND "queue_answer_time_ms" <= 20000
             THEN 1 ELSE 0 END) AS "contacts_answered_in_20s",
```

```
    SUM("is_queued") AS "contacts_queued",
    CAST(SUM(CASE WHEN "is_handled" = 1 AND "queue_answer_time_ms" <= 20000
                  THEN 1 ELSE 0 END) AS DOUBLE)
        / NULLIF(SUM("is_queued"), 0) * 100.0 AS "service_level_20s_pct"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Contacts queued

Definition: Count of contacts placed into a queue.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_queued") AS "contacts_queued"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Contacts handled

Definition: Count of contacts connected to an agent.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_handled") AS "contacts_handled"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Contacts transferred in

Definition: Contacts transferred into a queue.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_transferred_in") AS "contacts_transferred_in"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Contacts transferred out

Definition: Contacts transferred out of a queue.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_transferred_out") AS "contacts_transferred_out",
    SUM("is_transferred_out_internal") AS "transferred_out_internal",
    SUM("is_transferred_out_external") AS "transferred_out_external"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Maximum queued time

Definition: Longest time any contact spent waiting in queue.

Source table: `contact_record`

```
SELECT
    "queue_id",
    MAX("queue_duration_ms") / 1000.0 AS "max_queued_time_sec"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "queue_duration_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Average contact duration

Definition: Average time from contact initiation to disconnect.

Source table: `contact_record`

```
SELECT
    "queue_id",
    AVG(
        date_diff('millisecond', "initiation_timestamp", "disconnect_timestamp")
    ) / 1000.0 AS "avg_contact_duration_sec"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "initiation_timestamp" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Agent performance metrics

Average handle time

Definition: Average time from contact connection to ACW completion.

Source table: `contact_statistic_record`

```
SELECT
    "agent_id",
    AVG("handle_time_ms") / 1000.0 AS "avg_handle_time_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'

GROUP BY "agent_id";
```

After contact work time

Definition: Total time agents spent in ACW state.

Source table: `contact_statistic_record`

```
SELECT
```

```
    "agent_id",
    SUM("after_contact_work_time_ms") / 1000.0 AS "total_acw_time_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "after_contact_work_time_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "agent_id";
```

Customer hold time

Definition: Total time customers spent on hold after connecting to agent.

Source table: `contact_statistic_record`

```
SELECT
    "agent_id",
    SUM("customer_hold_time_ms") / 1000.0 AS "total_hold_time_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "customer_hold_time_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "agent_id";
```

Agent idle time

Definition: Time agent spent in Available status without handling contacts.

Source table: `agent_statistic_record`

```
SELECT
    "user_id" AS "agent_id",
    SUM("agent_idle_time") / 1000.0 AS "total_idle_time_sec"
FROM "connect_datalake"."agent_statistic_record"
WHERE "published_date" >= TIMESTAMP '2026-06-09 00:00:00'

  AND "channel" = 'CHAT'
  AND "chat_agent_metrics_total_response_time_ms" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Average total messages

Definition: Average total messages per chat contact.

Source table: `contact_record`

```
SELECT
    "queue_id",
    AVG(CAST("chat_contact_metrics_total_messages" AS DOUBLE)) AS "avg_total_messages"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "channel" = 'CHAT'
  AND "chat_contact_metrics_total_messages" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Conversations abandoned

Definition: Contacts where chat was abandoned by agent or customer.

Source table: `contact_record`

```
SELECT
    "queue_id",
    COUNT(*) AS "conversations_abandoned"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
```

```
  AND "channel" = 'CHAT'

       OR "chat_customer_metrics_conversation_abandon" = true)
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id";
```

Conversational analytics metrics

Average talk time

Definition: Average combined agent and customer talk time per voice contact.

Source table: `contact_lens_conversational_analytics`

```
SELECT
    AVG("talk_time_total_ms") / 1000.0 AS "avg_talk_time_sec"
FROM "connect_datalake"."contact_lens_conversational_analytics"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "channel" = 'VOICE'
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Average non-talk time

Definition: Average hold plus silence time per voice contact.

Source table: `contact_lens_conversational_analytics`

```
SELECT
    AVG("non_talk_time_total_ms") / 1000.0 AS "avg_non_talk_time_sec"
FROM "connect_datalake"."contact_lens_conversational_analytics"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "channel" = 'VOICE'
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Sentiment scores

Definition: Overall sentiment scores for agent and customer.

Source table: `contact_lens_conversational_analytics`

```
SELECT
```

```
    AVG("sentiment_overall_score_agent") AS "avg_agent_sentiment",
    AVG("sentiment_overall_score_customer") AS "avg_customer_sentiment",
    AVG("sentiment_end_score_agent") AS "avg_agent_end_sentiment",
    AVG("sentiment_end_score_customer") AS "avg_customer_end_sentiment"
FROM "connect_datalake"."contact_lens_conversational_analytics"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Average agent interruptions

Definition: Average count of agent interruptions per contact.

Source table: `contact_lens_conversational_analytics`

```
SELECT
    AVG(CAST("interruptions_agent_count" AS DOUBLE)) AS "avg_agent_interruptions"
FROM "connect_datalake"."contact_lens_conversational_analytics"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "channel" = 'VOICE'
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

AI agent metrics

AI agent invocation success rate

Definition: Rate of successful AI Agent invocations.

Source table: `ai_agent`

```
SELECT
    "ai_agent_name",
    SUM(CASE WHEN "invocation_success" = true THEN 1 ELSE 0 END) AS "success_count",
    COUNT(*) AS "total_invocations",
    CAST(SUM(CASE WHEN "invocation_success" = true THEN 1 ELSE 0 END) AS DOUBLE)

FROM "connect_datalake"."ai_agent"
WHERE "creation_timestamp" >= CAST('2026-06-09' AS TIMESTAMP) * 1000
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
  AND "ai_agent_id" IS NOT NULL
GROUP BY "ai_agent_name";
```

AI handoff rate

Definition: Rate of AI sessions that escalated to human agents.

Source table: `ai_session`

```
SELECT
    SUM(CASE WHEN "is_handed_off" = true THEN 1 ELSE 0 END) AS "ai_handoffs",
    COUNT(*) AS "ai_involved_contacts",
    CAST(SUM(CASE WHEN "is_handed_off" = true THEN 1 ELSE 0 END) AS DOUBLE)
        / NULLIF(COUNT(*), 0) * 100.0 AS "handoff_rate_pct"
FROM "connect_datalake"."ai_session"
WHERE "creation_timestamp" >= CAST('2026-06-09' AS TIMESTAMP) * 1000
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
  AND "ai_session_id" IS NOT NULL;
```

AI quality scores

Definition: Average goal success, faithfulness, and completeness scores.

Source table: `ai_session`

```
SELECT
    AVG("goal_success_rate") AS "avg_goal_success_rate",
    AVG("faithfulness_score") AS "avg_faithfulness_score",
    AVG("completeness_score") AS "avg_completeness_score"
FROM "connect_datalake"."ai_session"
WHERE "creation_timestamp" >= CAST('2026-06-09' AS TIMESTAMP) * 1000
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
  AND "goal_success_rate" IS NOT NULL;
```

AI tool accuracy

Definition: Accuracy scores for AI tool parameter usage, selection, and utilization.

Source table: `ai_tool`

```
SELECT
    "ai_tool_name",
    AVG("ai_tool_parameter_accuracy") AS "avg_parameter_accuracy",
    AVG("ai_tool_selection_accuracy") AS "avg_selection_accuracy",
    AVG("ai_tool_utilization_accuracy") AS "avg_use_accuracy"
FROM "connect_datalake"."ai_tool"
```

```
WHERE "creation_timestamp" >= CAST('2026-06-09' AS TIMESTAMP) * 1000

  AND "item_type" = 'Form'
  AND "to_delete" = false
  AND ("evaluation_type" IS NULL OR "evaluation_type" != 'calibration')
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Average evaluation score

Definition: Average evaluation score across submitted evaluations.

Source table: `contact_evaluation_record`

```
SELECT
    AVG("score") AS "avg_evaluation_score_pct"
FROM "connect_datalake"."contact_evaluation_record"
WHERE "evaluation_submitted_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "evaluation_submitted_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "item_type" = 'Form'
  AND "to_delete" = false
  AND ("evaluation_type" IS NULL OR "evaluation_type" != 'calibration')
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Automatic fails percent

Definition: Percentage of evaluations that triggered automatic fail.

Source table: `contact_evaluation_record`

```
SELECT
    CAST(
        COUNT(DISTINCT CASE WHEN "automatic_fail" = true THEN "evaluation_id" END) AS
 DOUBLE
    ) / NULLIF(COUNT(DISTINCT "evaluation_id"), 0) * 100.0

  AND "item_type" = 'Form'
  AND "to_delete" = false
  AND ("evaluation_type" IS NULL OR "evaluation_type" != 'calibration')
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Outbound campaign metrics

Campaign contacts

Definition: Count of outbound campaign contacts.

Source table: `contact_record`

```
SELECT
    "campaign_id",
    COUNT(*) AS "campaign_contacts"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "campaign_id" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "campaign_id";
```

Human answered

Definition: Outbound campaign calls connected to a live customer.

Source table: `contact_record`

```
SELECT
    "campaign_id",
    COUNT(*) AS "human_answered"
FROM "connect_datalake"."contact_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "campaign_id" IS NOT NULL
  AND "answering_machine_detection_status" = 'HUMAN_ANSWERED'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "campaign_id";
```

Cases metrics

Cases created

Definition: Total cases created in a time period.

Source table: `case_events`

```
SELECT
    COUNT(DISTINCT "case_id") AS "cases_created"
FROM "connect_datalake"."case_events"
WHERE "event_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "event_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "event_type" = 'CASE.CREATED'
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Average case resolution time

Definition: Average time from case creation to close.

Source table: `case_events`

```
SELECT
    AVG(
        date_diff('hour', "created_timestamp", "last_closed_timestamp")
    ) AS "avg_resolution_time_hours"
FROM "connect_datalake"."case_events"
WHERE "last_closed_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "last_closed_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "created_timestamp" IS NOT NULL
  AND "instance_id" = '<YOUR_INSTANCE_ID>';
```

Bot metrics

Bot conversation outcomes

Definition: Percentage breakdown of bot conversation outcomes.

Source table: `bot_conversations`

```
WITH bot_outcomes AS (
    SELECT
        "bot_id",
        "bot_conversation_outcome",
        COUNT(*) AS "cnt",

    FROM "connect_datalake"."bot_conversations"
    WHERE "bot_conversation_start_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
      AND "bot_conversation_start_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
      AND "instance_id" = '<YOUR_INSTANCE_ID>'
    GROUP BY "bot_id", "bot_conversation_outcome"
)
SELECT
    "bot_id",
    "bot_conversation_outcome",
    "cnt",
    CAST("cnt" AS DOUBLE) / "total" * 100.0 AS "outcome_pct"
FROM bot_outcomes;
```

Common query patterns

The following patterns show how to combine multiple data lake tables for comprehensive dashboards and reporting.

Daily summary dashboard

Definition: Comprehensive daily queue metrics including service level.

Source table: `contact_statistic_record`

```
SELECT
    "queue_id",
    SUM("is_queued") AS "contacts_queued",
    SUM("is_handled") AS "contacts_handled",
    SUM("is_abandoned") AS "contacts_abandoned",
    AVG(CASE WHEN "is_handled" = 1 THEN "queue_answer_time_ms" END) / 1000.0
        AS "avg_answer_time_sec",
    AVG(CASE WHEN "is_handled" = 1 THEN "handle_time_ms" END) / 1000.0
        AS "avg_handle_time_sec",
    CAST(SUM(CASE WHEN "is_handled" = 1 AND "queue_answer_time_ms" <= 20000
                  THEN 1 ELSE 0 END) AS DOUBLE)
        / NULLIF(SUM("is_queued"), 0) * 100.0 AS "sl_20s_pct"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY "queue_id"
ORDER BY "contacts_queued" DESC;
```

Hourly trend analysis

Definition: Hourly contact volume and service level trends.

Source table: `contact_statistic_record`

```
SELECT
    date_trunc('hour', "disconnect_timestamp") AS "hour",
    "queue_id",
    SUM("is_queued") AS "contacts_queued",
    SUM("is_handled") AS "contacts_handled",
    SUM("is_abandoned") AS "contacts_abandoned",
    CAST(SUM("is_abandoned") AS DOUBLE)
        / NULLIF(SUM("is_queued"), 0) * 100.0 AS "abandon_rate_pct",
```

```
    AVG(CASE WHEN "is_handled" = 1 THEN "handle_time_ms" END) / 1000.0 AS "aht_sec"
FROM "connect_datalake"."contact_statistic_record"
WHERE "disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND "disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND "instance_id" = '<YOUR_INSTANCE_ID>'
GROUP BY date_trunc('hour', "disconnect_timestamp"), "queue_id"
ORDER BY "hour";
```

Conversational analytics enriched contacts

Definition: Enrich contact records with conversational analytics.

Source table: `contact_record` joined with `contact_lens_conversational_analytics`

```
SELECT
    cr."contact_id",
    cr."queue_id",
    cr."agent_id",
    cr."agent_interaction_duration_ms" / 1000.0 AS "interaction_sec",
    cl."talk_time_agent_ms" / 1000.0 AS "agent_talk_sec",
    cl."talk_time_customer_ms" / 1000.0 AS "customer_talk_sec",
    cl."sentiment_overall_score_agent",
    cl."sentiment_overall_score_customer"
FROM "connect_datalake"."contact_record" cr
JOIN "connect_datalake"."contact_lens_conversational_analytics" cl
    ON cr."contact_id" = cl."contact_id"
    AND cr."instance_id" = cl."instance_id"
WHERE cr."disconnect_timestamp" >= TIMESTAMP '2026-06-09 00:00:00'
  AND cr."disconnect_timestamp" <  TIMESTAMP '2026-06-10 00:00:00'
  AND cr."instance_id" = '<YOUR_INSTANCE_ID>'
  AND cr."channel" = 'VOICE';
```

Agent schedule adherence (activity-level)

Definition: Compares an agent's actual activity state (from `agent_statistic_record`) against their scheduled shift activities (from scheduling tables) for each time interval in a day. Produces a per-interval adherence determination: IN (agent was doing what they were scheduled to do) or OUT (they weren't).

Output columns: Agent, Date, Begin, End, Scheduled Activity, Actual Activity, Adherence State, Duration

Source tables:

- `staff_shifts` — Agent shifts for the day (latest non-deleted version)
- `staff_shift_activities` — Scheduled activity blocks within each shift
- `shift_activities` — Activity name lookup (maps ARN to human-readable name)
- `agent_statistic_record` — Actual agent state per interval
- `users` — Agent name and ARN resolution

Adherence logic (simplified):

- Scheduled "Open" — agent is IN if status is Available, On Contact, or ACW
- Scheduled "Break" — agent is IN if status is Break or Lunch
- Scheduled "Meeting" — agent is IN if status is Training or Meeting
- Otherwise — OUT

```

Best practices

- **Partition pruning** — Always include partition filters (`disconnect_timestamp`, `published_date`, or `creation_timestamp`) to minimize scan costs.
- **Deduplication** — Connect Customer delivers records at least once. Use `DISTINCT` on primary keys when exact counts are required.
- **Time zones** — All timestamps are in UTC. Apply `AT TIME ZONE` for local reporting.
- **Milliseconds** — Most duration fields are stored in milliseconds. Divide by 1000.0 for seconds.
- **Instance ID filter** — Always filter by `instance_id` in multi-instance environments.
- **Real-time metrics** — For true real-time metrics, use the `GetCurrentMetricData` API. The data lake provides historical data only.

Data retention in the Connect Customer analytics data lake

The data lake retention system in Connect Customer maintains a rolling 25-month window of accessible data, with the cutoff date updating at 12 AM UTC. For example, if you access the data lake on September 1, 2025, at 03:00 AM UTC, Connect Customer will provide access to data from August 1, 2023, 12:00 AM UTC onwards, while any data before this cutoff date will not be accessible.

Retaining data past the 25-month window

The 25-month window is fixed. You cannot change the retention period. To keep data for longer, such as to meet statutory retention requirements, copy the data to storage that you control before it ages out of the window.

You access the data lake tables from your own account with AWS Lake Formation and . For more information, see Access Connect Customer data lake. To retain data, run a scheduled query that writes each table to your own Amazon S3 bucket, for example with an `CREATE TABLE AS SELECT` (CTAS) query or an `UNLOAD` statement. You can then apply an Amazon S3 Lifecycle configuration to move the exported objects to a lower-cost storage class, such as Amazon S3 Glacier, and to expire them after your required retention period. For more information, see Managing the lifecycle of objects in the *Amazon S3 User Guide*.

Each data lake table uses a designated timestamp field for age calculations. The following table lists each the data lake table name and the name of their age timestamp column.

Table name	Age timestamp column
agent_queue_statistic_record	interval_end_time
agent_statistic_record	interval_end_time
coaching_session_record	session_created_timestamp
contact_evaluation_record	evaluation_submitted_timestamp
contact_flow_events	start_timestamp
contact_lens_conversational_analytics	disconnect_timestamp
contact_statistic_record	disconnect_timestamp
contact_record	disconnect_timestamp
evaluation_review_record	creation_timestamp
staff_shift_activities	last_updated_timestamp

Table name	Age timestamp column
staff_shifts	last_updated_timestamp
staff_timeoffs	last_updated_timestamp
staff_timeoff_intervals	last_updated_timestamp
short_term_forecasts	creation_timestamp
long_term_forecasts	creation_timestamp

Security in Connect Customer

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS compliance programs. To learn about the compliance programs that apply to Connect Customer, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Connect Customer. The following topics show you how to configure Connect Customer to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Connect Customer resources.

Topics

- Data protection in Connect Customer

- Set IP address restrictions and session timeouts in Connect Customer

Data protection in Connect Customer

The AWS shared responsibility model applies to data protection in Connect Customer. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see Data Privacy FAQ. For information about data protection in Europe, see the General Data Protection Regulation (GDPR) Center.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Connect Customer or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data handled by Connect Customer

Data held within Connect Customer is segregated by the AWS account ID and the Connect Customer instance ID. This makes sure that data can be accessed only by the authorized users of a specific Connect Customer instance.

Connect Customer handles a variety of data related to the contact center, including but not limited to the following categories.

- **Resources and configurations** – This includes queues, flows, users, routing profiles, and task templates.
- **Contact metadata** – This includes connection time, handle time, source number (ANI), destination number (DNIS), and user defined contact attributes.
- **Agent-related performance data** – This includes login time, status changes, and contacts handled.
- **Phone call audio streams** – When enabled, this also includes call recordings.
- **Chat transcripts** – Included only if enabled in flows.
- **Screen recordings** – Included only if enabled in flows.
- **Attachments** – Included only if enabled at the instance level.
- **Integration configuration** – Includes user defined name, description and metadata when creating integration with external applications.
- **Knowledge documents** – This includes documents used by agents to handle contacts.
- **Voiceprints** – When Connect Customer Voice ID is enabled, a voiceprint is created from the customer's voice for future authentication. Similarly, a voiceprint is created while registering a fraudster in the Voice ID system for future fraud detection.
- **Speaker and Fraudster Audio** – When Connect Customer Voice ID is enabled, the audio used for enrolling speakers and registering fraudsters is stored so that Voice ID can re-enroll and reregister them in future when there is a need to do so.

- **Forecasts, capacity plans, and schedules** – Included only if enabled and created.

Connect Customer stores the following Personally Identifiable Information (PII) data related to your customers:

- The customer's phone number: ANI for inbound calls, and DNIS for outbound calls or transfers.
- If you are using Connect Customer Customer Profiles, all this data could potentially be PII. This data is always encrypted at rest using either a customer managed key or an AWS owned key. The Connect Customer Customer Profiles data is segregated by the AWS account ID and the domain. Multiple Connect Customer instances can share a single Customer Profiles domain.
- For outbound campaigns, Amazon Pinpoint passes customer phone numbers and relevant attributes to Connect Customer. On the Connect Customer side, these are always encrypted at rest using either a customer managed key or an AWS owned key. The outbound campaigns data is segregated by the Connect Customer instance ID and are encrypted by instance-specific keys.

External application data

With Amazon AppIntegrations, you can integrate with external applications. It stores references to other AWS resources and client-service specified metadata. No data is stored other than incidentally while being processed. When syncing data periodically with a Connect Customer service, data is encrypted using a customer managed key and stored temporarily for one month.

Phone call media

Connect Customer is in the audio path for calls handled by the service. It is therefore responsible for relaying the call’s media stream between participants. This can include the audio between a customer and a flow / IVR, the audio between a customer and an agent, or mixing the audio between multiple parties in a conference or during a transfer. There are two types of phone calls:

- PSTN calls. This includes inbound customer calls, outbound calls placed by agents to customers, and calls to an agent’s physical phone, if this option has been enabled in the Contact Control Panel (CCP).
- Softphone calls placed to the agent’s browser.

PSTN calls are connected between Connect Customer and various telecommunications carriers using either private circuits maintained between Connect Customer and our providers or existing

AWS internet connectivity. For PSTN calls routed over the public internet, signaling is encrypted with TLS and the audio media is encrypted with SRTP.

Softphone calls are established to the agent's browser with an encrypted WebSocket connection using TLS. The audio media traffic to the browser is encrypted in transit using DTLS-SRTP.

Call recordings and screen recordings

At the instance-level, by default the call recording and screen recording capabilities are available when an Amazon S3 bucket is created for them. You determine which contacts are recorded by specifying it in the flows. This allows for more detailed control over which contacts are recorded.

Note the following behavior for call recordings:

- The call recording feature has options for choosing whether to record the customer and system audio during IVR interactions or any combination of customer, agent, or both during agent interactions.
- There are a total of two possible recordings per contact: one for automated interactions (that is, IVR) and one for agent interactions. Enabling or disabling recording for automated interactions takes effect immediately. Conversely, modifying recording for agent interactions only takes effect after the agent joins the call.
- Agent audio is NOT transmitted to Connect Customer when the agent is not on a call. On November 9, 2023, Connect Customer deployed an optimization to improve agent productivity that pre-configures the microphone media stream of the agent's browser before the contact arrives. This reduces setup time for both incoming and outgoing calls. As a result, the microphone icon in the agent's browser appears to be on, even when the agent is not on a call.
- When a customer is on hold during agent interaction, the agent is still recorded.
- The transfer conversation between agents is recorded.
- When a call is transferred during a flow or IVR interaction (for example, by using the Transfer to phone number block) the recording continues to capture what the customer says and hears even after they are tranferred to an external voice system.
- Any transfers to external numbers during the agent interaction are not recorded after the agent leaves the call.
- If a participant mutes their own microphone, for example, to consult with a someone sitting next to them, their side-bar conversation is not recorded.

Screen recording only records the agent's screen if the contact is enabled for screen recording. Screen recording begins when the agent accepts a contact and ends with the agent completes the after contact work. Screen recording supports the voice, chat, and task channels.

> **Important**
>
> During a video call or screen sharing session, agents are able to see the customer's video or screen share even when the customer is on hold. It is the customer's responsibility to handle PII accordingly. If you want to change this behavior, you can build a custom CCP and communication widget. For more information, see Integrate in-app, web, video calling, and screen sharing natively into your application.

You can limit access to the call and screen recordings based on user permissions. Recordings can be searched and played back within the Connect Customer admin website.

Call recording and screen recording storage

Call and screen recordings are stored in two phases:

- Recordings intermediately held within Connect Customer during and after the contact, but before delivery.
- Recordings delivered to your Amazon S3 bucket.

The recordings that are stored in your Amazon S3 bucket are secured using a KMS key that was configured when your instance was created.

At all times, you maintain full control over the security of call recordings delivered to your Amazon S3 bucket.

Access to call recordings and screen recordings

You can search for and listen to call recordings or view screen recordings in Connect Customer. To determine which users can do this, assign them the appropriate permissions in their security profile. If AWS CloudTrail is enabled, access to specific recordings by Connect Customer users is captured in CloudTrail.

The capabilities of Amazon S3, AWS KMS, and IAM put you in full control of who has access to call recording data.

Contact metadata

Connect Customer stores metadata related to contacts that flow through the system and allows authorized users to access this information. With the Contact Search feature, you can search and view contact data, such as origination phone numbers or other attributes set by the flow, that are associated with a contact for diagnostics or reporting purposes.

Contact data classified as PII that is stored by Connect Customer is encrypted at rest using a key that is time-limited and specific to the Connect Customer instance. Specifically, the customer origination phone number is cryptographically hashed with a key that is specific to the instance to allow for use in contact search. For contact search, the encryption key is not time-sensitive.

The following data stored by Connect Customer is treated as sensitive:

- Origination phone number
- Outbound phone number
- External numbers dialed by agents for transfers
- External numbers transferred to by a flow
- Contact name
- Contact description
- All contact attributes
- All contact references

Conversational analytics real-time processing

Content processed by conversational analytics in real-time is encrypted at rest and in transit. Data is encrypted with keys owned by conversational analytics.

Conversational analytics persists data (transcript, category names) on the Connect Customer side for a short period of time. This is to make sure that the API serves data continuously, for up to 24h after contact terminates.

Voiceprints and Voice ID audio recordings

When you enable Connect Customer Voice ID, it computes voiceprints out of your customer's speech for authenticating them in future, and stores the data. Similarly, when you enable fraud detection, it stores the voiceprint for each fraudster registered in Voice ID.

While enrolling a customer into Voice ID for authentication and fraud detection, you must specify a `CustomerSpeakerId` for them. Since Voice ID stores biometric information for each speaker, we strongly recommend that you use an identifier that does not contain PII in the `CustomerSpeakerId` field.

Speaker and Fraudster Audio

When you enable Connect Customer Voice ID, it stores a compacted version of the audio (called utterances) that it aggregated while enrolling a speaker or registering a fraudster. This audio is used in the future whenever the voiceprints for the speakers and fraudsters need to be regenerated. The data is retained until the speaker/fraudster is deleted. The original audio used for enrollment or evaluation is deleted after a 24 hour retention period.

The data is retained until the speaker/fraudster is deleted or opted out.

Outbound campaigns

For outbound campaigns, Amazon Pinpoint passes customer phone numbers and relevant attributes to Connect Customer. On Connect Customer, these are always encrypted at rest using either a customer managed key or an AWS owned key. The outbound campaigns data is segregated by the Connect Customer instance ID and are encrypted by instance specific keys.

Task templates

Any processing of task template resources in Connect Customer is encrypted at rest and in transit. Data is encrypted with an AWS KMS key.

Forecasts, Capacity Plans, and Schedules

When forecasts, capacity plans, and schedules are generated, they are always encrypted at rest and in transit. Data is encrypted with an AWS KMS key.

Encryption at rest in Connect Customer

Contact data classified as PII, or data that represents customer content being stored by Connect Customer, is encrypted at rest (that is, before it is put, stored, or saved to a disk) using AWS KMS encryption keys owned by AWS. For information about AWS KMS keys, see What is AWS Key Management Service? in the *AWS Key Management Service Developer Guide*. Contact data in non-temporary storage is encrypted such that data encryption keys generated from the KMS keys are not shared across Amazon Connect instances.

Amazon S3 server-side encryption is used to encrypt conversation recordings (voice and chat). Call recordings, screen recordings, and transcripts are stored in two phases:

- Recordings intermediately held within Connect Customer during and after the contact, but before delivery.
- Recordings delivered to your Amazon S3 bucket.

The recordings and chat transcripts that are stored in your Amazon S3 bucket are secured using a KMS key that was configured when your instance was created.

For more information about key management in Connect Customer, see Key management in Connect Customer.

Topics

- Agentic CX designer encryption at rest
- Amazon AppIntegrations data encryption at rest
- Connect Customer Cases encryption at rest
- Connect Customer Customer Profiles encryption at rest
- Connect Customer agent assist encryption at rest
- Connect Customer Voice ID encryption at rest
- Outbound campaigns encryption at rest
- Forecasts, capacity plans, and schedules

Agentic CX designer encryption at rest

When you create applications, conversation flows, and other resources in Agentic CX designer, all data are encrypted at rest using AWS owned key encryption keys stored in AWS Key Management Service.

Amazon AppIntegrations data encryption at rest

When you create a DataIntegration encrypted with a customer managed key, Amazon AppIntegrations creates a grant on your behalf by sending a `CreateGrant` request to AWS KMS. Grants in AWS KMS are used to give Amazon AppIntegrations access to a KMS key in your account.

You can revoke access to the grant, or remove the access that Amazon AppIntegrations has to the customer managed key at any time. If you do, Amazon AppIntegrations can not access any of the

data encrypted by the customer managed key, which affects operations that are dependent on that data.

External application data that Amazon AppIntegrations processes is encrypted at rest in an S3 bucket using the customer managed key that you provided during configuration. Integration configuration data is encrypted at rest using a key that is time-limited and specific to the user account.

Amazon AppIntegrations requires the grant to use the customer managed key for the following internal operations:

- Send `GenerateDataKeyRequest` to AWS KMS to generate data keys encrypted by your customer managed key.
- Send `Decrypt` requests to AWS KMS to decrypt encrypted data keys so that they can be used to encrypt your data.

Connect Customer Cases encryption at rest

All customer provided data in case fields, case comments, descriptions of the fields and templates stored by Connect Customer Cases is encrypted at rest using encryption keys stored in AWS Key Management Service (AWS KMS).

Connect Customer Cases service owns, manages, monitors, and rotates the encryption keys (that is, AWS owned keys) to meet the high security standards. Payload of the case event streams is temporarily (typically for a few seconds) stored in Amazon EventBridge before it is made available through the default-bus in customers account. EventBridge also encrypts the entire payload at rest using AWS owned keys.

Connect Customer Customer Profiles encryption at rest

All user data stored in Connect Customer Customer Profiles is encrypted at rest. Connect Customer Customer Profiles encryption at rest provides enhanced security by encrypting all your data at rest using encryption keys stored in AWS Key Management Service (AWS KMS). This functionality helps reduce the operational burden and complexity involved in protecting sensitive data. With encryption at rest, you can build security-sensitive applications that meet strict encryption compliance and regulatory requirements.

Organizational policies, industry or government regulations, and compliance requirements often require the use of encryption at rest to increase the data security of your applications. Customer

Profiles integrated with AWS KMS to enable its encryption at rest strategy. For more information, see AWS Key Management Service Concepts in the AWS Key Management Service Developer Guide.

When creating a new domain, you must provide a KMS key that the service will use to encrypt your data in transit and at rest. The customer managed key is created, owned, and managed by you. You have full control over the customer managed key (AWS KMS charges apply).

You can specify an encryption key when you create a new domain or profile object type or switch the encryption keys on an existing resources by using the AWS Command Line Interface (AWS CLI), or the Connect Customer Customer Profiles Encryption API. When you choose a customer managed key, Connect Customer Customer Profiles creates a grant to the customer managed key that grants it access to the customer managed key.

AWS KMS charges apply for a customer managed key. For more information about pricing, see AWS KMS pricing.

Connect Customer agent assist encryption at rest

All user data stored in Connect Customer agent assist is encrypted at rest using encryption keys stored in AWS Key Management Service. If you optionally provide a customer managed key, agent assist uses it to encrypt knowledge content stored at rest outside of agent assist search indices. agent assist uses dedicated search indices per customer and they are encrypted at rest by using AWS owned keys stored in AWS Key Management Service. Additionally, you can use CloudTrail to audit any data access using the agent assist APIs.

AWS KMS charges apply when using a key that you provide. For more information about pricing, see AWS KMS pricing.

Connect Customer Voice ID encryption at rest

Connect Customer Voice ID stores customer voiceprints which cannot be reverse-engineered to obtain the enrolled customer's speech or identify a customer. All user data stored in Connect Customer Voice ID is encrypted at rest. When creating a new Voice ID domain, you must provide a customer managed key that the service uses to encrypt your data at rest. The customer managed key is created, owned, and managed by you. You have full control over the key.

You can update the KMS key in the Voice ID domain by using the `update-domain` command in AWS Command Line Interface (AWS CLI), or the UpdateDomain Voice ID API.

When you change the KMS key, an asynchronous process will be triggered to re-encrypt the old data with the new KMS key. After this process completes, all of your domain's data will be

encrypted under the new KMS key, and you can safely retire the old key. For more information, see UpdateDomain.

Voice ID creates a grant to the customer managed key that grants it access to the key. For more information, see How Connect Customer Voice ID uses grants in AWS KMS.

Following is a list of data that is encrypted at rest using the customer managed key:

- **Voiceprints**: The voiceprints generated while enrolling the speakers and registering fraudsters into the system.
- **Speaker and fraudster audio**: The audio data used for enrolling the speakers and registering the fraudsters.
- **CustomerSpeakerId**: The customer-provided SpeakerId while enrolling the customer into Voice ID.
- **Customer-provided metadata**: These include free-form strings such as `Domain Description`, `Domain Name`, `Job Name`, and more.

AWS KMS charges apply for a customer managed key. For more information about pricing, see AWS KMS pricing.

How Connect Customer Voice ID uses grants in AWS KMS

Connect Customer Voice ID requires a grant to use your customer managed key. When you create a domain, Voice ID creates a grant on your behalf by sending a see CreateGrant request to AWS KMS. The grant is required to use your customer managed key for the following internal operations:

- Send DescribeKey requests to AWS KMS to verify that the symmetric customer managed key ID provided is valid.
- Send GenerateDataKey requests to KMS key to create data keys with which to encrypt objects.
- Send Decrypt requests to AWS KMS to decrypt the encrypted data keys so that they can be used to encrypt your data.
- Send ReEncrypt requests to AWS KMS when the key is updated to re-encrypt a limited set of data using the new key.
- Store files in S3 using the AWS KMS key to encrypt the data.

You can revoke access to the grant, or remove the service's access to the customer managed key at any time. If you do, Voice ID won't be able to access any of the data encrypted by the

customer managed key, which affects all the operations that are dependent on that data, leading to `AccessDeniedException` errors and failures in the asynchronous workflows.

Customer managed key policy for Voice ID

Key policies control access to your customer managed key. Every customer managed key must have exactly one key policy, which contains statements that determine who can use the key and how they can use it. When you create your customer managed key, you can specify a key policy. For more information, see Managing access to KMS keys in the *AWS Key Management Service Developer Guide*.

Following is an example key policy which gives a user the permissions they need to call all Voice ID APIs using the customer managed key:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Allow key access to Amazon Connect VoiceID.",
            "Effect": "Allow",
            "Principal": {
                "AWS": "your_user_or_role_ARN"
            },
            "Action": [
                "kms:CreateGrant",
                "kms:Decrypt",
                "kms:DescribeKey"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "kms:ViaService": [
                        "voiceid.us-east-1.amazonaws.com"
                    ]
                }
            }
        }
    ]
}
```

For information about specifying permissions in a policy, see Specifying KMS keys in IAM policy statements in the AWS Key Management Service Developer Guide.

For information about troubleshooting key access, see Troubleshooting key access in the AWS Key Management Service Developer Guide.

Voice ID encryption context

An encryption context is an optional set of key-value pairs that contain additional contextual information about the data. AWS KMS uses the encryption context as additional authenticated data to support authenticated encryption.

When you include an encryption context in a request to encrypt data, AWS KMS binds the encryption context to the encrypted data. To decrypt data, you include the same encryption context in the request.

Voice ID uses the same encryption context in all AWS KMS cryptographic operations, where the key is `aws:voiceid:domain:arn` and the value is the resource Amazon Resource Name (ARN) Amazon Resource Name (ARN).

```
"encryptionContext": {
   "aws:voiceid:domain:arn": "arn:aws:voiceid:us-west-2:111122223333:domain/
sampleDomainId"
}
```

You can also use the encryption context in audit records and logs to identify how the customer managed key is being used. The encryption context also appears in logs generated by CloudTrail or Amazon CloudWatch Logs.

Using encryption context to control access to your customer managed key

You can use the encryption context in key policies and IAM policies as conditions to control access to your symmetric customer managed key. You can also use encryption context constraints in a grant.

Connect Customer Voice ID uses an encryption context constraint in grants to control access to the customer managed key in your account or Region. The grant constraint requires that the operations that the grant allows use the specified encryption context.

The following are example key policy statements to grant access to a customer managed key for a specific encryption context. The condition in this policy statement requires that the grants have an encryption context constraint that specifies the encryption context.

```
{
    "Sid": "Enable DescribeKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/ExampleReadOnlyRole"
     },
     "Action": "kms:DescribeKey",
     "Resource": "*"
},
{
     "Sid": "Enable CreateGrant",
     "Effect": "Allow",
     "Principal": {
         "AWS": "arn:aws:iam::111122223333:role/ExampleReadOnlyRole"
     },
     "Action": "kms:CreateGrant",
     "Resource": "*",
     "Condition": {
         "StringEquals": {
             "kms:EncryptionContext:"aws:voiceid:domain:arn": "arn:aws:voiceid:us-
west-2:111122223333:domain/sampleDomainId""
          }
     }
}
```

Monitoring your encryption keys for Voice ID

When you use an AWS KMS customer managed key with Voice ID, you can use AWS CloudTrail or Amazon CloudWatch Logs to track requests that Voice ID sends to AWS KMS.

The following examples is a sample AWS CloudTrail event for `CreateGrant` operation called by Voice ID to access data encrypted by your customer managed key:

CreateGrant

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
```

```
        "principalId": "AROA5STZEFPSZEOW7NP3X:SampleUser1",
        "arn": "arn:aws:sts::111122223333:assumed-role/SampleRole/SampleUser",
        "accountId": "111122223333",
        "accessKeyId": "AAAAAAA1111111EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AROA5STZEFPSZEOW7NP3X",
                "arn": "arn:aws:iam::111122223333:role/SampleRole",
                "accountId": "111122223333",
                "userName": "SampleUser"
            },
            "webIdFederationData": {},
            "attributes": {

```

Outbound campaigns encryption at rest

Outbound campaigns stores customer phone numbers and relevant attributes. This information is always encrypted at rest, using either a customer managed key or an AWS owned key. The data is separated by the Connect Customer instance ID and is encrypted by instance specific keys.

You can provide your own customer managed key when onboarding to Outbound campaigns.

The service uses your customer-managed key to encrypt sensitive data at rest. This key is created, owned, and fully managed by you, giving you complete control over its usage and security.

If you do not provide your own customer managed key, then Outbound campaigns encrypts sensitive data at rest using an AWS owned key specific to your Connect Customer instance. You can't view, manage, use, or audit AWS owned keys. However, you don't have to take any action or change any programs to protect the keys that encrypt your data. For more information, see AWS owned keys in the *AWS Key Management Service Developer Guide*.

AWS KMS charges apply for a customer managed key. For more information about pricing, see AWS KMS pricing.

How outbound campaigns uses grants in AWS KMS

Outbound campaigns requires a grant to use your customer managed key. When you onboard to outbound campaigns using the AWS console or the `StartInstanceOnboardingJob` API, Outbound campaigns creates a grant on your behalf by sending a `CreateGrant` request to AWS KMS. Grants in AWS KMS are used to give the Connect Customer Outbound campaigns service-linked role access to a KMS key in your account.

Outbound campaigns requires the grant to use the customer managed key for the following internal operations:

- Send DescribeKey requests to AWS KMS to verify that the symmetric customer managed key ID provided is valid.
- Send a `GenerateDataKeyWithoutPlainText` request to AWS KMS to generate data keys encrypted by your customer managed key.
- Send `Decrypt` requests to AWS KMS to decrypt encrypted data keys so that they can be used to encrypt your data.

You can revoke access to the grant, or remove the access that outbound campaigns has to the customer managed key at any time. If you do, outbound campaigns can not access any of the data encrypted by the customer managed key, which affects operations that are dependent on that data.

Customer managed key policy for outbound campaigns

Key policies control access to your customer managed key. Every customer managed key must have exactly one key policy, which contains statements that determine who can use the key and how they can use it. When you create your customer managed key, you can specify a key policy. For more information, see Managing access to KMS keys in the *AWS Key Management Service Developer Guide*.

Following is an example key policy which gives a user the permissions they need to call outbound campaigns StartInstanceOnboardingJob, PutDialRequestBatch and PutOutboundRequestBatch API using the customer managed key:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Sid": "Allow key access to Amazon Connect outbound campaigns.",
      "Effect": "Allow",
      "Principal": {
        "AWS": "your_user_or_role_ARN"
      },
      "Action": [
        "kms:Decrypt",
        "kms:CreateGrant"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "kms:ViaService": "connect-campaigns.us-east-1.amazonaws.com",
          "kms:EncryptionContext:aws:accountId": "111122223333",
          "kms:EncryptionContext:aws:connect:instanceId": "InstanceID"
        }
      }
    },
    {
      "Sid": "Allow direct access to key metadata to the account",
      "Effect": "Allow",
      "Principal": {
         "AWS": "arn:aws:iam::111122223333:root"
      },
      "Action": [
        "kms:Describe*"
      ],
      "Resource": "*"
    }
  ]
}
```

For information about specifying permissions in a policy, see Specifying KMS keys in IAM policy statements in the AWS Key Management Service Developer Guide.

For information about troubleshooting key access, see Troubleshooting key access in the AWS Key Management Service Developer Guide.

Outbound campaigns encryption context

An encryption context is an optional set of key-value pairs that contain additional contextual information about the data. AWS KMS uses the encryption context as additional authenticated data to support authenticated encryption.

When you include an encryption context in a request to encrypt data, AWS KMS binds the encryption context to the encrypted data. To decrypt data, you include the same encryption context in the request.

Outbound campaigns uses the same encryption context in all AWS KMS cryptographic operations, where the key are aws:accountId and aws:connect:instanceId and the value is the aws account id and Connect instance id.

```
"encryptionContext": {
   "aws:accountId": "111122223333",
   "aws:connect:instanceId": "sample instance id"
}
```

You can also use the encryption context in audit records and logs to identify how the customer managed key is being used. The encryption context also appears in logs generated by CloudTrail or Amazon CloudWatch Logs.

Using encryption context to control access to your customer managed key

You can use the encryption context in key policies and IAM policies as conditions to control access to your symmetric customer managed key. You can also use encryption context constraints in a grant.

Outbound campaigns uses an encryption context constraint in grants to control access to the customer managed key in your account or region. The grant constraint requires that the operations that the grant allows use the specified encryption context.

The following are example key policy statements to grant access to a customer managed key for a specific encryption context. The condition in this policy statement requires that the grants have an encryption context constraint that specifies the encryption context.

```
{
```

```
    "Sid": "Enable DescribeKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/ExampleReadOnlyRole"
     },
     "Action": "kms:DescribeKey",

          }
     }
}
```

Monitoring your encryption keys for Outbound campaigns

When you use an AWS KMS customer managed key with your outbound campaigns resources, you can use AWS CloudTrail or Amazon CloudWatch Logs to track requests that Amazon Location sends to AWS KMS.

The following examples are AWS CloudTrail events for CreateGrant, GenerateDataKeyWithoutPlainText, DescribeKey, and Decrypt to monitor KMS operations called by Amazon Location to access data encrypted by your customer managed key:

CreateGrant

```
{
  "eventVersion": "1.09",
  "userIdentity": {
    "type": "AssumedRole",
    "principalId": "AROAIGDTESTANDEXAMPLE:Sampleuser01",

```

Forecasts, capacity plans, and schedules

When you create forecasts, capacity plans, and schedules, all data are encrypted at rest using AWS owned key encryption keys stored in AWS Key Management Service.

Encryption in transit in Connect Customer

All data exchanged with Connect Customer is protected in transit between the user's web browser and Connect Customer using industry-standard TLS encryption. Which version of TLS?

External data is additionally encrypted while being processed by AWS KMS.

When Connect Customer integrates with AWS services, such as AWS Lambda, Amazon Kinesis, or Amazon Polly, data is always encrypted in transit using TLS.

When event data is forwarded from external applications to Connect Customer it is always encrypted in transit using TLS.

Key management in Connect Customer

You can specify AWS KMS keys, including bring your own keys (BYOK), to use for envelope encryption with Amazon S3 input/output buckets.

When you associate the AWS KMS key to the S3 storage location in Connect Customer, the API caller's permissions (or the console user's permissions) are used to create a grant on the key with the corresponding Connect Customer instance service role as the grantee principal. For the service linked role specific to that Connect Customer instance, the grant allows the role to use the key for encryption and decryption. For example:

- If you call the DisassociateInstanceStorageConfig API to dissociate the AWS KMS key from the S3 storage location in Connect Customer, the grant is removed from the key.
- If you call the AssociateInstanceStorageConfig API to associate the AWS KMS key to the S3 storage location in Connect Customer but you don't have the `kms:CreateGrant` permission, the association will fail.

Use the `list-grants` CLI command to list all grants for the specified customer managed key.

For information about AWS KMS keys see What is AWS Key Management Service? in the *AWS Key Management Service Developer Guide*.

agent assist

Connect Customer agent assist stores knowledge documents that are encrypted at rest in S3 using a BYOK or a service-owned key. The knowledge documents are encrypted at rest in

Amazon OpenSearch Service using a service-owned key. agent assist stores agent queries and call transcripts using a BYOK or a service-owned key.

The knowledge documents used by Connect Customer agent assist are encrypted by an AWS KMS key.

Amazon AppIntegrations

Amazon AppIntegrations doesn't support BYOK for encryption of configuration data. When syncing external application data, periodically you are required to BYOK. Amazon AppIntegrations requires a grant to use your customer managed key. When you create a data integration, Amazon AppIntegrations sends a `CreateGrant` request to AWS KMS on your behalf. You can revoke access to the grant, or remove the service's access to the customer managed key at any time. If you do, Amazon AppIntegrations won't be able to access any of the data encrypted by the customer managed key, which affects Connect Customer services that are dependent on that data.

Customer Profiles

For Customer Profiles, you can specify AWS KMS keys to use for encrypting your data. If you don't specify a customer managed key, Connect Customer Customer Profiles provides encryption by default for your data at rest using an AWS-owned encryption key.

Before you turn on Data Store for a new or existing domain, you must configure an AWS KMS key.

You can also define individual KMS keys for your Object Types. When encrypting customer data, we use the Object Type KMS key if present. Otherwise, we use the domain's KMS key.

After you enable Data Vault, you can't update KMS keys for your domain or Object Types. While you can create new Object Types with new keys, you can't modify existing key settings.

Voice ID

For using Connect Customer Voice ID, it is mandatory to provide a customer managed key KMS key (BYOK) while creating a Connect Customer Voice ID domain, which is used to encrypt all the customer data at rest.

Outbound campaigns

Outbound campaigns encrypts all sensitive data using an AWS owned key or a customer managed key. As the customer managed key is created, owned, and managed by the you, you have full control over the customer managed key (AWS KMS charges apply).

Amazon Connect Customer and interface VPC endpoints (AWS PrivateLink)

You can establish a private connection between your VPC and a subset of endpoints in Connect Customer by creating an interface VPC endpoint. Following are the supported endpoints:

- Amazon AppIntegrations
- Customer Profiles
- Outbound campaigns
- Voice ID
- agent assist
- Connect Customer Service

Interface endpoints are powered by AWS PrivateLink, a technology that you can use to privately access Connect Customer APIs without an internet gateway, NAT device, VPN connection, or Direct Connect connection. Instances in your VPC don't need public IP addresses to communicate with the Connect Customer APIs that integrate with AWS PrivateLink.

For more information, see the AWS PrivateLink Guide.

Creating an interface VPC endpoint for Connect Customer

You can create an interface endpoint using either the Amazon VPC console or the AWS Command Line Interface (AWS CLI). For more information, see Create an interface endpoint in the *AWS PrivateLink Guide*.

Connect Customer supports the following service names:

- com.amazonaws.*region*.app-integrations
- com.amazonaws.*region*.cases
- com.amazonaws.*region*.profile
- com.amazonaws.*region*.connect-campaigns
- com.amazonaws.*region*.voiceid
- com.amazonaws.*region*.wisdom (This is for agent assist.)
- com.amazonaws.*region*.connect

- com.amazonaws.*region*.connect-fips (This is for creating an endpoint for Connect Customer Service that complies with the Federal Information Processing Standard (FIPS).)

If you enable private DNS for an interface endpoint, you can make API requests to Connect Customer using the default DNS name for the Region. For example, voiceid.us-east-1.amazonaws.com. For more information, see DNS hostnames in the *AWS PrivateLink Guide*.

Creating a VPC endpoint policy

You can attach an endpoint policy to your VPC endpoint that controls access. The policy specifies the following information:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Control access to services using endpoint policies in the *AWS PrivateLink Guide*.

Example: VPC endpoint policy

The following VPC endpoint policy grants access to the listed Connect Customer Voice ID actions for all principals on all resources.

```
{
    "Statement":[
        {
            "Effect":"Allow",
            "Action":[
                "voiceid:CreateDomain",
                "voiceid:EvaluateSession",
                "voiceid:ListSpeakers"
            ],
            "Resource":"*",
            "Principal":"*"
        }
    ]
}
```

Following is another example. In this one, the VPC endpoint policy grants access to the listed outbound campaigns actions for all principals on all resources.

```
{
    "Statement":[
        {
            "Effect":"Allow",
            "Action":[
                 "connect-campaigns:CreateCampaign",
                "connect-campaigns:DeleteCampaign",
                "connect-campaigns:ListCampaigns"
            ],
            "Resource":"*",
            "Principal":"*"
        }
    ]
}
```

Amazon Connect Customer service improvement and how to opt out of using your data

When you enable Amazon Connect Customer, we might use Your Content processed by Amazon Connect Customer to develop and improve your experience.

By making Your Content available to improve Amazon Connect Customer, you help us innovate faster and customize features to meet your needs. This also helps us enhance the service in the following ways:

- Deliver smarter capabilities faster. We improve Amazon Connect Customer based on how you use it and what you need.
- Prevent problems proactively. We identify and address issues before they affect you.
- Resolve issues faster. We diagnose and fix problems more quickly.

All this helps Amazon Connect Customer partner with you to continuously improve your business performance.

Only Amazon employees have access to the data. Your trust, privacy, and the security of Your Content are our highest priority, and we make sure that our use complies with our commitments to you. For more information, see Data Privacy FAQ.

You can always choose to opt out of having your data used to develop and improve AI features of Amazon Connect Customer by using an AWS Organizations opt-out policy. For information about how to opt out, see AI services opt-out policies in the *AWS Organizations User Guide*.

To check your opt-out status, review the opt-out policy configured by your organization. For more information, see AI services opt-out policy syntax and examples.

> **Note**
>
> To use the opt-out policy, your AWS accounts must be centrally managed by AWS Organizations. If you haven't already created an organization for your AWS accounts, see Creating and managing an organization in the *AWS Organizations User Guide*.

Identity and access management for Connect Customer

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Connect Customer resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- Required permissions for using custom IAM policies to manage access to the Connect Customer console
- Restrict AWS resources that can be associated with Connect Customer
- How Connect Customer works with IAM
- Connect Customer identity-based policy examples
- Connect Customer resource-level policy examples
- AWS managed policies for Connect Customer
- Troubleshooting Connect Customer identity and access
- Use service-linked roles and role permissions for Connect Customer
- Use service-linked roles for outbound campaigns in Connect Customer

- Using service-linked roles for Amazon AppIntegrations
- Using service-linked roles for Connect Customer Customer Profiles
- Using service-linked roles for Connect Customer Managed Synchronization

Audience

How you use AWS Identity and Access Management (IAM) differs based on your role:

- **Service user** - request permissions from your administrator if you cannot access features (see Troubleshooting Connect Customer identity and access)
- **Service administrator** - determine user access and submit permission requests (see How Connect Customer works with IAM)
- **IAM administrator** - write policies to manage access (see Connect Customer identity-based policy examples)

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated as the AWS account root user, an IAM user, or by assuming an IAM role.

You can sign in as a federated identity using credentials from an identity source like AWS IAM Identity Center (IAM Identity Center), single sign-on authentication, or Google/Facebook credentials. For more information about signing in, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

For programmatic access, AWS provides an SDK and CLI to cryptographically sign requests. For more information, see AWS Signature Version 4 for API requests in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity called the AWS account *root user* that has complete access to all AWS services and resources. We strongly recommend that you don't use the root user for everyday tasks. For tasks that require root user credentials, see Tasks that require root user credentials in the *IAM User Guide*.

Users and groups

An *IAM user* is an identity with specific permissions for a single person or application. We recommend using temporary credentials instead of IAM users with long-term credentials. For more information, see Require human users to use federation with an identity provider to access AWS using temporary credentials in the *IAM User Guide*.

An *IAM group* specifies a collection of IAM users and makes permissions easier to manage for large sets of users. For more information, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity with specific permissions that provides temporary credentials. You can assume a role by switching from a user to an IAM role (console) or by calling an AWS CLI or AWS API operation. For more information, see Methods to assume a role in the *IAM User Guide*.

IAM roles are useful for federated user access, temporary IAM user permissions, cross-account access, cross-service access, and applications running on Amazon EC2. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy defines permissions when associated with an identity or resource. AWS evaluates these policies when a principal makes a request. Most policies are stored in AWS as JSON documents. For more information about JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Using policies, administrators specify who has access to what by defining which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. An IAM administrator creates IAM policies and adds them to roles, which users can then assume. IAM policies define permissions regardless of the method used to perform the operation.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you attach to an identity (user, group, or role). These policies control what actions identities can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be *inline policies* (embedded directly into a single identity) or *managed policies* (standalone policies attached to multiple identities). To learn how to choose between managed and inline policies, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples include IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. You must specify a principal in a resource-based policy.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Other policy types

AWS supports additional policy types that can set the maximum permissions granted by more common policy types:

- **Permissions boundaries** – Set the maximum permissions that an identity-based policy can grant to an IAM entity. For more information, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – Specify the maximum permissions for an organization or organizational unit in AWS Organizations. For more information, see Service control policies in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – Set the maximum available permissions for resources in your accounts. For more information, see Resource control policies (RCPs) in the *AWS Organizations User Guide*.
- **Session policies** – Advanced policies passed as a parameter when creating a temporary session for a role or federated user. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

Required permissions for using custom IAM policies to manage access to the Connect Customer console

If you're using custom IAM policies to manage access to the Connect Customer console, your users need some or all of the permissions listed in this article, depending on the tasks they need to do.

> **Note**
>
> Using `connect:*` in a custom IAM policy grants your users all of the Connect Customer permissions listed in this article.

> **Note**
>
> Certain pages on the Connect Customer console, such as Tasks and Customer Profiles, require that you add permissions to your inline policies.

AWS managed policy: AmazonConnect_FullAccess policy

To allow full read/write access to Connect Customer, you must attach two policies to your users, groups, or roles. Attach the `AmazonConnect_FullAccess` policy and a custom policy with the following contents:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AttachAnyPolicyToAmazonConnectRole",
            "Effect": "Allow",
            "Action": "iam:PutRolePolicy",
            "Resource": "arn:aws:iam::*:role/aws-service-role/
connect.amazonaws.com/AWSServiceRoleForAmazonConnect*"
        }
    ]
}
```

To allow a user to create an instance, make sure that they have the permissions granted by the `AmazonConnect_FullAccess` policy.

When you use `AmazonConnect_FullAccess` policy, note the following:

- Additional privileges are required to create an Amazon S3 bucket with a name of your choosing, or to use an existing bucket while creating or updating an instance from the Connect Customer admin website. If you choose default storage locations for your call recordings, chat transcripts,

email messages, attachments, call transcripts, and other data, the system prepends "amazon-connect-" to those objects.

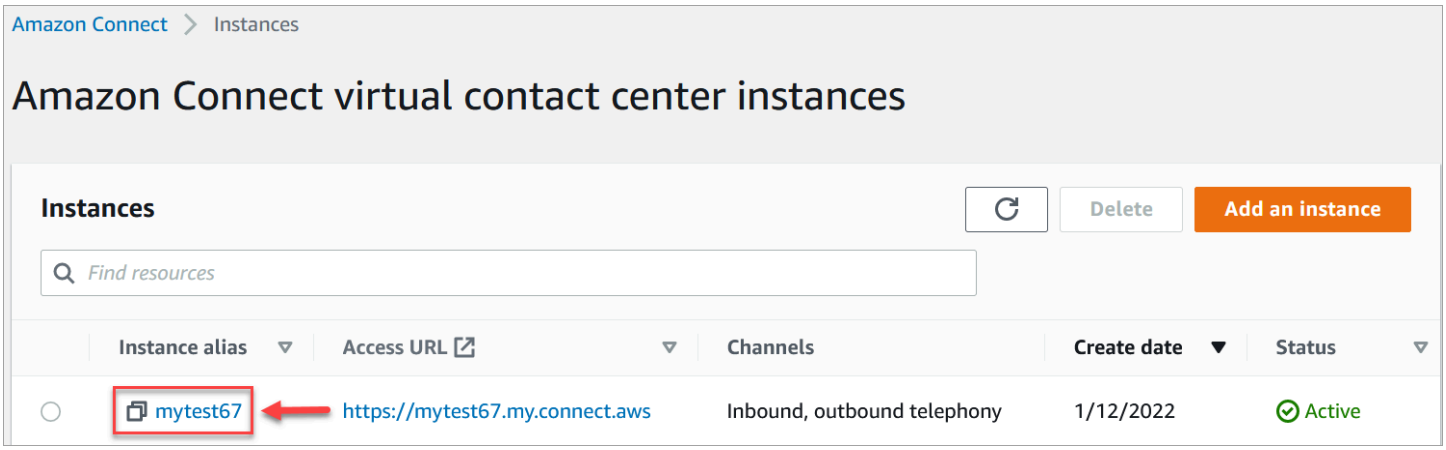
- The aws/connect KMS key is available to use as a default encryption option. To use a custom encryption key, assign users additional KMS privileges.
- Assign users additional privileges to attach other AWS resources like Amazon Polly, Live Media Streaming, Data Streaming, and Lex bots to their Connect Customer instances.

AWS managed policy: AmazonConnectReadOnlyAccess policy

To allow read-only access, you need to attach only the AmazonConnectReadOnlyAccess policy.

Connect Customer console home page

The following image shows a sample Connect Customer console home page, with an arrow pointing to the instance alias. Choose the instance alias to navigate to the detailed instance pages.



Use the permissions listed in the following table to manage access to this page.

Action/Use case	Permissions needed
List instance	connect:ListInstances ds:DescribeDirectories
Describe instance: View the details of the instance/ current settings	connect:DescribeInstance connect:ListLambdaFunctions connect:ListLexBots

Action/Use case	Permissions needed
	connect:ListInstanceStorageConfigs connect:ListApprovedOrigins connect:ListSecurityKeys connect:DescribeInstanceAttributes connect:DescribeInstanceStorageConfig ds:DescribeDirectories

Action/Use case	Permissions needed
Create instance	connect:AssociateCustomerProfilesDomain connect:CreateInstance connect:DescribeInstance connect:ListInstances connect:AssociateInstanceStorageConfig connect:UpdateInstanceAttribute ds:CheckAlias ds:CreateAlias ds:AuthorizeApplication ds:UnauthorizeApplication ds:CreateIdentityPoolDirectory ds:DescribeDirectories iam:CreateServiceLinkedRole iam:PutRolePolicy kms:CreateGrant kms:DescribeKey kms:ListAliases kms:RetireGrant logs:CreateLogGroup

Action/Use case	Permissions needed

	`s3:CreateBucket`
	
	`s3:GetBucketLocation`
	
	`s3:ListAllMyBuckets`
	
	`servicequotas:GetServiceQuota`
	
	`profile:CreateDomain`
	
	`profile:GetDomain`
	
	`profile:GetProfileObjectType`
	
	`profile:ListAccountIntegrations`
	
	`profile:ListDomains`
	
	`profile:ListProfileObjectTypeTemplates`
	
	`profile:PutIntegration`

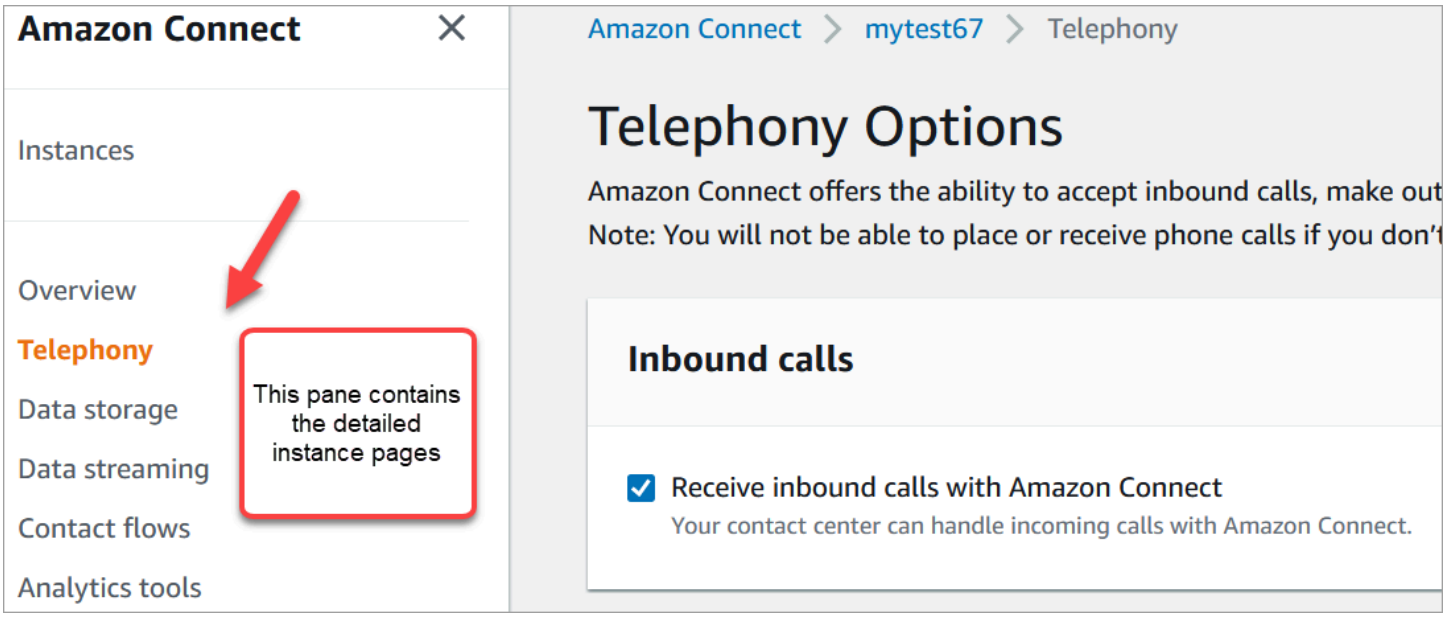
Create a replica instance (Connect Customer Global Resiliency): Replicate an instance in another AWS Region with the Replicate Instance API	`connect:ReplicateInstance` Because this action creates a new instance in the replica AWS Region, you also need the permissions listed for **Create instance** in the preceding rows.

Action/Use case	Permissions needed

Delete instance	`connect:DescribeInstance`
	`connect:DeleteInstance`
	`connect:ListInstances`
	`ds:DescribeDirectories`
	`ds:DeleteDirectory`
	`ds:UnauthorizeApplication`

Detailed instance pages

The following image shows the navigation menu you use to access each of the detailed instance pages.



To access the detailed instance pages, you need permissions to the Connect Customer console home page (describe/list). Or, use the `AmazonConnectReadOnlyAccess` policy.

The following tables list the granular permissions for each detailed instance page.

Note

To perform `Edit` actions, users also need `List` and `Describe` permissions.

Overview page

Action/Use case	Permissions needed

Create service-linked role	`connect:DescribeInstance`
	`connect:ListInstances`
	`connect:DescribeInstanceAttribute`
	`connect:UpdateInstanceAttribute`
	`connect:ListIntegrationAssociations`
	`profile:ListAccountIntegrations`

Restrict AWS resources that can be associated with Connect Customer

Each Connect Customer instance is associated with an IAM service-linked role when the instance is created. Connect Customer can integrate with other AWS services for use cases such as call recording storage (Amazon S3 bucket), natural language bots (Amazon Lex bots), and data streaming (Amazon Kinesis Data Streams). Connect Customer assumes the service-linked role to interact with these other services. The policy is first added to the service-linked role as part of corresponding APIs on the Connect Customer service (that are in turn called by the AWS admin console). For example, if you want to use a certain Amazon S3 bucket with your Connect Customer instance, the bucket must be passed to the AssociateInstanceStorageConfig API.

For the set of IAM actions defined by Connect Customer, see Actions defined by Connect Customer.

Following are some examples of how to restrict access to other resources that might be associated with a Connect Customer instance. They should be applied to the User or Role that is interacting with Connect Customer APIs or the Connect Customer console.

> **Note**
>
> A policy with an explicit `Deny` would override the `Allow` policy in these examples.

For more information about what resources, condition keys, and dependent APIs you can use to restrict access, see Actions, resources, and condition keys for Connect Customer.

Example 1: Restrict which Amazon S3 buckets can be associated with a Connect Customer instance

This example allows an IAM principal to associate an Amazon S3 bucket for call recordings for the given Connect Customer instance ARN, and a specific Amazon S3 bucket named `my-connect-recording-bucket`. The `AttachRolePolicy` and `PutRolePolicy` actions are scoped to the Connect Customer service-linked role (a wildcard is used in this example, but you can provide the role ARN for the instance if needed).

> **Note**
>
> To use an AWS KMS key to encrypt recordings in this bucket, an additional policy is needed.

Example 2: Restrict which AWS Lambda functions can be associated with a Connect Customer instance

AWS Lambda functions are associated with a Connect Customer instance, but the Connect Customer service-linked role is not used to invoke them, and so is not modified. Instead, a policy is added to the function through the `lambda:AddPermission` API that allows the given Connect Customer instance to invoke the function.

To restrict which functions can be associated with a Connect Customer instance, you specify the Lambda function ARN that a user can use to invoke `lambda:AddPermission`:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "connect:AssociateLambdaFunction",
                "lambda:AddPermission"
            ],
            "Resource": [
                "arn:aws:connect:us-east-1:111122223333:instance/instance-id",
                "arn:aws:lambda:*:*:function:my-function"
            ]
        }
    ]
}
```

Example 3: Restrict which Amazon Kinesis Data Streams can be associated with a Connect Customer instance

This example follows a similar model to the Amazon S3 example. It restricts which specific Kinesis Data Streams might be associated with a given Connect Customer instance for delivering contact records.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {

                "arn:aws:kinesis:*:111122223333:stream/stream-name"
            ]
        },
        {
            "Sid": "VisualEditor2",
            "Effect": "Allow",
            "Action": "kinesis:ListStreams",
            "Resource": "*"
        }
    ]
}
```

How Connect Customer works with IAM

Before you use IAM to manage access to Connect Customer, you should understand what IAM features are available to use with Connect Customer. To get a high-level view of how Connect Customer and other AWS services work with IAM, see AWS Services That Work with IAM in the *IAM User Guide*.

Topics

- Connect Customer identity-based policies
- Authorization based on Connect Customer tags
- Connect Customer IAM roles

Connect Customer identity-based policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. Connect Customer supports specific

actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see IAM JSON Policy Elements Reference in the *IAM User Guide*.

Actions

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Action` element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in Connect Customer use the following prefix before the action: `connect:`. Policy statements must include either an `Action` or `NotAction` element. Connect Customer defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [
      "connect:action1",
      "connect:action2"
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word `Describe`, include the following action:

```
"Action": "connect:Describe*"
```

To see a list of Connect Customer actions, Actions, Resources, and Condition Keys for Connect Customer.

Resources

Connect Customer supports resource-level permissions (specifying a resource ARN in an IAM policy). Following is a list of Connect Customer resources:

- Instance
- Contact
- User
- Routing profile

- Security profile
- Hierarchy group
- Queue
- File
- Flow
- Hours of operation
- Phone number
- Task templates
- Customer profile domain
- Customer profile object type
- Outbound campaigns

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Resource` JSON policy element specifies the object or objects to which the action applies. As a best practice, specify a resource using its Amazon Resource Name (ARN). For actions that don't support resource-level permissions, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

The Connect Customer instance resource has the following ARN:

```
arn:${Partition}:connect:${Region}:${Account}:instance/${InstanceId}
```

For more information about the format of ARNs, see Amazon Resource Names (ARNs) and AWS Service Namespaces.

For example, to specify the `i-1234567890abcdef0` instance in your statement, use the following ARN:

```
"Resource": "arn:aws:connect:us-east-1:123456789012:instance/i-1234567890abcdef0"
```

To specify all instances that belong to a specific account, use the wildcard (*):

```
"Resource": "arn:aws:connect:us-east-1:123456789012:instance/*"
```

Some Connect Customer actions, such as those for creating resources, cannot be performed on a specific resource. In those cases, you must use the wildcard (*).

```
"Resource": "*"
```

Many Connect Customer; API actions involve multiple resources. For example,

To specify multiple resources in a single statement, separate the ARNs with commas.

```
"Resource": [
      "resource1",
      "resource2"
```

To see a list of Connect Customer resource types and their ARNs, see Actions, Resources, and Condition Keys for Connect Customer. The same article explains with which actions you can specify the ARN of each resource.

Condition keys

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Condition` element specifies when statements execute based on defined criteria. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request. To see all AWS global condition keys, see AWS global condition context keys in the *IAM User Guide*.

Connect Customer defines its own set of condition keys and also supports using some global condition keys. To see all AWS global condition keys, see AWS Global Condition Context Keys in the *IAM User Guide*.

All Amazon EC2 actions support the `aws:RequestedRegion` and `ec2:Region` condition keys. For more information, see Example: Restricting Access to a Specific Region.

To see a list of Connect Customer condition keys, see Actions, Resources, and Condition Keys for Connect Customer.

Examples

To view examples of Connect Customer identity-based policies, see Connect Customer identity-based policy examples.

Authorization based on Connect Customer tags

You can attach tags to Connect Customer resources or pass tags in a request to Connect Customer. To control access based on tags, you provide tag information in the condition element of a policy using the `connect:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys.

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see Describe and update Connect Customer users based on tags.

Connect Customer IAM roles

An IAM role is an entity within your AWS account that has specific permissions.

Using temporary credentials with Connect Customer

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as AssumeRole or GetFederationToken.

Connect Customer supports using temporary credentials.

Service-linked roles

Service-linked roles allow AWS services to access resources in other services to complete an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view but not edit the permissions for service-linked roles.

Connect Customer supports service-linked roles. For details about creating or managing Connect Customer service-linked roles, see Use service-linked roles and role permissions for Connect Customer.

Choosing an IAM role in Connect Customer

When you create a resource in Connect Customer, you must choose a role to allow Connect Customer to access Amazon EC2 on your behalf. If you have previously created a service role or service-linked role, then Connect Customer provides you with a list of roles to choose from. It's important to choose a role that allows access to start and stop Amazon EC2 instances.

Connect Customer identity-based policy examples

By default, IAM entities don't have permission to create or modify Connect Customer resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM administrator must create IAM policies that grant IAM entities permission to perform specific API operations on the specified resources they need. The IAM administrator must then attach those policies to the IAM entities that require those permissions.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating Policies on the JSON Tab in the *IAM User Guide*.

Topics

- Policy best practices
- Allow IAM users to view their own permissions
- Grant "View User" permissions
- Allow users to integrate with external applications
- Describe and update Connect Customer users based on tags
- Allow batch and single-case operations for cases
- Allow only batch operations for cases
- Allow only single-case operations for cases
- Create Connect Customer users based on tags
- Create and view Amazon AppIntegrations resources
- Create and view Connect Customer agent assist Assistants
- Manage outbound campaigns resources

Policy best practices

Identity-based policies determine whether someone can create, access, or delete Connect Customer resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the *AWS managed policies* that grant permissions for many common use cases. They are available in your AWS account. We

recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the *IAM User Guide*.

- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as *least-privilege permissions*. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the *IAM User Guide*.
- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as CloudFormation. For more information, see IAM JSON policy elements: Condition in the *IAM User Guide*.
- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see Validate policies with IAM Access Analyzer in the *IAM User Guide*.
- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or a root user in your AWS account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Secure API access with MFA in the *IAM User Guide*.

For more information about best practices in IAM, see Security best practices in IAM in the *IAM User Guide*.

Allow IAM users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

```
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",
            "Action": [
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:ListAttachedUserPolicies",
                "iam:ListUserPolicies",
                "iam:GetUser"
            ],
            "Resource": ["arn:aws:iam::*:user/${aws:username}"]
        },
        {
            "Sid": "NavigateInConsole",
            "Effect": "Allow",
            "Action": [
                "iam:GetGroupPolicy",
                "iam:GetPolicyVersion",
                "iam:GetPolicy",
                "iam:ListAttachedGroupPolicies",
                "iam:ListGroupPolicies",
                "iam:ListPolicyVersions",
                "iam:ListPolicies",
                "iam:ListUsers"
            ],
            "Resource": "*"
        }
    ]
}
```

Grant "View User" permissions

When you create a user or group in your AWS account, you can associate an IAM policy with that group or user, which specifies the permissions that you want to grant.

For example, imagine you have a group of entry-level developers. You can create an IAM group named `Junior application developers`, and include all entry-level developers. Then, associate a policy with that group that grants them permissions to view Connect Customer users. In this scenario, you might have a policy such as the following sample.

JSON

```
{
```

```
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "connect:DescribeUser",
                "connect:ListUsers"
            ],
            "Resource": "*"
        }
    ]
}
```

This sample policy grants permissions to API actions listed in the `Action` element.

> **Note**
>
> If you don't specify a user ARN or ID in your statement, you must also grant the permission to use all resources for the action using the * wildcard for the `Resource` element.

Allow users to integrate with external applications

This example shows how you might create a policy that allows users to interact with their external application integrations.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowAllAppIntegrationsActions",
            "Effect": "Allow",
            "Action": [
                "app-integrations:ListEventIntegrations",
                "app-integrations:CreateEventIntegration",
                "app-integrations:GetEventIntegration",
                "app-integrations:UpdateEventIntegration",
                "app-integrations:DeleteEventIntegration",
```

```
                "app-integrations:ListDataIntegrations",
                "app-integrations:CreateDataIntegration",
                "app-integrations:GetDataIntegration",
                "app-integrations:UpdateDataIntegration",
                "app-integrations:DeleteDataIntegration"
            ],
            "Resource": "*"
 }
 ]
}
```

Describe and update Connect Customer users based on tags

In an IAM policy, you can optionally specify conditions that control when a policy is in effect. For example, you can define a policy that allows users to update only an Connect Customer user who is working in the test environment.

You can define some conditions that are specific to Connect Customer, and define other conditions that apply to all of AWS. For more information and a list of AWS-wide conditions, see Condition in IAM JSON Policy Elements Reference in the *IAM User Guide*.

The following sample policy allows the "describe" and "update" actions for users with specific tags.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "connect:DescribeUser",
                "connect:UpdateUser*"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Department": "Test"
                }
            }
        }
```

```
    ]
}
```

This policy allows "describe user" and "update user" but only for those Connect Customer users tagged with tag "Department: Test" where "Department" is the tag key and "Test" is the tag value.

Allow batch and single-case operations for cases

The BatchUpdateCase and BatchCreateRelatedItem operations use the same IAM actions as their single-case counterparts, `cases:UpdateCase` and `cases:CreateRelatedItem`. A policy that doesn't include the `cases:IsBatchAction` condition key allows both batch and single-case operations by default. Set the key to `true` to allow only batch operations, or set it to `false` to deny batch operations. Use this key to control which type of operation a policy allows.

A policy that grants these actions without a `cases:IsBatchAction` condition allows both batch and single-case operations. With the following sample policy, you can update cases and create related items in both batch and single-case operations.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowBatchAndSingleCaseActions",
            "Effect": "Allow",
            "Action": [
                "cases:UpdateCase",
                "cases:CreateRelatedItem"
            ],
            "Resource": "arn:aws:cases:region:account-id:domain/domain-id/case/*"
        }
    ]
}
```

Allow only batch operations for cases

With the following sample policy, you can update cases and create related items in batch operations only.

```
{
    "Version": "2012-10-17",
```

```
    "Statement": [
        {
            "Sid": "AllowOnlyBatchCaseActions",
            "Effect": "Allow",
            "Action": [
                "cases:UpdateCase",
                "cases:CreateRelatedItem"
            ],
            "Resource": "arn:aws:cases:region:account-id:domain/domain-id/case/*",
            "Condition": {
                "BoolIfExists": {
                    "cases:IsBatchAction": "true"
                }
            }
        }
    ]
}
```

Allow only single-case operations for cases

An `Allow` statement without a `cases:IsBatchAction` condition permits both batch and single-case operations. To allow only single-case operations, add an explicit `Deny` statement for requests where `cases:IsBatchAction` is `true` or the condition key is missing. An explicit `Deny` overrides any `Allow`, so batch operations stay blocked even if another policy allows them. With the following sample policy, you can only update cases and create related items in single-case operations. The policy denies these actions for batch operations.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCaseActions",
            "Effect": "Allow",
            "Action": [
                "cases:UpdateCase",
                "cases:CreateRelatedItem"
            ],
            "Resource": "arn:aws:cases:region:account-id:domain/domain-id/case/*"
        },
        {
            "Sid": "DenyBatchCaseActions",
            "Effect": "Deny",
```

```
            "Action": [
                "cases:UpdateCase",
                "cases:CreateRelatedItem"
            ],
            "Resource": "arn:aws:cases:region:account-id:domain/domain-id/case/*",
            "Condition": {
                "BoolIfExists": {
                    "cases:IsBatchAction": "true"
                }
            }
        }
    ]
}
```

Create Connect Customer users based on tags

The following sample policy allows the create actions for users with specific request tags.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "connect:CreateUser",
                "connect:TagResource"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/Owner": "TeamA"
                }
            }
        }
    ]
}
```

This policy allows "create user" and "tag resource" but the tag "Owner: TeamA" must be present in the requests.

Create and view Amazon AppIntegrations resources

The following sample policy allows event integrations to be created, listed, and fetched.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "app-integrations:CreateEventIntegration",
                "app-integrations:GetEventIntegration",
                "app-integrations:ListEventIntegrations"
            ],
            "Resource": "*"
        }
    ]
}
```

Create and view Connect Customer agent assist Assistants

The following sample policy allows agent assist assistants to be created, listed, fetched, and deleted.

JSON

```
{
"Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
             "wisdom:CreateContent",
            "wisdom:DeleteContent",
            "wisdom:CreateKnowledgeBase",
            "wisdom:GetAssistant",
            "wisdom:GetKnowledgeBase",
            "wisdom:GetContent",
```

```
            "wisdom:GetRecommendations",
            "wisdom:GetSession",
            "wisdom:NotifyRecommendationsReceived",
            "wisdom:QueryAssistant",
            "wisdom:StartContentUpload",
            "wisdom:UpdateContent",
            "wisdom:UntagResource",
            "wisdom:TagResource",
            "wisdom:CreateSession"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/AmazonConnectEnabled": "True"
                }
            }
        },
        {
            "Action": [
                "wisdom:ListAssistants",
                "wisdom:ListKnowledgeBases"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
    ]
}
```

Manage outbound campaigns resources

Onboarding permissions: The following sample policy allows Connect Customer instances to be onboarded to outbound campaigns.

```
"Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "kms:DescribeKey",
                "kms:CreateGrant"
            ],
            "Resource": [
                "arn:aws:kms:region:account-id:key/key-id"
                  ]
```

```
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Allow",
            "Action": [
                "connect:DescribeInstance"
            ],
            "Resource": [

                "arn:aws:connect:region:account-id:instance/instance-id"
            ]
        },
        {
            "Sid": "VisualEditor2",
            "Effect": "Allow",
            "Action": [
                "events:PutTargets",
                "events:PutRule",
                "iam:CreateServiceLinkedRole",
                "iam:AttachRolePolicy",
                "iam:PutRolePolicy",
                "ds:DescribeDirectories",
                "connect-campaigns:StartInstanceOnboardingJob",
                "connect-campaigns:GetConnectInstanceConfig",
                "connect-campaigns:GetInstanceOnboardingJobStatus",
                "connect-campaigns:DeleteInstanceOnboardingJob",
                "connect:DescribeInstanceAttribute",
                "connect:UpdateInstanceAttribute",
                "connect:ListInstances",
                "kms:ListAliases"
            ],
            "Resource": "*"
        }
```

To disable outbound campaigns for an instance, add the following permissions:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
```

```
            "Effect": "Allow",
            "Action": [
                "kms:DescribeKey",
                "kms:RetireGrant"
            ],
            "Resource": [
               "arn:aws:kms:us-east-1:111122223333:key/KeyId"
            ]
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Allow",
            "Action": [
                "events:DeleteRule",
                "events:RemoveTargets",
                "events:DescribeRule",
                "iam:DeleteRolePolicy",
                "events:ListTargetsByRule",
                "iam:DeleteServiceLinkedRole",
                "connect-campaigns:DeleteConnectInstanceConfig"
            ],
            "Resource": "*"
        }
    ]
}
```

Management permissions: The following sample policy allows all read and write operations on outbound campaigns.

```
{
    "Sid": "AllowConnectCampaignsOperations",
    "Effect": "Allow",
    "Action": [
        "connect-campaigns:CreateCampaign",
        "connect-campaigns:DeleteCampaign",
        "connect-campaigns:DescribeCampaign",
        "connect-campaigns:UpdateCampaignName",
        "connect-campaigns:GetCampaignState"
        "connect-campaigns:UpdateOutboundCallConfig",
        "connect-campaigns:UpdateDialerConfig",
        "connect-campaigns:PauseCampaign",
        "connect-campaigns:ResumeCampaign",
```

```
        "connect-campaigns:StopCampaign",
        "connect-campaigns:GetCampaignStateBatch",
        "connect-campaigns:ListCampaigns"
    ],
    "Resource": "*"
}
```

ReadOnly permissions: The following sample policy allows read-only access to the campaigns.

```
{
    "Sid": "AllowConnectCampaignsReadOnlyOperations",
    "Effect": "Allow",
    "Action": [
        "connect-campaigns:DescribeCampaign",
        "connect-campaigns:GetCampaignState",
        "connect-campaigns:GetCampaignStateBatch",
        "connect-campaigns:ListCampaigns"
     ],
    "Resource": "*",
}
```

Tag-based permissions: The following sample policy restricts access to the campaigns integrated with a particular Connect Customer instance using tags. More permissions can be added based on the use case.

```
{
    "Sid": "AllowConnectCampaignsOperations",
    "Effect": "Allow",
    "Action": [
        "connect-campaigns:DescribeCampaign",
        "connect-campaigns:GetCampaignState"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
             "aws:ResourceTag/owner":
 "arn:aws:connect:region:customer_account_id:instance/connect_instance_id"
         }
    }
}
```

> **Note**
>
> `connect-campaigns:ListCampaigns` and `connect-campaigns:GetCampaignStateBatch` operations cannot be restricted by Tag.

Connect Customer resource-level policy examples

Connect Customer supports resource-level permissions for users, so you can specify actions for them for an instance, as shown in the following policies.

Topics

- Deny all actions on an Connect Customer instance
- Deny the "delete" and "update" actions
- Allow actions for integrations with specific names
- Allow "create users" but deny if you're assigned to a specific security profile
- Allow recording actions on a contact
- Allow or Deny queue API actions for phone numbers in a replica Region
- View specific Amazon AppIntegrations resources
- Grant access to Connect Customer Customer Profiles
- Grant read-only access to Customer Profiles data
- Query Connect Customer agent assist only for a specific Assistant
- Grant full access to Connect Customer Voice ID
- Grant access to Connect Customer outbound campaigns resources
- Restrict the ability to search on transcripts analyzed by Connect Customer conversational analytics

Deny all actions on an Connect Customer instance

An Connect Customer instance is the top-level resource within Connect Customer. All other sub-resources are created within its scope. To deny all actions on all resources within a Connect Customer instance, you can use one of the following methods:

- Use `connect:instanceId` context keys.
- Use Instance ARN followed by a wildcard (*).

The following sample policy denies all connect actions for the instance with instanceId 00fbeee1-123e-111e-93e3-11111bfbfcc1.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "connect:*",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "connect:instanceId": "00fbeee1-123e-111e-93e3-11111bfbfcc1"
                }
            }
        }
    ]
}
```

Alternatively, you can deny all actions by specifying the Instance ARN followed by a wildcard (*) . The following sample policy denies all connect actions for the instance with instance ARN `arn:aws:connect:us-east-1:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc1`.

JSON

```
{
"Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": [
                "connect:*"
            ],
            "Resource": "arn:aws:connect:us-
east-1:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc1*"
        }
    ]
```

```
}
```

Deny the "delete" and "update" actions

This following sample policy denies the "delete" and "update" actions for users in one Connect Customer instance. It uses a wild card at the end of the Connect Customer user ARN so that "delete user" and "update user" are denied on the full user ARN (that is, all Connect Customer users in the provided instance, such as arn:aws:connect:us-east-1:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc1/agent/00dtcddd1-123e-111e-93e3-11111bfbfcc1).

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": [
                "connect:DeleteUser",
                "connect:UpdateUser*"
            ],
            "Resource": "arn:aws:connect:us-
east-1:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc1/agent/*"
        }
    ]
}
```

Allow actions for integrations with specific names

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowAllAppIntegrationsActions",
            "Effect": "Allow",
```

```
            "Action": [
                "app-integrations:ListEventIntegrations",
                "app-integrations:CreateEventIntegration",
                "app-integrations:GetEventIntegration",
                "app-integrations:UpdateEventIntegration",
                "app-integrations:DeleteEventIntegration"
            ],
            "Resource":"arn:aws:app-integrations:*:*:event-integration/
MyNamePrefix-*"
 }
    ]
}
```

Allow "create users" but deny if you're assigned to a specific security profile

The following sample policy allows "create users" but explicitly denies using arn:aws:connect:us-west-2:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc1/security-profile/11dtcggg1-123e-111e-93e3-11111bfbfcc17 as the parameter for security profile in CreateUser request.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "connect:CreateUser"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": [
                "connect:CreateUser"
            ],
            "Resource": "arn:aws:connect:us-
west-2:123456789012:instance/00fbeee1-123e-111e-93e3-11111bfbfcc17/security-
profile/11dtcggg1-123e-111e-93e3-11111bfbfcc17"
        }
```

```
    ]
}
```

Allow recording actions on a contact

The following sample policy allows "start contact recording" on a contact in a specific instance. Since contactID is dynamic, * is used.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "connect:StartContactRecording"
            ],
            "Resource": "arn:aws:connect:us-west-2:111122223333:instance/
instanceId/contact/*",
            "Effect": "Allow"
        }
    ]
}
```

Set up a trusted relationship with *accountID*.

The following actions are defined for the recording APIs:

- "connect:StartContactRecording"
- "connect:StopContactRecording"
- "connect:SuspendContactRecording"
- "connect:ResumeContactRecording"

Allow more contact Actions in the same role

If the same role is used to calling other contact APIs, you can list the following contact actions:

- GetContactAttributes

- ListContactFlows
- StartChatContact
- StartOutboundVoiceContact
- StopContact
- UpdateContactAttributes

Or use a wildcard to allow all contact actions, for example: "connect:*"

Allow more resources

You can also use a wildcard to allow more resources. For example, here's how to allow all connect actions on all contact resources:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "connect:*"
            ],
            "Resource": "arn:aws:connect:us-west-2:111122223333:instance/*/
contact/*",
            "Effect": "Allow"
        }
    ]
}
```

Allow or Deny queue API actions for phone numbers in a replica Region

The CreateQueue and UpdateQueueOutboundCallerConfig APIs contain an input field named `OutboundCallerIdNumberId`. This field represents a phone number resource that can be claimed to a traffic distribution group. It supports both the phone number V1 ARN format that is returned by ListPhoneNumbers and the V2 ARN format that is returned by ListPhoneNumbersV2.

Following are the V1 and V2 ARN formats that `OutboundCallerIdNumberId` supports:

- **V1 ARN format**: `arn:aws:connect:`*`your-region`*`:`*`your-account_id`*`:instance/`*`instance_id`*`/phone-number/`*`resource_id`*
- **V2 ARN format**: `arn:aws:connect:`*`your-region`*`:`*`your-account_id`*`:phone-number/`*`resource_id`*

> **Note**
>
> We recommend using the V2 ARN format. The V1 ARN format is going to be deprecated in the future.

Provide both ARN formats for phone number resources in the replica Region

If the phone number is claimed to a traffic distribution group, to correctly allow/deny access to queue API actions for phone number resources while operating in the replica Region **you must provide the phone number resource in both V1 and V2 ARN formats**. If you provide the phone number resource in only one ARN format, it does not result in the correct allow/deny behavior while operating in the replica Region.

Example 1: Deny access to CreateQueue

For example, you're operating in the replica Region us-west-2 with account `123456789012` and instance `aaaaaaaa-bbbb-cccc-dddd-0123456789012`. You want to deny access to CreateQueue API when the `OutboundCallerIdNumberId` value is a phone number claimed to a traffic distribution group with resource ID `aaaaaaaa-eeee-ffff-gggg-0123456789012`. In this scenario you must use the following policy:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "DenyCreateQueueForSpecificNumber",
            "Effect": "Deny",
            "Action": "connect:CreateQueue",
            "Resource": [
                "arn:aws:connect:us-east-1:123456789012:phone-number/aaaaaaaa-
eeee-ffff-gggg-0123456789012",
```

```
                "arn:aws:connect:us-west-2:123456789012:instance/aaaaaaaa-bbbb-
cccc-dddd-0123456789012/phone-number/aaaaaaaa-eeee-ffff-gggg-0123456789012"
            ]
        }
    ]
}
```

Where us-west-2 is the Region where the request is being made.

Example 2: Only allow access to UpdateQueueOutboundCallerConfig

For example, you're operating in the replica Region us-west-2 with account 123456789012 and instance aaaaaaaa-bbbb-cccc-dddd-0123456789012. You want to only allow access to UpdateQueueOutboundCallerConfig API when the OutboundCallerIdNumberId value is a phone number claimed to a traffic distribution group with resource ID aaaaaaaa-eeee-ffff-gggg-0123456789012. In this scenario you must use the following policy:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "OnlyAllowUpdateQueueOutboundCallerConfigForSpecificNumber",
            "Effect": "Allow",
            "Action": "connect:UpdateQueueOutboundCallerConfig",
            "Resource": [
                "arn:aws:connect:us-east-1:123456789012:phone-number/aaaaaaaa-
eeee-ffff-gggg-0123456789012",
                "arn:aws:connect:us-west-2:123456789012:instance/aaaaaaaa-bbbb-
cccc-dddd-0123456789012/phone-number/aaaaaaaa-eeee-ffff-gggg-0123456789012"
            ]
        }
    ]
}
```

View specific Amazon AppIntegrations resources

The following sample policy allows a specific event integrations to be fetched.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "app-integrations:GetEventIntegration"
            ],
            "Resource": "arn:aws:app-integrations:us-west-2:111122223333:event-
integration/Name"
        }
    ]
}
```

Grant access to Connect Customer Customer Profiles

Connect Customer Customer Profiles use `profile` as the prefix for actions instead of `connect`. The following policy grants full access to a specific domain in Connect Customer Customer Profiles.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "profile:*"
            ],
            "Resource": "arn:aws:profile:us-west-2:111122223333:domains/
domainName",
            "Effect": "Allow"
        }
    ]
}
```

Set up a trusted relationship with accountID to domain domainName.

Grant read-only access to Customer Profiles data

Following is an example for granting read access to the data in Connect Customer Customer Profiles.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "profile:SearchProfiles"
            ],
            "Resource": "arn:aws:profile:us-east-1:111122223333:domains/
domainName",
            "Effect": "Allow"
        }
    ]
}
```

Query Connect Customer agent assist only for a specific Assistant

The following sample policy allows querying only a specific Assistant.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "wisdom:QueryAssistant"
            ],
            "Resource": "arn:aws:wisdom:us-
east-1:111122223333:assistant/assistantID"
        }
    ]
}
```

Grant full access to Connect Customer Voice ID

Connect Customer Voice ID uses `voiceid` as the prefix for actions instead of connect. The following policy grants full access to a specific domain in Connect Customer Voice ID:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "voiceid:*"
            ],
            "Resource": "arn:aws:voiceid:us-west-2:111122223333:domain/
domainName",
            "Effect": "Allow"
        }
    ]
}
```

Set up a trusted relationship with accountID to domain domainName.

Grant access to Connect Customer outbound campaigns resources

Outbound campaigns uses `connect-campaign` as the prefix for actions instead of `connect`. The following policy grants full access to a specific outbound campaign.

```
{
    "Sid": "AllowConnectCampaignsOperations",
    "Effect": "Allow",
    "Action": [
        "connect-campaigns:DeleteCampaign",
        "connect-campaigns:DescribeCampaign",
        "connect-campaigns:UpdateCampaignName",
        "connect-campaigns:GetCampaignState"
        "connect-campaigns:UpdateOutboundCallConfig",
        "connect-campaigns:UpdateDialerConfig",
        "connect-campaigns:PauseCampaign",
        "connect-campaigns:ResumeCampaign",
        "connect-campaigns:StopCampaign"
```

```
    ],
    "Resource": "arn:aws:connect-campaigns:us-west-2:accountID:campaign/campaignId",
    }
```

Restrict the ability to search on transcripts analyzed by Connect Customer conversational analytics

The following policy allows search and describe contacts, but denies searching a contact using transcripts analyzed by Connect Customer conversational analytics.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "connect:DescribeContact"
            ],
            "Resource": "arn:aws:connect:us-
east-1:111122223333:instance/instance-id/contact/*"
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Allow",
            "Action": [
                "connect:SearchContacts"
            ],
            "Resource": "arn:aws:connect:us-
east-1:111122223333:instance/instance-id"
        },
        {
            "Sid": "VisualEditor2",
            "Effect": "Deny",
            "Action": [
                "connect:SearchContacts"
            ],
            "Resource": "arn:aws:connect:us-
east-1:111122223333:instance/instance-id",
            "Condition": {
```

```
                "ForAnyValue:StringEquals": {
                    "connect:SearchContactsByContactAnalysis": [
                        "Transcript"
                    ]
                }
            }
        }
    ]
}
```

AWS managed policies for Connect Customer

To add permissions to users, groups, and roles, it is more efficient to use AWS managed policies than to write policies yourself. It takes time and expertise to create IAM customer managed policies that provide your team with only the permissions that they need. To get started quickly, you can use AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see AWS managed policies in the *IAM User Guide*.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the ReadOnlyAccess AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see AWS managed policies for job functions in the *IAM User Guide*.

AWS managed policy: AmazonConnect_FullAccess

To allow full read/write access to Connect Customer, you must attach two policies to your IAM users, groups, or roles. Attach the `AmazonConnect_FullAccess` policy and a custom policy to have full access to Connect Customer.

To view the permissions for the AmazonConnect_FullAccess policy, see AmazonConnect_FullAccess in the *AWS Managed Policy Reference*.

Custom Policy

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AttachAnyPolicyToAmazonConnectRole",
            "Effect": "Allow",
            "Action": "iam:PutRolePolicy",
            "Resource": "arn:aws:iam::*:role/aws-service-role/
connect.amazonaws.com/AWSServiceRoleForAmazonConnect*"
        }
    ]
}
```

To allow a user to create an instance, make sure that they have the permissions granted by the AmazonConnect_FullAccess policy.

When you use AmazonConnect_FullAccess policy, note the following:

- The custom policy that contains the iam:PutRolePolicy action, allows the user with this policy assigned to configure any resource in the account to work with a Connect Customer instance. Since this added action grants such broad permissions, only assign it when necessary. As an alternative, you can create the service-linked role with access to the necessary resources and let the user have access to pass the service-linked role to Connect Customer (which is granted by the AmazonConnect_FullAccess policy).
- Additional privileges are required to create a Amazon S3 bucket with a name of your choosing, or use an existing bucket while creating or updating an instance from the Connect Customer admin website. If you choose default storage locations for your call recordings, chat transcripts, call transcripts, and other data, the system prepends "amazon-connect-" to the names of those objects.
- The aws/connect KMS key is available to use as a default encryption option. To use a custom encryption key, assign users additional KMS privileges.

- Assign users additional privileges to attach other AWS resources like Amazon Polly, Live Media Streaming, Data Streaming, and Lex bots to their Connect Customer instances.

For more information and detailed permissions, see Required permissions for using custom IAM policies to manage access to the Connect Customer console.

AWS managed policy: AmazonConnectReadOnlyAccess

To allow read-only access, you can attach the `AmazonConnectReadOnlyAccess` policy.

To view the permissions for this policy, see AmazonConnectReadOnlyAccess in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonConnectServiceLinkedRolePolicy

This policy is attached to the service-linked role named `AWSServiceRoleForAmazonConnect` to allow Connect Customer to perform various actions on specified resources. As you enable additional features in Connect Customer, additional permissions are added for the AWSServiceRoleForAmazonConnect service-linked role to access the resources associated with those features.

To view the permissions for this policy, see AmazonConnectServiceLinkedRolePolicy in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonConnectCampaignsServiceLinkedRolePolicy

The `AmazonConnectCampaignsServiceLinkedRolePolicy` role permissions policy allows Connect Customer outbound campaigns to perform various actions on specified resources. As you enable additional features in Connect Customer, additional permissions are added for the AWSServiceRoleForConnectCampaigns service-linked role to access the resources associated with those features.

To view the permissions for this policy, see AmazonConnectCampaignsServiceLinkedRolePolicy in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonConnectVoiceIDFullAccess

To allow full access to Connect Customer Voice ID, you must attach two policies to your users, groups, or roles. Attach the `AmazonConnectVoiceIDFullAccess` policy and a custom policy to access Voice ID through the Connect Customer admin website.

To view the permissions for the `AmazonConnectVoiceIDFullAccess` policy, see AmazonConnectVoiceIDFullAccess in the *AWS Managed Policy Reference*.

Custom policy

JSON

```

                "StringEquals": {
                    "events:ManagedBy": "connect.amazonaws.com"
                }
            }
        }
    ]
```

```
}
```

The custom policy configures the following:

- The `iam:PutRolePolicy` allows the user who gets that policy to configure any resource in the account to work with the Connect Customer instance. Due to its broad scope, grant this permission only when absolutely necessary.
- Attaching a Voice ID domain to an Connect Customer instance requires additional Connect Customer and Amazon EventBridge permissions. You need permissions to call Connect Customer APIs for creating, deleting, and listing integration associations. Additionally, EventBridge permissions are required to create and delete rules that provide contact records related to Voice ID.

Connect Customer Voice ID does not have a default encryption option, so you must allow the following API operations in the key policy to use your customer-managed key. Additionally, you need to grant these permissions on the relevant key, as they are not included in the managed policy.

- `kms:Decrypt` - to access or store encrypted data.
- `kms:CreateGrant` – when creating or updating a domain, used to create a grant to the customer managed key for the Voice ID domain. The grant controls access to the specified KMS key which allows access to grant operations Connect Customer Voice ID requires. For more information about using grants, see Using grants in the *AWS Key Management Service Developer Guide*.
- `kms:DescribeKey` – when creating or updating a domain, allows determining the ARN for KMS key you provided.

For more about creating domains and KMS keys, see Get started enabling Voice ID in Connect Customer and Encryption at rest in Connect Customer.

AWS managed policy: CustomerProfilesServiceLinkedRolePolicy

The `CustomerProfilesServiceLinkedRolePolicy` role permissions policy allows Connect Customer to perform various actions on specified resources. As you enable additional features in Amazon Connect, additional permissions are added for the AWSServiceRoleForProfile service-linked role to access the resources associated with those features.

To view the permissions for this policy, see CustomerProfilesServiceLinkedRolePolicy in the *AWS Managed Policy Reference*.

AWS managed policy: AmazonConnectSynchronizationServiceRolePolicy

The `AmazonConnectSynchronizationServiceRolePolicy` permissions policy allows Connect Customer Managed Synchronization to perform various actions on specified resources. As resource synchronization is enabled for more resources, additional permissions are added to the AWSServiceRoleForAmazonConnectSynchronization service-linked role to access these resources.

To view the permissions for this policy, see AmazonConnectSynchronizationServiceRolePolicy in the *AWS Managed Policy Reference*.

Connect Customer updates to AWS managed policies

View details about updates to AWS managed policies for Connect Customer since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the Connect Customer Document history page.

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Updated actions for Connect Customer Customer Profiles	Updated the Connect Customer Customer Profiles permissions in the service-linked role policy to `profile:*` on all Connect Customer Customer Profiles resources with the `amazon-connect-` domain prefix and template resources, with an explicit deny for the following actions: • `profile:CreateDomain` • `profile:UpdateDomain`	May 20, 2026

Change	Description	Date
	• profile:DeleteDomain • profile:CreateEventStream • profile:DeleteEventStream • profile:DeleteWorkflow • profile:DeleteProfileKey • profile:UntagResource • profile:TagResource • profile:CreateIntegrationWorkflow Additionally, the following actions are allowed on all resources: profile:ListRecommenderRecipes , profile:ListAccountIntegrations , and profile:ListDomains .	

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Updated actions for agent assist	Updated the agent assist permissions in the service-linked role policy to `wisdom:*` on all Connect Customer agent assist resources with resource tag `'AmazonConnectEnabled':'True'` , with an explicit deny for the following actions: • `wisdom:DeleteAssistant` • `wisdom:DeleteKnowledgeBase`	May 18, 2026
AmazonConnectServiceLinkedRolePolicy – Added actions for agent assist	Added the following agent assist actions to the service-linked role policy: • `wisdom:Retrieve` • `wisdom:ListAssistantAssociations`	November 18, 2025

Change	Description	Date
AmazonConnectSynchronizationServiceRolePolicy – Added actions for Managed Synchronization	Modified the allowed actions by adding batch and import wildcards. The following actions were added: • `connect:BatchCreate*` • `connect:BatchUpdate*` • `connect:BatchDelete*` • `connect:BatchDescribe*` • `connect:Import*`	November 21, 2025

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for AWS End User Messaging Social	Added AWS End User Messaging Social actions to allow the listing of WhatsApp business accounts and the retrieval of a business account's WhatsApp message templates. The following actions were added: • `social-messaging:ListLinkedWhatsAppBusinessAccounts` • `social-messaging:GetWhatsAppMessageTemplate` • `social-messaging:ListWhatsAppMessageTemplates` The AWS End User Messaging Social template APIs are restricted to WhatsApp business accounts that are tagged `AmazonConnectEnabled : True` .	October 20, 2025

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer Customer Profiles	Added the following Connect Customer Customer Profiles actions to the service-linked role policy below the **AllowCustomerProfilesForConnectDomain** Sid. Also, added support for profile UploadJobs on all amazon-connect-* resources, and not just “upload-jobs” resources: • `profile:GetUploadJob` • `profile:GetUploadJobPath` • `profile:StartUploadJob` • `profile:StopUploadJob`	July 25, 2025
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Polly	Added the following Amazon Polly actions to the service-linked role policy: • `polly:ListLexicons` • `polly:DescribeVoices` • `polly:SynthesizeSpeech`	July 9, 2025

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer Customer Profiles	Added the following Connect Customer Customer Profiles actions to the service-linked role policy: • `profile:GetUploadJob` • `profile:GetUploadJobPath` • `profile:StartUploadJob` • `profile:StopUploadJob` • `profile:CreateUploadJob` • `profile:ListUploadJobs` • `profile:DetectProfileObjectType`	June 30, 2025

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer Customer Profiles	Added the following Customer Profiles actions to the service-linked role policy: • `profile:CreateDomainLayout` • `profile:UpdateDomainLayout` • `profile:DeleteDomainLayout` • `profile:GetDomainLayout` • `profile:ListDomainLayouts` • `profile:GetSimilarProfiles`	June 9, 2025
AmazonConnectServiceLinkedRolePolicy – Added actions for agent assist, to support messaging	Added the following agent assist actions to the service-linked role policy to support messaging. These actions allow Connect Customer to send, list, and get the next message by using the agent assist API: • `wisdom:SendMessage` • `wisdom:GetNextMessage` • `wisdom:ListMessages`	March 14, 2025

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for agent assist	Added the following agent assist actions to the service-linked role policy: • wisdom:CreateAIAgent • wisdom:CreateAIAgentVersion • wisdom:DeleteAIAgent • wisdom:DeleteAIAgentVersion • wisdom:UpdateAIAgent • wisdom:UpdateAssistantAIAgent • wisdom:RemoveAssistantAIAgent • wisdom:GetAIAgent • wisdom:ListAIAgents • wisdom:ListAIAgentVersions • wisdom:CreateAIPrompt • wisdom:CreateAIPromptVersion • wisdom:DeleteAIPrompt • wisdom:DeleteAIPromptVersion • wisdom:UpdateAIPrompt	December 31, 2024

Change	Description	Date
	• wisdom:GetAIPrompt • wisdom:ListAIPrompts • wisdom:ListAIPromptVersions • wisdom:CreateAIGuardrail • wisdom:CreateAIGuardrailVersion • wisdom:DeleteAIGuardrail • wisdom:DeleteAIGuardrailVersion • wisdom:UpdateAIGuardrail • wisdom:GetAIGuardrail • wisdom:ListAIGuardrails • wisdom:ListAIGuardrailVersions • wisdom:CreateAssistant • wisdom:ListTagsForResource	

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added action for Amazon Pinpoint, to support push notifications	Added the following Amazon Pinpoint action to the service-linked role policy to support push notifications. This action allows Connect Customer to send push notifications by using the Amazon Pinpoint API: • `mobiletargeting:SendMessages`	December 10, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for integration with AWS End User Messaging Social	Added the following AWS End User Messaging Social actions to the service-linked role policy. The actions allow Connect Customer to invoke these APIs on End User Messaging Social phone numbers that have the `'AmazonConnectEnabled':'True'` resource tag. • `social-messaging:SendWhatsAppMessage` • `social-messaging:PostWhatsAppMessageMedia` • `social-messaging:GetWhatsAppMessageMedia` • `social-messaging:GetLinkedWhatsAppBusinessAccountPhoneNumber`	December 2, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon SES, to support the email channel	Added the following Amazon SES actions to the service-linked role policy to support the email channel. These actions allow Connect Customer send, receive, and manage emails by using the Amazon SES APIs: • `ses:DescribeReceiptRule` • `ses:UpdateReceiptRule` • `ses:DeleteEmailIdentity` • `ses:SendRawEmail` • `iam:PassRole`	November 22, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added Actions for Connect Customer Customer Profiles	Added the following actions to manage Connect Customer Customer Profiles resources: • `profile:GetIntegration` • `profile:PutIntegration` • `profile:DeleteIntegration` • `profile:CreateEventTrigger` • `profile:GetEventTrigger` • `profile:ListEventTriggers` • `profile:UpdateEventTrigger` • `profile:DeleteEventTrigger`	November 18, 2024

Change	Description	Date
CustomerProfilesServiceLinkedRolePolicy – Added permissions for managing outbound campaigns	Added the following actions to retrieving profile information and triggering a campaign. • With `connect-campaigns:PutProfileOutboundRequestBatch`, you can trigger a campaign based on your Customer Profiles Event Trigger Definition. • With `profile:BatchGetProfile`, you can retrieve profile information necessary for triggering an event.	December 1, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added Actions for Connect Customer Customer Profiles and Connect Customer agent assist	Added the following actions to manage Connect Customer Customer Profiles resources: • `profile:ListObjectTypeAttributes` • `profile:ListProfileAttributeValues` • `profile:BatchGetProfile` • `profile:BatchGetCalculatedAttributeForProfile` • `profile:ListSegmentDefinitions` • `profile:CreateSegmentDefinition` • `profile:GetSegmentDefinition` • `profile:DeleteSegmentDefinition` • `profile:CreateSegmentEstimate` • `profile:GetSegmentEstimate` • `profile:CreateSegmentSnapshot` • `profile:GetSegmentSnapshot` • `profile:GetSegmentMembership`	November 18, 2024

Change	Description	Date
	Added the following actions to manage Connect Customer agent assist resources: • wisdom:CreateMessageTemplate • wisdom:UpdateMessageTemplate • wisdom:UpdateMessageTemplateMetadata • wisdom:GetMessageTemplate • wisdom:DeleteMessageTemplate • wisdom:ListMessageTemplates • wisdom:SearchMessageTemplates • wisdom:ActivateMessageTemplate • wisdom:DeactivateMessageTemplate • wisdom:CreateMessageTemplateVersion • wisdom:ListMessageTemplateVersions • wisdom:CreateMessageTemplateAttachment • wisdom:DeleteMessageTemplateAttachment	

Change	Description	Date
	• wisdom:RenderMessageTemplate	

Change	Description	Date
AmazonConnectCampaignsServiceLinkedRolePolicy – Added Actions for Connect Customer Customer Profiles and Connect Customer agent assist	Added the following actions to manage Connect Customer resources: • connect:StartOutboundVoiceContact • connect:GetMetricData • connect:GetCurrentMetricData • connect:BatchPutContact • connect:StopContact • connect:GetMetricDataV2 • connect:DescribeContactFlow • connect:SendOutboundEmail Added the following actions to manage EventBridge resources: • events:DeleteRule • events:PutRule • events:PutTargets • events:RemoveTargets • events:ListRules • events:ListTargetsByRule	November 18, 2024

Change	Description	Date
	Added the following actions to manage Connect Customer agent assist resources: • `wisdom:GetMessageTemplate` • `wisdom:RenderMessageTemplate`	
AmazonConnectSynchronizationServiceRolePolicy – Consolidated allowed actions and added a deny-list of actions for Managed Synchronization	Modified the allowed actions by using wildcards and added an explicit deny-list of actions.	November 12, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Chime SDK Voice Connector	Added the following Amazon Chime SDK Voice Connector actions to the service-linked role policy. These actions allow Connect Customer to obtain Amazon Chime Voice Connector information by using get and list Amazon Chime SDK Voice Connector APIs: • `chime:GetVoiceConnector` : Allows Connect Customer to invoke the GetVoiceConnector API on any Amazon Chime SDK Voice Connectors that have an `'AmazonConnectEnabled':'True'` resource tag. • `chime:ListVoiceConnectors` : Allows Connect Customer to list all Amazon Chime SDK Voice Connectors created in the account across all Regions.	October 25, 2024

Change	Description	Date
AmazonConnectSynchronizationServiceRolePolicy – Added for Managed Synchronization	Added the following actions to the service-linked role managed policy to support the launch of the `HoursOfOperationOverride` attribute. • `connect:CreateHoursOfOperationOverride` • `connect:UpdateHoursOfOperationOverride` • `connect:DeleteHoursOfOperationOverride` • `connect:DescribeHoursOfOperationOverride` • `connect:ListHoursOfOperationOverrides`	September 25, 2024

Change	Description	Date
AmazonConnectSynchronizationServiceRolePolicy – Added for Managed Synchronization	Added the following actions to the service-linked role managed policy for managed synchronization: • connect:AssociatePhoneNumberContactFlow • connect:DisassociatePhoneNumberContactFlow • connect:AssociateRoutingProfileQueues • connect:DisassociateQueueQuickConnects • connect:AssociateQueueQuickConnects • connect:DisassociateUserProficiencies • connect:AssociateUserProficiencies • connect:DisassociateRoutingProfileQueues • connect:CreateAuthenticationProfile • connect:UpdateAuthenticationProfile	July 5, 2024

Change	Description	Date
	• connect:DescribeAuthenticationProfile • connect:ListAuthenticationProfiles	
AmazonConnectReadOnlyAccess – Renamed action connect:GetFederationTokens and changed to connect:AdminGetEmergencyAccessToken	The AmazonConnectReadOnlyAccess managed policy has been updated due to the renaming of the Connect Customer action connect:GetFederationTokens to connect:AdminGetEmergencyAccessToken. This change is backwards compatible and the connect:AdminGetEmergencyAccessToken action will function in the same way as the connect:GetFederationTokens action. If you leave the previously named connect:GetFederationTokens action in your policies, they will continue to function as expected.	June 15, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Cognito user pools and Connect Customer Customer Profiles	Added the following Amazon Cognito user pools actions to the service-linked role policy to allow select read operations on Cognito User Pool User Pool resources that have an `AmazonConnectEnabled` resource tag. This tag is put on the resource when the `CreateIntegrationAssociations` API is called: • `cognito-idp:DescribeUserPool` • `cognito-idp:ListUserPoolClients` Added the following Connect Customer Customer Profiles action to the service-linked role policy to allow permissions to put data into the Connect-adjacent service, Customer Profiles: • profile:PutProfileObject	May 23, 2024

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for agent assist	The following action is allowed to be performed on agent assist resources that have the resource tag `'AmazonConnectEnabled':'True'` on agent assist Knowledge Base: • `wisdom:ListContentAssociations`	May 20, 2024
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Pinpoint	Added the following actions to the service-linked role policy to use Amazon Pinpoint phone numbers to allow Connect Customer to send SMS: • `sms:DescribePhoneNumbers` • `sms:SendTextMessage`	November 17, 2023
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer agent assist	The following action is allowed to be performed on agent assist resources that have the resource tag `'AmazonConnectEnabled':'True'` on agent assist Knowledge Base: • `wisdom:PutFeedback`	November 15, 2023

Change	Description	Date
AmazonConnectCampaignsServiceLinkedRolePolicy – Added actions for Connect Customer	Connect Customer added new actions to retrieve outbound campaigns: • `connect:BatchPutContact` • `connect:StopContact`	November 8, 2023
AmazonConnectSynchronizationServiceRolePolicy – Added new AWS managed policy	Added a new service-linked role managed policy for managed synchronization. The policy provides access to read, create, update, and delete Connect Customer resources and is used to automatically synchronize AWS resources across AWS Regions.	November 3, 2023

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Customer Profiles	Added the following action to manage Connect Customer Customer Profiles Service Linked Roles: • `profile:ListCalculatedAttributesForProfile` • `profile:GetDomain` • `profile:ListIntegrations` • `profile:CreateCalculatedAttributeDefinition` • `profile:DeleteCalculatedAttributeDefinition` • `profile:GetCalculatedAttributeDefinition` • `profile:UpdateCalculatedAttributeDefinition`	October 30, 2023

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer agent assist	The following actions are allowed to be performed on agent assist resources that have the resource tag `'AmazonConnectEnabled':'True'` on agent assist Knowledge Base: • `wisdom:CreateQuickResponse` • `wisdom:GetQuickResponse` • `wisdom:SearchQuickResponses` • `wisdom:StartImportJob` • `wisdom:GetImportJob` • `wisdom:ListImportJobs` • `wisdom:ListQuickResponses` • `wisdom:UpdateQuickResponse` • `wisdom:DeleteQuickResponse`	October 25, 2023

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Customer Profiles	Added the following action to manage Connect Customer Customer Profiles Service Linked Roles: • `profile:ListCalculatedAttributeDefinitions` • `profile:GetCalculatedAttributeForProfile`	October 6, 2023

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer agent assist	The following actions are allowed to be performed on agent assist resources that have the resource tag `'AmazonConnectEnabled':'True'` on agent assist knowledge bases and assistants: • `wisdom:CreateContent` • `wisdom:DeleteContent` • `wisdom:CreateKnowledgeBase` • `wisdom:GetAssistant` • `wisdom:GetKnowledgeBase` • `wisdom:GetContent` • `wisdom:GetRecommendations` • `wisdom:GetSession` • `wisdom:NotifyRecommendationsReceived` • `wisdom:QueryAssistant` • `wisdom:StartContentUpload` • `wisdom:UntagResource` • `wisdom:TagResource`	September 29, 2023

Change	Description	Date
	• `wisdom:CreateSession` The following `List` actions are allowed to be performed on all agent assist resources: • `wisdom:ListAssistants` • `wisdom:KnowledgeBases`	
CustomerProfilesServiceLinkedRolePolicy – Added CustomerProfilesServiceLinkedRolePolicy	New managed policy.	March 7, 2023
AmazonConnect_FullAccess – Added permission for managing Connect Customer Customer Profiles Service Linked Roles	Added the following action to manage Connect Customer Customer Profiles Service Linked Roles. • With `iam:CreateServiceLinkedRole`, you can create a service-linked role for Customer Profiles.	January 26, 2023
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon CloudWatch	Added the following action to publish usage Connect Customer metrics for an instance to your account. • `cloudwatch:PutMetricData`	Februrary 22, 2022

Change	Description	Date
AmazonConnect_FullAccess – Added permissions for managing Connect Customer Customer Profiles domains	Added all permissions for managing Connect Customer Customer Profiles domains that are created for new Connect Customer instances. • `profile:ListAccountIntegrations` - Lists all the integrations associated with a specific URI in the AWS account. • `profile:ListDomains` - Returns a list of all the domains for an AWS account that have been created. • `profile:GetDomain` - Returns information about a specific domain. • `profile:ListProfileObjectTypeTemplates` - Allow the Connect Customer console to display a list of templates that you can use to create your data mappings. • With `profile:GetObjectTypes` , you can view all the current Object Types (data mappings) that you've created.	November 12, 2021

Change	Description	Date
	The following permissions are allowed to be performed on domains with a name that is prefixed with `amazon-connect-` : • With `profile:AddProfileKey` , you can associate a new key value with a specific profile • With `profile:CreateDomain` , you can create new domains • With `profile:CreateProfile` , you can create new profiles • With `profile:DeleteDomain` , you can delete domains • With `profile:DeleteIntegration` , you can delete integrations with a domain • With `profile:DeleteProfile` , you can delete a profile • With `profile:DeleteProfileKey` , you can delete a profile key • With `profile:DeleteProfileObject` , you can delete a profile object	

Change	Description	Date
	• With `profile:DeleteProfileObjectType`, you can delete a profile object type • With `profile:GetIntegration`, you can retrieve information about an integration • With `profile:GetMatches`, you can retrieve possible profile matches • With `profile:GetProfileObjectType`, you can retrieve profile object types • With `profile:ListIntegrations`, you can list integrations • With `profile:ListProfileObjects`, you can list profile objects • With `profile:ListProfileObjectTypes`, you can list profile object types • With `profile:ListTagsForResource`, you can list tags for a resource • With `profile:MergeProfiles`, you can merge profile matches	

Change	Description	Date
	• With `profile:PutIntegration`, you can add an integration between the service and a third-party service which includes Amazon AppFlow and Connect Customer • With `profile:PutProfileObject`, you can create and update objects • With `profile:PutProfileObjectType`, you can create and update object types • With `profile:SearchProfiles`, you can search profiles • With `profile:TagResource`, you can tag resources • With `profile:UntagResource`, you can untag resources • With `profile:UpdateDomain`, you can update domains • With `profile:UpdateProfile`, you can update profiles	

Change	Description	Date
AmazonConnectServiceLinkedRolePolicy – Added actions for Connect Customer Customer Profiles	Added the following actions so Connect Customer flows and the agent experience can interact with the profiles in your default Customer Profiles domain: • `profile:SearchProfiles` • `profile:CreateProfile` • `profile:UpdateProfile` • `profile:AddProfileKey` Added the following action so Connect Customer flows and the agent experience can interact with the profile objects in your default Customer Profiles domain: • `profile:ListProfileObjects` Added the following action so Connect Customer flows and the agent experience can determine whether Customer Profiles is enabled for your Connect Customer instance:	November 12, 2021

Change	Description	Date
	• `profile:ListAccountIntegrations`	
AmazonConnectVoiceIDFullAccess – Added new AWS managed policy	Added a new AWS managed policy so you can set up your users to use Connect Customer Voice ID. This policy provides full access to Connect Customer Voice ID through the AWS console, SDK, or other means.	September 27, 2021
AmazonConnectCampaignsServiceLinkedRolePolicy – Added new service-linked role policy	Added a new service-linked role policy for outbound campaigns. The policy provides access to retrieve all the outbound campaigns.	September 27, 2021
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Lex V2	Added the following actions for the all bots created in the account across all Regions. These actions were added to support integration with Amazon Lex V2. • `lex:ListBots` - Lists all the bots available in a given Region for your account. • `lex:ListBotAliases` - Lists all the aliases for a given bot.	June 15, 2021

Change	Description	Date
AmazonConnect_FullAccess – Added actions for Amazon Lex V2	Added the following actions for the all bots created in the account across all Regions. These actions were added to support integration with Amazon Lex V2. • `lex:ListBots` • `lex:ListBotAliases`	June 15, 2021
Connect Customer started tracking changes	Connect Customer started tracking changes for its AWS managed policies.	June 15, 2021

Troubleshooting Connect Customer identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Connect Customer and IAM.

Topics

- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my Connect Customer resources

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to Connect Customer.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Connect Customer. However, the action requires the service to have

permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my Connect Customer resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Connect Customer supports these features, see How Connect Customer works with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Use service-linked roles and role permissions for Connect Customer

What are service-linked roles (SLR) and why are they important?

Connect Customer uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to a Connect Customer instance.

Service-linked roles are predefined by Connect Customer and include all the permissions that Connect Customer requires to call other AWS services on your behalf.

You need to enable service-linked roles so you can use new features in Connect Customer, such as tagging support, the new user interface in **User management** and **Routing profiles**, and queues with CloudTrail support.

For information about other services that support service-linked roles, see AWS services that work with IAM and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for Connect Customer

Connect Customer uses the service-linked role with the prefix **AWSServiceRoleForAmazonConnect_***unique-id* – Grants Amazon Connect permission to access AWS resources on your behalf.

The AWSServiceRoleForAmazonConnect prefixed service-linked role trusts the following services to assume the role:

- `connect.amazonaws.com`

The AmazonConnectServiceLinkedRolePolicy role permissions policy allows Connect Customer to complete the following actions on the specified resources:

- Action: all Connect Customer actions, `connect:*`, on all Connect Customer resources.
- Action: IAM `iam:DeleteRole` to allow deletion of the service-linked role.
- Action: Amazon S3 `s3:GetObject`, `s3:DeleteObject`, `s3:GetBucketLocation`, and `GetBucketAcl` for the S3 bucket specified for recorded conversations.

  It also grants `s3:PutObject`, `s3:PutObjectAcl`, and `s3:GetObjectAcl` to the bucket specified for exported reports.
- Action: Amazon CloudWatch Logs `logs:CreateLogStream`, `logs:DescribeLogStreams`, and `logs:PutLogEvents` to the CloudWatch Logs group specified for flow logging.
- Action: Amazon Lex V2 `lex:ListBots`, `lex:ListBotAliases` for all bots created in the account across all Regions.
- Action: Connect Customer Customer Profiles `profile:*` on all Connect Customer Customer Profiles resources with the `amazon-connect-` domain prefix and template resources associated

with your Connect Customer instance, except for the following actions which are explicitly denied:

- `profile:CreateDomain`
- `profile:UpdateDomain`
- `profile:DeleteDomain`
- `profile:CreateEventStream`
- `profile:DeleteEventStream`
- `profile:DeleteWorkflow`
- `profile:DeleteProfileKey`
- `profile:UntagResource`
- `profile:TagResource`
- `profile:CreateIntegrationWorkflow`

Additionally, the following actions are allowed on all resources: `profile:ListRecommenderRecipes`, `profile:ListAccountIntegrations`, and `profile:ListDomains`.

> **Note**
>
> Each Connect Customer instance can be associated with only one domain at a time. However, you can link any domain to a Connect Customer instance. Cross-domain access within the same AWS account and Region is automatically enabled for all domains that start with the prefix `amazon-connect-`. To restrict cross-domain access, you can either use separate Connect Customer instances to logically partition your data or use Customer Profiles domain names within the same instance that do not start with the `amazon-connect-` prefix, thereby preventing cross-domain access.

- Action: agent assist `wisdom:*` on all Connect Customer agent assist resources with resource tag `'AmazonConnectEnabled':'True'` associated with your Connect Customer instance, except for the following actions which are explicitly denied:
  - `wisdom:DeleteAssistant`
  - `wisdom:DeleteKnowledgeBase`
- Action: Amazon CloudWatch Metrics `cloudwatch:PutMetricData` to publish Connect Customer usage metrics for an instance to your account.

- Action: Amazon Pinpoint SMS and Voice `sms-voice:DescribePhoneNumbers` and `sms-voice:SendTextMessage` to allow Connect Customer to send SMS.
- Action: Amazon Pinpoint `mobiletargeting:SendMessages` to allow Connect Customer to send push notifications.
- Action: Amazon Cognito user pools `cognito-idp:DescribeUserPool` and `cognito-idp:ListUserPoolClients` to allow Connect Customer access to select read operations on Amazon Cognito user pools resources that have an `AmazonConnectEnabled` resource tag.
- Action: Amazon Chime SDK Voice Connector `chime:GetVoiceConnector` to allow read access for Connect Customer on all Amazon Chime SDK Voice Connector resources that have an `'AmazonConnectEnabled':'True'` resource tag.
- Action: Amazon Chime SDK Voice Connector `chime:ListVoiceConnectors` for all Amazon Chime SDK Voice Connectors created in the account across all Regions.
- Action: Connect Customer Messaging WhatsApp integration. Grants Connect Customer permissions to the following AWS End User Messaging Social APIs:
  - `social-messaging:SendWhatsAppMessage`
  - `social-messaging:PostWhatsAppMessageMedia`
  - `social-messaging:GetWhatsAppMessageMedia`
  - `social-messaging:GetLinkedWhatsAppBusinessAccountPhoneNumber`

  The Social APIs are restricted to your phone number resources that are enabled for Connect Customer. A phone number is tagged with `AmazonConnectEnabled : True` when it is imported into a Connect Customer instance.
- Action: Connect Customer Messaging WhatsApp message template integration. Grants Connect Customer permission to call AWS End User Messaging Social APIs. An AWS account's WhatsApp business accounts might be listed. Additionally, the templates of a WhatsApp business account might be listed and a template's details might be retrieved as long as the WhatsApp business account is tagged `AmazonConnectEnabled: True`.
  - `social-messaging:ListLinkedWhatsAppBusinessAccounts`
  - `social-messaging:GetWhatsAppMessageTemplate`
  - `social-messaging:ListWhatsAppMessageTemplates`
- Action: Amazon SES
  - `ses:DescribeReceiptRule`
  - `ses:UpdateReceiptRule`

on all Amazon SES receipt rules. Used to send and receive emails.

- `ses:DeleteEmailIdentity` for {*instance-alias*}.email.connect.aws SES domain identity. Used for email domain management that is provided by Connect Customer.
- `ses:SendRawEmail` for sending emails with an SES configuration set that is provided by Connect Customer (configuration-set-for-connect-DO-NOT-DELETE).

- `iam:PassRole` for `AmazonConnectEmailSESAccessRole` service role which is used by Amazon SES. For Amazon SES Receipt rule management, Amazon SES requires a role to be passed, which it assumes.

- Action: Amazon Polly
  - `polly:ListLexicons`
  - `polly:DescribeVoices`
  - `polly:SynthesizeSpeech`

As you enable additional features in Connect Customer, the following permissions are added for the service-linked role to access the resources associated with those features by using in-line policies:

- Action: Amazon Data Firehose `firehose:DescribeDeliveryStream` and `firehose:PutRecord`, and `firehose:PutRecordBatch` for the delivery stream defined for agent event streams and contact records.
- Action: Amazon Kinesis Data Streams `kinesis:PutRecord`, `kinesis:PutRecords`, and `kinesis:DescribeStream` for the stream specified for agent event streams and contact records.
- Action: Amazon Lex `lex:PostContent` for the bots added to your instance.
- Action: Connect Customer Voice-ID `voiceid:*` for the Voice ID domains associated with your instance.
- Action: EventBridge `events:PutRule` and `events:PutTargets` for the Connect Customer managed EventBridge rule for publishing CTR records for your associated Voice ID domains.
- Action: outbound campaigns
  - `connect-campaigns:CreateCampaign`
  - `connect-campaigns:DeleteCampaign`
  - `connect-campaigns:DescribeCampaign`

- `connect-campaigns:UpdateCampaignName`
- `connect-campaigns:GetCampaignState`
- `connect-campaigns:GetCampaignStateBatch`
- `connect-campaigns:ListCampaigns`
- `connect-campaigns:UpdateOutboundCallConfig`
- `connect-campaigns:UpdateDialerConfig`
- `connect-campaigns:PauseCampaign`
- `connect-campaigns:ResumeCampaign`
- `connect-campaigns:StopCampaign`

for all operations related to outbound campaigns.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Create a service-linked role for Connect Customer

You don't need to manually create a service-linked role. When you create a new instance in Amazon Connect in the AWS Management Console, Connect Customer creates the service-linked role for you.

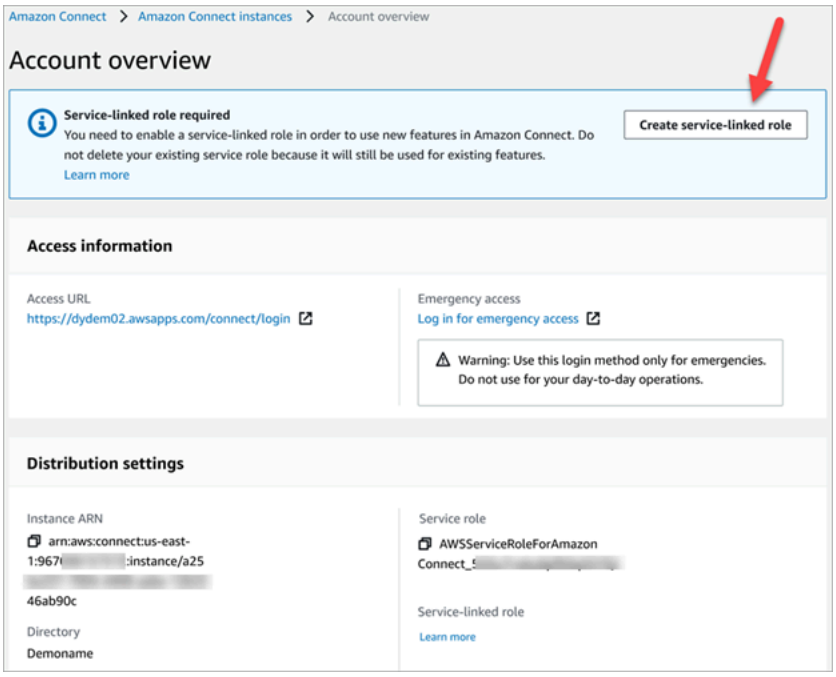
If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you create a new instance in Amazon Connect, Connect Customer creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **Amazon Connect - Full access** use case. In the IAM CLI or the IAM API, create a service-linked role with the `connect.amazonaws.com` service name. For more information, see Creating a service-linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

For instances created before October 2018

> **Tip**
>
> Having trouble signing in to manage your AWS account? Don't know who manages your AWS account? For help, see Troubleshooting AWS account sign-in issues.

If your Connect Customer instance was created before October 2018, you don't have service-linked roles set up. To create a service-linked role, on the **Account overview** page, choose **Create service-linked role**, as shown in the following image.

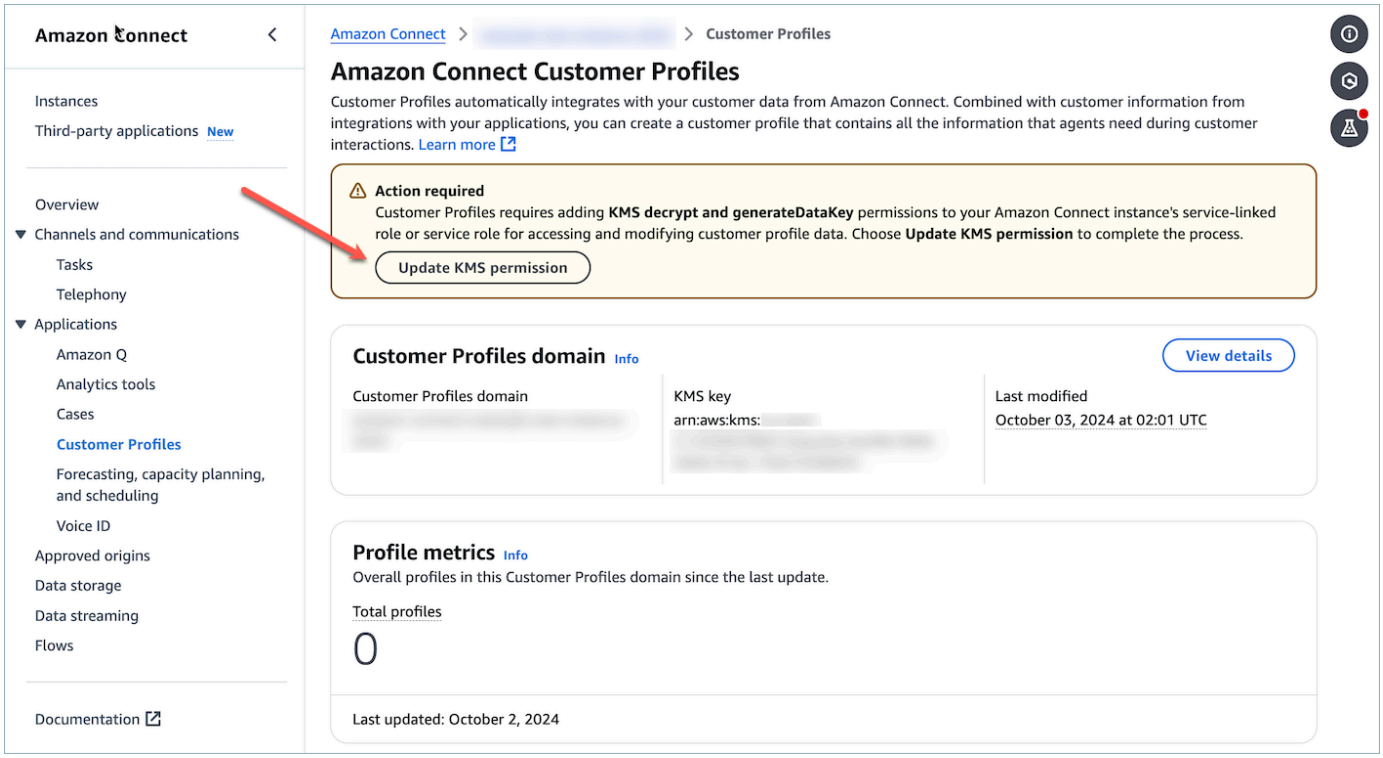


For a list of the IAM permissions required to create the service-linked role, see Overview page in the Required permissions for using custom IAM policies to manage access to the Connect Customer console topic.

For Customer Profile domains created before Jan 31, 2025 and configured with a customer KMS key to encrypt data, you need to grant additional KMS permissions to your Amazon Connect Instance.

If your associated Customer Profile domain was created before Jan 31, 2025 and the domain uses a Customer-Managed KMS key (CMK) for encryption, to enable CMK enforcement by the Connect Instance, take the following actions:

1. Provide an Connect Customer instance's Service-Linked Role (SLR) permission to use your Customer Profiles domain's AWS KMS keys by navigating to the Customer Profiles's page in Connect Customer's AWS Management Console and choose **Update KMS permission**.



2. Create a support ticket with the Connect Customer Customer Profiles team to request CMK permission enforcement for your account.

For a list of IAM permission to update your Connect Customer instance, see the required permission for custom IAM policies for the Customer Profiles page.

Edit a service-linked role for Connect Customer

You cannot edit the AWSServiceRoleForAmazonConnect prefixed service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Checking a service-linked role has permissions for Amazon Lex

1. On the navigation pane of the IAM console, choose **Roles**.
2. Choose the name of the role to modify.

Delete a service-linked role for Connect Customer

You don't need to manually delete the AWSServiceRoleForAmazonConnect prefixed role. When you delete your Amazon Connect instance in the AWS Management Console, Connect Customer cleans up the resources and deletes the service-linked role for you.

Supported Regions for Connect Customer service-linked roles

Connect Customer supports using service-linked roles in all of the Regions where the service is available. For more information, see AWS Regions and Endpoints.

Use service-linked roles for outbound campaigns in Connect Customer

Connect Customer outbound campaigns uses AWS Identity and Access Management service-linked roles. When a Connect Customer instance is enabled to use outbound campaigns, it creates a unique service linked role that allows it to perform actions on the Connect Customer instance.

A service-linked role makes setting up outbound campaigns easier because you don't have to manually add the necessary permissions. Outbound campaigns defines the permissions of its service-linked roles, and unless defined otherwise, only outbound campaigns can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see AWS services that work with IAM in the *IAM User Guide*. Look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for outbound campaigns

Outbound campaigns uses the service-linked role prefixed `AWSServiceRoleForConnectCampaigns`. This role grants outbound campaigns permission to access AWS resources on your behalf.

The `AWSServiceRoleForConnectCampaigns` service-linked role trusts the following services to assume the role:

- `connect-campaigns.amazonaws.com`

The AmazonConnectCampaignsServiceLinkedRolePolicy role permissions policy allows outbound campaigns to complete the following actions on the specified resources. Additional permissions are added for the service-linked role to access the resources:

- Action: Outbound campaigns `connect-campaigns:ListCampaigns` for the AWS account.
- Action: Connect Customer
  - `connect:BatchPutContact`
  - `connect:StopContact`
  - `connect:DescribeContactFlow`
  - `connect:SendOutboundEmail`
  - `connect:SendOutboundWebNotification`

  on `arn:aws:connect:*:*:instance/*` resources.
- Action: Connect Customer `connect:SendOutboundChatMessage` on `arn:aws:connect:*:*:instance/*` and `arn:aws:connect:*:*:phone-number/*` resources in the same AWS account as the calling principal.
- Action: AWS End User Messaging Social `social-messaging:SendWhatsAppMessage` on `arn:aws:social-messaging:*:*:phone-number-id/*` resources that are tagged with `AmazonConnectEnabled: True` and in the same AWS account as the calling principal.
- Action: AWS End User Messaging Social `social-messaging:GetWhatsAppMessageTemplate` on `arn:aws:social-messaging:*:*:waba/*` resources in the same AWS account as the calling principal.
- Action: Amazon Pinpoint SMS and Voice `sms-voice:SendTextMessage` on `arn:aws:sms-voice:*:*:phone-number/*` resources in the same AWS account as the calling principal.
- Action: EventBridge `events:ListRules` on `arn:aws:events:*:*:rule/*` resources in the same AWS account as the calling principal.
- Action: EventBridge:
  - `events:DeleteRule`
  - `events:PutRule`
  - `events:PutTargets`
  - `events:RemoveTargets`

  for rules named `ConnectCampaignsRule*` managed by **`connect-campaigns.amazonaws.com`**, in the same AWS account as the calling principal. The

`events:ListTargetsByRule` action is also permitted on `ConnectCampaignsRule*` resources in the same account.

- Action: agent assist Message Templates:
  - `wisdom:GetMessageTemplate`
  - `wisdom:RenderMessageTemplate`

  on all resources tagged with `aws:ResourceTag/AmazonConnectCampaignsEnabled`.

Permissions for Connect Customer Customer Profiles are provided through the `ConnectCampaignsCustomerProfilesIntegrationAccess` managed policy.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Create a service-linked role for outbound campaigns

You don't need to manually create a service-linked role. When you associate a Connect Customer instance with outbound campaigns by invoking the `StartInstanceOnboardingJob` API, outbound campaigns creates the service-linked role for you.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you associate a new Connect Customer instance with outbound campaigns, Connect Customer creates the service-linked role for you again.

Edit a service-linked role for outbound campaigns

With Outbound campaigns, you can't edit the `AWSServiceRoleForConnectCampaigns` service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Delete a service-linked role for outbound campaigns

If you no longer need outbound campaigns, we recommend that you delete the associated service-linked role. That way you don’t have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

To delete outbound campaigns resources used by the `AWSServiceRoleForConnectCampaigns`

- Delete all campaigns setup for the AWS account.

To manually delete the service-linked role using IAM

- Use the IAM console, the AWS CLI, or the AWS API to delete the `AWSServiceRoleForConnectCampaigns` service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for outbound campaigns service-linked roles

Outbound campaigns supports using service-linked roles in all of the Regions where the service is available. For more information, see AWS Regions and Endpoints.

Using service-linked roles for Amazon AppIntegrations

Amazon AppIntegrations uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to Amazon AppIntegrations. Service-linked roles are predefined by Amazon AppIntegrations and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up Amazon AppIntegrations easier because you don't have to manually add the necessary permissions. Amazon AppIntegrations defines the permissions of its service-linked roles, and unless defined otherwise, only Amazon AppIntegrations can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete a service-linked role only after first deleting their related resources. This protects your Amazon AppIntegrations resources because you can't inadvertently remove permission to access the resources.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for Amazon AppIntegrations

Amazon AppIntegrations uses the service-linked role named **AWSServiceRoleForAppIntegrations** which allows AppIntegrations to access AWS services and resources on your behalf.

The AWSServiceRoleForAppIntegrations service-linked role trusts the following service to assume the role:

- `app-integrations.amazonaws.com`

The role permissions policy named AppIntegrationsServiceLinkedRolePolicy allows Amazon AppIntegrations to complete the following actions on the specified resources:

JSON

                "appflow:StartFlow",
                "appflow:StopFlow",
                "appflow:UpdateFlow"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/AppIntegrationsManaged": "true"
                }
            },
            "Resource": "arn:aws:appflow:*:*:flow/FlowCreatedByAppIntegrations-*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "appflow:TagResource"
            ],
            "Condition": {
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": [
                        "AppIntegrationsManaged"
                    ]
                }
            },
            "Resource": "arn:aws:appflow:*:*:flow/FlowCreatedByAppIntegrations-*"
        }
    ]
}
```

- Action: `cloudwatch:PutMetricData` on `"*"` using the `StringEquals` condition `"cloudwatch:namespace": "AWS/AppIntegrations"`.
- Action: `appflow:DescribeConnectorEntity` and `appflow:ListConnectorEntities` on `"*"`.
- Action: `appflow:DescribeConnectorProfiles` and `appflow:UseConnectorProfile` on `arn:aws:appflow:*:*:connector-profile/*`

- Action: `appflow:DeleteFlow`, `appflow:DescribeFlow`, `appflow:DescribeFlowExecutionRecords`, `appflow:StartFlow`, `appflow:StopFlow`, and `appflow:UpdateFlow` on `arn:aws:appflow:*:*:flow/FlowCreatedByAppIntegrations-*` using the `StringEquals` condition `"aws:ResourceTag/AppIntegrationsManaged": "true"`.
- Action: `appflow:TagResource` on `arn:aws:appflow:*:*:flow/FlowCreatedByAppIntegrations-*` using the `ForAllValues:StringEquals` `aws:TagKeys` condition `AppIntegrationsManaged`.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating a service-linked role for Amazon AppIntegrations

You don't need to manually create a service-linked role. When you create a data or event integration using either the agent assist, Customer Profiles, or Tasks widget in Connect Customer in the AWS Management Console, the AWS CLI, or the AWS API, Amazon AppIntegrations creates the service-linked role for you.

> **Important**
>
> This service-linked role can appear in your account if you completed an action in another service that uses the features supported by this role. Also, if you created any new Amazon AppIntegrations resources after September 30, 2022, when it began supporting service-linked roles, then Amazon AppIntegrations created the AWSServiceRoleForAppIntegrations role in your account. To learn more, see A new role appeared in my IAM account.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you create a data or event integration using either the agent assist, Customer Profiles, or Tasks widget in Connect Customer, Amazon AppIntegrations creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **AppIntegrations** use case. In the AWS CLI or the AWS API, create a service-linked role with the `app-integrations.amazonaws.com` service name. For more information, see Creating a service-

linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing a service-linked role for Amazon AppIntegrations

You can't edit the AWSServiceRoleForAppIntegrations service-linked role with Amazon AppIntegrations. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting a service-linked role for Amazon AppIntegrations

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it. You must first delete your data and event integration associations in the AWS Console and then delete your data and event integrations using the AWS CLI.

> **Note**
>
> If the Amazon AppIntegrations service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete data integration associations used by the AWSServiceRoleForAppIntegrations in the AWS Console

1. Go to the agent assist section of the Connect Customer Console and choose the name of the data integration association that you wish to delete.
2. Choose **Delete** on the right hand side of the **Integration details** section.
3. In the pop-box, enter the name of the integration for confirmation and choose **Delete**.

To delete data integrations used by the AWSServiceRoleForAppIntegrations using the AWS CLI

1. List your data integrations to view the names of your existing integrations.

   ```
   aws appintegrations list-data-integrations
   ```

2. Delete each integration using the data integration name.

```
aws appintegrations delete-data-integration --data-integration-
identifier DATA_INTEGRATION_NAME
```

To delete event integration associations used by the AWSServiceRoleForAppIntegrations in the AWS Console

1. Go to the Customer Profiles or the Tasks section of the Connect Customer Console and choose the name of the event integration association that you wish to delete.
2. After you choose an event integration on the Tasks section, a pop-up will appear. Choose the **Remove connection** button and enter the word *remove* to delete your event integration association.

To delete event integrations used by the AWSServiceRoleForAppIntegrations using the AWS CLI

1. List your event integrations to view the names of your existing integrations.

```
aws appintegrations list-event-integrations
```

2. Delete each integration using the data integration name.

```
aws appintegrations delete-event-integration --name
EVENT_INTEGRATION_NAME
```

To manually delete the service-linked role using IAM

Use the IAM console, the AWS CLI, or the AWS API to delete the AWSServiceRoleForAppIntegrations service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported regions for Amazon AppIntegrations service-linked roles

Amazon AppIntegrations supports using service-linked roles in all of the Regions where the service is available. For more information, see AWS regions and endpoints.

You can use the AWSServiceRoleForAppIntegrations role in the following Regions.

Region name	Region identity	Support in Amazon AppIntegrations
US East (N. Virginia)	us-east-1	Yes
US West (Oregon)	us-west-2	Yes
Asia Pacific (Mumbai)	ap-south-1	Yes
Asia Pacific (Seoul)	ap-northeast-2	Yes
Asia Pacific (Singapore)	ap-southeast-1	Yes
Asia Pacific (Sydney)	ap-southeast-2	Yes
Asia Pacific (Tokyo)	ap-northeast-1	Yes
Canada (Central)	ca-central-1	Yes
Europe (Frankfurt)	eu-central-1	Yes
Europe (London)	eu-west-2	Yes
Africa (Cape Town)	af-south-1	Yes

Using service-linked roles for Connect Customer Customer Profiles

Connect Customer Customer Profiles uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to Customer Profiles. Service-linked roles are predefined by Customer Profiles and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up Connect Customer Customer Profiles easier because you don't have to manually add the necessary permissions. Connect Customer Customer Profiles defines the permissions of its service-linked roles, and unless defined otherwise, only Connect Customer Customer Profiles can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see AWS services that work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for Connect Customer Customer Profiles

Connect Customer Customer Profiles uses the service-linked role named **AWSServiceRoleForProfile_*unique-id*** which allows Amazon Connect Customer Profiles to access AWS services and resources on your behalf..

The **AWSServiceRoleForProfile** prefixed service-linked role trusts the following services to assume the role:

- `profile.amazonaws.com`

The role permissions policy named CustomerProfilesServiceLinkedRolePolicy allows Connect Customer Customer Profiles to complete the following actions on the specified resources:

- Action: Amazon CloudWatch Metrics `cloudwatch:PutMetricData` to publish Amazon Connect usage metrics for an instance to your account.
- Action: IAM `iam:DeleteRole` to delete the **AWSServiceRoleForProfile** prefixed service-linked role itself when associated Amazon Connect Customer Profiles Domain is deleted.
- Action: Amazon Connect Outbound Campaigns `connect-campaigns:PutProfileOutboundRequestBatch` to trigger a campaign based on your Customer Profiles Event Trigger Definition.
- Action: Amazon Connect Customer Profiles `profile:BatchGetProfile` to retrieve profile information necessary for triggering a campaign.
- Action: Amazon Connect Customer Profiles `profile:GetRecommender` to retrieve recommenders necessary for triggering a campaign.
- Action: Amazon Connect Customer Profiles `profile:GetCalculatedAttributeForProfile` to retrieve calculated attributes necessary for triggering a campaign.
- Action: Amazon Connect Customer Profiles `profile:GetProfileRecommendations` to retrieve profile recommendations necessary for triggering a campaign.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating a service-linked role for Connect Customer Customer Profiles

You don't need to manually create a service-linked role. When you create your first Amazon Connect Customer Profiles Domain in the AWS Management Console, the AWS CLI, or the AWS API, Customer Profiles creates the service-linked role for you. Note each Connect Customer Customer Profiles domain requires a dedicated SLR in order for Connect Customer Customer Profiles to take actions for you.

> **Important**
>
> This service-linked role can appear in your account if you completed an action in another service that uses the features supported by this role. Also, if you were using the Connect Customer Customer Profiles service before June 8, 2023, when it began supporting service-linked roles, then Connect Customer Customer Profiles created the **AWSServiceRoleForProfile** prefixed role in your account. To learn more, see A new role appeared in my IAM account.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you create your first Amazon Connect Customer Profiles Domain, Customer Profiles creates the service-linked role for you again.

Editing a service-linked role for Connect Customer Customer Profiles

With Connect Customer Customer Profiles, you can't edit the **AWSServiceRoleForProfile** prefixed service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting a service-linked role for Connect Customer Customer Profiles

You don't need to manually delete the **AWSServiceRoleForProfile** prefixed role. When you delete the Amazon Connect Customer Profiles Domain in the AWS Management Console, the AWS CLI, or the AWS API, Customer Profiles cleans up the resources and deletes the service-linked role for you.

You can also use the AWS CLI or the AWS API to manually delete the service-linked role. To do this, you must first manually clean up the resources for your service-linked role and then you can manually delete it.

> **Note**
>
> If the Connect Customer Customer Profiles service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete Connect Customer Customer Profiles resources used by the AWSServiceRoleForProfile prefixed service-linked role

- Delete the Connect Customer Customer Profiles domain in the AWS Management Console, the AWS CLI, or the AWS API.

To manually delete the service-linked role using IAM

Use the AWS CLI or the AWS API to delete the **AWSServiceRoleForProfile** prefixed service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported regions for Connect Customer Customer Profiles service-linked roles

Connect Customer Customer Profiles supports using service-linked roles in all of the Regions where the service is available. For more information, see AWS regions and endpoints.

Region name	Region identity	Support in Connect Customer
US East (N. Virginia)	us-east-1	Yes
US West (Oregon)	us-west-2	Yes
Asia Pacific (Seoul)	ap-northeast-2	Yes
Asia Pacific (Singapore)	ap-southeast-1	Yes
Asia Pacific (Sydney)	ap-southeast-2	Yes

Region name	Region identity	Support in Connect Customer
Asia Pacific (Tokyo)	ap-northeast-1	Yes
Canada (Central)	ca-central-1	Yes
Europe (Frankfurt)	eu-central-1	Yes
Europe (London)	eu-west-2	Yes
Africa (Cape Town)	af-south-1	Yes

Using service-linked roles for Connect Customer Managed Synchronization

Amazon Connect managed synchronization uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to Managed Synchronization. Service-linked roles are predefined by Managed Synchronization and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up Managed Synchronization easier because you don't have to manually add the necessary permissions. Managed Synchronization defines the permissions of its service-linked roles, and unless defined otherwise, only Managed Synchronization can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete a service-linked role only after first deleting their related resources. This protects your Managed Synchronization resources because you can't inadvertently remove permission to access the resources.

For information about other services that support service-linked roles, see AWS services that work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for Managed Synchronization

Managed Synchronization uses the service-linked role that is prefixed with **AWSServiceRoleForAmazonConnectSynchronization** which grants Amazon Connect Managed

Synchronization read, write, update, and delete permission to access AWS resources on your behalf. The full name of the role in your account will contain the prefix and a unique ID that will be similar to the following:

`AWSServiceRoleForAmazonConnectSynchronization_`*`unique-id`*

The **AWSServiceRoleForAmazonConnectSynchronization** prefixed service-linked role trusts the following services to assume the role:

- `synchronization.connect.amazonaws.com`

The role permissions policy named AmazonConnectSynchronizationServiceRolePolicy allows Managed Synchronization to complete the following actions on the specified resources:

- Action: Connect Customer for all Connect Customer resources
  - `connect:Create*`
  - `connect:Update*`
  - `connect:Delete*`
  - `connect:Describe*`
  - `connect:BatchCreate*`
  - `connect:BatchUpdate*`
  - `connect:BatchDelete*`
  - `connect:BatchDescribe*`
  - `connect:List*`
  - `connect:Search*`
  - `connect:Associate*`
  - `connect:Disassociate*`
  - `connect:Get*`
  - `connect:BatchGet*`
  - `connect:Import*`
  - `connect:TagResource`
  - `connect:UntagResource`
- Action: Amazon CloudWatch metrics `cloudwatch:PutMetricData` to publish Connect Customer usage metrics for an instance to your account.

The role permissions policy named AmazonConnectSynchronizationServiceRolePolicy disallows Managed Synchronization from completing the following actions on the specified resources:

- Action: Amazon Connect for all Amazon Connect resources
  - `connect:Start*`
  - `connect:Stop*`
  - `connect:Resume*`
  - `connect:Suspend*`
  - `connect:*Contact`
  - `connect:*Contacts`
  - `connect:*ContactAttributes*`
  - `connect:*RealtimeContact*`
  - `connect:*AnalyticsData*`
  - `connect:*MetricData*`
  - `connect:*UserData*`
  - `connect:*ContactEvaluation`
  - `connect:*AttachedFile*`
  - `connect:UpdateContactSchedule`
  - `connect:UpdateContactRoutingData`
  - `connect:ListContactReferences`
  - `connect:CreateParticipant`
  - `connect:CreatePersistentContactAssociation`
  - `connect:CreateInstance`
  - `connect:DeleteInstance`
  - `connect:ListInstances`
  - `connect:ReplicateInstance`
  - `connect:GetFederationToken`
  - `connect:ClaimPhoneNumber`
  - `connect:ImportPhoneNumber`
  - `connect:ReleasePhoneNumber`
  - `connect:SearchAvailablePhoneNumbers`

- `connect:CreateTrafficDistributionGroup`
- `connect:DeleteTrafficDistributionGroup`
- `connect:GetTrafficDistribution`
- `connect:UpdateTrafficDistribution`

You must configure permissions to allow your users, groups, or roles to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating a service-linked role for Managed Synchronization

You don't need to manually create a service-linked role. When you replicate a Connect Customer instance by invoking the `ReplicateInstance` API, Managed Synchronization creates the service-linked role for you.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you replicate the Connect Customer instance again, Managed Synchronization creates the service-linked role for you again.

Editing a service-linked role for Managed Synchronization

With Managed Synchronization, you can't edit the AWSServiceRoleForAmazonConnectSynchronization prefixed service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting a service-linked role for Managed Synchronization

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don’t have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

> **Note**
>
> If the Managed Synchronization service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete Managed Synchronization resources used by the AWSServiceRoleForAmazonConnectSynchronization prefixed role

- Delete all replica Amazon Connect instances for the source instance.

To manually delete the service-linked role using IAM

Use the IAM console, the AWS CLI, or the AWS API to delete the AWSServiceRoleForAmazonConnectSynchronization prefixed service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for Managed Synchronization service-linked roles

Managed Synchronization supports using service-linked roles in all of the Regions where Amazon Connect Global Resiliency is available. For more information, see Set up Connect Customer Global Resiliency.

Region name	Region identity	Support in Managed Synchronization
US East (N. Virginia)	us-east-1	Yes
US West (Oregon)	us-west-2	Yes

Logging and monitoring Connect Customer

Monitoring is important for maintaining the reliability, availability, and performance of your contact center.

You should collect monitoring data from all of the parts of your AWS solution so that you can more easily debug a multipoint failure if one occurs. But before you start monitoring Connect Customer, you should create a monitoring plan that includes answers to the following questions:

- What are your monitoring goals?
- What data about your Connect Customer instance will you monitor?
- How often will you monitor your instance?
- What monitoring tools will you use?

- Who will perform the monitoring tasks?
- Who should be notified when something goes wrong?

See the following topics to learn how to use Amazon CloudWatch Logs and AWS CloudTrail to monitor Connect Customer and describes the Connect Customer metrics sent to CloudWatch:

- Monitoring your Connect Customer instance using CloudWatch
- Log Connect Customer API calls with AWS CloudTrail

Add tags to resources in Connect Customer

A *tag* is a custom metadata label that you can add to a resource in order to make it easier to identify, organize, and find in a search. Tags are comprised of two individual parts: A tag key and a tag value. This is referred to as a *key:value* pair.

A *tag key* typically represents a larger category, while a tag value represents a subset of that category. For example you could have *tag key=Color* and *tag value=Blue*, which would produce the key:value pair `Color:Blue`. Note that you can set the value of a tag to an empty string. However, you can't set the value of a tag to null. Omitting the tag value is the same as using an empty string.

Tag keys can be up to 128 characters in length and tag values can be up to 256 characters in length; both are case sensitive. For more information, see:

- Connect Customer TagResource
- Connect Customer Customer Profiles TagResource
- Connect Customer Voice ID TagResource: You can add tags to the Voice ID domain.
- Amazon AppIntegrations TagResource

Connect Customer services support up to 50 tags per resource. For a given resource, each tag key must be unique with only one value.

Note

Your tags cannot begin with `aws:` because AWS reserves this prefix for system-generated tags. You cannot add, modify, or delete `aws:*` tags, and they don't count against your tags-per-resource limit.

The following table describes the Connect Customer resources that can be tagged using the AWS CLI or an AWS SDK.

Tagging support for Connect Customer resources

Resource	Supports tagging using the Connect Customer admin website	Supports tagging using the CLI/SDK	Supports tagging on creation
Agent	Yes	Yes	Yes
Agent group	No	Yes	Yes
Agent group level	No	No	Yes
Agent state	No	Yes	Yes
Case	Yes	Yes	Yes
Contact	No	No	No
Contact evaluations	No	Yes	Yes
Email addresses	Yes	Yes	Yes
Evaluation forms	Yes	Yes	Yes
Flow	Yes	Yes	Yes
Flow module	Yes	Yes	Yes
Hours of operation	Yes	Yes	Yes

Resource	Supports tagging using the Connect Customer admin website	Supports tagging using the CLI/SDK	Supports tagging on creation
Instance	Yes	Yes	Yes
Integration associati on	No	Yes	Yes
Outbound campaign	No	Yes	Yes
Phone number	No	Yes	Yes
Prompts	Yes	Yes	Yes
Queue agent	No	No	Yes
Queues	Yes	Yes	Yes
Quick connects	No	Yes	Yes
Routing Profile	Yes	Yes	Yes
Rules	Yes	Yes	Yes
Security profile	Yes	Yes	Yes
Task template	No	No	Yes
Traffic distribution group	No	Yes	Yes
Transfer destination	No	Yes	Yes
Use case	No	Yes	Yes
Vocabulary	No	Yes	Yes

To learn more about tagging, including best practices, see Tagging AWS resources in the *AWS General Reference*.

Tag metadata are removed only when the Connect Customer instance is deleted

Connect Customer retains tag metadata for resources even after the resource is deleted. The metadata is retained as long as the Connect Customer instance is active.

This design supports historical reporting and access control (TBAC) use cases. Specifically, Connect Customer uses tag-based access control for historical metrics. If tags were removed immediately when a resource was deleted, users who did not previously have access to those resources could inadvertently gain access to historical metrics involving them. Retaining tags ensures that access boundaries remain consistent over time.

Tags are removed only after the entire Connect Customer instance is deleted, at which point historical data access is no longer applicable.

Tag-based access control

To use tags to control access to resources within your AWS accounts, you need to provide tag information in the condition element of an IAM policy. For example, to control access to your Voice ID domain based on the tags you've assigned to it, use the `aws:ResourceTag/key-name` condition key to specify which tag key:value pair must be attached to the domain, to allow given actions for it.

For more detailed information on tag-based access control in the Connect Customer console, see Apply tag-based access control in Connect Customer.

For more detailed information on tag-based access control in IAM, see Controlling access to AWS resources using tags in the *IAM User Guide*

Compliance validation in Connect Customer

Our new AWS sign-up experience is not designed for regulated workloads. If you're using our new AWS sign-up experience, but you want to use AWS for regulated workloads, you can sign up for AWS (advanced) or activate advanced features for your AWS environment.

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Best practices for PII compliance in Connect Customer

Following this list of best practices can help you ensure your Connect Customer contact center is PII (Personally Identifiable Information) compliant.

- Conduct compliance eligibility audits for all services used in your contact center, as well as any third party integration points.
- AWS Key Management Service (KMS) encrypts Amazon S3 contents at the object level, which covers recordings, logs, and saved reports by default for Amazon S3. Make sure encryption in transit and at rest rules apply downstream or to third party apps.
- Use encryption in the **Store customer input** block for sensitive DTMF information.
- Use your own KMS key when ingesting data in Connect Customer Customer Profile domains.
- Do not upload content containing customer PII to Connect Customer agent assist.
- When using Connect Customer Voice ID, do not use PII in the `CustomerSpeakerId`.
- As with any AWS service, we strongly recommend that you not use sensitive information to name resources.
- When using pre-defined attributes in a Connect Customer instance, do not use sensitive information in it's name and values.

Best practices for PCI compliance in Connect Customer

Following this list of best practices can help you ensure your Connect Customer contact center is PCI-compliant.

- Conduct compliance eligibility audits for all services used in your contact center, as well as any third party integration points.
- Payment card information (PCI) should be collected using encrypted DTMF. You can also use Amazon Lex V2 to gather PCI information using speech input. Amazon Lex is PCI compliant.
- If PCI is captured in call recordings, the PCI data must be scrubbed from the recording and obfuscated from any logs or transcriptions. We recommend working with an Amazon Solution Architect if you need help doing this.
- Use encryption in transit and at rest for any downstream integration points.
- Enable multi-factor authentication (MFA) for any access to PCI as Connect Customer is a public endpoint.
- AWS Key Management Service (KMS) encrypts Amazon S3 contents at the object level, which covers recordings, logs, and saved reports by default for Amazon S3. Make sure encryption in transit and at rest rules apply downstream or to third party apps.
- Use encryption in the **Store customer input** block for sensitive DTMF information.
- Use your own KMS key when ingesting data in Connect Customer Customer Profile domains.
- For more information, see https://www.pcisecuritystandards.org.

Best practices for HIPAA compliance in Connect Customer

Following this list of best practices can help you ensure your Connect Customer contact center is HIPAA compliant.

- Conduct compliance eligibility audits for all services used in your contact center, as well as any third party integration points.
- AWS Key Management Service (KMS) encrypts Amazon S3 contents at the object level, which covers recordings, logs, and saved reports by default for Amazon S3. Make sure encryption in transit and at rest rules apply downstream or to third party apps.
- Use encryption in the **Store customer input** block for sensitive DTMF information.
- For more information about HIPAA compliance, see https://www.hipaacompliance.org/.

Resilience in Connect Customer

The AWS global infrastructure is built around AWS Regions and Availability Zones (AZs). AWS Regions provide multiple physically separated and isolated AZs, which are connected with low-

latency, high-throughput, and highly redundant networking. These AZs are physically separated by many miles, but still close enough together (60 miles or less) to be used as a single logical data center.

Each AZ features one or more discrete data centers, each housed in its own facility with redundant power, networking, and connectivity. These measures act as safeguards, and minimize the likelihood of an issue like a power outage or earthquake impacting multiple data centers or multiple AZs.

AZs are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Connect Customer runs on AWS proven infrastructure operating in multiple AZs within various geographic regions around the world. This makes Connect Customer more highly available, fault tolerant, and scalable than would be possible if a contact center solution was run from a single data center.

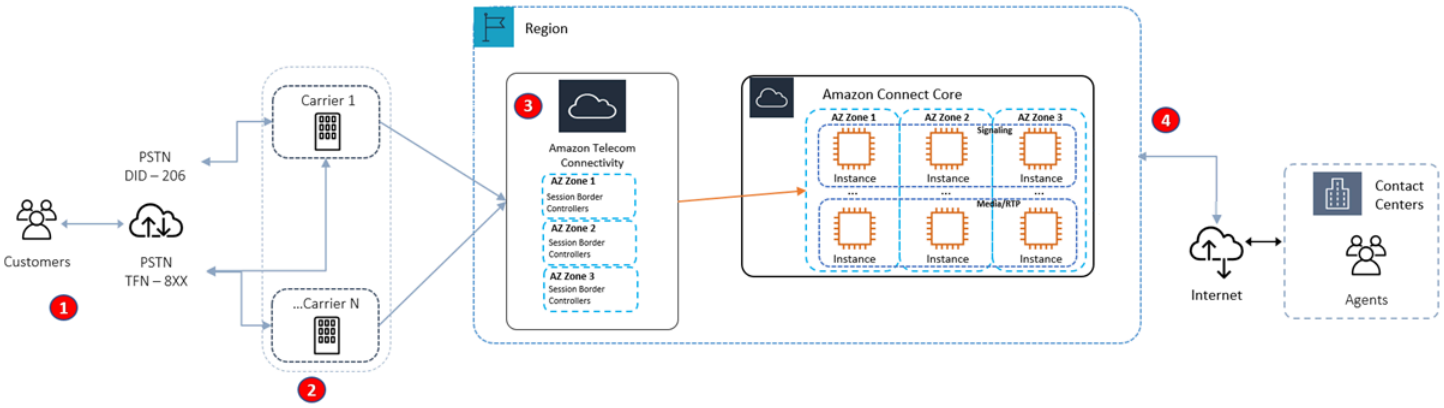
Within each AWS Region you can create a Connect Customer instance, with a minimum of 3 AZs. When you create a Connect Customer instance, that instance is propagated across those AZs in an active-active-active configuration. If there is a failure in one AZ, that node is taken out of rotation without impacting production. With this architecture, you can perform maintenance, release new features, and expand infrastructure without requiring any downtime.

Single-region telephony and softphone architecture

Connect Customer is integrated with multiple telephony providers with redundant dedicated network paths to three or more AZs in every AWS Region where the service is offered today. If a particular component, data center, or an entire AZ experiences failure, the affected endpoint is automatically taken out of rotation. This helps you to continue providing a consistent quality experience for your customers.

Inbound (US toll-free) and outbound calls in Connect Customer are processed through multiple telecom carriers. Each carrier is connected to multiple AZs in an active-active configuration. This makes sure that impairment of a network path or an entire AZ does not impact your end-customer experience. If there is an impairment at the carrier level, this design helps minimize impact to your customer's experience by placing outbound calls and accepting US inbound toll-free calls across multiple carriers.

The following diagram illustrates this process:



1. Callers reach your contact center using carriers that operate across multiple AZs at all times.
2. RespOrg routes US toll-free traffic across multiple carriers in an active-active fashion.
3. Outbound calling is load balanced across multiple telephony providers.
4. An agent's browser chooses from at least two servers across multiple AZs, based on reachability.

More resources

To learn more about resiliency for Connect Customer, the following resources from AWS Workshop Studio are highly recommended:

- Connect Customer Global Resiliency Best Practices
- Connect Customer Global Resiliency and AWS Services Multi-Region Best Practices

Infrastructure security in Connect Customer

As a managed service, Connect Customer is protected by the AWS global network security procedures that are described on the Best Practices for Security, Identity, and Compliance page.

You use AWS published API calls to access Connect Customer through the network.

Supported versions of TLS

Clients must support Transport Layer Security (TLS) 1.2 or later.

Connect Customer offers a new website access model with a new domain (instance name.my.connect.aws) that supports TLS 1.2 or newer versions only. It is available by default for

instances created after March 2021. Existing customers can opt in to using the new domain using the following methods:

- For non-SAML Connect Customer instances, change your access URL from **.awsapps.com/connect** to **.my.connect.aws** and log in again.
- For SAML-enabled instances, specify an extra query parameter new_domain=true in the relay state URL and log in again. For more information, see Use a destination in your relay state URL.

Other requirements

Clients must support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

You can call these API operations from any network location, but Connect Customer does support resource-based access policies, which can include restrictions based on the source IP address.

Cross-service confused deputy prevention in AWS

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the *calling service*) calls another service (the *called service*). The calling service can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

We recommend using the `aws:SourceArn` and `aws:SourceAccount` global condition context keys in resource policies to limit the permissions that Connect Customer gives another service to the resource. If you use both global condition context keys, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must use the same account ID when used in the same policy statement.

The most effective way to protect against the confused deputy problem is to use the exact Amazon Resource Name (ARN) of the resource you want to allow. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the `aws:SourceArn` global context condition key with wildcards (*) for the unknown portions of the ARN. For example, `arn:aws:servicename::region-name::your AWS account ID:*`.

Connect Customer Customer Profiles cross-service confused deputy prevention

The following examples show policies that apply to cases where someone else is set up as the administrator for Connect Customer Customer Profiles. Use these policies to prevent the confused deputy problem.

Example Connect Customer Customer Profiles policy to create Customer Profile domains

Example Connect Customer Customer Profiles policy to create Customer Profiles object types

JSON

```

            "aws:SourceAccount":"111122223333"
            },
            "ArnEquals":{
            "aws:SourceArn":"arn:aws:connect:us-
east-1:111122223333:instance/InstanceId"
            }
         }
      }
   ]
}
```

Security Best Practices for Connect Customer

Connect Customer provides a number of security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don't represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

Topics

- Connect Customer preventative security best practices
- Connect Customer detective security best practices
- Connect Customer Chat security best practices
- Connect Customer WebRTC security best practices

Connect Customer preventative security best practices

- Make sure that all profile permissions are as restrictive as possible. Allow access to only those resources absolutely required for the user's role. For example, don't give agents permissions to create, read, or update users in Connect Customer.
- Make sure that multi-factor authentication (MFA) is set up through your SAML 2.0 identity provider, or Radius server, if that's more applicable for your use case. After MFA is set up, a third text box becomes visible on the Connect Customer login page to provide the second factor.
- If you use an existing directory through Directory Service or SAML-based authentication for identity management, make sure that you follow all security requirements appropriate for your use case.
- Use the **Log in for emergency access** URL on the instance page of the AWS console only in emergency situations, not for daily use. For more information, see Emergency login to the Connect Customer admin website.

Use service control policies (SCPs)

Service control policies (SCPs) are a type of organization policy that you can use to manage permissions in your organization. An SCP defines a guardrail, or sets limits, on the actions that the account's administrator can delegate to users and roles in the affected accounts. You can use SCPs to protect critical resources associated with your Connect Customer workload.

Set a Service Control Policy to prevent the deletion critical resources

If you're using SAML 2.0-based authentication and delete the AWS IAM Role that is used for authenticating Connect Customer users, users won't be able to log in to the Connect Customer instance. You will need to delete and recreate users to be associated with a new Role. This results in the deletion of all data associated with those users.

To prevent the accidental deletion of critical resources and to protect the availability of your Connect Customer instance, you can set a Service Control Policy (SCP) as an additional control.

Following is an example SCP that can be applied at the AWS Account, Organizational Unit, or Organizational Root to prevent the deletion of the Connect Customer instance and associated Role:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Sid": "AmazonConnectRoleDenyDeletion",
      "Effect": "Deny",
      "Action": [
        "iam:DeleteRole"
      ],
      "Resource": [
        "arn:aws:iam::*:role/ConnectUserRole"
      ]
    },
    {
      "Sid": "AmazonConnectInstanceDenyDeletion",
      "Effect": "Deny",
      "Action": [
        "connect:DeleteInstance"
      ],
      "Resource": [
         "arn:aws:connect:us-east-1:111122223333:instance/InstanceId"
      ]
    }
  ]
}
```

Connect Customer detective security best practices

Logging and monitoring are important for the availability, reliability and, performance of contact center. You should log relevant information from Connect Customer flows to CloudWatch and build alerts and notifications based on the same.

Define log retention requirements and lifecycle policies early on, and plan to move log files to cost-efficient storage locations as soon as practical. Connect Customer public APIs log to CloudTrail; for

more information, see Log Connect Customer API calls with AWS CloudTrail. Review and automate actions based on CloudTrail logs.

We recommend Amazon S3 for long-term retention and archiving of log data, especially for organizations with compliance programs that require log data to be auditable in its native format. After log data is in an Amazon S3 bucket, define lifecycle rules to automatically enforce retention policies and move these objects to other, cost-effective storage classes, such as Amazon S3 Standard - Infrequent Access (Standard - IA) or Amazon Glacier.

The AWS Cloud provides flexible infrastructure and tools to support both sophisticated partner offerings and self-managed centralized-logging solutions. This includes solutions such as Amazon OpenSearch Service and Amazon CloudWatch Logs.

You can implement fraud detection and prevention for incoming contacts by customizing Connect Customer flows per your requirements. For example, you can check incoming contacts against previous contact activity in Dynamo DB and then take actions such as disconnecting a contact who is on a deny list.

Connect Customer Chat security best practices

When you integrate with the Connect Customer Participant Service directly (or use the Connect Customer Chat Java Script library) and use WebSocket or streaming endpoints to receive messages for your frontend applications or websites, you must protect your application from DOM-based XSS (cross-site scripting) attacks.

The following security recommendations can help safeguard against XSS attacks:

- Implement proper output encoding to help prevent malicious scripts from executing.
- Do not mutate DOM directly. For example, don't use `innerHTML` to render chat response contents. It might contain malicious Javascript code that can lead to an XSS attack. Use frontend libraries like React to escape and sanitize any executable code included in the chat response.
- Implement a Content Security Policy (CSP) to restrict the sources from which your application can load scripts, styles, and other resources. This adds an extra layer of protection.

Connect Customer WebRTC security best practices

For both WebRTC and chat contacts, participants are issued a Participant Token, which is a bearer token that uniquely identifies them within a contact session. Because possession of this token

grants access, its exposure can lead to impersonation attacks. Therefore, protecting this token is critical.

The following security recommendations can help safeguard against impersonation attacks:

- **Authenticate users before token issuance**. Make sure that robust authentication and authorization checks are performed before vending a participant token to any client or external service.
- **Minimize token exposure**. Do not log participant tokens or embed them in URLs. Use secure transport (HTTPS/TLS) for all token exchanges..
- **Respond to token leaks quickly**. If a token leak is detected, immediately terminate or stop the associated contact to prevent unauthorized access.
- **Use least privilege principles**. Limit token lifespan wherever possible, ensuring tokens are valid only for the duration necessary.
- **Monitor and audit**. Track token usage and access patterns to detect anomalies or potential abuse.

Set IP address restrictions and session timeouts in Connect Customer

> **Note**
>
> This feature is in preview release and subject to change. To obtain access to this feature, contact your Connect Customer Solutions Architect, Technical Account Manager, or Support.

To further lock down your contact center, for example, to comply with requirements and regulations in your industry, you can set up IP address restrictions and session timeouts.

- IP address restrictions require agents to sign in only from your VPN, or block access from specific countries or subnets.
- Session timeouts require agents to log in to Connect Customer again.

In Connect Customer you configure an *authentication profile* to set IP address restrictions and session durations of logged in agents. An authentication profile is a resource that stores the authentication settings for users in your contact center.

Getting started with authentication profiles

Your Connect Customer instance includes a default authentication profile. This authentication profile applies to **all users** in your contact center by default and does not need to be assigned.

Authentication profiles are currently only configurable with the AWS SDK. To configure your default authentication profile, use the following commands.

> **Tip**
>
> You need your Connect Customer instance ID to run these commands. For instructions about how to locate your instance ID, see Find your Connect Customer instance ID or ARN.

1. List the authentication profiles in your instance to get the profile ID of the authentication profile you want to update. You can call the ListAuthenticationProfile API or run the `list-authentication-profiles` CLI command.

   Following is an example `list-authentication-profiles` command:

   ```
   aws connect list-authentication-profiles --instance-id your-instance-id
   ```

   Following is an example of the default authentication profile that is returned by the `list-authentication-profiles` command.

   ```
   {
       "AuthenticationProfileSummaryList": [
           {
           "Arn": "arn:aws:connect:us-west-2:account-id:instance/your-instance-id/
   authentication-profile/profile-id",
           "Id": "profile-id",
           "IsDefault": true,
           "LastModifiedRegion": "us-west-2",
           "LastModifiedTime": 1.719249173664E9,
           "Name": "Default Authentication Profile"
           }
   ```

```
    ],
    "NextToken": null
}
```

2. View the configuration of the authentication profile you want to update. You can call the DescribeAuthenticationProfile or run the `describe-authentication-profile` CLI command.

   Following is an example `describe-authentication-profile` command:

   ```
   aws connect describe-authentication-profile --instance-id your-instance-id --
   authentication-profile-id authentication-profile-id
   ```

   Following is an example of the information returned by the `describe-authentication-profile` command.

   ```
   {
       "AuthenticationProfile": {
       "AllowedIps": [],
       "Arn": "arn:aws:connect:us-west-2:account-id:instance/your-instance-id/
   authentication-profile/profile-id",
       "BlockedIps": [],
       "CreatedTime": 1.718999177811E9,
       "Description": "A basic default Authentication Profile",
       "Id": "profile-id",
       "IsDefault": true,
       "LastModifiedRegion": "us-west-2",
       "LastModifiedTime": 1.719249173664E9,
       "MaxSessionDuration": 720,
       "Name": "Default Authentication Profile",
       "PeriodicSessionDuration": 60,
       "SessionInactivityDuration": 60,
       "SessionInactivityHandlingEnabled": false
       }
   }
   ```

   For a description of each field, see AuthenticationProfile in the *Connect Customer API Reference*.

3. Configure the authentication profile by using the UpdateAuthenticationProfile API or the `update-authentication-profile` CLI command. All fields except `InstanceId` and `ProfileId` are optional. Only the settings you define in the API call are changed.

Following is an example `update-authentication-profile` command. It configures the default authentication profile that's automatically assigned to all users. It allows some IP addresses, blocks others, enables automatic logouts on user inactivity, and sets the session inactivity duration to 60 minutes.

```
aws connect update-authentication-profile
    --instance-id your-instance-id
    --authentication-profile-id authentication-profile-id
    --name "Default Authentication Profile"
    --description "A basic default Authentication Profile"
    --allowed-ips "ip-range-1" "ip-range-2" ...
    --blocked-ips "ip-range-3" "ip-range-4" ...
    --session-inactivity-handling-enabled
    --session-inactivity-duration 60
```

Configure IP-based access control

If you want to configure access to your contact center based on IP addresses, you can use the IP-based access control feature of your authentication profile.

There are two types of IP configurations that you can configure in an authentication profile: allowed IP address ranges and blocked IP address ranges. The following points describe how IP-based access control works.

- IP addresses can be in both IPV4 *and* IPV6 formats.
- You can define both individual IP addresses *and* IP address ranges in CIDR notation.
- Blocked IP configurations always take precedence.
- If IP addresses are defined in the Allowed IP list, *only* those IP addresses are allowed.
  - These IP addresses can be scoped down by the Blocked IP list.
- If only Blocked IP addresses are defined, any IP address can access the instance, *except* those defined in the block list.
- If IP addresses are defined in both allowed and blocked IP address lists, *only* the IP addresses defined in the allowed range are allowed, *minus* any IP addresses in the blocked range.

> **Note**
>
> IP address based access control does not apply to the emergency admin login. To apply restrictions on this user, you can apply `SourceIp` restrictions in your IAM policies for the API `connect:AdminGetEmergencyAccessToken`.

When a user's IP address is determined to be blocked by the instance, the user's session will be invalidated. A logout event is published in the Login/Logout report.

What users experience when their IP address check fails

Agents

When an agent is active in the Contact Control Panel (CCP), their IP address is checked periodically.

Following is what happens if the IP address fails the check:

- If the agent is not on an active call, the agent is signed out if their IP address changes to a disallowed address.
- If the agent is on an active call, the agent's session is invalidated. However, this does not end the currently active call. Here's what happens:
  1. The agent loses the ability to take any action, such as changing agent status, transferring calls, putting the call on hold, ending the call, or creating a case.
  2. The agent is notified that their ability to take action in the CCP is restricted.
  3. If they log in successfully after their session is invalidated, they are placed back into the active call and can take action again.

Admins and users using the Connect Customer admin website

When the IP address check fails for admins and other users taking actions on the Connect Customer admin website, such as saving updates to resources or barging in to active calls, they are automatically logged out.

Example IP address configurations

Example 1: IP addresses only defined in the allowed IP list

- AllowedIps: [`111.222.0.0/16`]

- BlockedIps: [ ]

Outcome:

- Only IP addresses between `111.222.0.0` and `111.222.255.255` are allowed to access the instance.

Example 2: IP addresses only defined in the blocked IP list

- AllowedIps: [ ]
- BlockedIps: [`155.155.155.0/24`]

Outcome:

- All IP addresses are allowed, *except* the IP address range `155.155.155.0 - 155.155.155.255` inclusive.

Example 3: IP addresses defined in both the allowed IP list and the blocked IP list

- AllowedIps: [`200.255.0.0/16`]
- BlockedIps: [`200.255.10.0/24, 200.255.40.50, 192.123.211.211`]

Outcome:

- IP addresses between `200.255.0.0 - 200.255.255.255` are allowed, minus (`200.255.10.0 - 200.255.10.255 AND 200.255.40.50`).
- Effectively, `200.255.0.0 - 200.255.9.255, 200.255.11.0 - 200.255.40.49, 200.255.40.51 - 200.255.255.255` are allowed.
- `192.123.211.211` is effectively ignored since it is not within range of the Allowed range.

Example 4: No IP addresses defined in either the allowed IP list or the blocked IP list

- AllowedIps: [ ]
- BlockedIps: [ ]

In this case, there are no restrictions.

> **Important**
>
> The `allowedIps` list defines the range of possible IPs allowed in your contact center only *if* it is not empty. If it is empty, *any* IP address is allowed to access your contact center unless explicitly blocked by the `blockedIps` list.

Configure user session timeouts

An Connect Customer session is defined as a continuous period of authenticated access to your contact center's website. There are two session timeouts that apply to user sessions in your contact center:

- **Maximum session duration**: This value represents the maximum time period a contact center user can be logged in before being forced to sign-in again. This value defaults to 12 hours and isn't configurable.
- **Session inactivity duration:** : This value represents the period before an agent is automatically signed out of the contact center when they go inactive.

By default, users in your Connect Customer instance remain signed in until the maximum session duration of 12 hours elapses, with no automatic logout for inactivity. However, organizations with stricter security and compliance requirements can use authentication profiles to enable automatic sign-out when users become inactive. Once enabled, this feature monitors user activity patterns and automatically ends sessions after the configured session inactivity duration has passed.

A contact center user is considered active when performing any of the following actions:

- Mouse and keyboard activity on the Contact Control Panel (CCP), agent workspace, or Admin Website
- Presence of an active voice contact

If the user is determined to be inactive, a pop-up will appear on the screen warning the user that their session is about to expire due to inactivity. A user can choose to remain logged in or log out.

To opt-in to automatic logout on user inactivity, perform the following API calls on an authentication profile in your instance using the Connect Customer SDK.

```
aws connect update-authentication-profile
    --instance-id your-instance-id
    --authentication-profile-id authentication-profile-id
    --session-inactivity-handling-enabled
    --session-inactivity-duration minutes between 15 and 720
```

Note

Customers who integrate their contact center with a third-party vendor (such as Salesforce Service Cloud Voice (SCV)) should refer to the vendor documentation to determine if this feature is supported before enabling automatic log-outs on inactivity.

Note

Customers who use AmazonConnectStreams or the AmazonConnectSDK to integrate their existing web applications with Connect Customer must implement activity handling as part of their integration before enabling automatic log-out on user inactivity. See the AmazonConnectStreams or AmazonConnectSDK documentation for more information.

Note

Automatic log-out on user inactivity is not supported when using Amazon Connect in a Virtual Desktop Infrastructure (VDI) with a split CCP model.

Agent training guide for the Contact Control Panel (CCP) and agent workspace in Connect Customer

This section provides an overview of the default Connect Customer agent workspace and Contact Control Panel. Your organization might be using a customized version of the agent workspace or Contact Control Panel. Please contact your Technical Support for specific questions about how your instance of Connect Customer works.

Agent workspace

With the agent workspace you can access all Connect Customer features in a single application. You can:

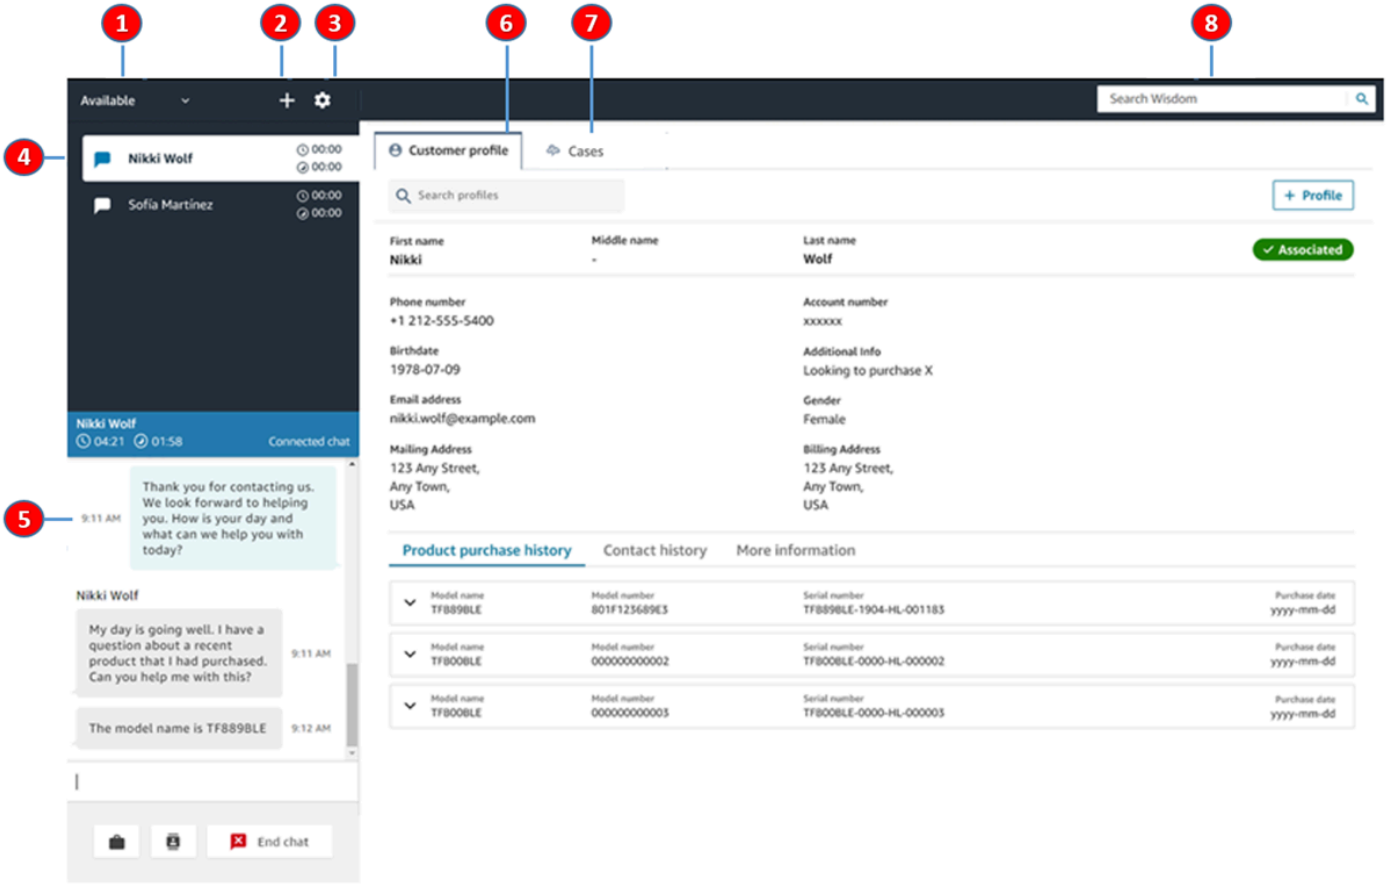
- Use the Contact Control Panel (CCP) to interact with customer contacts.
- Use Customer Profiles to view customer information.
- Use Cases to create, edit, and resolve customer cases.
- Use Connect Customer agent assist to obtain the information you need from your company knowledge base.

To access the agent workspace use the following URL:

- `https://instance-name.my.connect.aws/agent/`

Where *instance name* is provided by your IT department or the individuals that set up Connect Customer for your business.

The following image shows the agent workspace with the CCP, Customer Profiles, Cases, and agent assist.



1. Set your status.
2. Access to the number pad, quick connects, and task creation.
3. Log in and out. Set your language preferences, device settings (if enabled), and phone type.
4. Inbox of inbound calls, chats, and tasks.
5. Based on the channel of the contact that is in focus in your inbox, the appropriate content shows here; for example, when a chat is selected, the chat interface appears.
6. View customer information for the contact that is in focus in your inbox.
7. Search and view cases.
8. Search for knowledge articles to solve customer issues.

CCP

You use the Connect Customer Contact Control Panel (CCP) to interact with customer contacts. It's how you receive calls, chat with contacts, transfer them to other agents, put them on hold, and perform other key tasks.

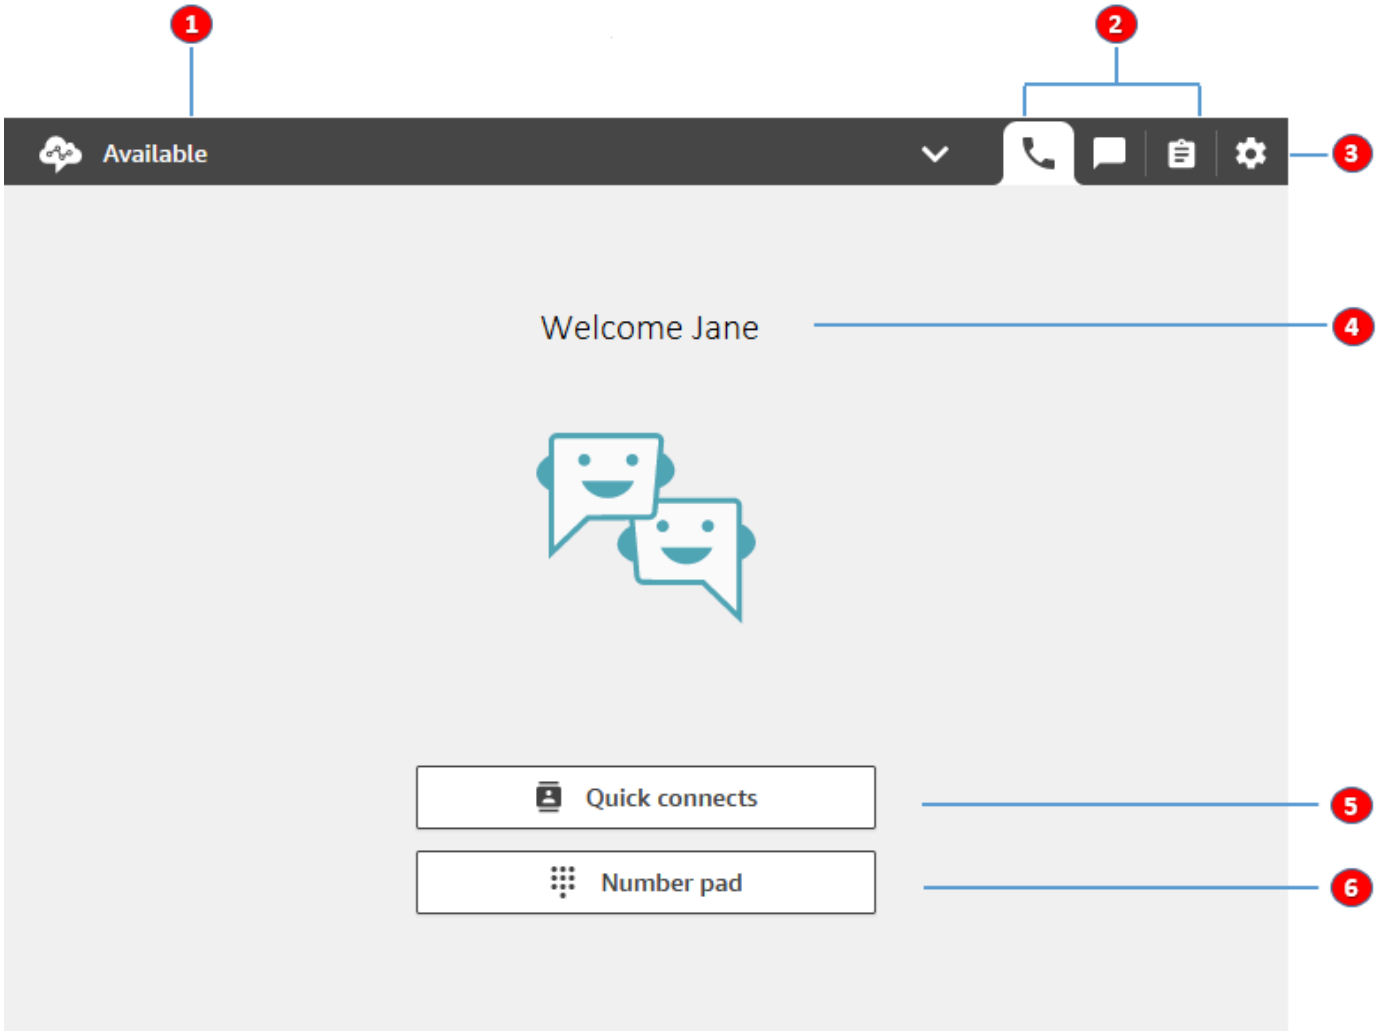
The URL to launch the CCP is:

- https://*instance name*.my.connect.aws/ccp-v2/

Where *instance name* is provided by your IT department or the individuals that set up Connect Customer for your business.

Large businesses often choose to customize their CCP. For example, they might want to integrate it with a CRM. However, this section describes how CCP works before it is customized.

The following image shows the CCP.



1. Set your status.
2. The channels enabled for your agent routing profile.
3. Log in and out. Set your language preferences, device settings (if enabled), and phone type.

4. Name of the agent that's currently signed in.
5. Choose a predefined destination to transfer the contact. Or call an external number.
6. Call a number or enter digits into an IVR menu.

Training video: How to use the Contact Center Panel (CCP) in Connect Customer

The following video introduces you to the Contact Control Panel (CCP). It shows how to perform common tasks, such as login and setup, accept incoming calls, place calls, transfer calls, accept chat, and more.

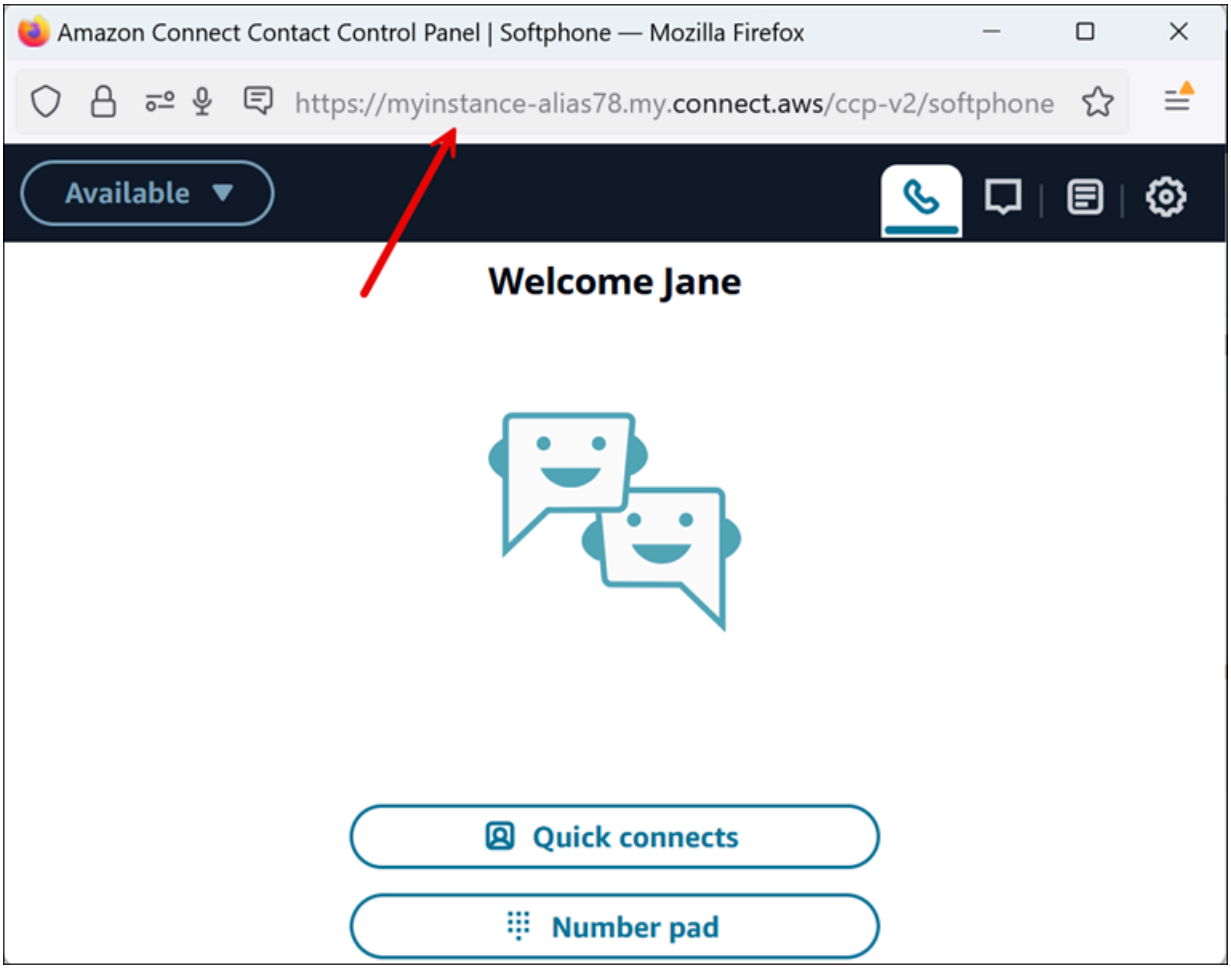
Connect Customer

Launch the Contact Control Panel (CCP) in Connect Customer

The URL to launch the CCP is:

- https://*instance name*.my.connect.aws/ccp-v2/

Where *instance name* is provided by your IT department or whoever set up Connect Customer for your business. The following image shows an example URL for the CCP.



With this updated CCP, your agents can manage voice, chat, and tasks from this single interface.

As the administrator, you can also launch the CCP directly from the Connect Customer console. Just choose the phone icon in the upper right corner.

To provide agents the ability to launch the CCP from their desktop and start handling contacts, there are a few things you need to do:

- Add agents as users to the instance. For more information, see Manage users that you add to Connect Customer.
- Configure permissions for the agents. By default, agents assigned to the Agent security profile can access the CCP and make outbound calls. But you can create a custom security profile and add additional permissions. For more information, see Security profiles for Connect Customer and Contact Control Panel (CCP) access.
- Give agents the URL to the CCP.
- Provide agents with their user name and password so that they can log in to the CCP.

We recommend telling agents to bookmark the URL to the CCP for more convenient access.

Agents can use the CCP with a softphone on their computer, or a desk phone. If they're using a softphone, they must use Chrome, Edge, or Firefox for their web browser. For more information, see Grant microphone access in Chrome, Firefox, or Edge.

> **Note**
>
> If you see the **Session expired** message while logging in, you probably just need to refresh the session token. Go to your identity provider and log in. Refresh the Connect Customer page. If you still get this message, contact your IT team.

Log in and log out of the Connect Customer CCP

Before you can log in to the Contact Control Panel (CCP), your administrator must give you the following information:

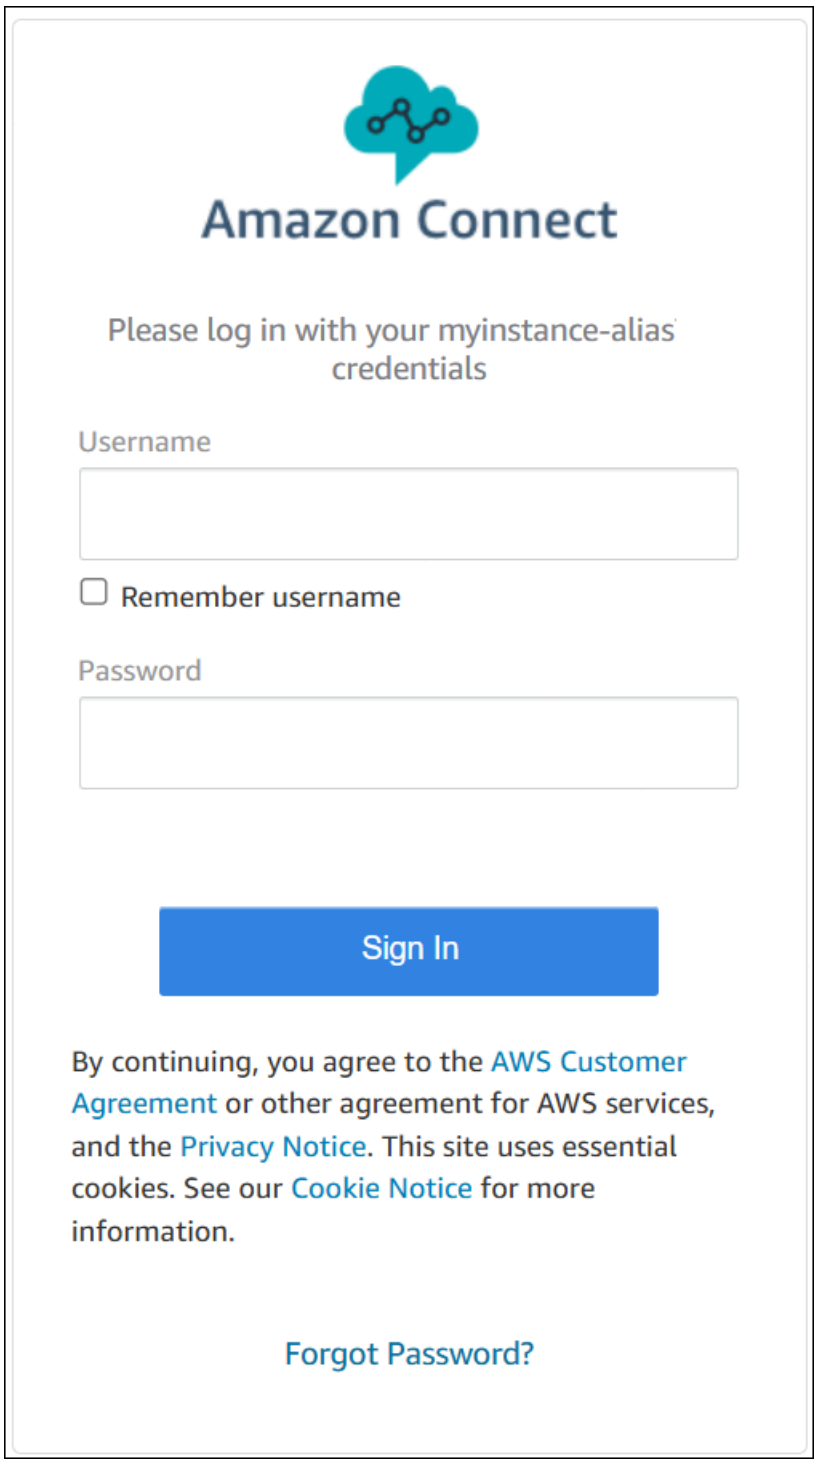
- The URL to launch the CCP:
  - https://*instance name*.my.connect.aws/ccp-v2/

  Where *instance name* is provided by your IT department or whoever set up Connect Customer for your business.
- Your agent ID.
- Your agent password.

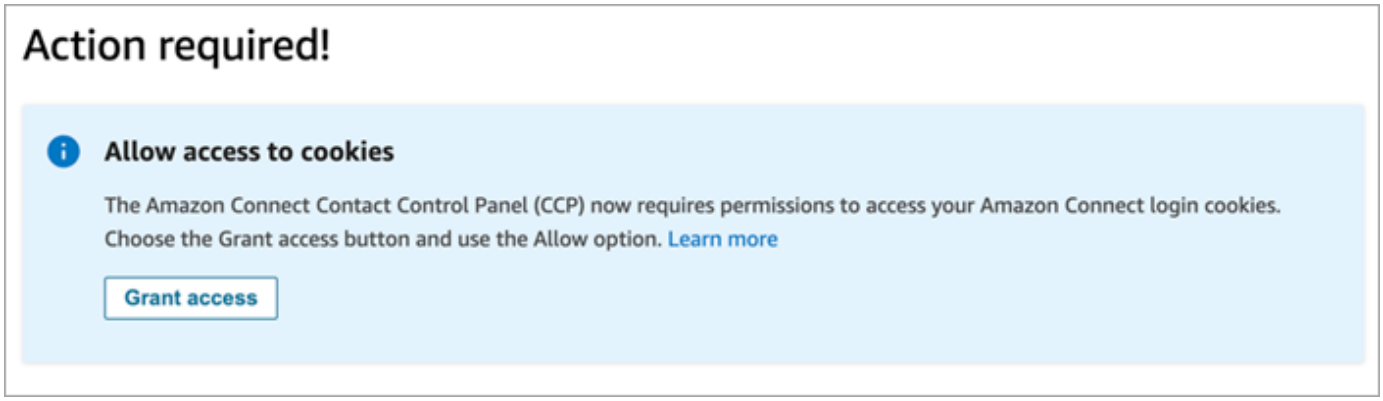
To log in

After you have that information, here's how to log in and get started.

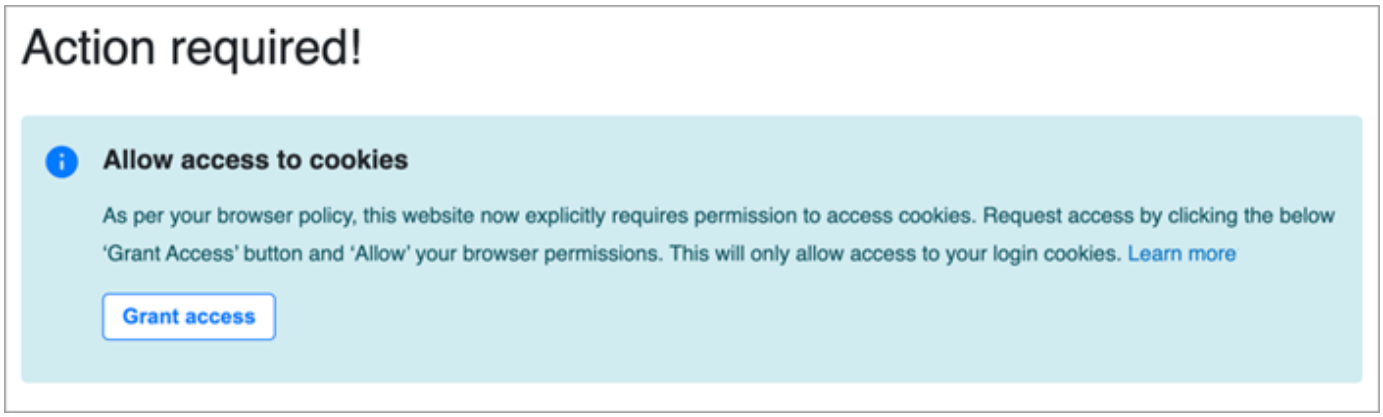
1. Make sure that your USB headset is securely connected to your computer.
2. Using Chrome or Firefox, open the CCP by using the URL that you received from your administrator.
3. Enter your agent ID and password, and then choose **Sign In**.



4. If you're prompted to **Allow access to cookies**, choose **Grant access**, and then choose **Allow**.



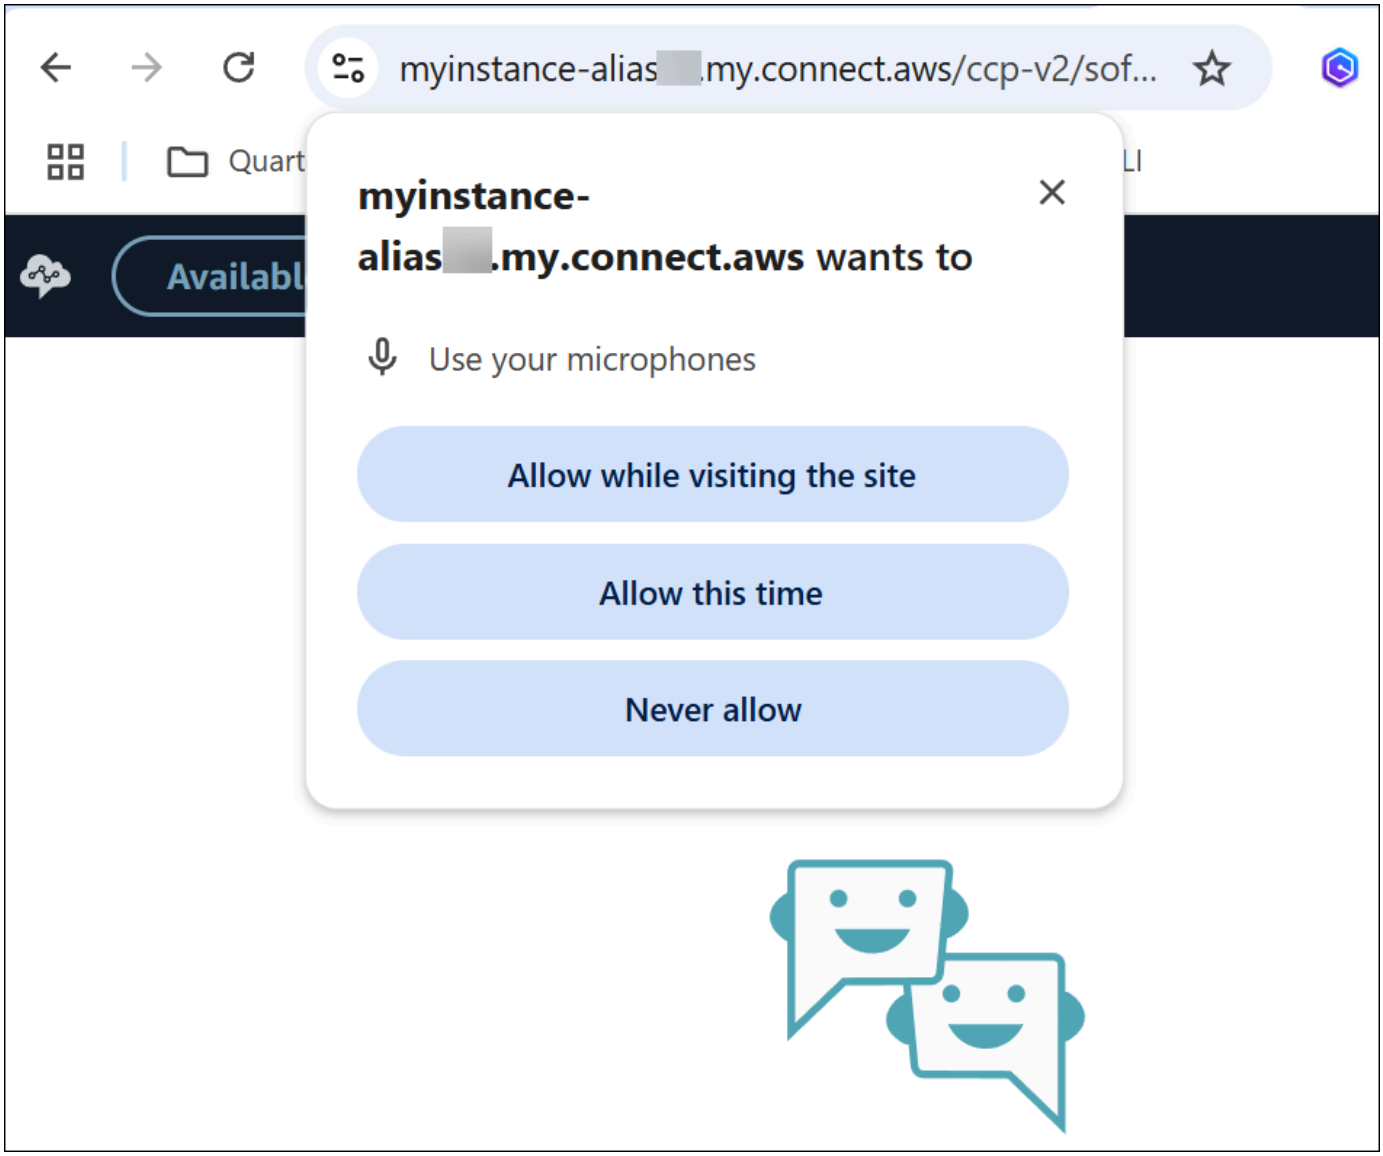
OR



Connect Customer uses cookies for authentication. Google Chrome requires you to authorize the use of Connect Customer cookies.

> **Tip**
>
> **IT admins**: For more information, see Using Connect Customer with third-party cookies.

5. If you are prompted to allow access to your microphone and speaker, choose **Allow**.



You're all set to go!

Problems logging in?

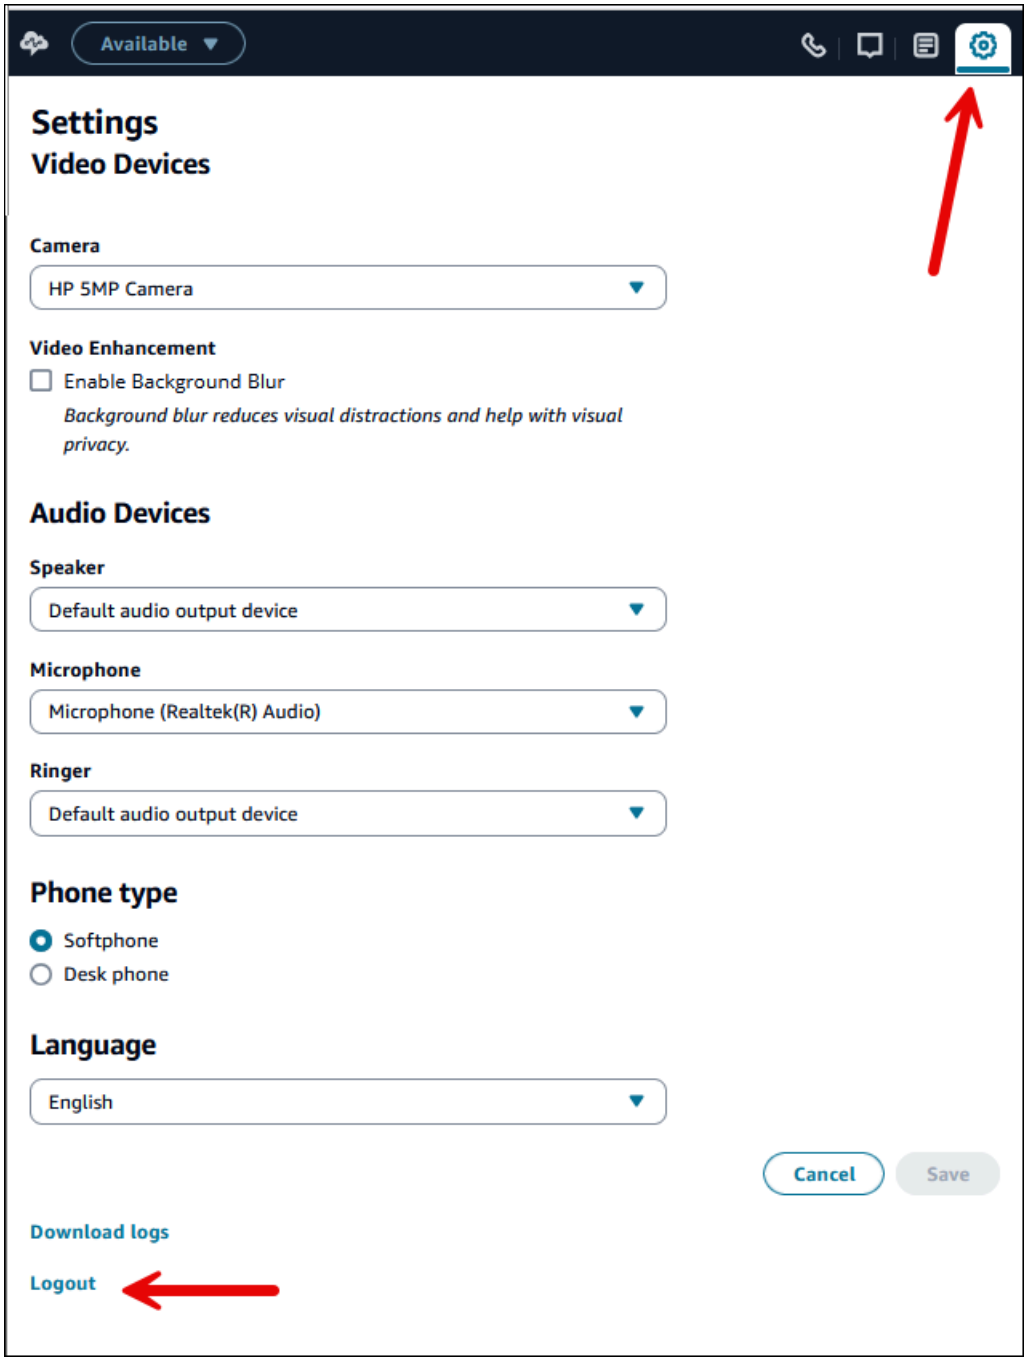
If you have problems logging in to the CCP, contact your manager for help, or the IT Department for your organization.

> **Note**
>
> If you see the **Session expired** message while logging in, you probably just need to refresh the session token. Go to your identity provider and log in. Refresh the Connect Customer page. If you still get this message, contact your IT team.

Log out of the Connect Customer CCP

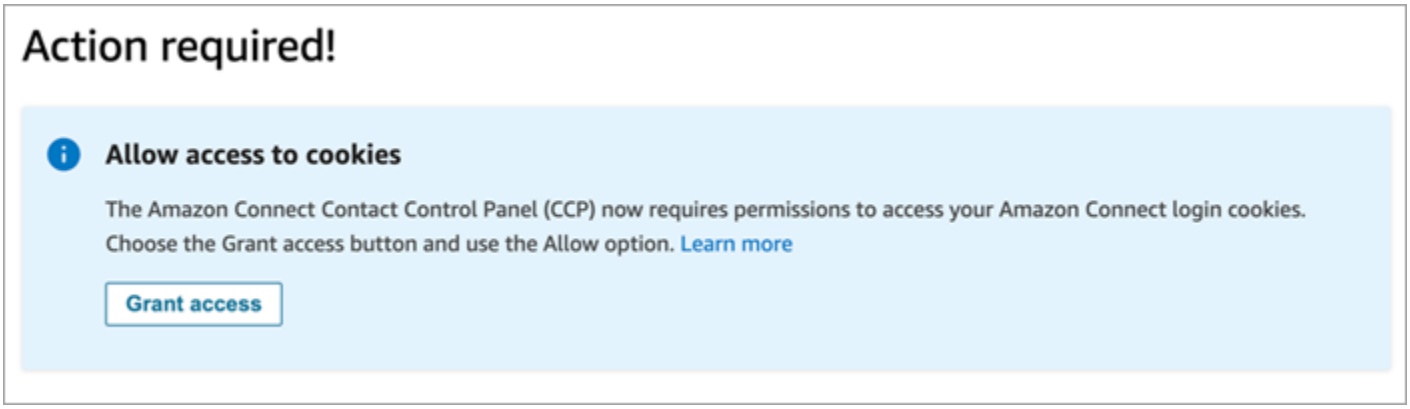
> **Important**
>
> Closing the CCP window or agent workspace doesn't automatically log out an agent. Agents must choose **Log out**.

1. At the top of the CCP, choose **Settings**.
2. Choose **Log out**.

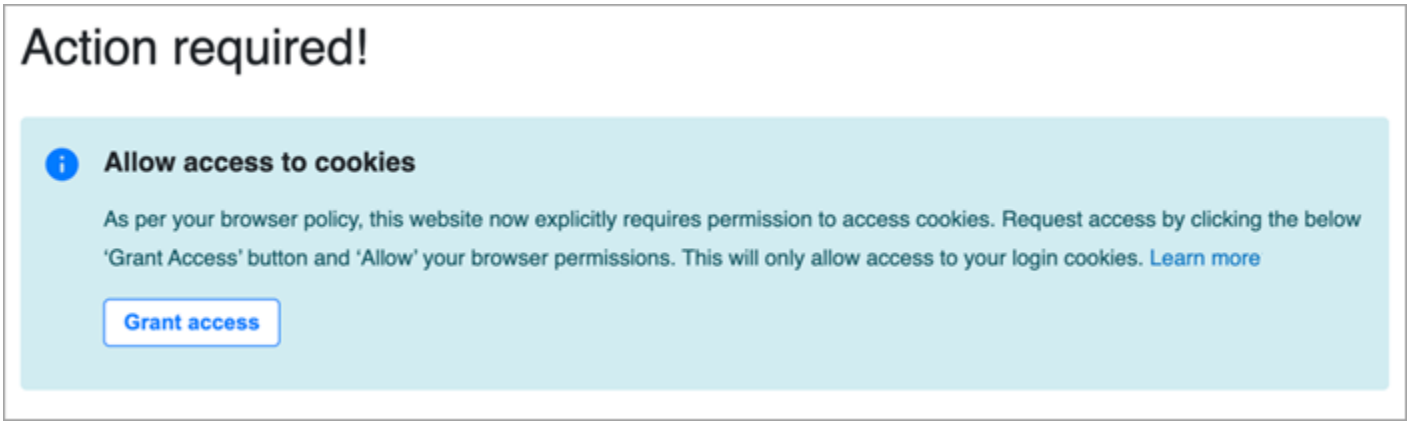


Allow the Connect Customer Contact Control Panel (CCP) to access cookies

When logging into the CCP you might see one of these banners:



OR



Connect Customer uses cookies for authentication. Google Chrome requires you to authorize the use of Connect Customer cookies.

1. When you log in to the CCP, on the **Allow access to cookies** banner choose **Grant access**.
2. At the next prompt, choose **Allow**.

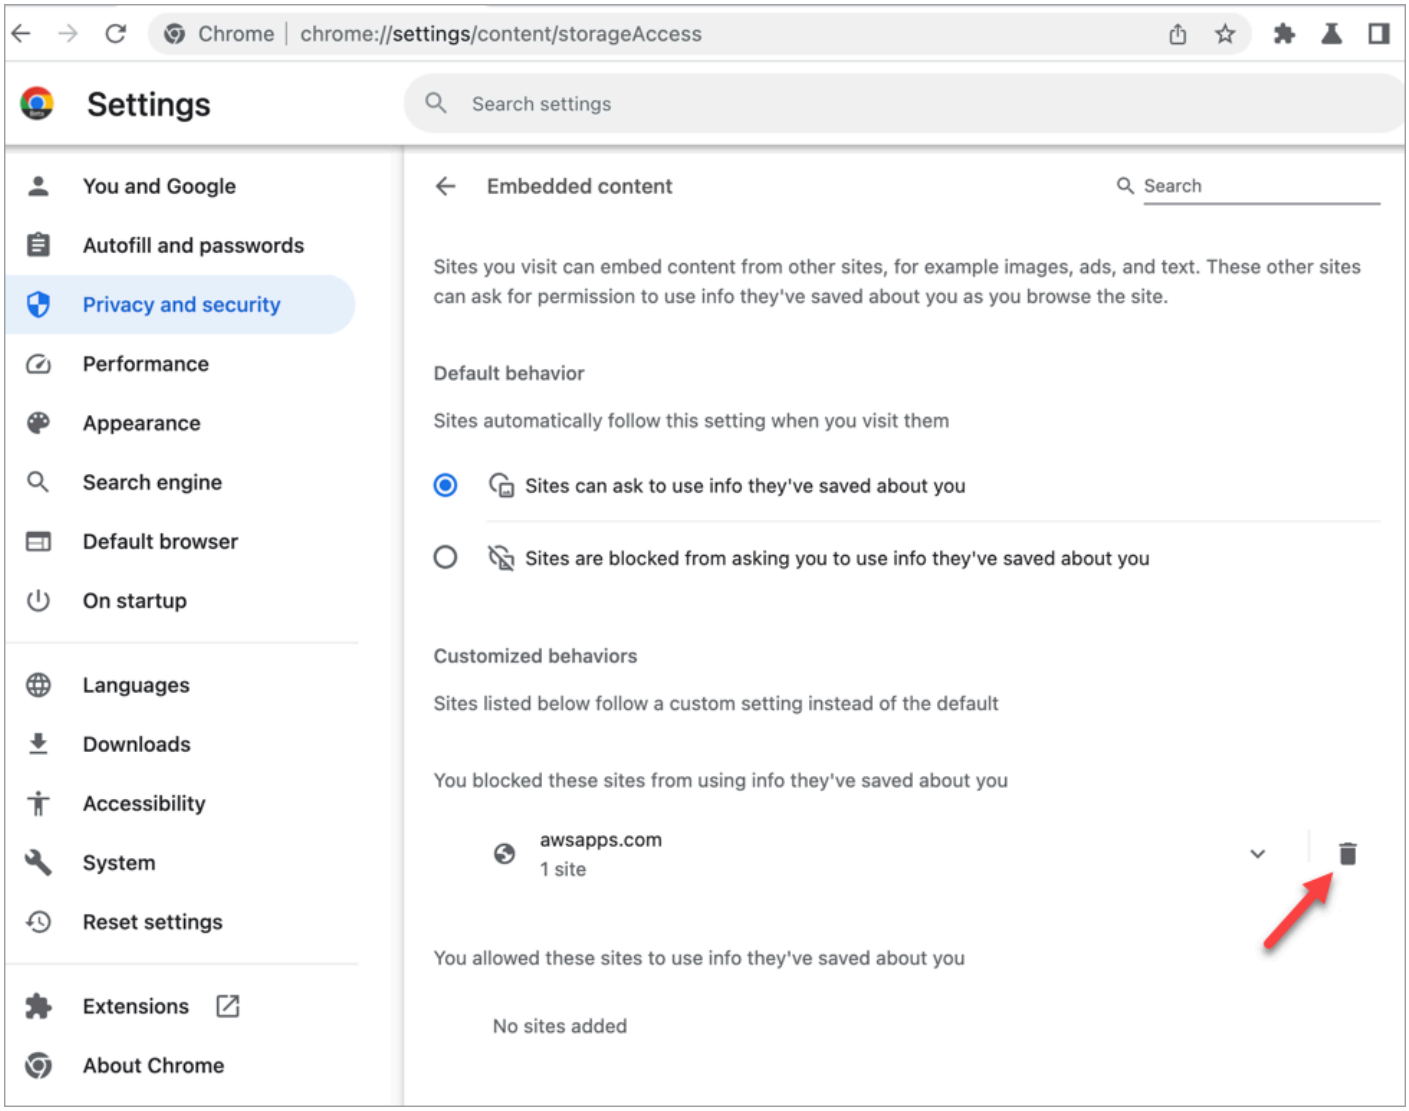
You might need to repeat these steps periodically, for example, if your organization requires it every 30 days.

What happens if you don't choose Grant access when prompted?

If you don't choose **Grant access** when prompted, you won't be able to log into the CCP. To enable access outside of the login workflow, perform the following steps:

1. Navigate to `chrome://settings/content/storageAccess`.
2. In the left navigation menu, choose **Privacy and security**.
3. Choose **Third-party cookies**.

4. Under **You blocked these sites from using info they've saved about you**, delete any entries associated with `awsapps.com` or `connect.aws` as shown in the following image.



5. You can close that instance of your browser.
6. Open your CCP. When prompted, choose **Grant access**, and then choose **Allow**.

Change your audio device settings in the CCP or agent workspace

When you're using the CCP or agent workspace, you can choose your preferred device for the audio, microphone, and ringer. With these settings, you can have audio notifications to ring from a desktop/laptop speaker instead of a headset, for example.

Important

Your speaker, ringer, and microphone settings are saved in your browser storage, not in Connect Customer.

- If your browser cache is cleared when you log off, these settings are also cleared.
- If you move to a different computer or browser, you will need to change these settings there, too.

Change audio device settings in the CCP

1. In the CCP or agent workspace, choose **Settings**. The **Settings** dialog box appears, similar to the following image.

Settings

Video Devices

Camera

HP 5MP Camera

Video Enhancement

Enable Background Blur

Background blur reduces visual distractions and help with visual privacy.

Audio Devices

Speaker

Default - MacBook Pro Speakers (Built-in)

Microphone

Default - MacBook Pro Microphone (Built-in)

Ringer

Default - MacBook Pro Speakers (Built-in)

Audio enhancement

Changes will apply to your next call or when the microphone is changed

Isolate your voice (only recommended for wired headsets)

Phone type

Softphone

Desk phone

Notifications

Enable Chat Audio Notifications

Language

English

Cancel Save

Download logs

Logout

2. Under **Audio devices**, use the dropdown to select your **Speaker**, **Microphone**, **Ringer**, and **Audio Enhancement**. For more information about Audio Enhancement, see Enable Audio Enhancement for agents in Amazon Connect.

Enable audio notifications for new chat messages

New chat messages always appear as visual indicators in the Contact Control Panel (CCP) or agent workspace. You can also enable Chat Audio Notifications to add an audio alert when a new message arrives. This opt-in setting persists across sessions.

1. Open the CCP or agent workspace, and then choose **Settings**.
2. Under **Notifications**, select **Enable Chat Audio Notifications**.

After you enable this setting, the CCP continues to display visual indicators for new chat messages and also plays an audio alert.

Prerequisite: Allow your browser to access your microphone

Before you can change your audio device settings in the CCP, you need to make sure you've given your browser permission to access your microphone. This populates the device list in the CCP.

If you haven't done this yet, see the instructions for your browser.

- Chrome
- Edge
- Firefox

What to check when your audio device isn't working as expected

Following are the top tips for resolving issues with audio devices.

- Check that your headset is properly connected to your desktop.
- Make sure that Windows exclusive mode is not enabled. For instructions that are appropriate for your device, search the internet for turning off Windows exclusive mode for your audio device.
- Make sure that the device is not muted or disabled in your operating system settings. Following are instructions for a Windows computer:

1. Press **Windows** + **I** to open **Settings**.
2. Choose **System**, and then choose **Sound** on the left navigation pane.
3. Scroll down the page and choose **Microphone privacy settings**.
4. Under **Allow apps to access your microphone**, set the toggle to **On**.

Info for IT admins and Developers

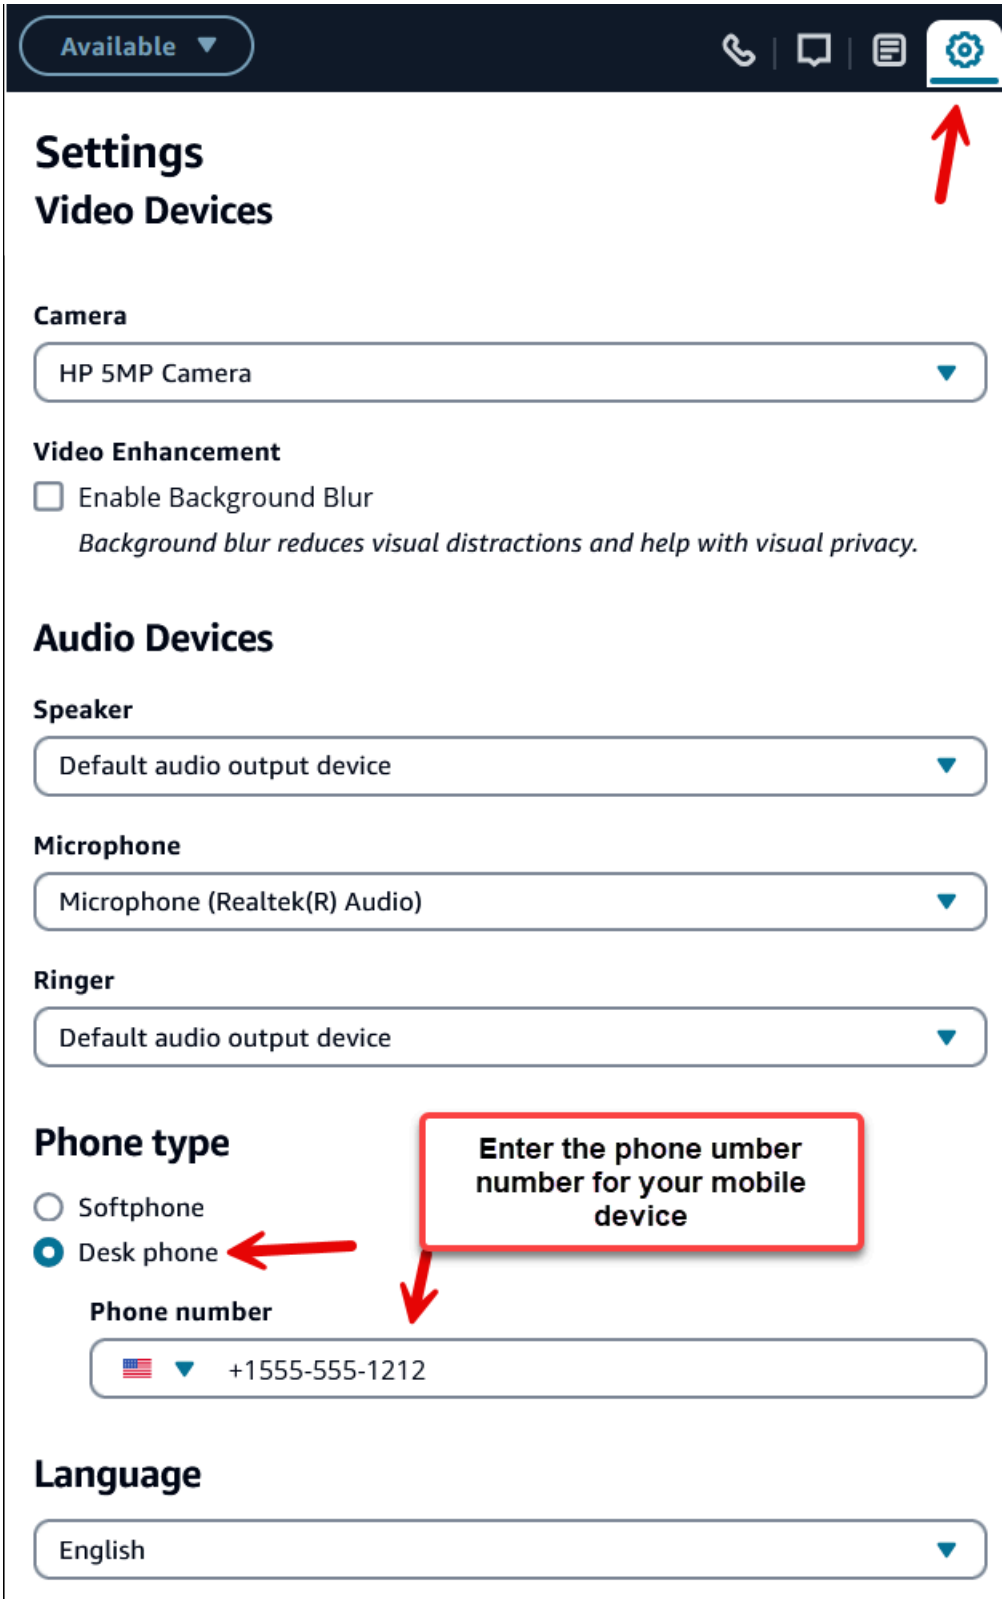
- **IT admins**: Agents need **Contact Control Panel (CCP) - Audio device settings** permissions in their security profile to access this feature.
- **Developers**: If you are embedding the CCP into a CRM or custom desktop, you can use either the **Audio device settings** security profile permission or Connect Customer Streams to pass the `enableAudioDeviceSettings` parameter to enable audio device settings upon initialization. If either of those flags is true, the audio device settings user interface is displayed in **Settings** on the CCP.

  For granular permission, we recommend using the security profile permission. The Streams flag is supported for backward compatibility.

Forward calls in the Connect Customer CCP to a mobile device (iPhone, Android)

You can take the audio portion of a call on your mobile device, and at the same time use your computer to access the Contact Control Panel. This topic explains how to forward calls to your mobile device.

1. In your Contact Control Panel (CCP), open Settings.
2. Under **Phone type**, choose **Desk phone**.
3. Enter the phone number for your mobile device, and choose **Save**.



When a contact calls, the audio portion of the call goes to your mobile device. At the same time, on your computer you can manage the call using the CCP.

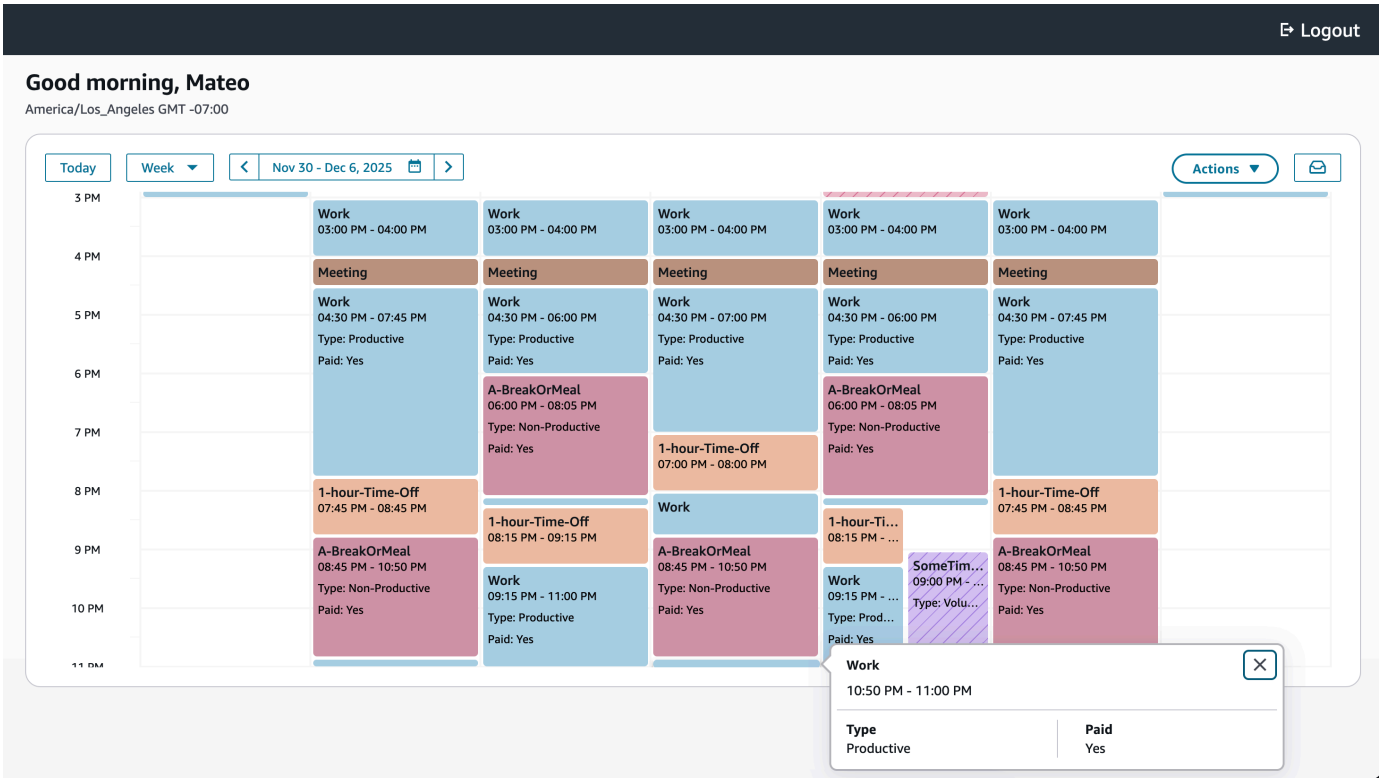
View the agent schedule in the agent workspace in Connect Customer

If your organization uses the forecasting, capacity planning, and scheduling features of Connect Customer you can view your schedule in the agent workspace.

Complete the following are steps to view your schedule in the agent workspace.

1. Log on to the agent workspace using the URL that your admin gives you (for example, `https://[instance name].my.connect.aws/ccp-v2/`).
2. Choose the Calendar icon on the application navigation bar to launch the staff schedule manager viewer. Otherwise, the staff schedule manager viewer launches automatically.

   The following image shows a sample schedule in the agent workspace.



Set your status to "Available" in the Contact Control Panel (CCP)

As a call center agent, set an **Available** status when you're ready to handle contacts.

Connect Customer uses information in the agent's routing profile to determine which contacts to route to them.

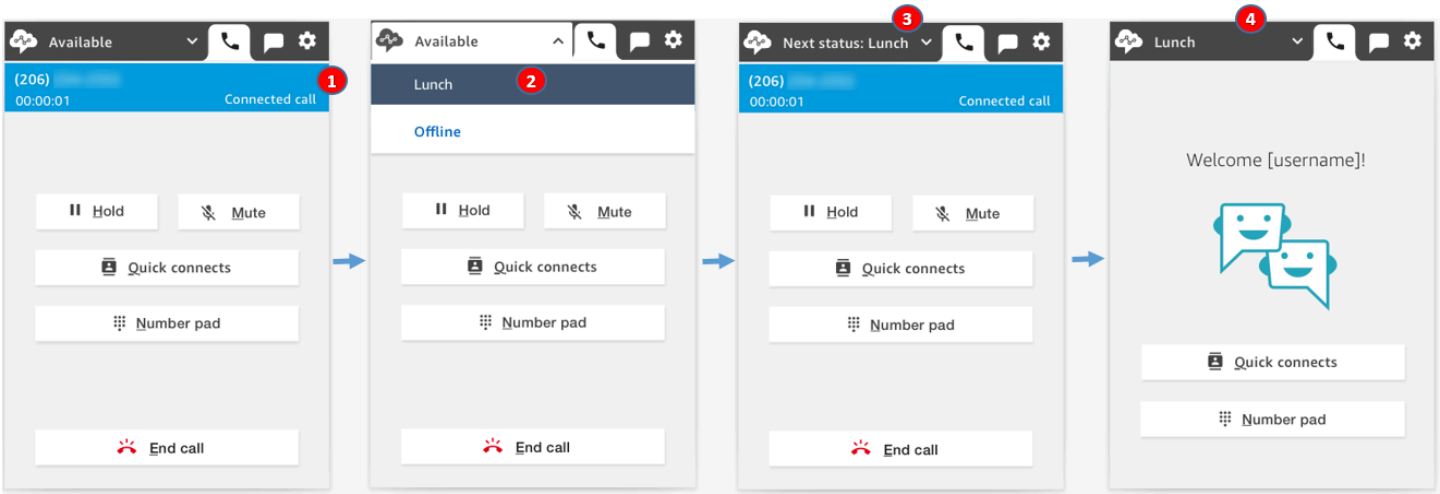
For more information about agent statuses, see Agent status in the Contact Control Panel (CCP). For information about how Connect Customer counts the Available status in the real-time metrics report, see Available.

Set your "Next status" in the Contact Control Panel (CCP)

> **Note**
>
> "Next status" is available only to customers who are using the latest Contact Control Panel (CCP). The URL for the latest CCP ends with **ccp-v2**.
> **IT administrators**: For more information about the **Next status** feature, such as changes to the agent event stream, see July 2021 Updates in the *Release notes*.

Use the **Next status** feature to pause new contacts being routed to you, while you finish your current contacts. When all your slots are cleared, Connect Customer automatically sets your CCP to the next status, such as **Lunch**.

The following images of the Contact Control Panel (CCP) show how to use this feature.



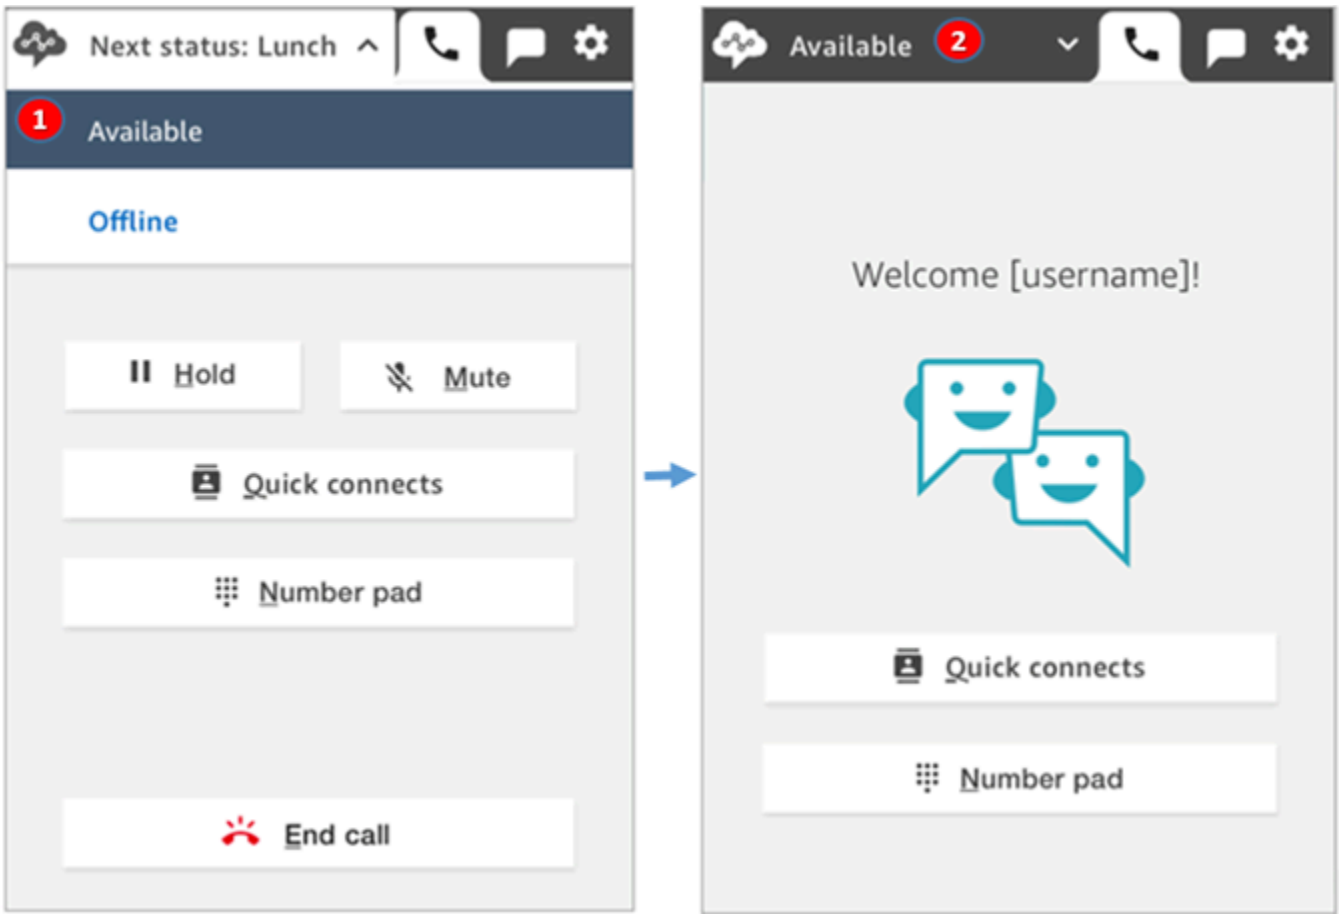
1. Available: The agent is on a contact.
2. The agent chooses their next status, such as **Lunch**. They can choose only a custom (NPT) status, or **Offline**.

3. The agent is in **Next status: Lunch**. They are still on contact. No new contacts can be routed to them.
4. The contact ends. The agent finishes ACW, and chooses **Clear contact**. Instead of going back to **Available**, their CCP is automatically set to **Lunch**.

How to cancel "Next status"

You can easily switch from **Next status** back to **Available**. The ability to switch your status is useful, for example, if you accidentally choose **Next status: Lunch**, or if you decide not to go to **Lunch** before Connect Customer automatically sets to that status.

The following images show this workflow.



1. While working on the same contact, the agent cancels **Next status: Lunch** and goes back to **Available**.
2. The contact ends and the agent is still **Available** for new contacts to be routed to them.

Example 1: Set "Next status" while handling only ACW contacts

Let's say an agent is finishing after contact work (ACW) for one or more contacts, such as a voice contact or multiple chats. They are not on contact with anyone.

Instead of choosing **Close contact** when the agent finishes ACW, they choose **Lunch**. This puts them in **Next status: Lunch** only briefly.

Here's what happens in this scenario:

1. Agent finishes ACW and chooses **Lunch** instead of **Close contact**.
2. Connect Customer stops routing new contacts to them.
3. All their slots are cleared. This is so the agent doesn't have to choose **Close contact** to end the ACW.
4. Because all the ACWs have been cleared, Connect Customer immediately starts the automatic transition that sets the agent's status to **Lunch**.

   Agents were put into **Next status - Lunch** only briefly (milliseconds!). They might even see it in the CCP if they look fast enough.

This order of events mirrors how the CCP works when agents change their status while working on ACW. For example, an agent is finishing ACW and they set their status to **Lunch**. Here's what happens next:

1. Connect Customer stops routing new contacts to them.
2. The ACW slot is cleared for the agent so they don't have to choose **Close contact**.
3. The agent is set to **Lunch**.

Example 2: Set "Next status" while managing some chats on contact and other chats in ACW

Let's say an agent is managing two chats:

- Customer 1 is in ACW.
- Customer 2 is on contact.

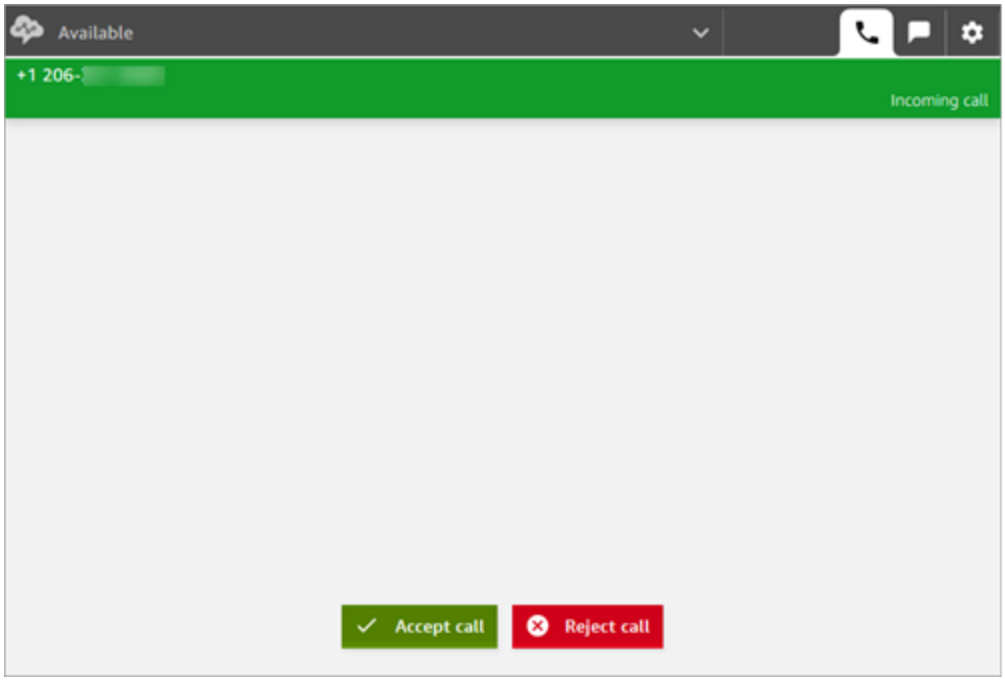
While still on a contact, the agent sets their status to **Offline**. This puts them in the **Next status: Offline** state.

Here's what happens in this scenario:

1. The agent sets their status to **Offline**.
2. Connect Customer stops routing new contacts to them.
3. The contact that is in ACW is cleared so the agent doesn't have to choose **Close contact**. Only the connected chat remains.
4. The agent's status is **Next status: Offline**, and they continue working on their connected chat.
5. After they finish work on that contact, the agent chooses **Clear contact** to end the ACW.
6. Connect Customer automatically sets the agent's status to **Offline**.

Accept customer calls using the Connect Customer Contact Control Panel (CCP)

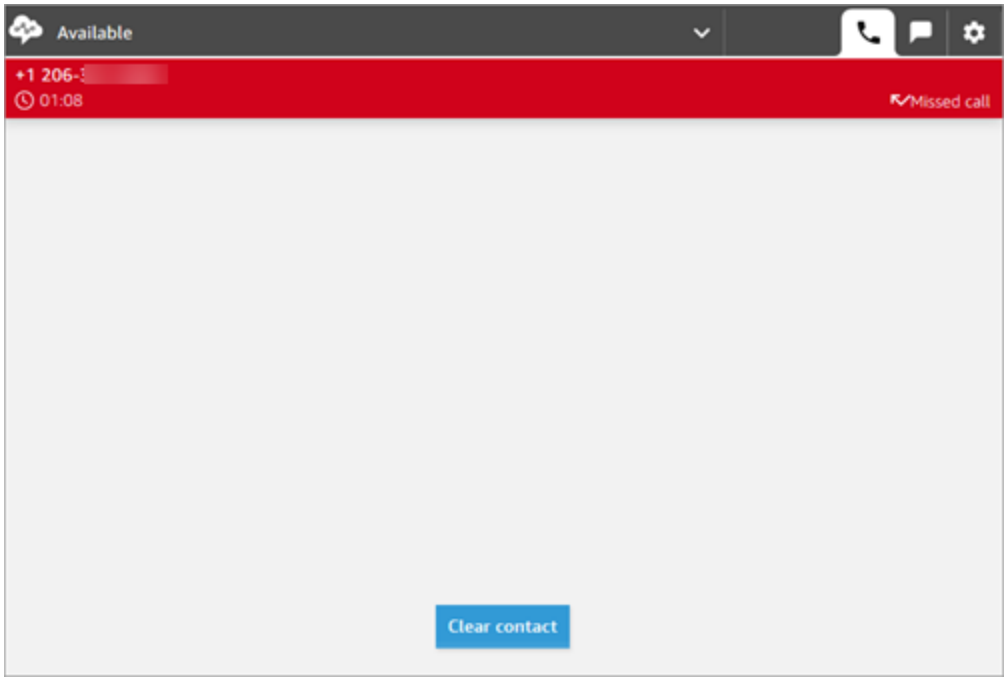
1. Whenever you set your status in the CCP to **Available**, Connect Customer can deliver calls to you, based on the settings in your routing profile.



2. When a call arrives, choose the **Accept call** button.

> **Note**
>
> The **Accept call** button does not appear if your admin has enabled Auto-accept for the voice channel in your user profile.
> **Firefox users**: If you are using the Firefox browser and using auto-accept for calls, you must keep the CCP or agent workspace browser tab in focus when you accept and connect to a voice contact. The CCP conforms to Firefox microphone usage guidance, and only has access to connect to the user's microphone when the CCP tab is in focus.

3. Before you're connected to the contact, Connect Customer announces the name of the originating queue.
4. You're now talking to the contact.
5. You have 20 seconds to accept or reject a contact. If you miss a call, it will look similar to the following image. Choose **Close contact** so you can accept another call.

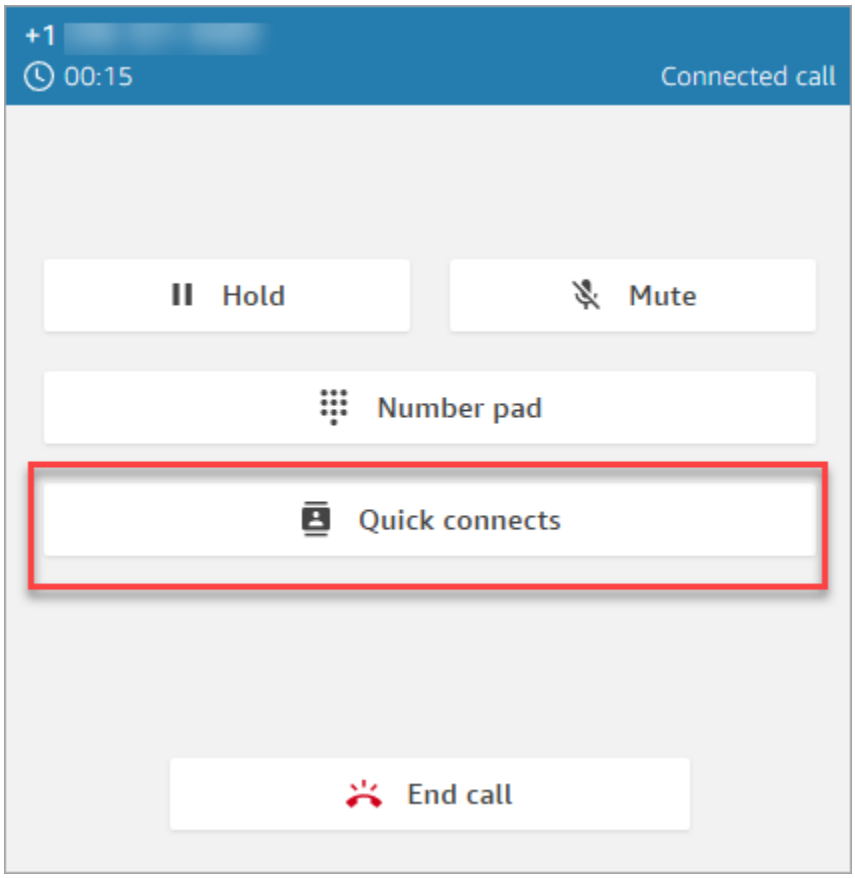


Transfer calls to a quick connect or external phone number using the Contact Control Panel (CCP)

You can transfer calls to people in a predefined list, called quick connects. You can also transfer calls to external phone numbers that you enter.

To transfer to a quick connect or to an external number

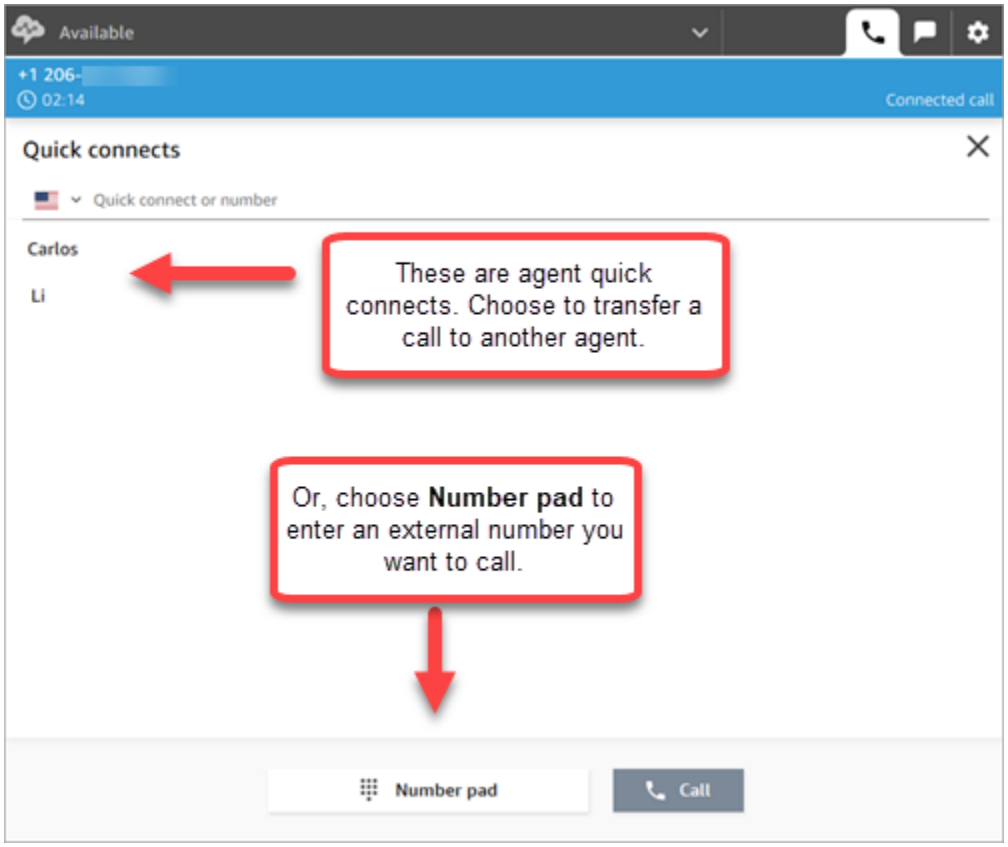
1. While you're connected to the contact, choose **Quick connects** on the CCP.



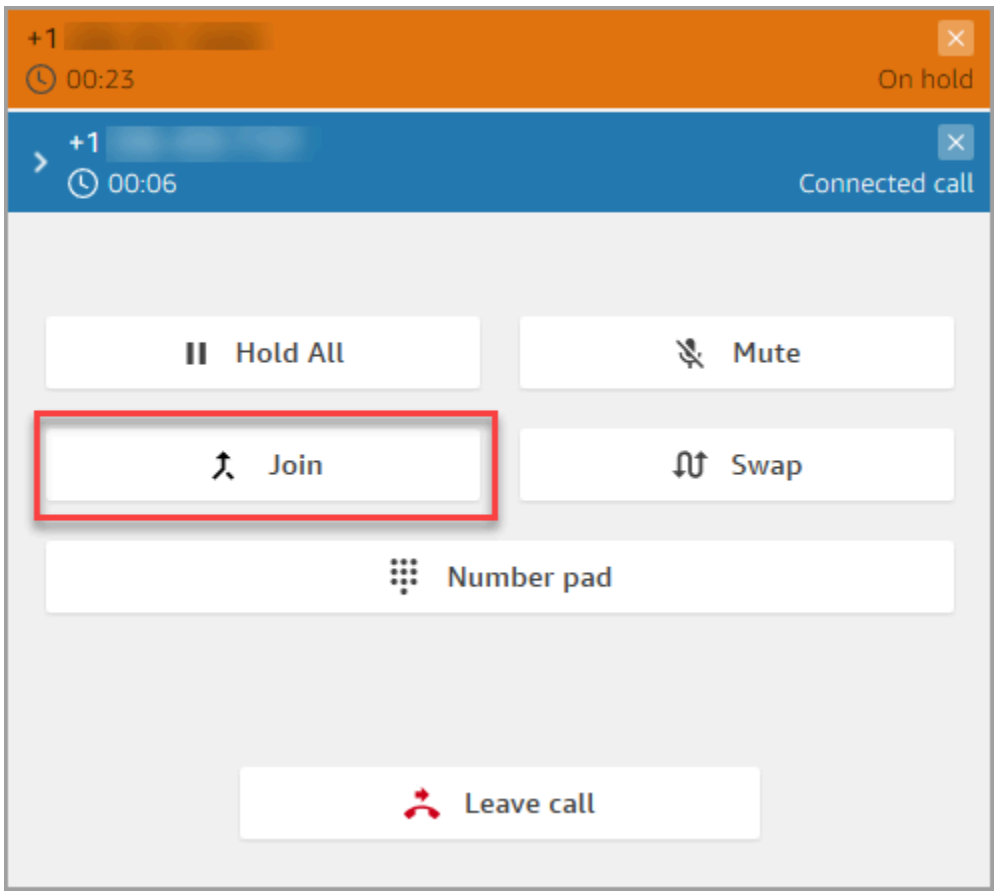
2. From the list of quick connects, choose the name of another agent to transfer the call to. (Your Connect Customer administrator adds the names of agents to the list of quick connects.)

> **Tip**
>
> Agents see the quick connects of the queues in their routing profile, including the Default outbound queue.

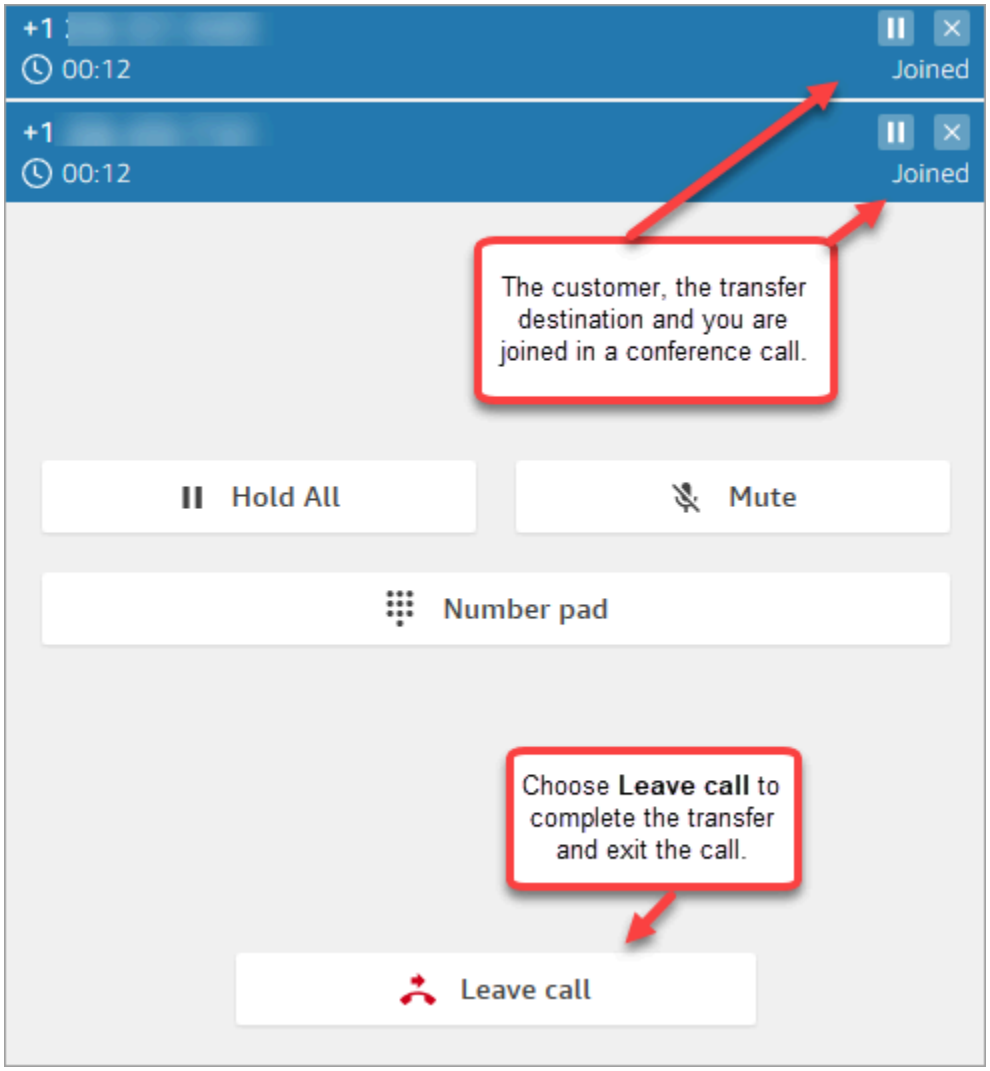
Or, to call an external number, choose **Number pad**, enter the number you want to call, and then choose **Call**.



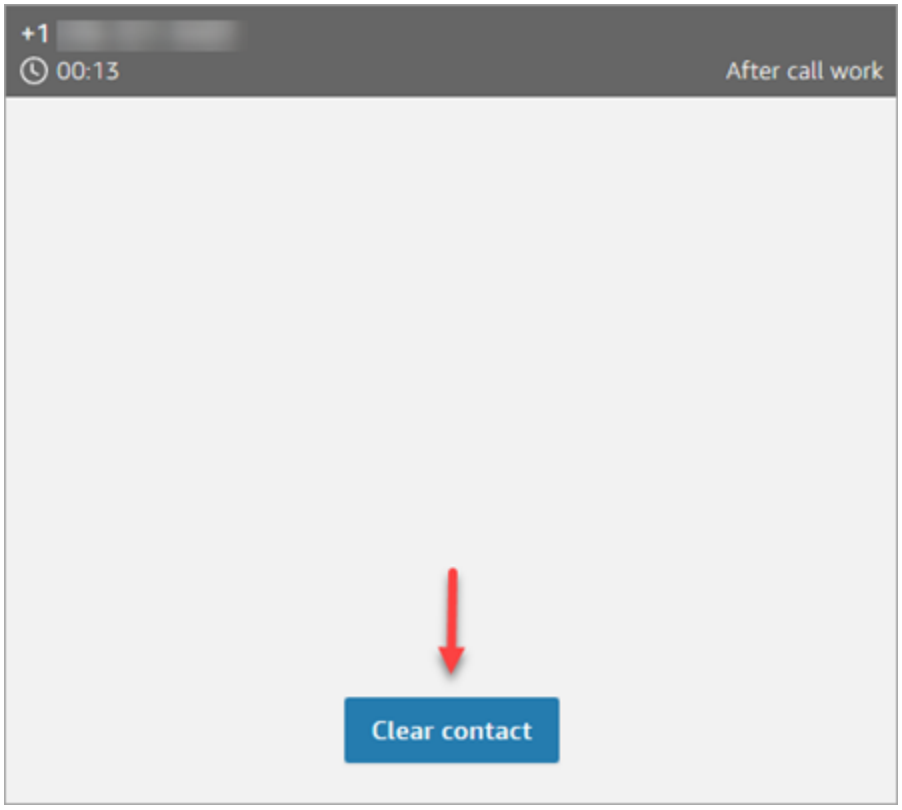
3. After the call is connected to the transfer destination, you can choose **Join** so the caller, the transfer destination, and you are in a conference call.



4. When the call is joined, the three of you can talk. Choose **Leave** to complete the transfer and exit the call.

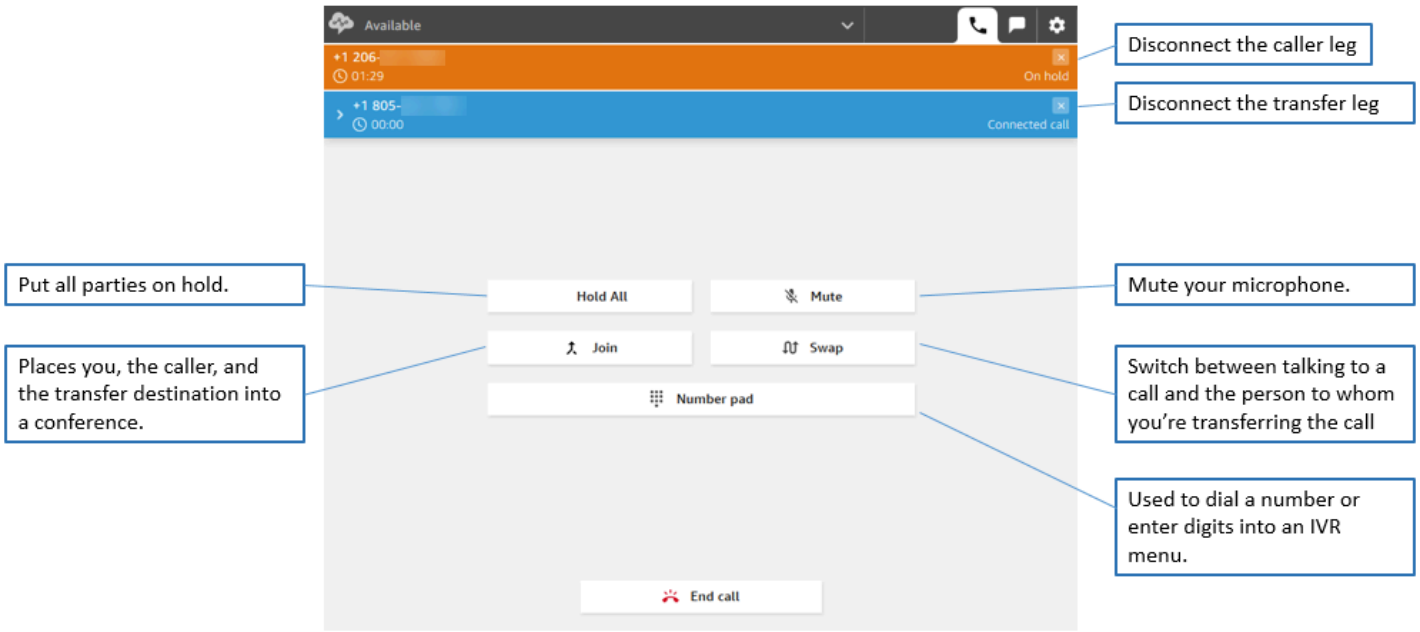


5. Complete the after contact work and then choose **Clear contact**.



Manage a transferred call

After you initiate a transfer, the customer is placed on hold and you are connected to the transfer destination. The following image shows what actions you can take at this point.

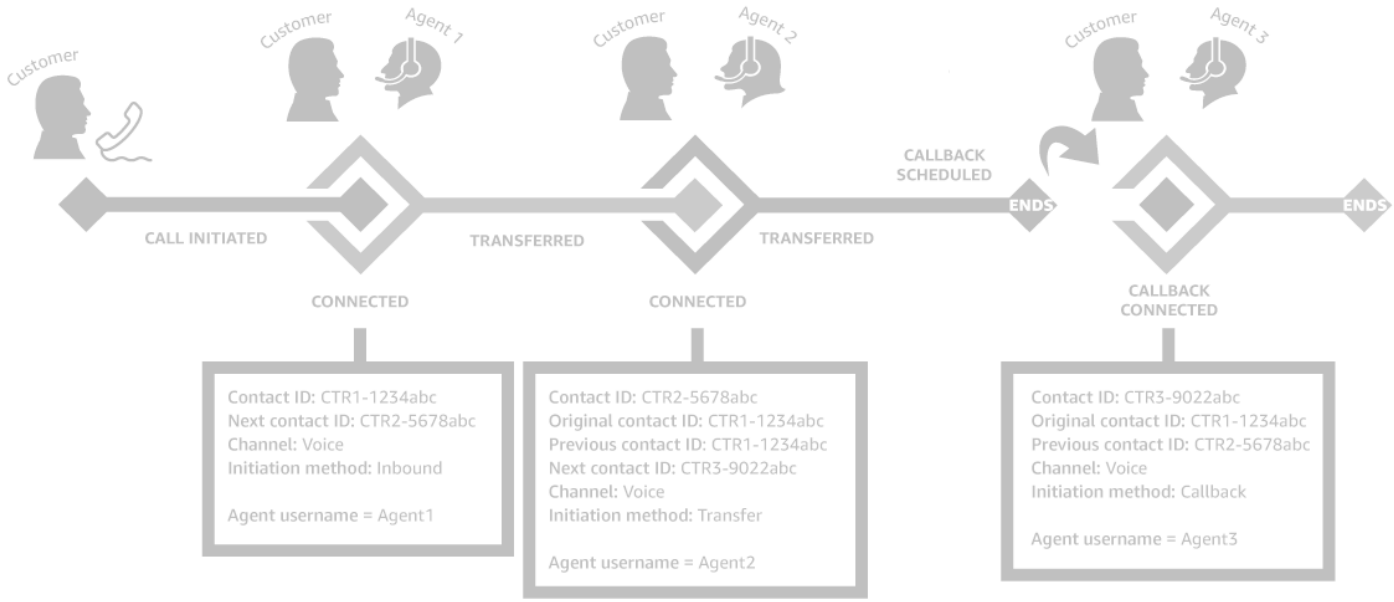


Transfers create multiple contact records

A contact record is opened for a customer when they are connected to your contact center. The contact record is completed when the interaction with the flow or agent ends (that is, the agent has completed the ACW and cleared the contact). This means it's possible for a customer to have multiple contact records.

The following diagram shows when a contact record is created for a contact. It shows three contact records for a contact:

- The first record is created when the contact is connected to Agent 1.
- The second record is created when the contact is transferred to Agent 2.
- The third record is created when the contact is connected to Agent 3 during a callback.



Each time a contact is connected to an agent, a new contact record is created. The contact records for a contact are linked together through the contactId fields: initial, next, and previous.

For more information, see About contact states in Connect Customer.

Host multiple participants on an ongoing customer service call in the Contact Control Panel (CCP)

You can add up to four additional participants to an ongoing customer service call, for a total of six participants: you, the caller, and four other people. You can use quick connects or your number pad to add participants.

For example, to help close a mortgage transaction, an agent at a financial services company can add a mortgage broker, the customer's spouse, a translator, and a supervisor to the call to help resolve any issues quickly.

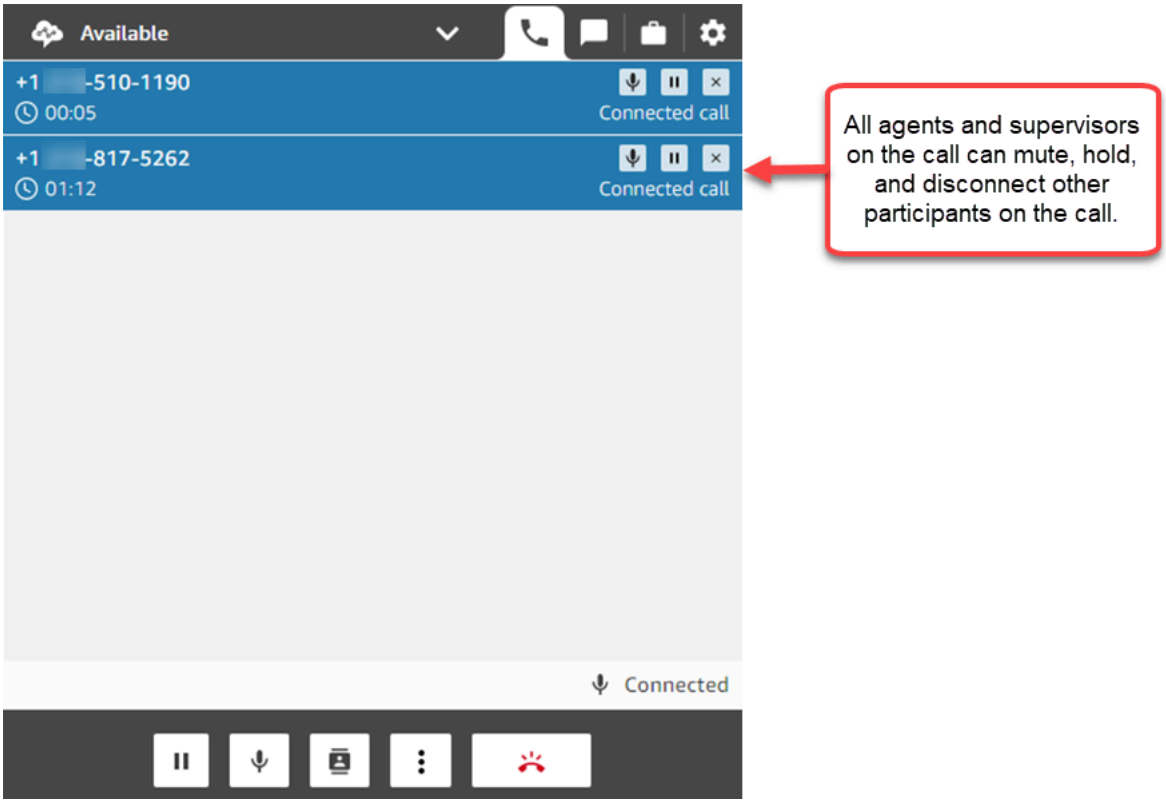
For information about how your experience hosting multi-party calls differs from the default three-party calls, see Comparison of multi-party and three-party functionality.

Connect Customer also supports adding additional users to join the web, in-app, and video call. To learn how to enable multi-user web, in-app and video calling, see Enable multi-user in-app, web, and video calling.

> **Note**
>
> IT admins: For important information about enabling this feature, see Enable enhanced multi-party contact monitoring.

Important things to know about hosting multi-party calls

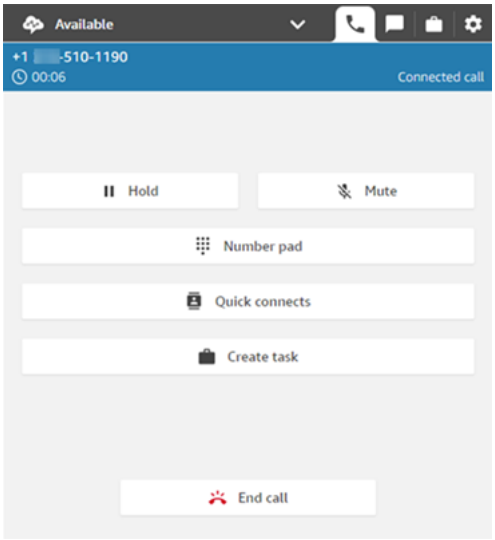
- If the primary agent leaves the call, you must have at least three participants on the call to add more participants.
- When you have multiple agents on the call, such as three agents and a caller, all agents on the call can view all parties and have the option to put any participant or another agent on hold, mute, and disconnect participants from the call.



- Every time you add a new participant to the call, you are prompted to greet and talk to them before adding them to the call. Choose **Join** to take all parties off hold.

How to add participants to a multi-party call

The following image shows the contact and you (the agent) on a call. The customer always appears at the top.

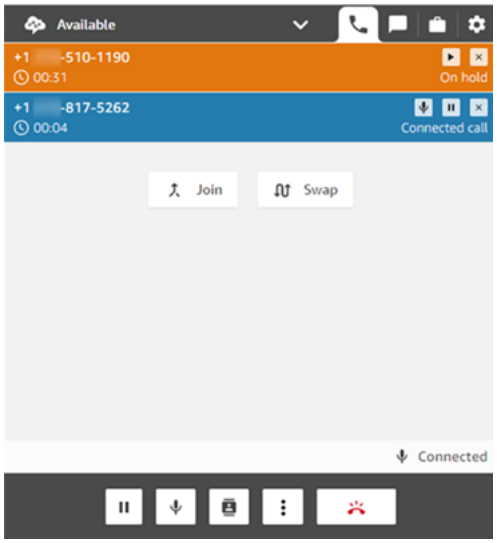


To add participants

1. While you're connected to the caller, choose **Quick connects** to add another agent or to make an external call. The caller is put on hold while you do this.

   When you add the third participant to the call, you can greet and talk to them before adding them to the call. For example, you can tell explain why you're adding them to the call.

   The following image shows the CCP after you add a third participant to the call. The contact is on hold, and you're talking to the third party.



2. Choose **Join** to take all parties off hold.

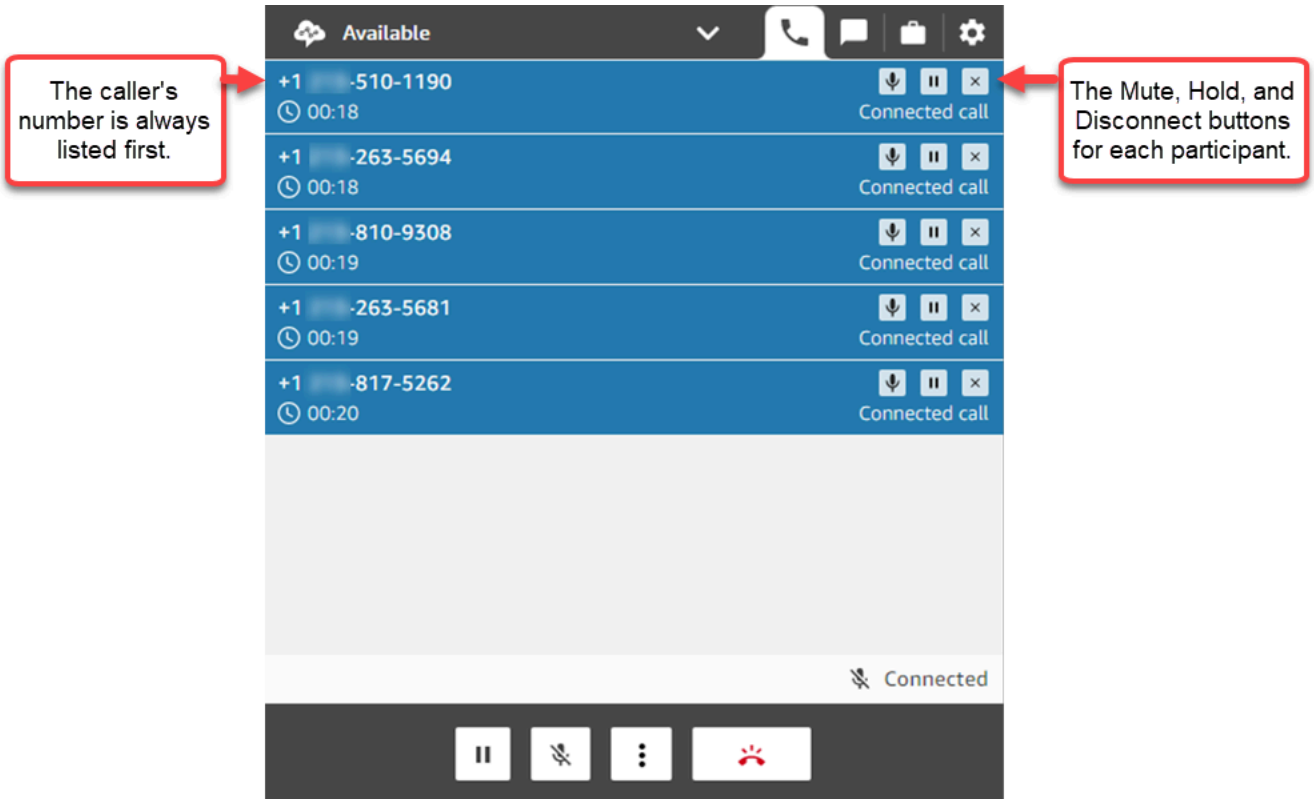
   –OR–

Choose **Swap** to toggle between the parties on hold and the party you just called.

> **Note**
>
> **Swap** is only available for three-party calls, such as you, the caller, and another agent or external party. It is not available when you have more than three parties on the call.

How to manage participants

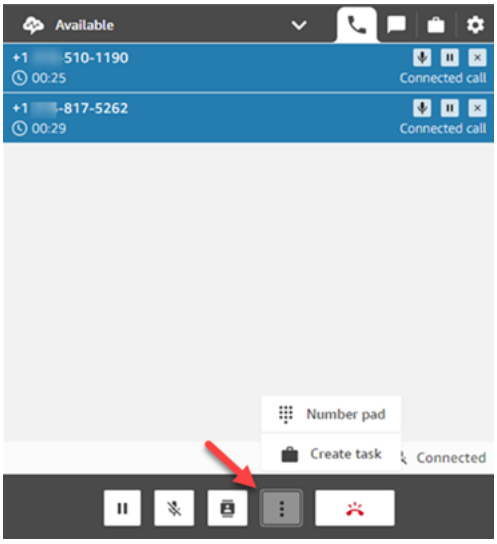
Every agent on a call can mute, hold, or disconnect individual participants.



You can transfer a multi-party call to another agent, or disconnect yourself from the ongoing call.

To transfer or disconnect

- Choose the **More** button to open the number pad and to create a task:



When do multi-party calls end?

A multi-party call stays up as long as the caller or the agent is on the call. For example, add an external party to a call and then you disconnect. The caller and external party continue the call.

If only third-parties are left on the line, the contact is terminated. However, as the agent you can choose to disconnect and allow only the caller and the third-party participants to remain on the call.

Make outbound calls using the Contact Control Panel (CCP)

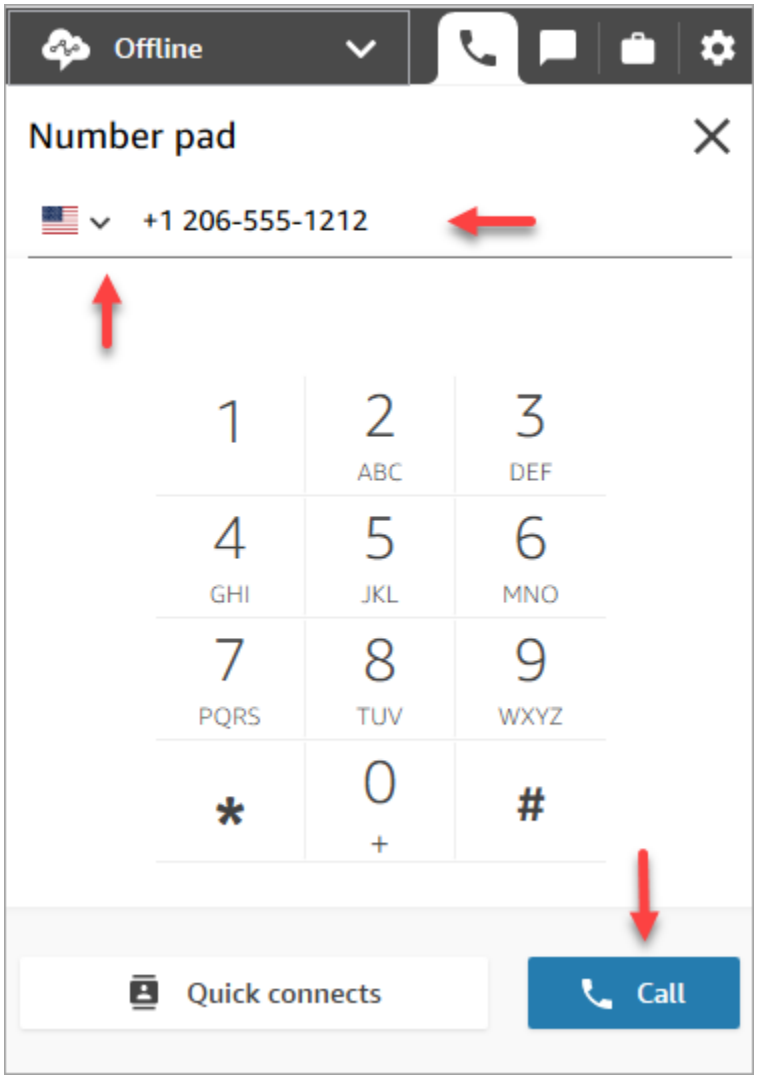
Before you can make an outbound call, your contact center must be set up to allow agents to make calls. For more information, see Step 3: Set telephony in Create a Connect Customer instance.

For information about the caller ID that's displayed when you make an outbound call, see Set up outbound caller ID in Connect Customer.

> **Note**
>
> **IT administrators**: For a list of countries available for outbound calls based on the Region of your instance, see Connect Customer pricing. If a country is not available in your dropdown menu, open a ticket to add it to your allow list. For more information, see Countries that call centers using Connect Customer can call by default.

To make an outbound call

1. In your Contact Control Panel, choose **Number pad**.
2. Use the dropdown menu to choose the country, then enter the number.

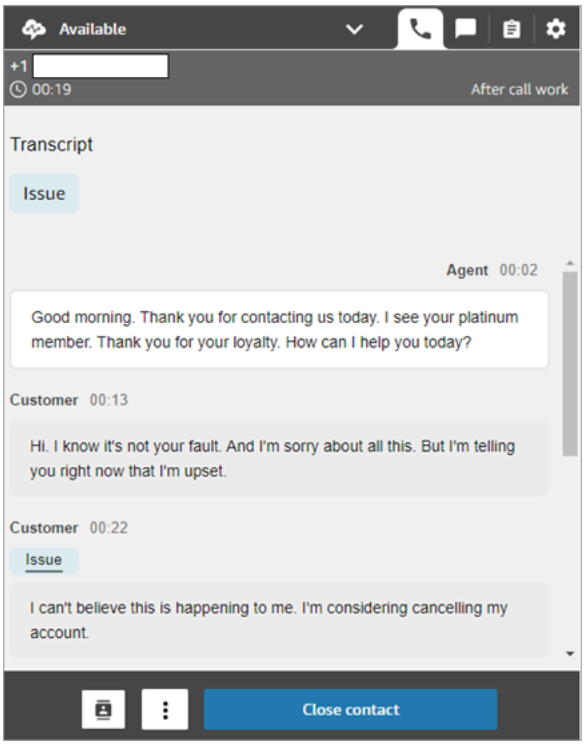


3. Choose **Call**.

View a call transcript during ACW in the CCP or Connect Customer agent workspace

At the end of a call, you can see an unredacted transcript of your conversation in the CCP or agent workspace. You can view the entire transcript for reference, and copy any useful text into your notes.

The call transcript displays any categories identified by conversational analytics. For example, in the following image, an issue has been identified at 22 seconds.



If a call is transferred to you from another agent, you will see an unredacted transcript of their conversation with the customer.

Customer sentiment score is not included in the CCP or agent workspace.

Note

IT administrators: This feature is available in the CCP and the agent workspace. To make this feature available to agents:

1. Enable conversational analytics for your Connect Customer instance.
2. Add the following permissions to the agent's security profile:
   - **Analytics and Optimization** - **Contact transcripts (unredacted) - Access**
   - **Analytics and Optimization** - **View My Contacts** or **Contact search**
   - **Contact Control Panel (CCP)** - **conversational analytics data**

Use the Contact Control Panel (CCP) in Connect Customer to chat with contacts

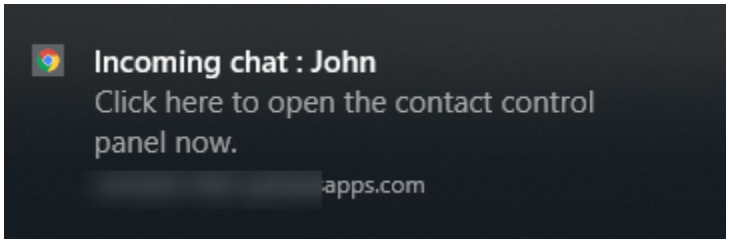
When you set your status in the CCP to **Available**, Connect Customer delivers calls or chats to you, based on the settings in your routing profile. An administrator can specify that up to 10 chat conversations can be routed to you at the same time.

You can't initiate chat conversations from the CCP.

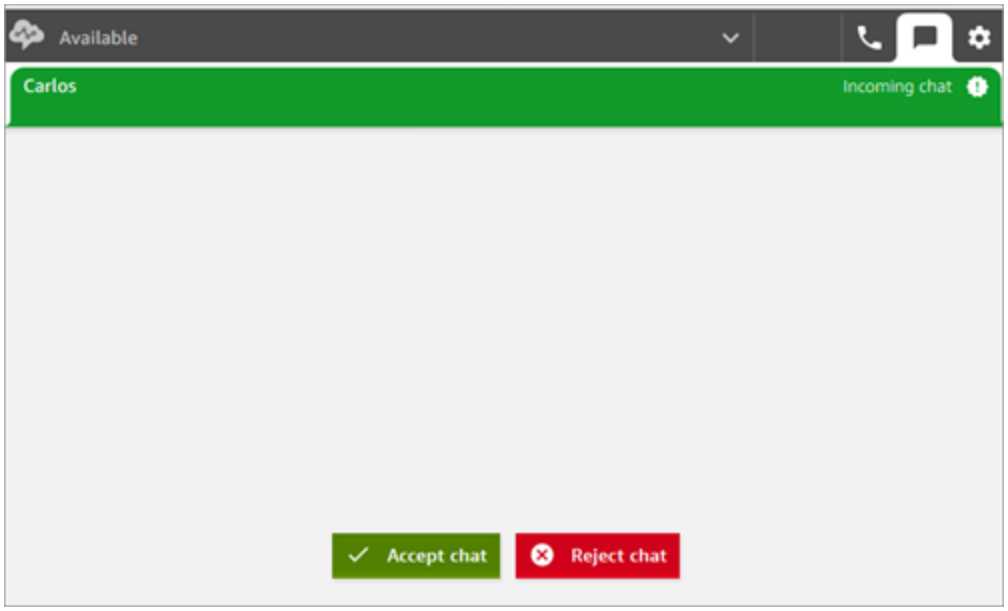
> **Note**
>
> IT Administrators: To enable customers and agents to send attachments, such as files, through the chat interface, see Enable attachments in your CCP so customers and agents can share and upload files.

When a chat contact arrives, here's how you are notified:

1. If you enabled notifications in your browser, you'll get a pop-up notification at the bottom of your screen, like this:

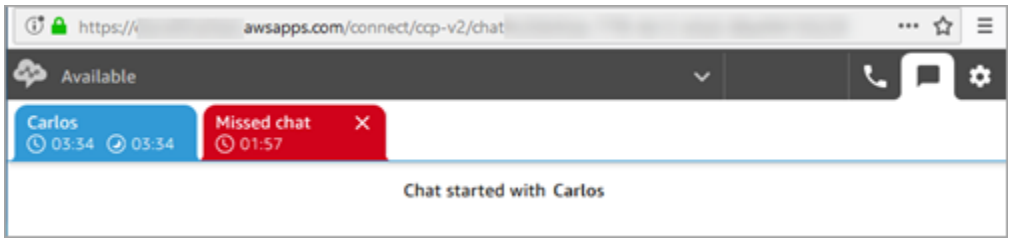


2. If you're on the chat tab, the page displays the name of the contact and a button for you to connect to the chat.



3. If you're on the phone tab, a banner displays the name of the contact and a button for you to connect to the chat.

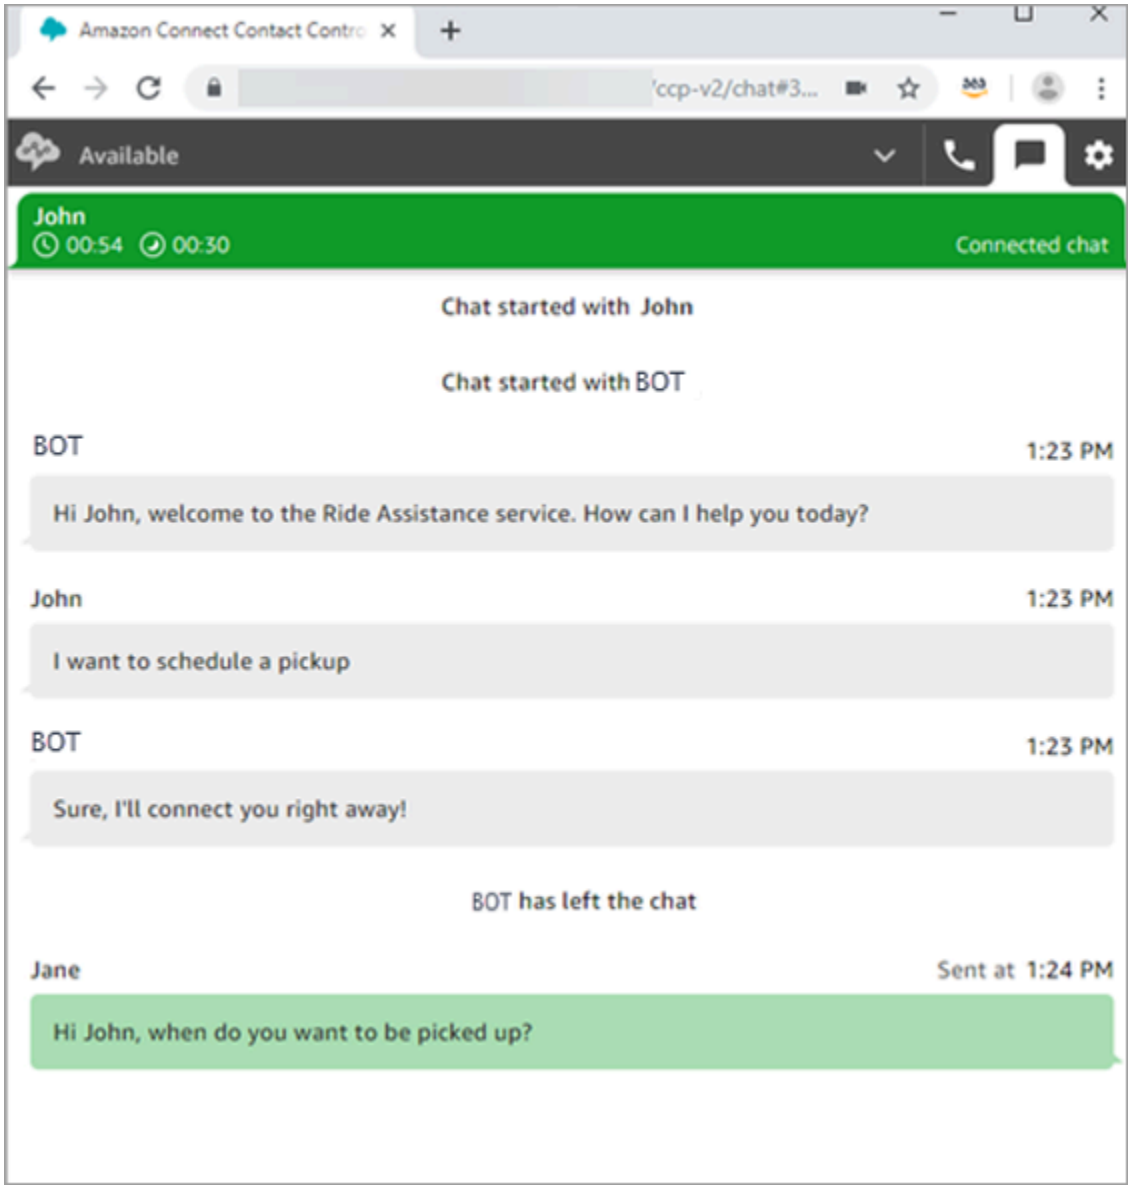
4. You have 20 seconds to accept or reject a contact. If you're on a chat, and another comes in but you don't accept it, a tab appears indicating the chat was missed.



5. Choose **Accept chat** to connect to the contact.

> **Note**
>
> Chat conversations must be accepted manually. There's no auto-accept for these conversations.

6. You'll see the full transcript of what the contact has already typed. If applicable, you'll also see what a bot or another agent has entered. In the following image, **John** is the name of the customer, **BOT** is the Amazon Lex bot, and **Jane** is the name of the agent.

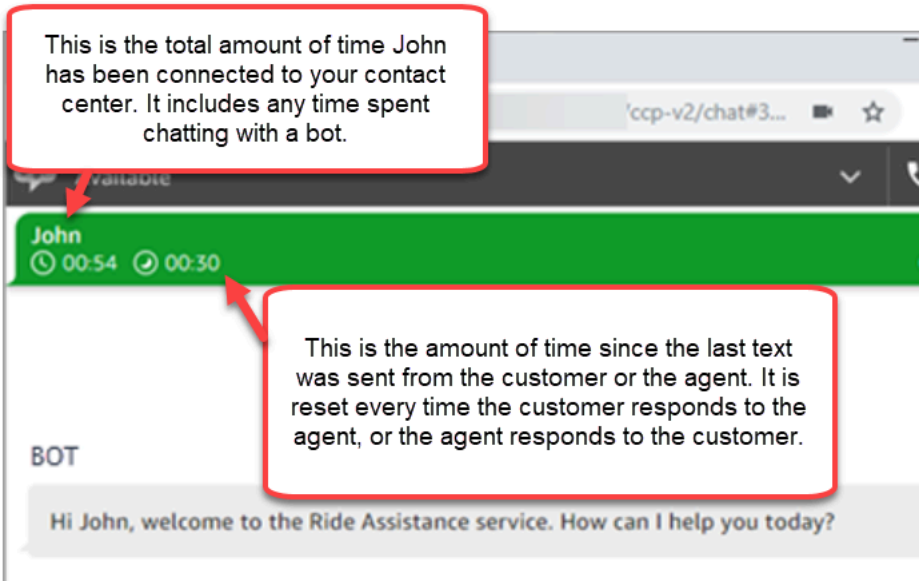


What do the timers at the top of the chat tabs mean?

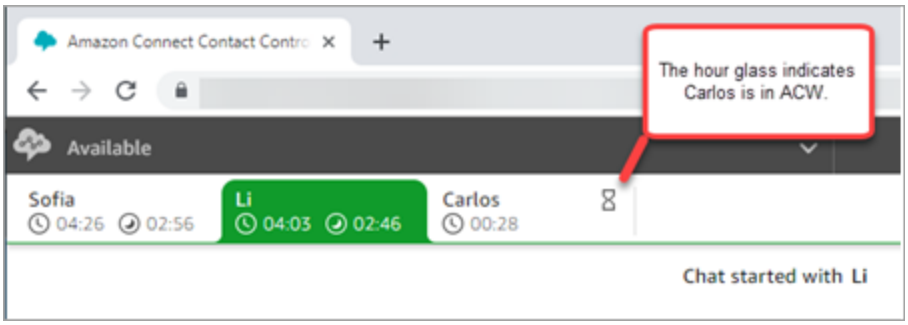
When you're in a chat conversation with a contact, you'll see two timers at the top of the chat tab. These timers tell you:

- How long the contact has been connected to your contact center. This includes the time spent with the bot, if you're using one.

- How long since the last text was sent. This can be either from the customer to the agent, or from the agent to the customer. The timer is reset with texts message between the two. It is not reset with each consecutive text message sent from a participant.



If you have multiple chat tabs open, an hour glass appears letting you know which ones are in an After Contact Work (ACW) state. The timer indicates how long the contact has been in ACW.



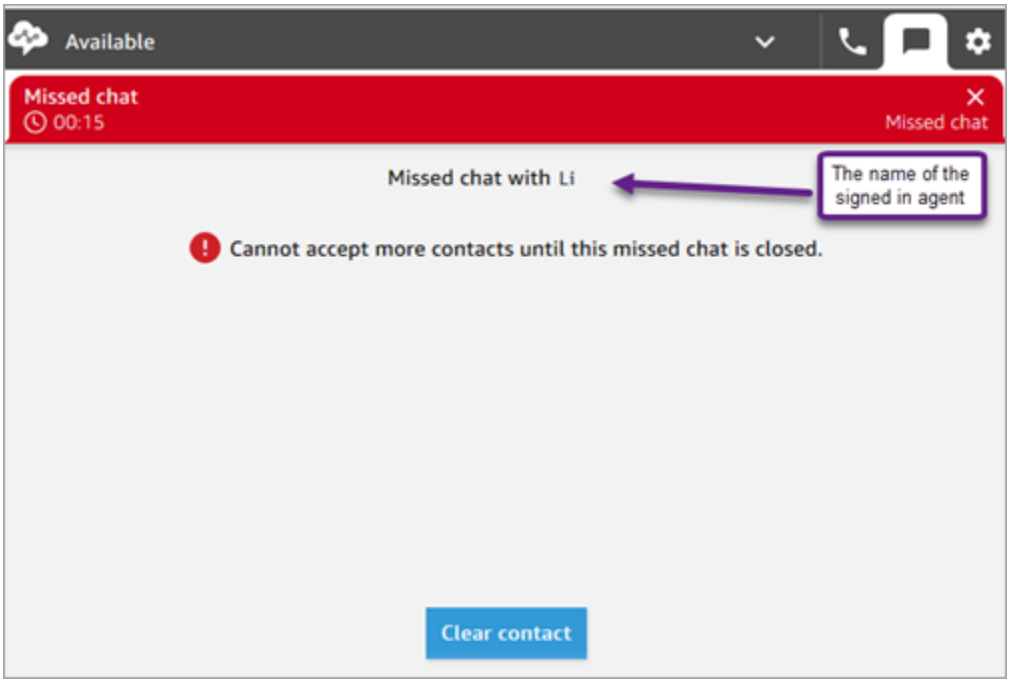
What happens to missed chats?

Let's say you take a break but forget to change your status in the CCP from **Available** to **Break**. Connect Customer tries to route a chat to you for 20 seconds. Keep in mind that your admin can't configure this amount of time.

After 20 seconds, the contact is counted as Agent non-response in the real-time metrics report and the historical metrics report.

When you return from break and choose the chat tab, you'll see the missed contacts and how long they've been there. Each contact occupies a slot. With all of your slots are occupied, Connect Customer won't route any more contacts to you. You must clear the missed contact so more contacts can be routed to you.

> **Important**
>
> If you're set up to handle contacts while already on another channel (for example, voice, chat, and task), you still must clear the missed contact before any other contacts on any other channel can be routed to you.



You can clear the slots so that chats are routed to you again. For each missed contact, choose the banner, and then choose **Close contact**.

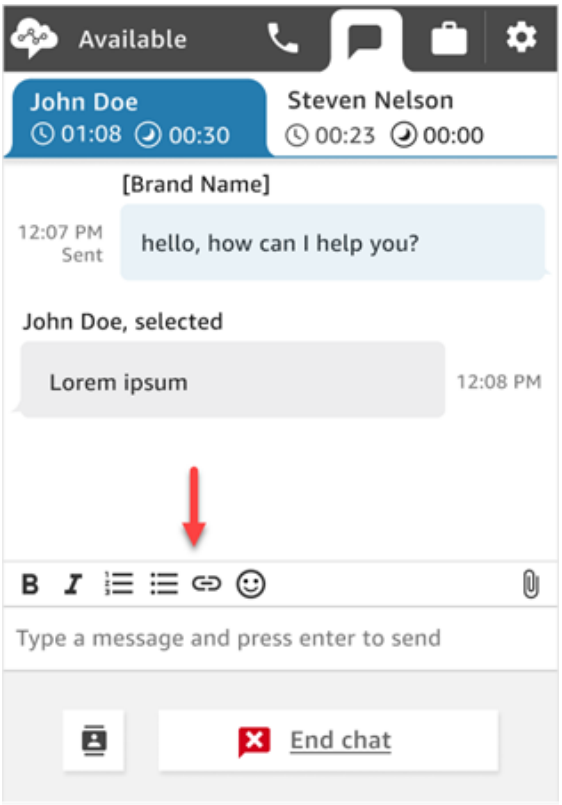
How to format messages

When composing a chat message, you have the ability to format your message. With message formatting, you can add structure and clarity to your support messages. You can add the following formatting:

- Bold
- Italic

- Bulleted list
- Numbered list
- Hyperlinks
- Emoji
- Attachments

To get started, highlight the text you want to format, and then select a the formatting options from the toolbar at the bottom of the chat window. You can see exactly what the message looks like before sending it.



Tip

Developers: Enable this feature from the chat user interface. For instructions, see Enable text formatting in Connect Customer for your customer's chat experience.

Host multiple participants on an ongoing customer service chat in the agent workspace or CCP

You can add up to four additional participants to an ongoing customer service chat, for a total of six participants: you, the customer, and four other people. You can use quick connects to add participants.

Prerequisites

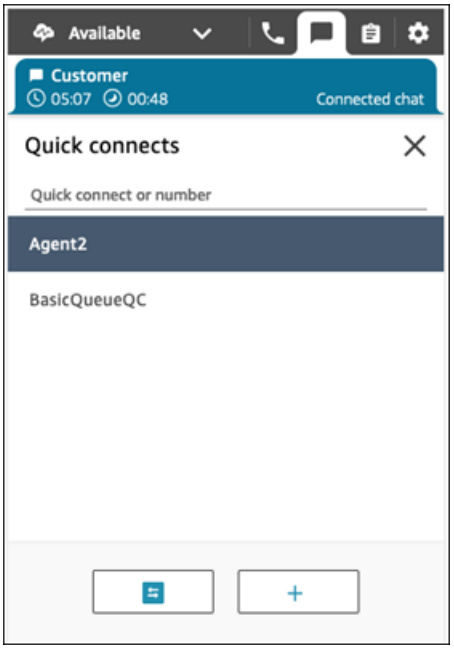
- This feature is only available in CCPv2, agent workspace, and custom CCP using Connect Customer Streams.js.
  - **IT administrators**:
    - By default, chats can have two participants, such as an agent and a customer. To enable agents to connect up to six parties on a chat, you need to select **Enable Multi-party Chats and Enhanced Monitoring for Chat** in the Connect Customer console. For instructions, see Update telephony and chat options.
  - **Developers**: In custom CCPs, use the updated Connect Customer Streams API to enable multi-party chats, up to six parties. See the Connect Customer Streams documentation on GitHub.
- **AWS GovCloud (US-West)**: This feature is not available in the AWS GovCloud (US-West) Region.

Important things to know

- This feature works for all supported forms of chat: chat/SMS, WhatsApp, and Apple Messages for Business.
- When you have multiple agents on the chat, such as three agents and a customer, all agents on the chat can view all parties and have the option to disconnect participants from the chat.
- If a customer leaves a chat with multiple agents, the chat ends for all participants.
- If an agent in a multi-party chat transfers the chat to another agent, all existing agents are disconnected.
- Read/Delivered receipts do not work with multi-party chat. They do start working again when the chat returns to two participants.
- If enhanced monitoring for chat is already enabled, to also enable multiparty chats you need to use the UpdateInstanceAttribute API with the `MULTI_PARTY_CHAT_CONFERENCE` attribute for the first time. Or, you can turn the feature OFF and then back ON to update your settings. For more information, see UpdateInstanceAttribute in the *Connect Customer API Reference Guide*.

How to add participants to a multi-party chat

The following image shows the contact and you (the agent) connected on a chat. The customer always appears at the top of the CCP.

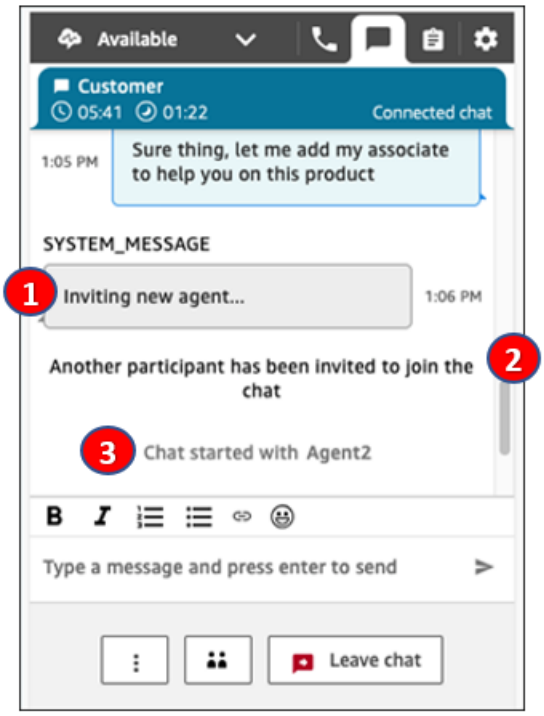


To add participants

- While you're connected to the customer, choose **Quick connects** to add another agent.

  > **Tip**
  >
  > Your admin can add a message in the flow to be played before the third party is added to the session.

  The following image shows the CCP after you invite a third participant to join the chat.

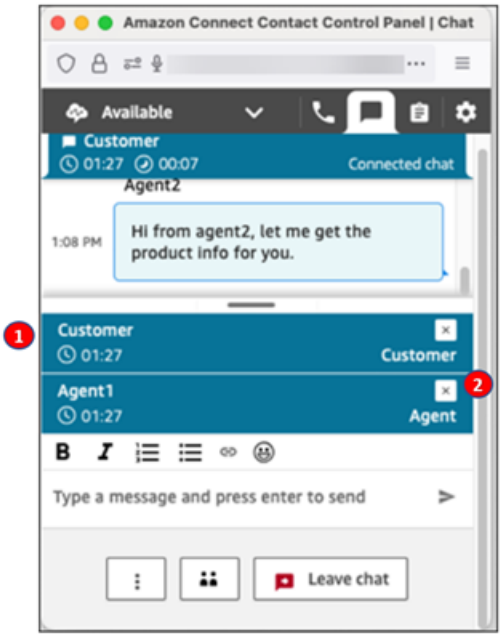


1. **Inviting new agent ...** - This is an example of a custom message that an Admin or Contact Center Manager can configure in the Play prompt block.
2. **Another participant has been invited** - This is a message from Connect Customer to let the agent know that they (the agent) made a request to add a participant to this chat.
3. **Chat started with Agent2** - This message is displayed when the second agent joins/accepts the chat on their end.

How to manage participants

The following image shows Agent2's CCP. From the perspective of Agent2, the customer and Agent1 are the other active participants.

Every agent on a chat can disconnect other individual participants.

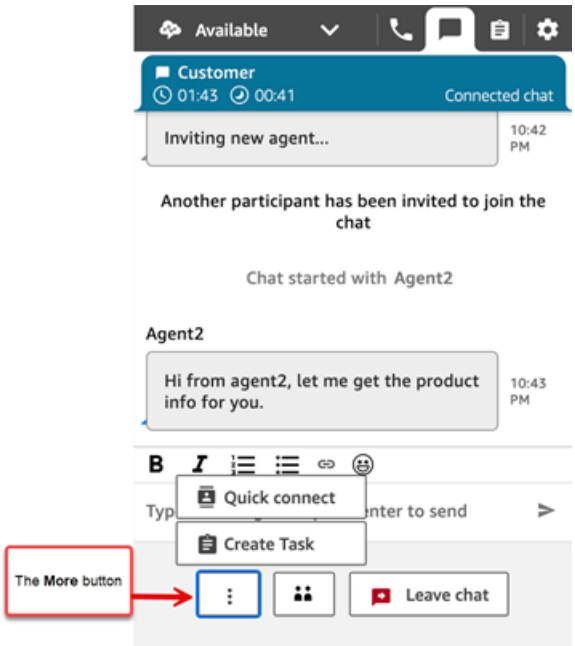


1. The customer and Agent1 are the other participants on the chat.
2. Agent2 can choose the **x** to disconnect any participant from the chat.

You can transfer a multi-party chat to another agent, or disconnect yourself from the ongoing chat.

To transfer

- Choose the **More** button, and then choose **Quick connect**.



To disconnect

- Choose **Leave chat**.

When do multi-party chats end?

A multi-party chat continues as long as the customer is on the chat.

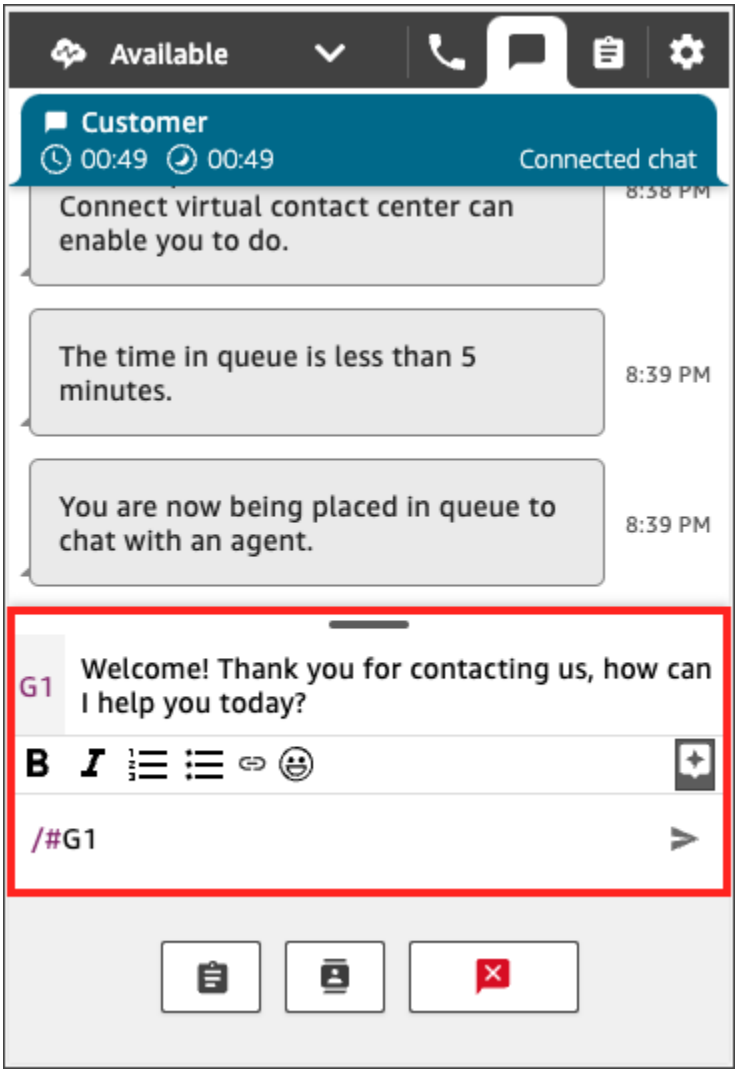
Search for quick responses to customers in the Contact Control Panel (CCP)

Use any of the following methods to search for quick responses:

- Use **`/#{search term}`** to search for the quick response. For example, enter **`/#`** in the box used to compose messages to bring up the quick response you want.
- Choose the star ( ) icon in the rich text toolbar.

> **Note**
>
> - The star icon only appears when contact is initiated.
> - To see the star icon in CCP, you must have at least 1 activated quick response associated with the current agent routing profile.

The following image shows a quick response found by entering a shortcut (**`/#G1`**).



You can also search for quick responses by typing `/#{search term}` in the message input field. With this syntax, you can quickly find responses without needing to remember short codes.

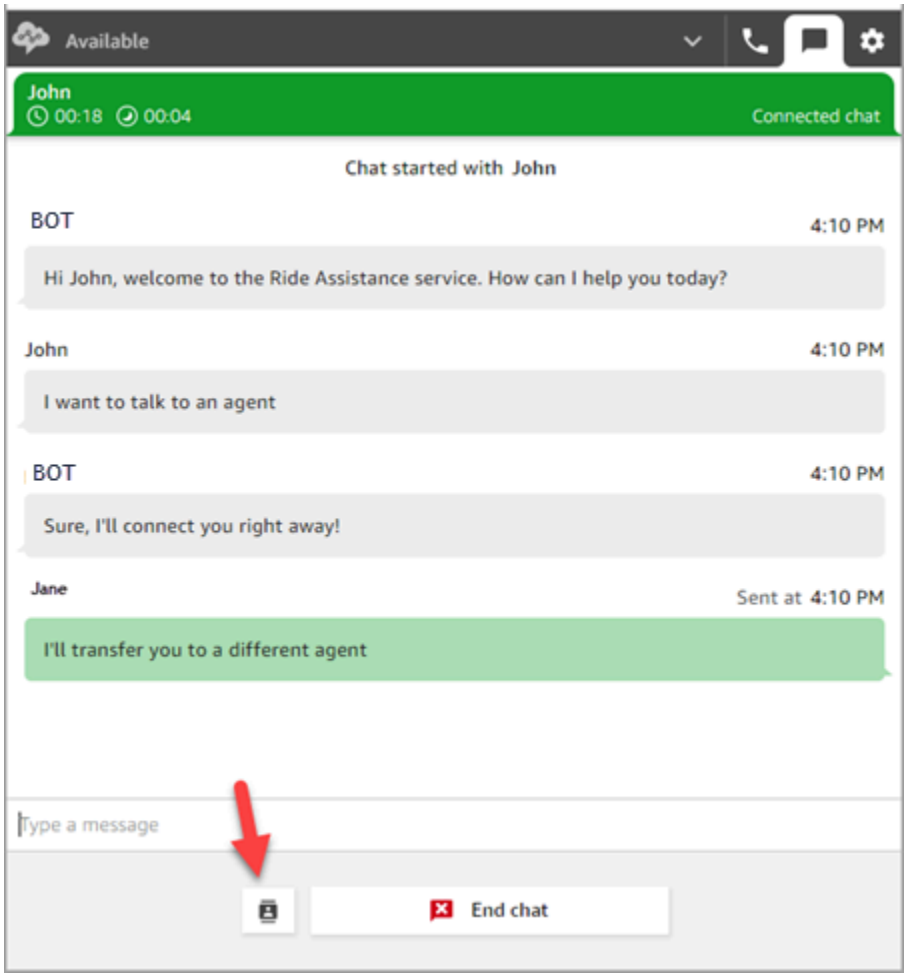
For information about creating, importing, and managing quick responses, including required permissions, see Create quick responses for use with chat and email contacts in Connect Customer.

Transfer a chat to an agent's queue, with all context preserved

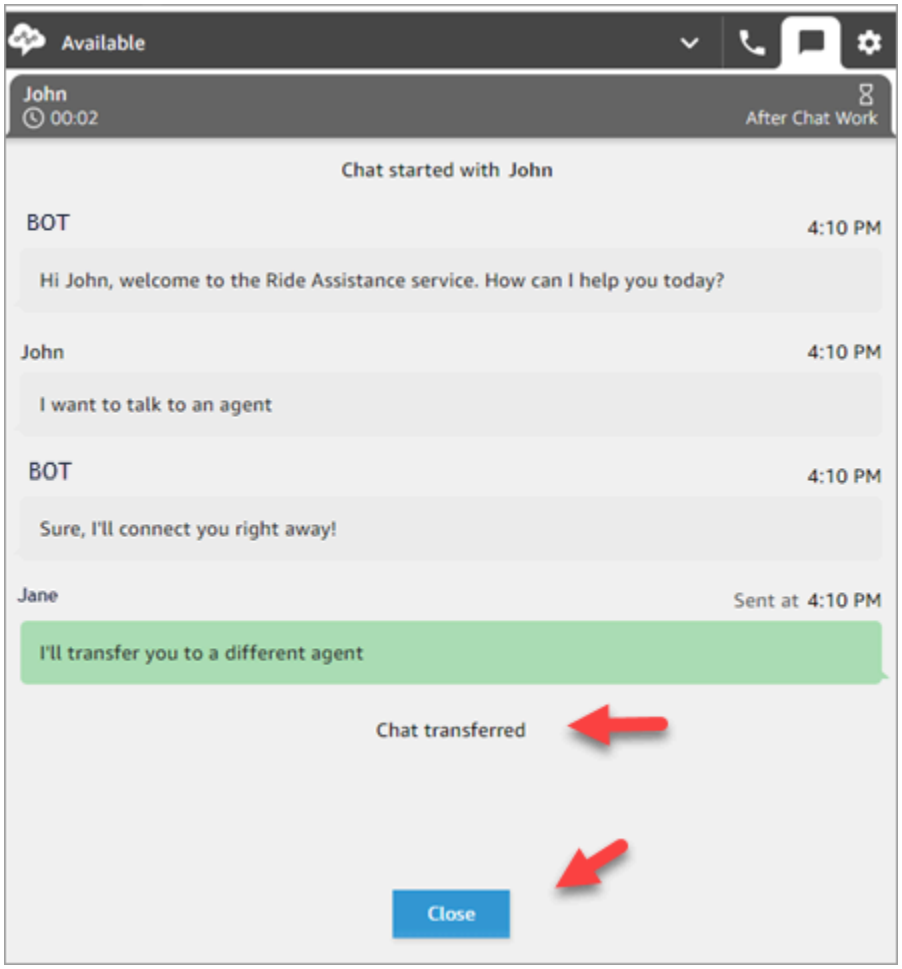
You can transfer a contact from a bot to an agent, or to another agent's queue, with all context preserved.

To transfer a customer to another queue

1. Choose the **Quick Connect** button at the bottom of the CCP page.



2. Choose or search for the queue you want to transfer to, and then choose the transfer button.
3. You'll see a confirmation message: Chat transferred. You're now doing After Contact Work (ACW) for the customer. Choose **Close** to end the contact.



Use the CCP in Connect Customer to make a call while on a chat

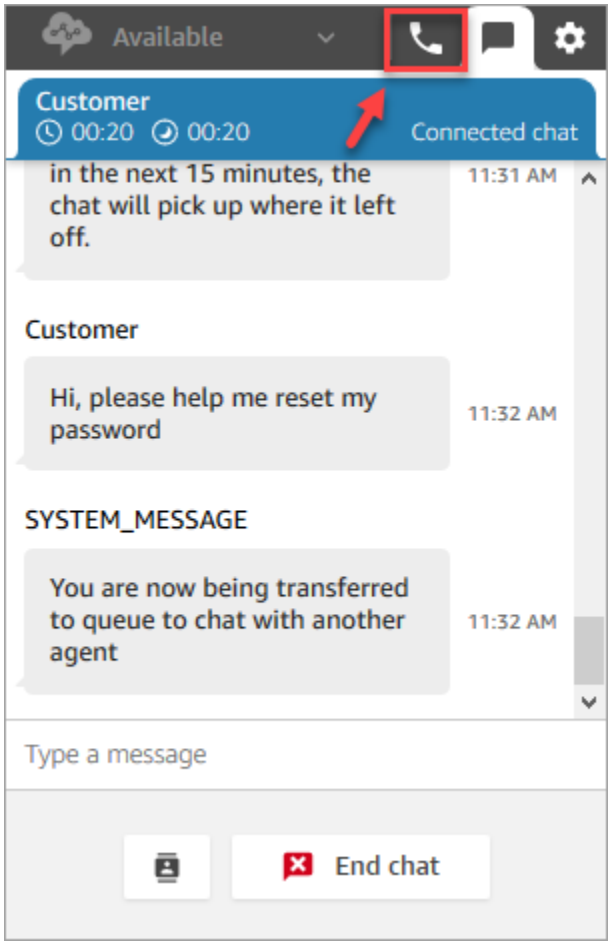
Let's say you're chatting with a contact and you want to consult with someone else. While you're on a chat, you can use the updated CCP to make outbound calls using the number pad and phone number quick connects.

Note the following limitation:

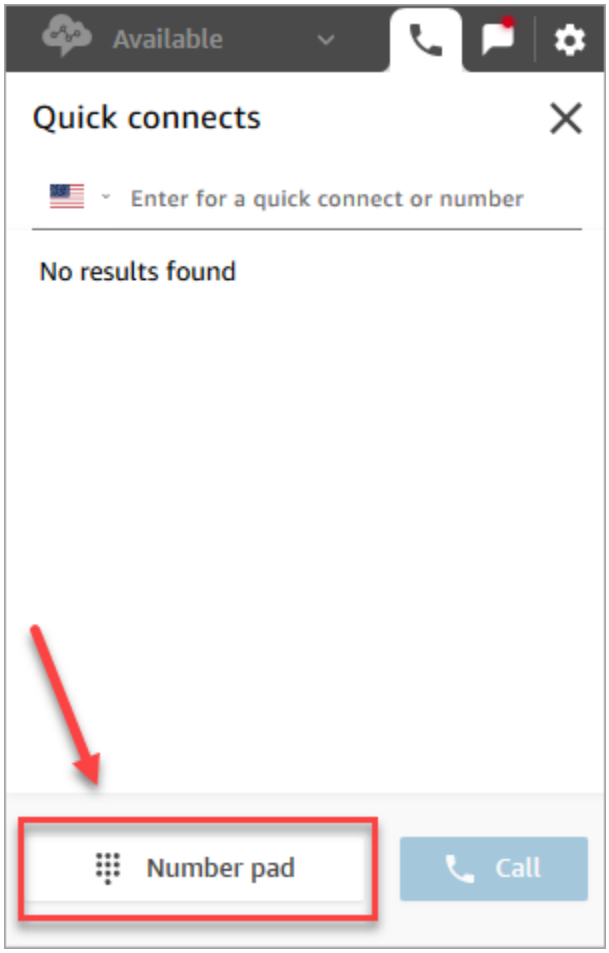
- You can't access agent quick connects while you're on a chat.
- Agents can receive calls while on a chat only if they are assigned to a routing profile that allows cross-channel concurrency.

To make an external call while you're on a chat

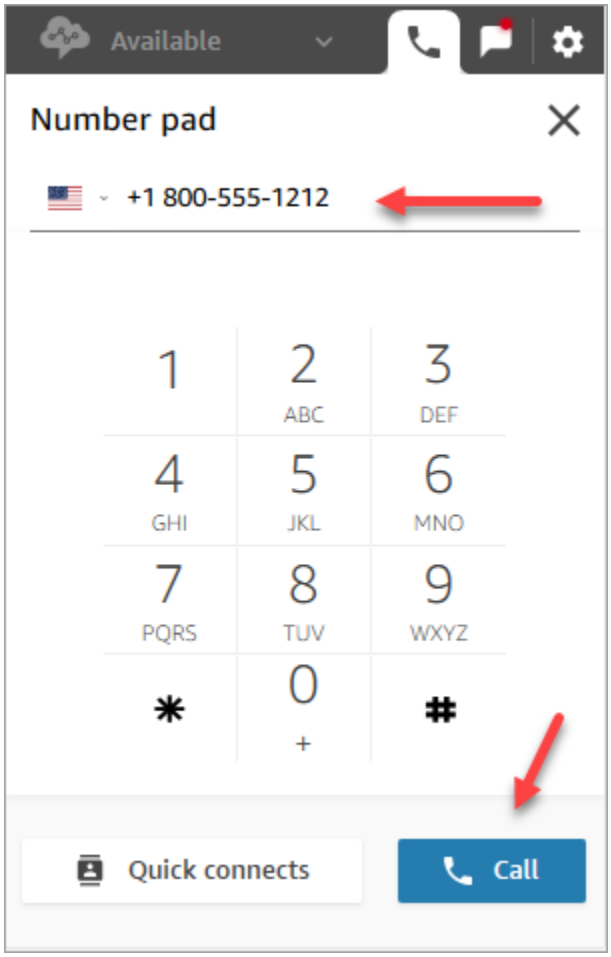
1. In the CCP, choose the phone tab.



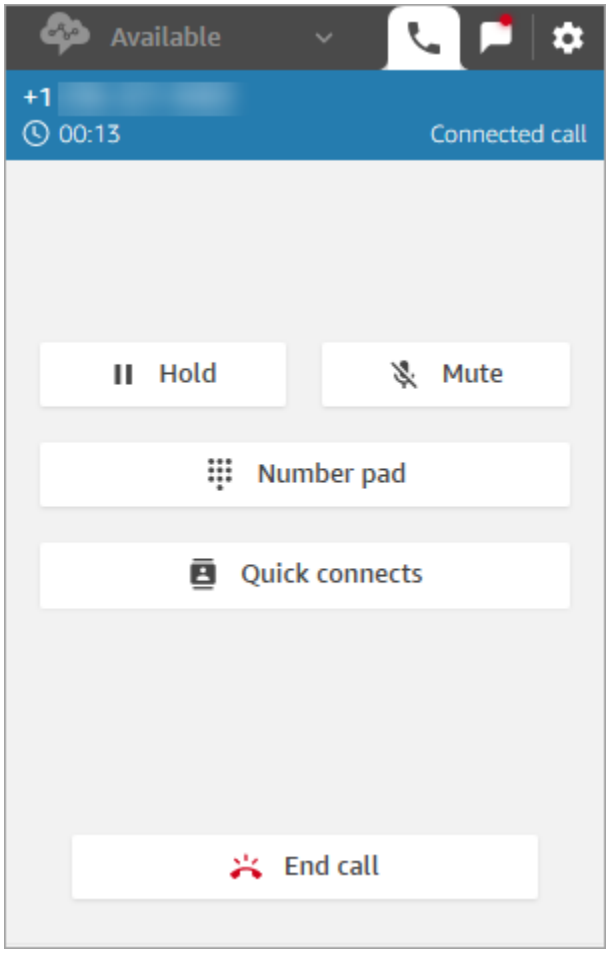
2. Choose **Number pad**.



3. Enter the external number you want to call, and then choose **Call**.



4. You'll be connected to the call at the same time the chat is still ongoing, as shown in the following image.



5. To go to the chat conversation while you're on the phone, choose the chat tab.
6. To end the phone conversation, choose the phone tab, choose **End call**, and then choose **Close contact**. You're still connected to the chat conversation.

Can't make outbound call to another agent

If you're on a chat and having trouble making an outbound call to another agent, it could be because that agent's routing profile is not set up to allow them to take calls while on a chat or task contact. They need to be assigned to a routing profile that allows cross-channel concurrency.

Can't see phone number quick connects in the CCP

Agent quick connects are not visible in the CCP while you're on a chat.

If you can't see phone number quick connects in your CCP, however, check that the phone number quick connect has been added to your queue as described in Step 2: Enable agents to see quick connects.

Enable agent quick connects for calls during a chat

To enable agents to consult over the phone with each other while they are on chats, your Connect Customer administrator needs to set up a direct dial number (DID) that routes to the agent. This configuration incurs additional costs.

Accept incoming emails

This topic explains how agents use the Contact Control Panel (CCP) to handle email contacts. Agents can accept incoming emails, review email content and threads, compose responses, and manage email contacts throughout their lifecycle.

Overview of email contact handling

When an email contact is routed to an agent, it appears in the CCP just like voice and chat contacts. Agents can accept, handle, and complete email contacts using the same familiar interface.

Key capabilities for handling email contacts include:

- Accepting incoming email contacts from the queue
- Viewing email content, including the message body and thread history
- Reading and downloading email attachments
- Composing and sending email responses
- Selecting the appropriate From email address
- Forwarding emails to external addresses
- Transferring email contacts to other agents or queues

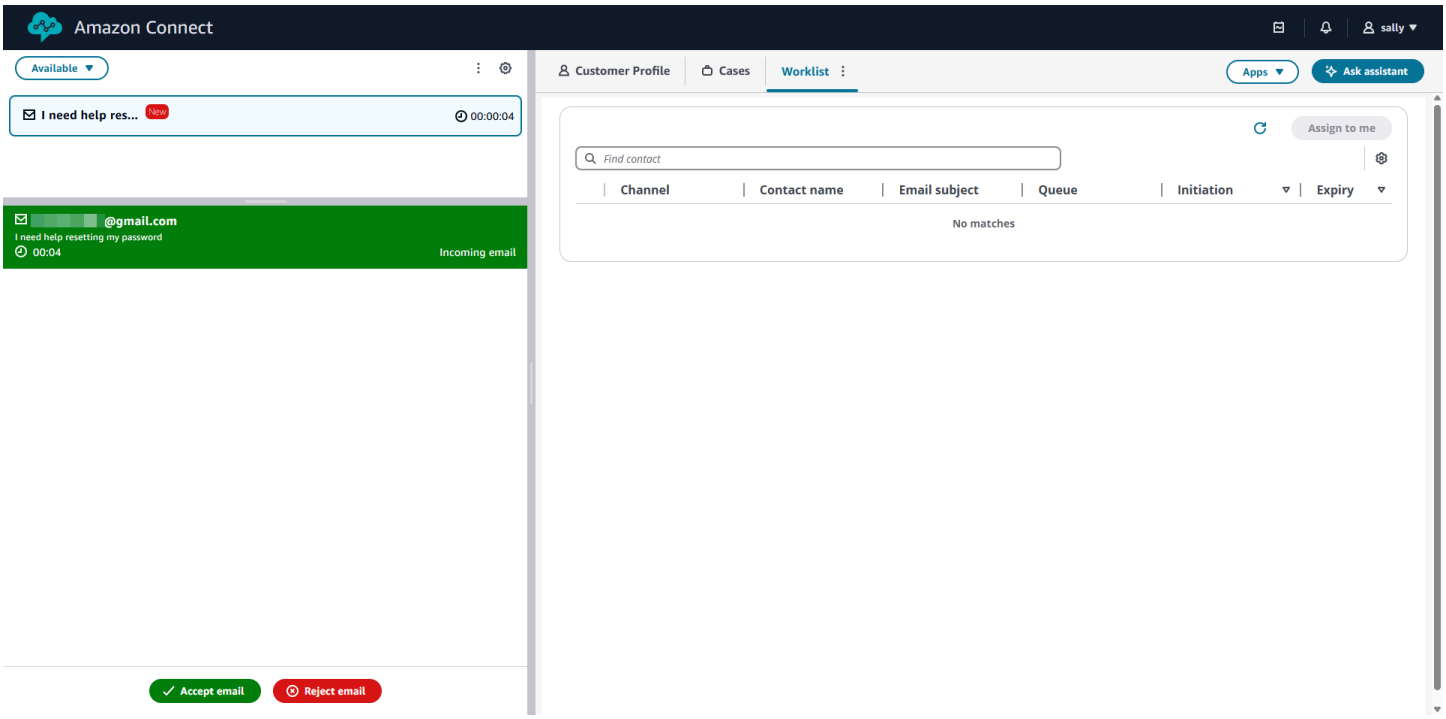
Receiving and accepting email contacts

Email contacts are routed to agents based on their routing profile and queue assignments, similar to other contact types.

Email contact notifications

When an email contact is offered to an agent:

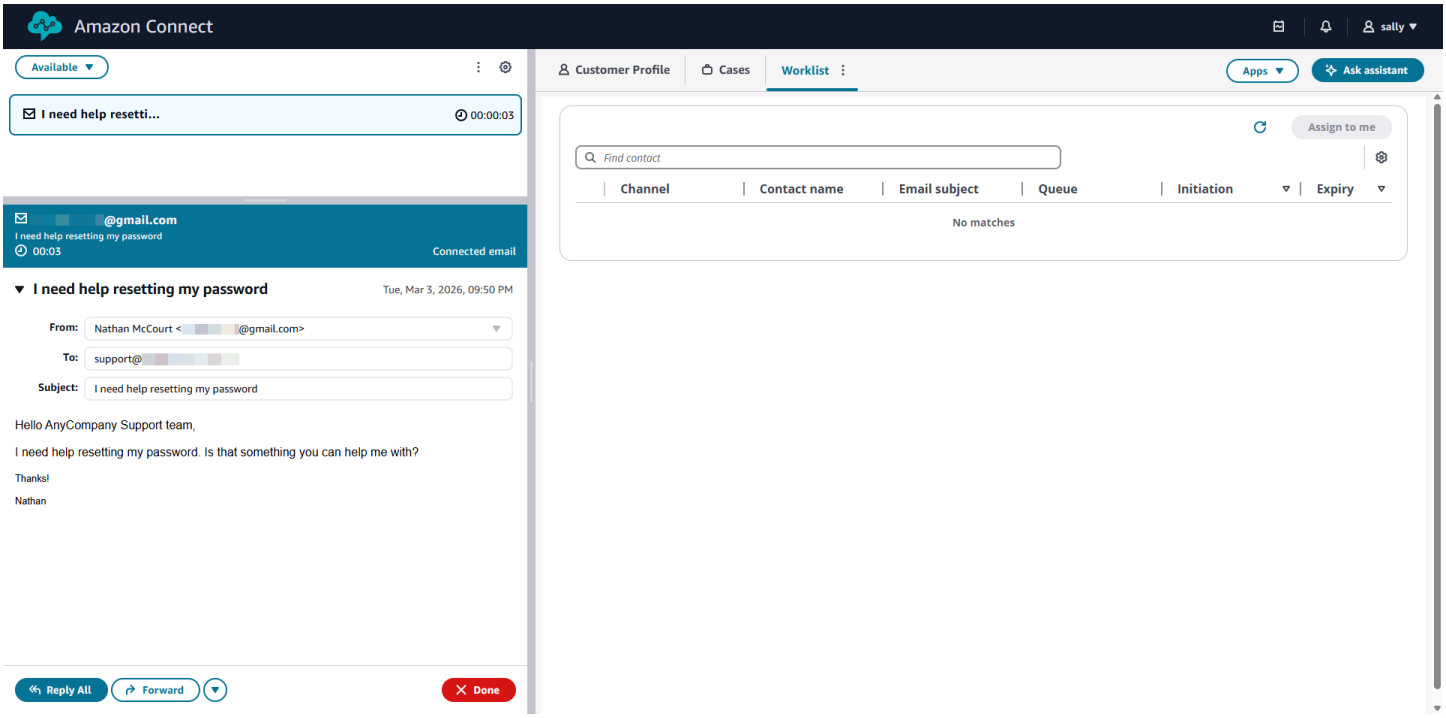
1. The CCP displays a notification showing an incoming email contact.
2. The notification includes basic information such as the sender's email address and subject line.
3. The agent has a configured amount of time to accept or reject the contact.



Accepting an email contact

To accept an incoming email contact:

1. When the email contact notification appears in the CCP, choose **Accept**.
2. The email contact opens in the CCP, displaying the email content and available actions.
3. Review the email details, including sender, recipients, subject, and message body.

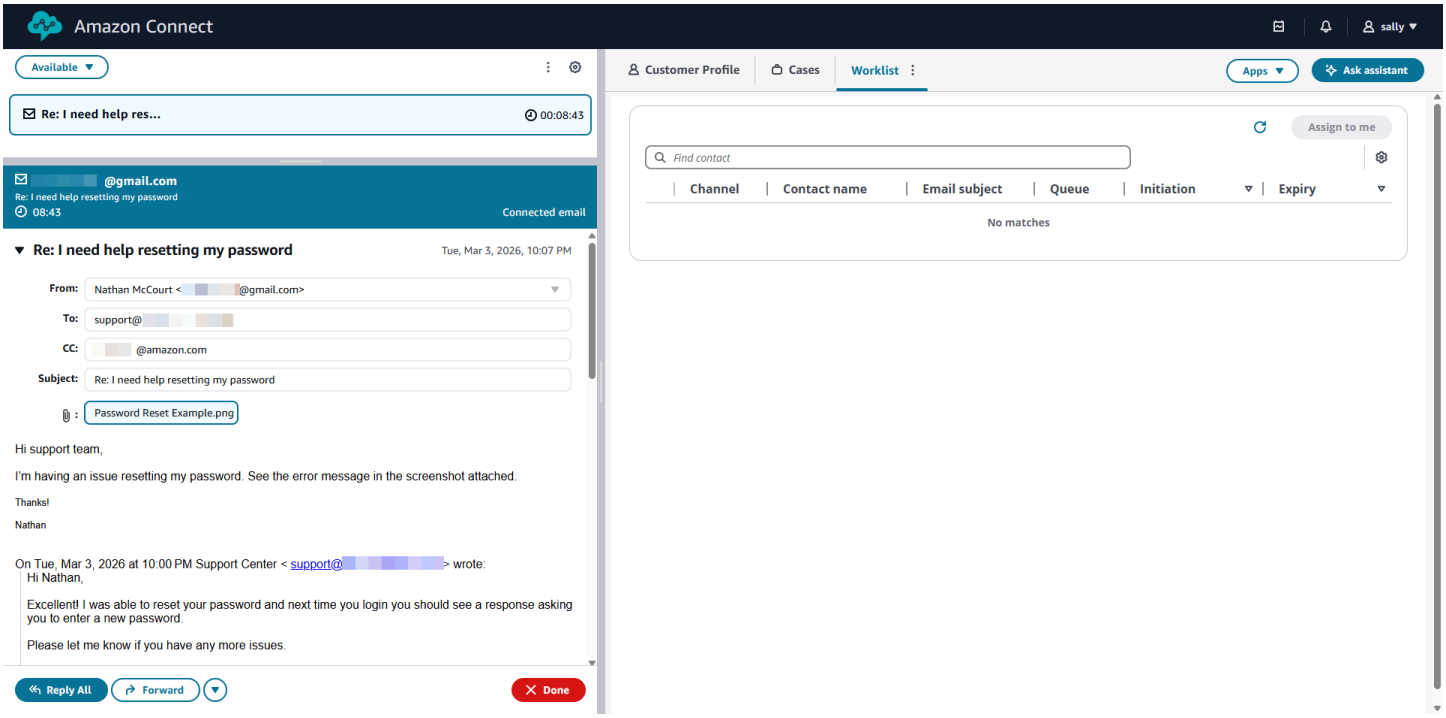


> **Note**
>
> If you don't accept the email contact within the configured timeout period, it will be returned to the queue and might be offered to another agent.

Email contact interface in the CCP

When an agent accepts an email contact, the CCP displays a dedicated email interface with the following components:

- **Email header**: Displays the From, To, CC, and Subject fields.
- **Message body**: Shows the content of the current email message.
- **Email thread**: Displays previous messages in the conversation, if applicable.
- **Attachments**: Lists any files attached to the email, with options to view or download.
- **Reply area**: Provides a text editor for composing responses.
- **Action buttons**: Includes options to send, transfer, or end the contact.



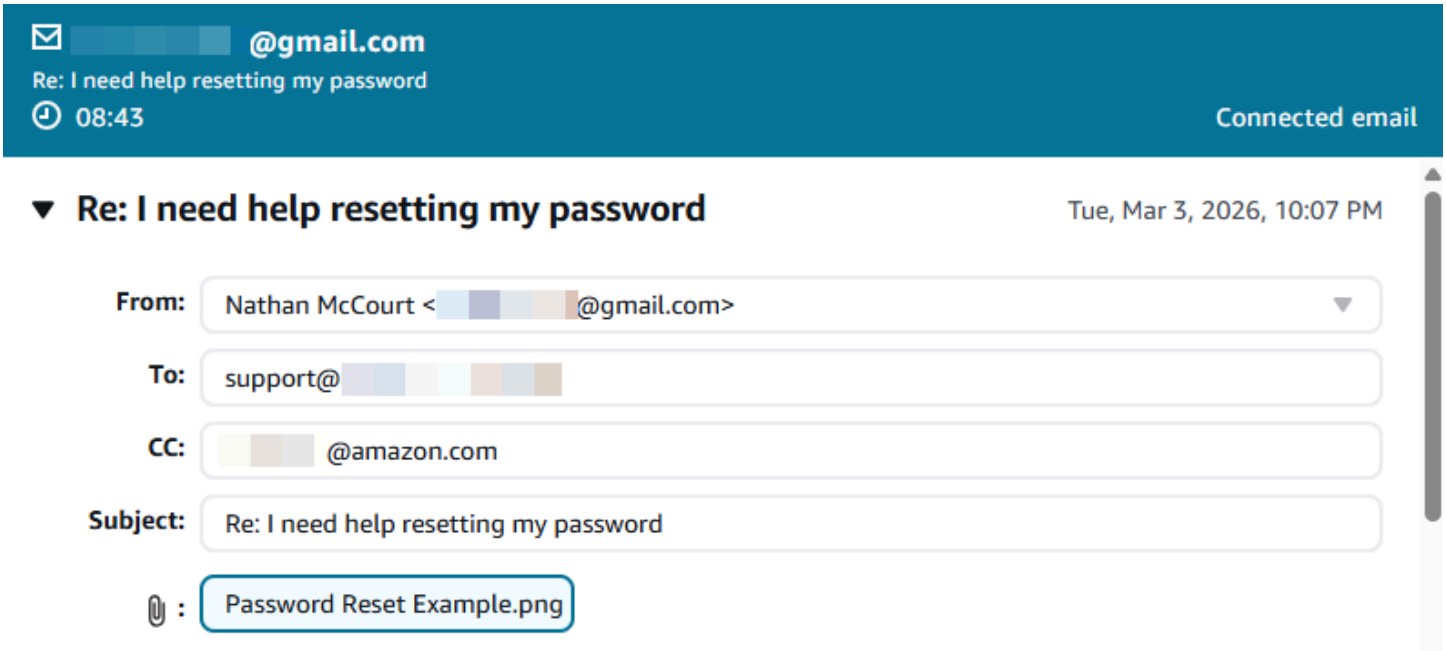
Reading and reviewing email content

Agents can review all aspects of an email contact to understand the customer's inquiry and provide an appropriate response.

Viewing email details

The email header displays key information:

- **From**: The customer's email address
- **To**: The email address(es) that received the message
- **CC**: Any email addresses copied on the message
- **Subject**: The email subject line
- **Date/Time**: When the email was sent

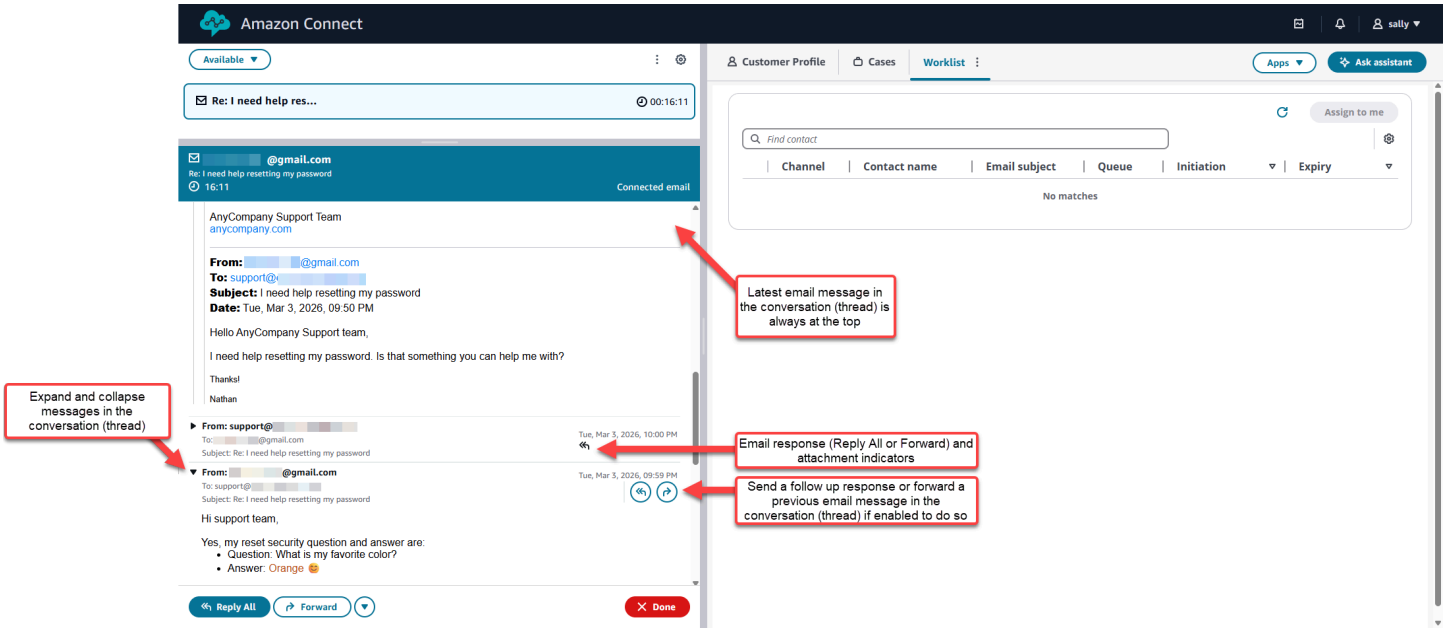


Viewing email threads

Connect Customer automatically groups related email messages into threads, allowing agents to see the full conversation history. Email threading follows standard email client conventions (RFC 5256).

To view an email thread:

1. In the CCP, the current email message is displayed at the top.
2. Previous messages in the thread appear below, in chronological order.
3. Expand or collapse individual messages to review their content.



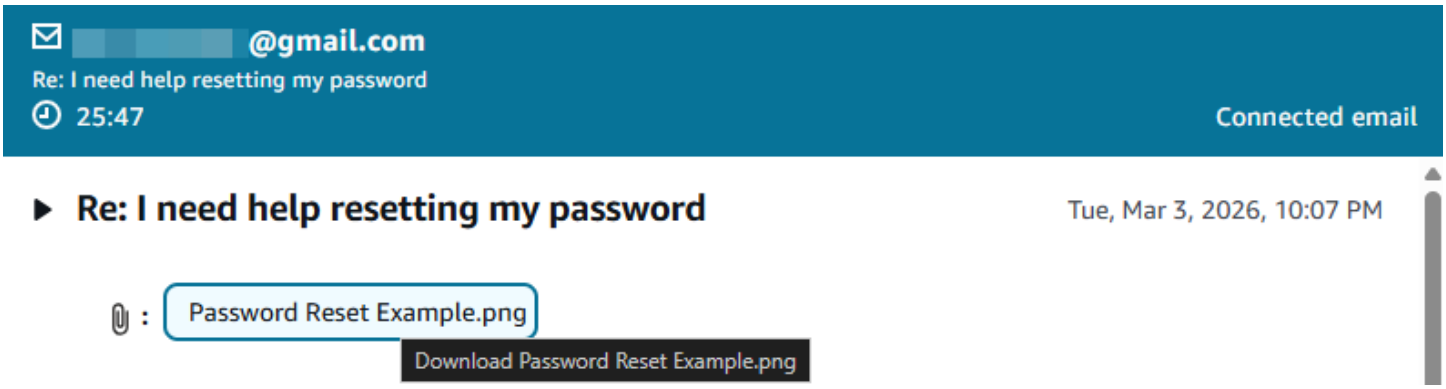
Email threads help agents understand the full context of a customer inquiry, including previous interactions and responses.

Viewing and downloading attachments

If an email includes attachments, they are listed in the attachments section of the CCP.

To view or download an attachment:

1. Locate the attachments section in the email interface.
2. Choose the attachment name to download it to your local device.
3. Open the downloaded file using the appropriate application.



> **Important**
>
> Attachments are stored in your organization's Amazon S3 bucket. Make sure you have the necessary permissions to access attachments. If attachment scanning is configured, only attachments that pass security scans will be available for download.

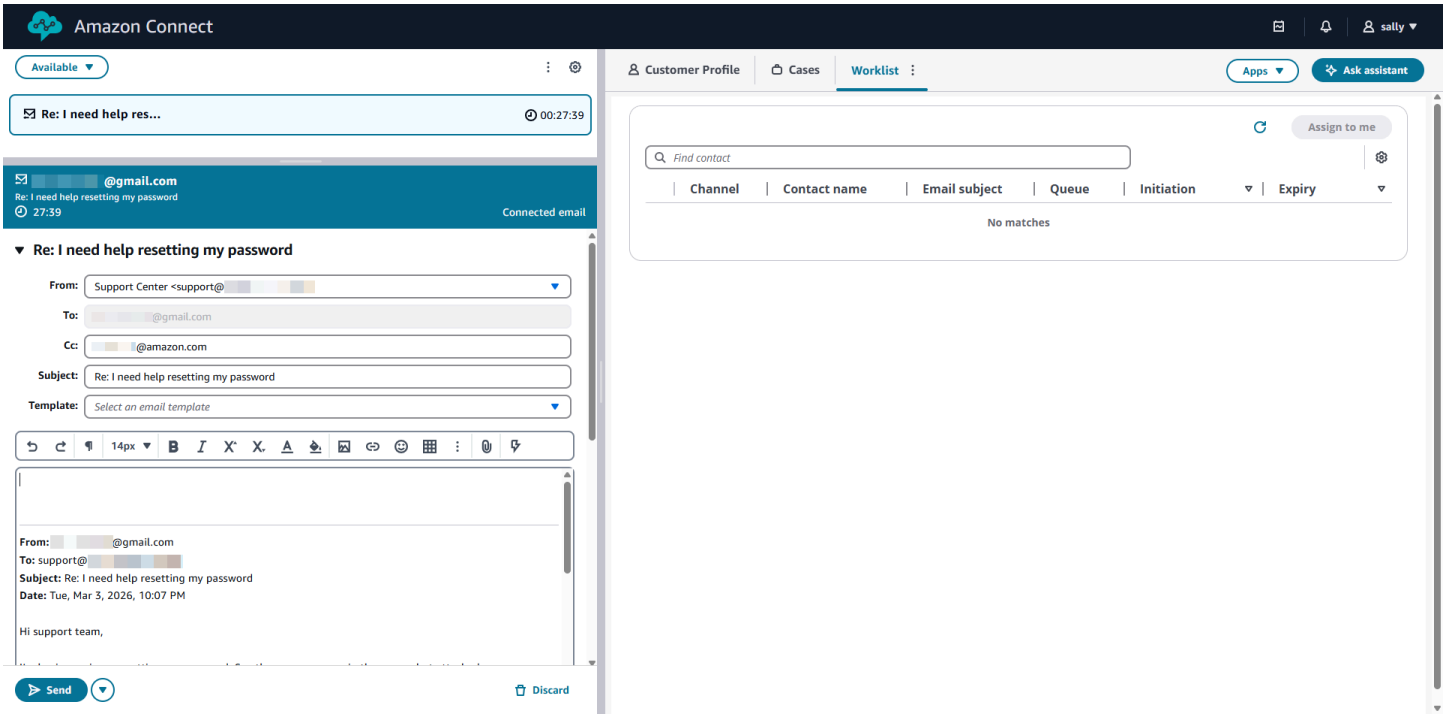
Composing and sending email responses

After reviewing an email contact, agents can compose and send a response directly from the CCP.

Composing a response

To compose an email response:

1. In the reply area of the CCP, enter your response message.
2. The CCP automatically populates the To and CC fields based on the incoming email. You cannot modify the To field. You can modify the CC field.
3. The Subject field is automatically populated with "Re: [original subject]". You can modify this if needed.
4. Use the text editor to format your message, if formatting options are available.
5. If needed, add attachments to your response by choosing the attachment option.



Sending a response

To send your email response:

1. Review your message for accuracy and completeness.
2. Verify that the From email address is correct. See Select a From email address for details on selecting the appropriate sender address.
3. Choose **Send** to send the email.
4. The email is sent through Amazon SES to the customer.

After sending a response, the email contact remains active until you choose to end it. While the email contact is active, you can send multiple messages within the same contact if needed.

Using message templates

If your organization has configured message templates, you can use them to quickly insert pre-written content into your email responses. For information about message templates, see Create message templates.

Email contact states

Email contacts move through various states during their lifecycle, similar to other contact types in Connect Customer:

- **Incoming**: The email contact is being offered to the agent.
- **Connected**: The agent has accepted the email contact and is actively handling it.
- **Ended**: The agent has completed handling the email contact.

Unlike voice contacts, email contacts do not have a "hold" state. Agents can work on multiple email contacts simultaneously, switching between them as needed.

Managing email contacts

Agents have several options for managing email contacts in the CCP.

Ending an email contact

To end an email contact:

1. After sending your final response or completing your work on the email, choose **End contact** or **Close**.
2. The email contact is marked as complete and removed from your active contacts.
3. Complete any required after-contact work (ACW) if configured.

> **Note**
>
> Ending an email contact does not prevent the customer from sending additional emails. If the customer replies after you end the contact, a new email contact will be created and routed according to your flow configuration.

Handling multiple email contacts

Agents can handle multiple email contacts simultaneously, up to the limits configured in their routing profile. To switch between active email contacts:

1. In the CCP, view the list of your active contacts.
2. Choose the email contact you want to work on.
3. The selected email contact is displayed in the CCP interface.

Topics

- Select a From email address
- Forward email contacts to external email addresses
- Email draft auto-save in the agent workspace

Select a From email address

When agents reply to or initiate emails, they can select which From (system) email address to use. This is helpful when agents support multiple brands, departments, or business units within the same contact center.

See Create email addresses if you do not have email addresses created in your Amazon Connect instance.

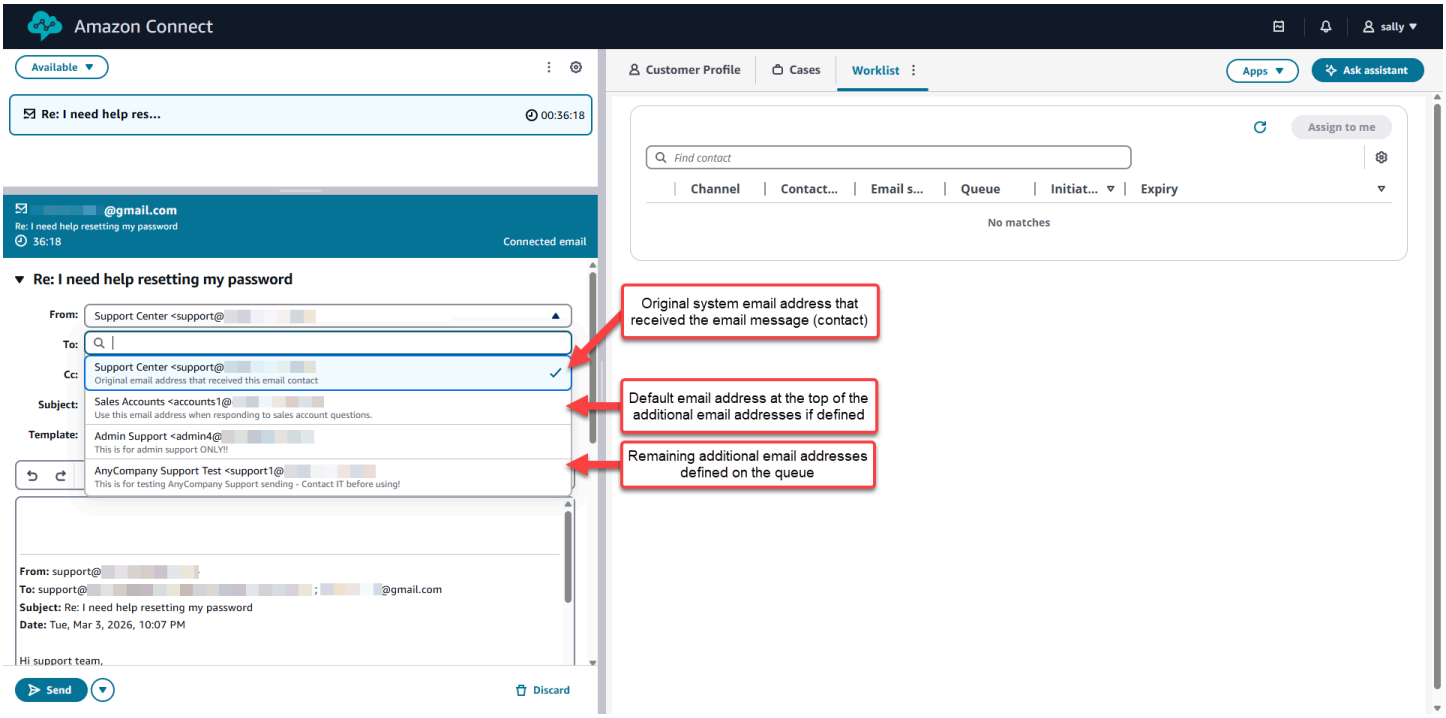
Selecting a From address when replying to inbound emails

When an agent replies to an inbound email contact:

1. The **From** address defaults to the original email address that received the customer's email.
2. The agent sees a label indicating **Original email address that received this email contact**.
3. The agent can change to a different address if needed by selecting from the **From** dropdown.

The available email addresses come from the queue that received the contact. The list is ordered as follows:

1. The original email address that received the inbound email (labeled as **Original email address that received this email contact**)
2. The default email address configured on the queue
3. The remaining additional email addresses configured on the queue



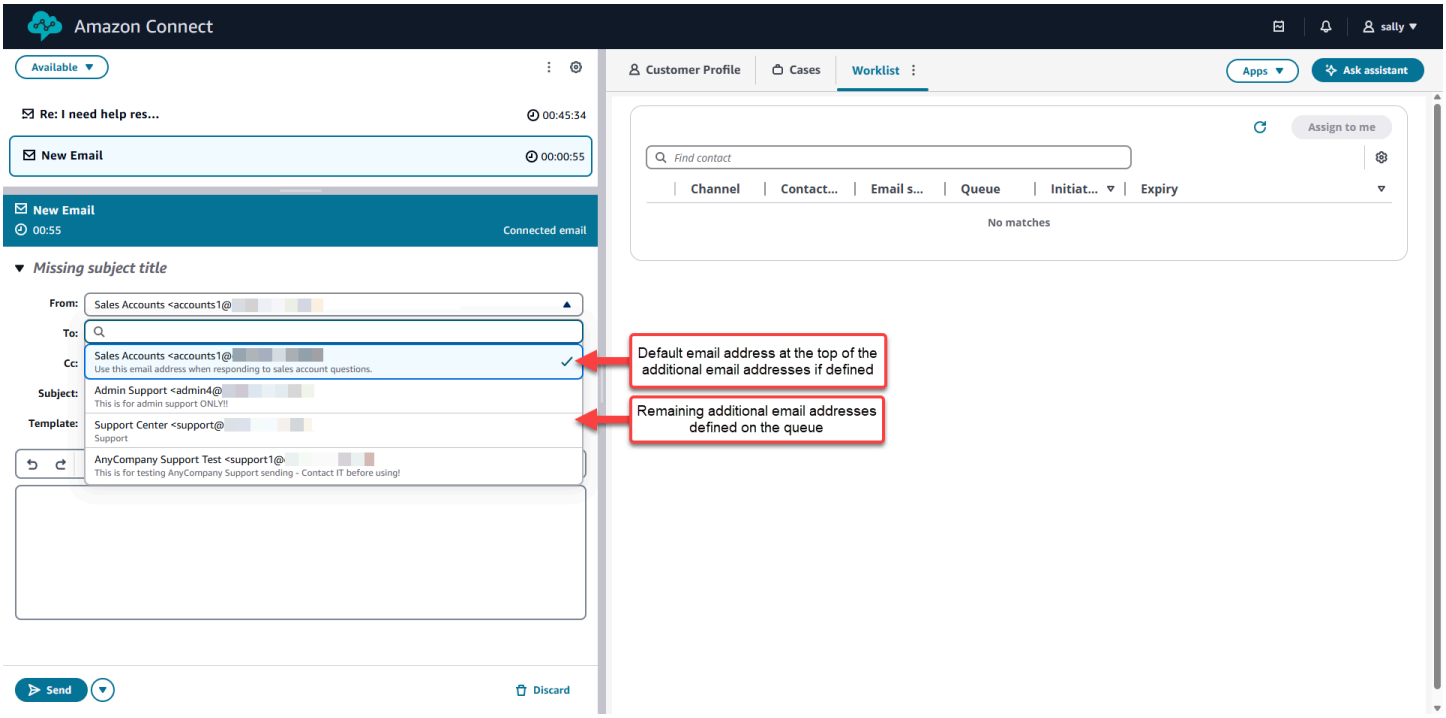
Selecting a From address when initiating outbound emails

When an agent initiates a new outbound email contact:

1. The **From** address defaults to the default email address configured on the agent's default outbound queue (specified in their routing profile).
2. The agent can change to a different address by selecting from the **From** dropdown.

The available email addresses come from the default outbound queue configured in the agent's routing profile. The list is ordered as follows:

1. The default email address configured on the default outbound queue
2. The remaining additional email addresses configured on the default outbound queue



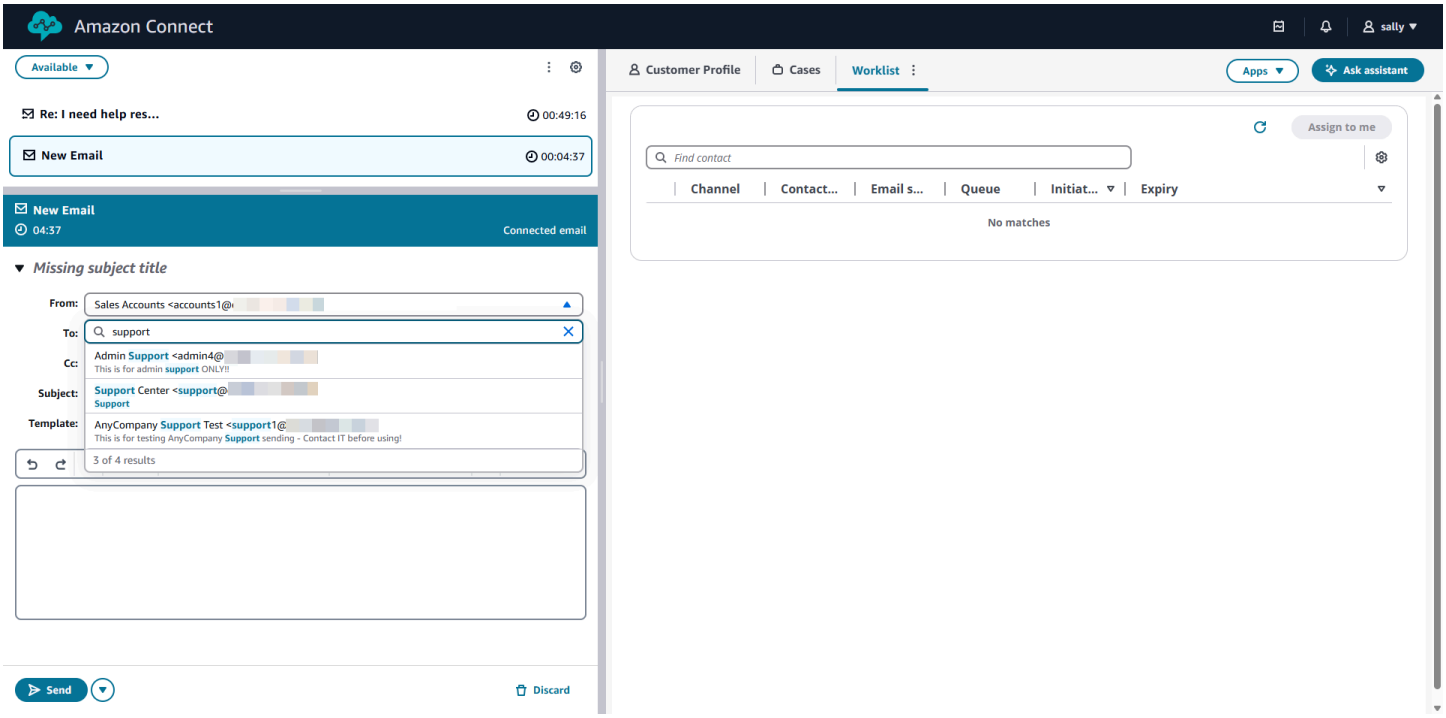
Using the From address selector

To select a From email address:

1. Choose the **From** dropdown to see all available email addresses.
2. Use the search box to quickly find the right address.
3. Review the information displayed for each address:

   - Friendly sender name (if configured)
   - Email address
   - Description (if configured)

   For example: `Support Team <support@example.com> - For customer support inquiries`
4. Select the appropriate address for your use case.



> **Note**
>
> The list of available email addresses respects your security permissions. If tag-based access control (TBAC) is configured, you only see email addresses that match your assigned tags.

Example use cases

The following examples show when agents might need to select a different From email address:

- **Multi-brand support**: An agent handles contacts for both an insurance division and a retail division. When sending a follow-up email, the agent selects the appropriate brand email address.
- **BPO scenario**: A BPO agent supporting multiple client brands receives a call from AnyCompany Brand. When initiating a follow-up email, the agent selects the AnyCompany Brand email address.
- **Blended agents**: An agent on a voice call needs to send follow-up instructions by email. The agent initiates an outbound email and selects the correct department email address.
- **Email routing correction**: An agent receives an email that was sent to sales@example.com but should have gone to support@example.com. The agent selects support@example.com as the From address when replying.

Forward email contacts to external email addresses

Agents can forward email contacts to external email addresses (for example, `firstname.lastname@anycompany.com`) or distribution lists (for example, `support-team-distro@anycompany.com`) when they need to involve other parties outside of Connect Customer. This feature allows agents to share customer emails with external teams, partners, or systems while maintaining the email thread within Connect Customer.

Overview of email forwarding

Email forwarding enables agents to:

- Send a copy of the email contact to external email addresses
- Forward emails to distribution lists or group email addresses
- Include additional context or instructions when forwarding

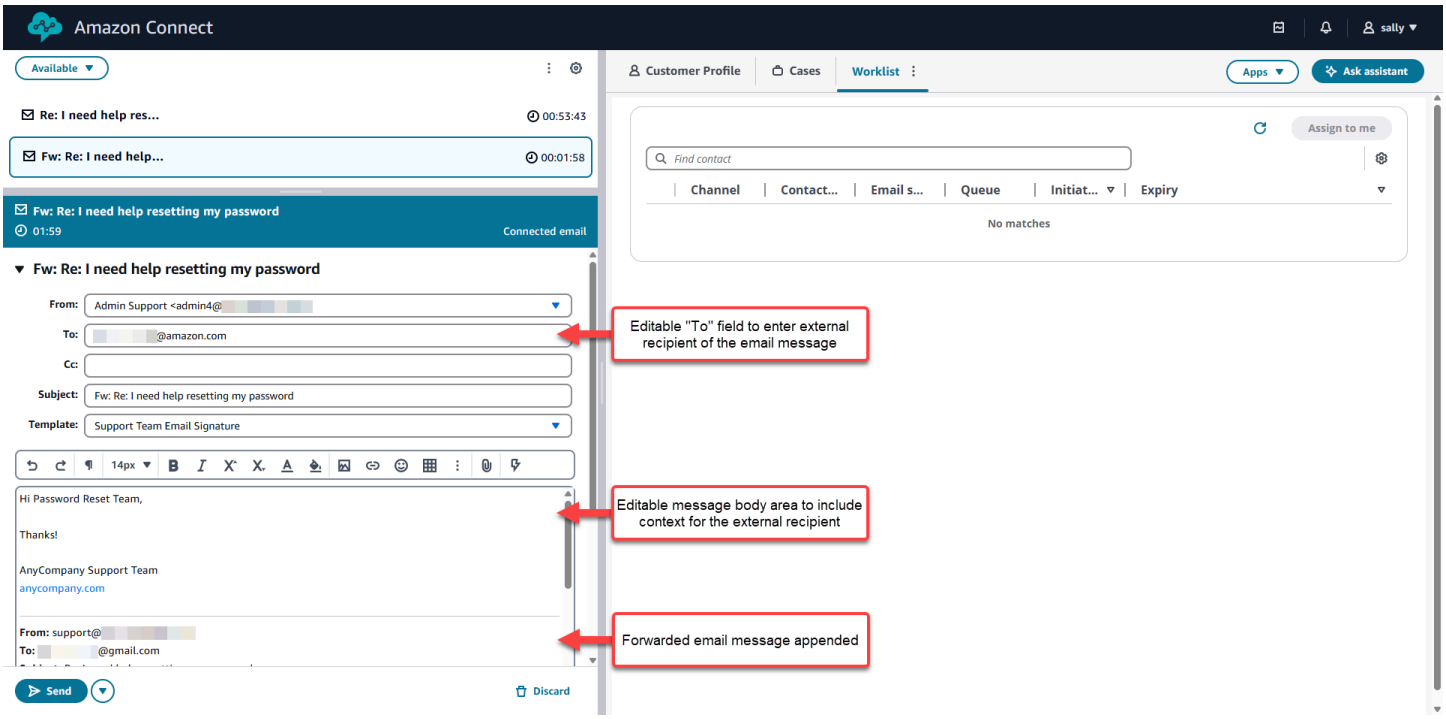
> **Important**
>
> Forwarding an email contact sends a copy to external recipients but does not transfer the contact out of Connect Customer. The agent remains responsible for the contact until they end it or transfer it to another agent or queue within Connect Customer.

How to forward an email contact

To forward an email contact to an external address:

1. In the CCP, open the email contact you want to forward.
2. Choose the **Forward** option or button.
3. In the **To** field, enter the external email address or addresses where you want to forward the email. You can only enter 1 email address in the **To** field. Additional recipients can be added to the **CC** field.
4. Optionally, add a message in the body field to provide context or instructions for the external recipients.
5. Optionally, attach files you want to include. Original inbound attachments do not carry over to the forwarded email.

6. Review the forwarded content, which includes:
   - The original email message and thread
   - Your additional message (if provided)
7. Choose **Send** to forward the email.



The forwarded email is sent to the external recipients. The email contact remains active in your CCP until you end it either by responding to it or choosing **Done** to close it.

Forwarding to distribution lists

You can forward email contacts to distribution lists or group email addresses in the same way you forward to individual addresses. Simply enter the distribution list email address in the **To** field.

Common use cases for forwarding to distribution lists include:

- Escalating issues to specialized teams
- Sharing customer feedback with product teams
- Notifying management of high-priority issues
- Coordinating with external partners or vendors

Permissions and restrictions

Email forwarding capabilities are controlled by your security profile permissions. Your administrator configures which agents can forward emails ("Initiate email conversation" must be enabled on your Contact Control Panel (CCP)) and to which external addresses (based on checking contact attributes in the Default outbound flow in Connect Customer: "This call is not being recorded").

Potential restrictions might include:

- Allowed external domains or email addresses
- Blocked domains to prevent forwarding to unauthorized recipients
- Limits on the number of external recipients per forward
- Requirements for manager approval before forwarding

> **Note**
>
> If you attempt to forward an email to an address that is not permitted by your organization's policies, you might receive an error message.

Best practices for forwarding emails

Follow these best practices when forwarding email contacts:

- **Verify recipient addresses**: Double-check that you're forwarding to the correct external address before sending.
- **Protect customer privacy**: Be mindful of customer data and privacy regulations when forwarding emails to external parties. Only forward to authorized recipients.
- **Add context**: Include a brief message explaining why you're forwarding the email and what action you expect from the recipients.
- **Review attachments**: Make sure that any attachments being forwarded are appropriate and don't contain sensitive information that shouldn't be shared externally.
- **Follow up**: If you're forwarding an email for action by external parties, make sure to follow up to ensure the issue is resolved.

- **Document the forward**: Add notes to the contact record indicating that you forwarded the email, to whom, and why.

Forwarding compared to transferring

It's important to understand the difference between forwarding and transferring an email contact:

- **Forwarding**: Sends a copy of the email to external recipients outside of Connect Customer. You remain responsible for the contact and must continue to handle it or end it.
- **Transferring**: Quick connect scenarios for transferring contacts, transfers the email contact to another agent or queue within Connect Customer. The contact is removed from your queue and assigned to the transfer destination.

Use forwarding when you need to share information with external parties while maintaining ownership of the contact. Use transferring when you need to hand off the contact to another agent or team within your contact center.

Email draft auto-save in the agent workspace

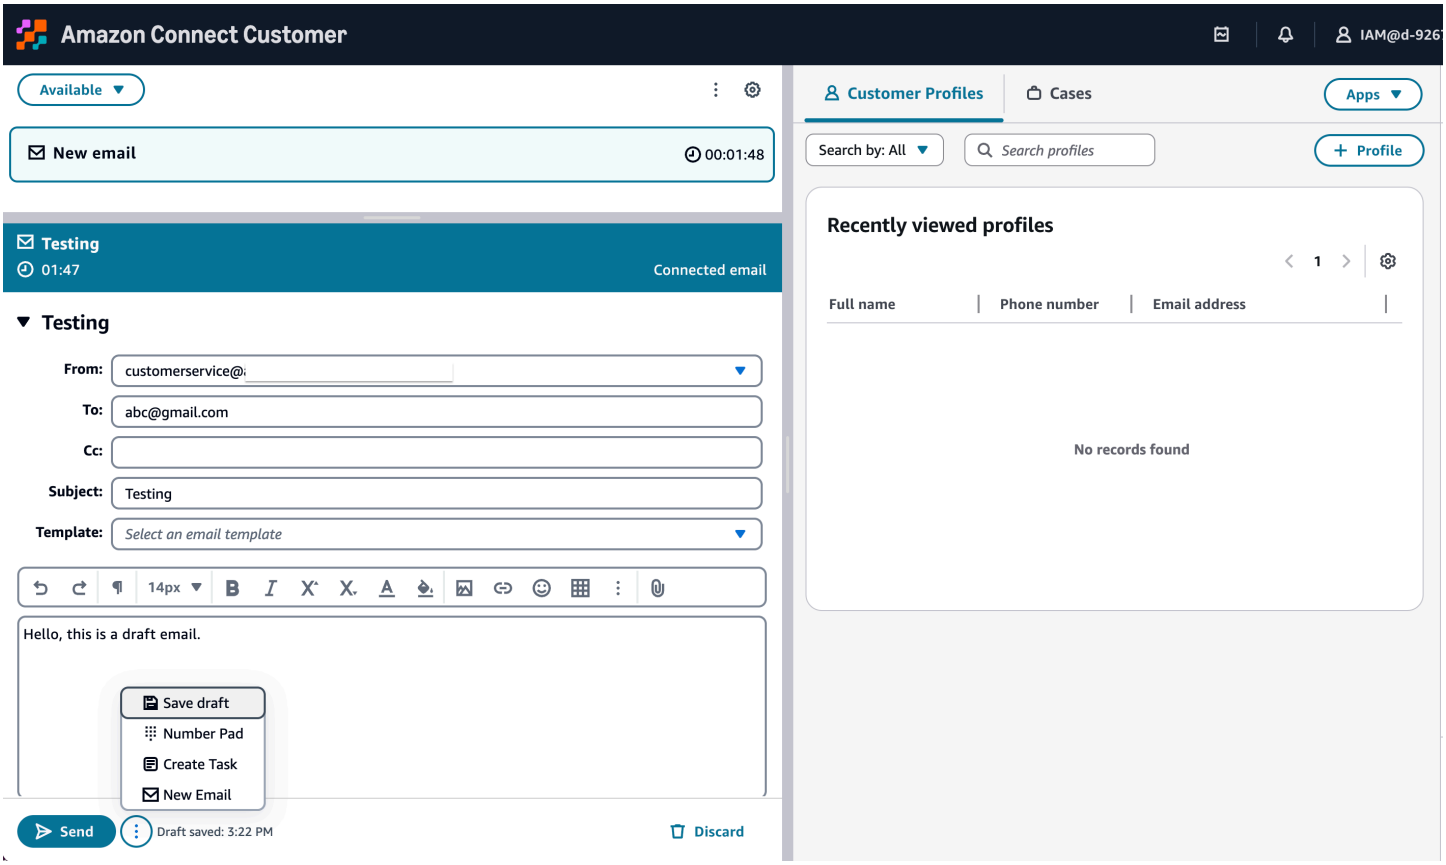
Amazon Connect Customer automatically saves in-progress emails as drafts, helping agents resume work without losing progress when connectivity is interrupted or when their browser is accidentally closed or refreshed. When agents return, their drafts are restored with the message body, recipients, subject line, and attachment references intact.

Automatically saving drafts doesn't require any configuration, and is available in the Agent Workspace and the Contact Control Panel (CCP).

How draft auto-save works

As an agent composes an email, Connect Customer automatically saves the draft every few seconds. The agent can also save at any time by choosing the options menu (the three-dot icon next to **Send**) and then **Save draft**. After a save, the composer shows a **Draft saved** status with the time of the most recent save, next to the **Send** and **Discard** controls.

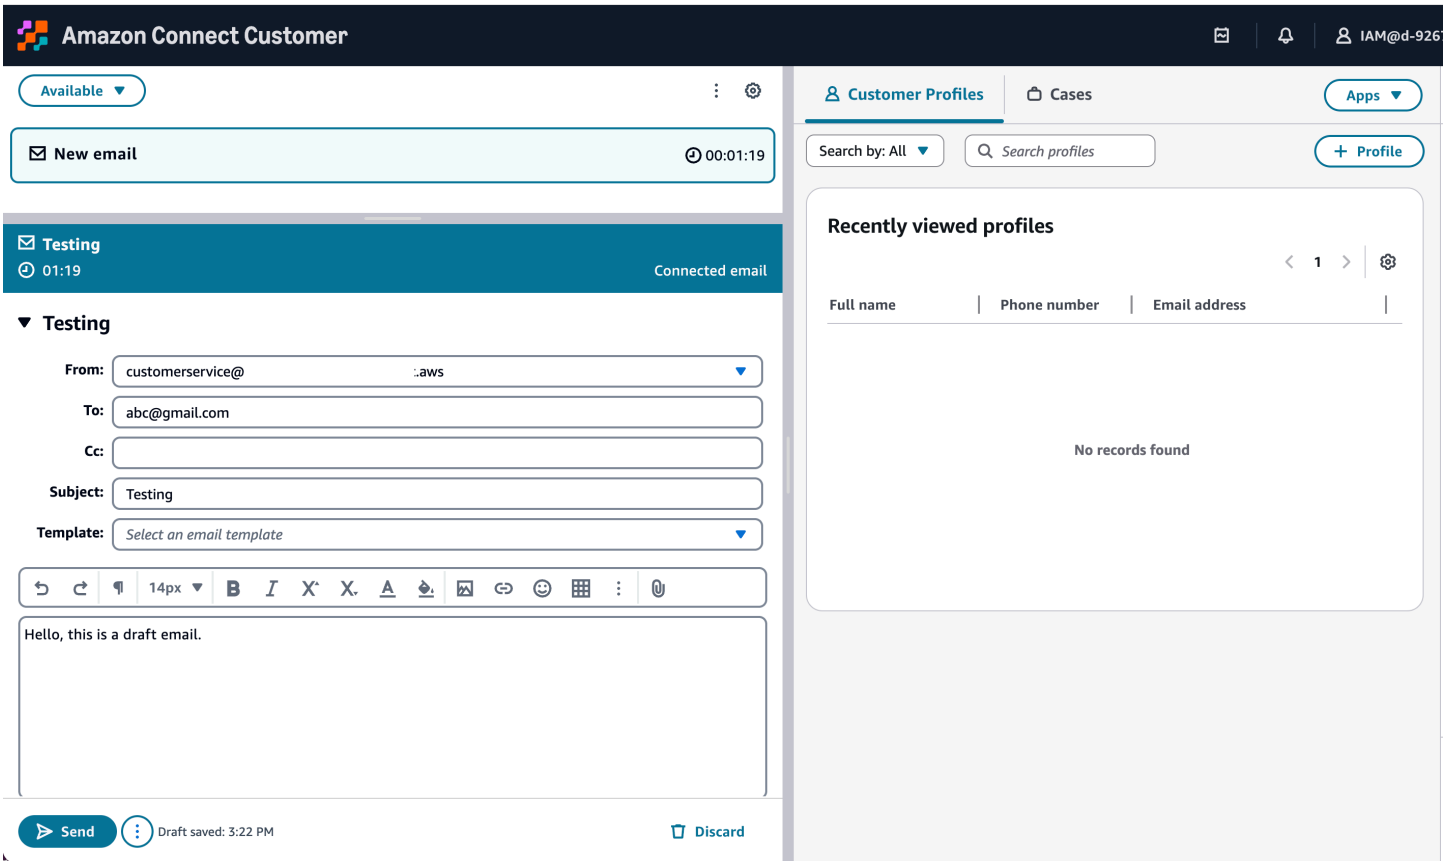
The following screenshot shows the agent workspace email composer. The options menu (the three-dot icon) is open at the bottom of the composer, next to the **Send** button. The menu lists **Save draft** first, followed by **Number Pad**, **Create Task**, and **New Email**.



A draft saves the following:

- The message body.
- The From, To, and CC email addresses.
- The subject.
- References to any attachments the agent has added.

The following screenshot shows the composer after a draft is saved. The status reads **Draft saved** followed by the time of the most recent save (for example, **Draft saved: 3:22 PM**), and appears at the bottom of the composer, to the left of the **Send** and **Discard** controls.



Agents can add or remove CC recipients and attachments while composing, and those changes are saved with the draft.

If a save can't be completed — for example, when a CC address is not a valid email address — Connect Customer shows the message **Failed to save draft. Please try again.** The agent can correct the issue and the draft saves on the next attempt.

Recovering a draft

When an agent reopens an email contact that has a saved draft, Connect Customer automatically loads the draft content into the email composer. The agent can continue editing the draft or discard it.

Draft recovery has the following behavior:

- Draft recovery works across sessions, including after the agent signs out and signs back in.
- A draft is tied to its specific email contact and isn't reused across other contacts.
- Connect Customer keeps only the most recent draft for a contact. Each save replaces the previous draft.

- Only the agent who created the draft can access it.

Discarding a draft

An agent can choose **Discard** to delete the draft. When an agent discards a draft, Connect Customer deletes the saved draft message from your Amazon S3 bucket.

Draft expiry and retention

The following rules govern draft expiry and retention:

- Draft contacts inherit the default 14-day expiry period, consistent with existing outbound email behavior.
- Draft contacts can have their expiry period extended. For more information about extending the expiry period, see the UpdateContact API.
- Draft contacts that an agent doesn't send or discard within the expiry period automatically expire and close, and Connect Customer deletes the saved draft message from your Amazon S3 bucket.

Considerations

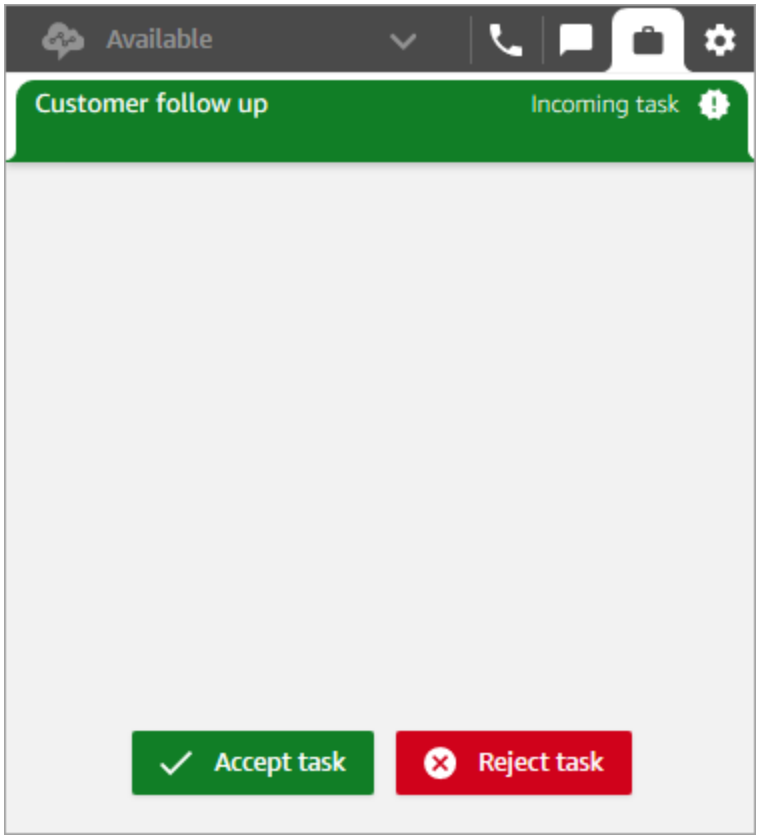
Keep the following considerations in mind:

- Draft auto-save requires no administrator configuration. It's on by default for the email channel.
- Connect Customer stores draft message content in the Amazon S3 bucket associated with your Connect Customer instance.
- Draft auto-save is available in the agent workspace and the CCP. It is not available in custom agent applications built on the Connect Customer Streams API.

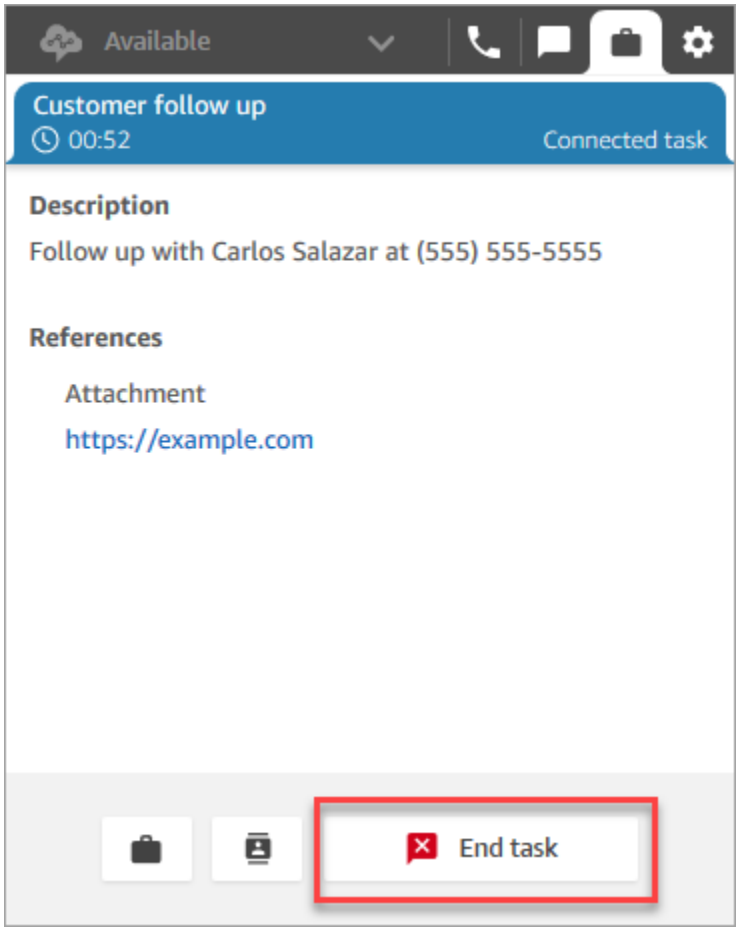
Accept a task assigned in the Contact Control Panel (CCP)

The steps in this topic describe how to deliver tasks to an agent when their status is set to **Available** in the Contact Control Panel (CCP).

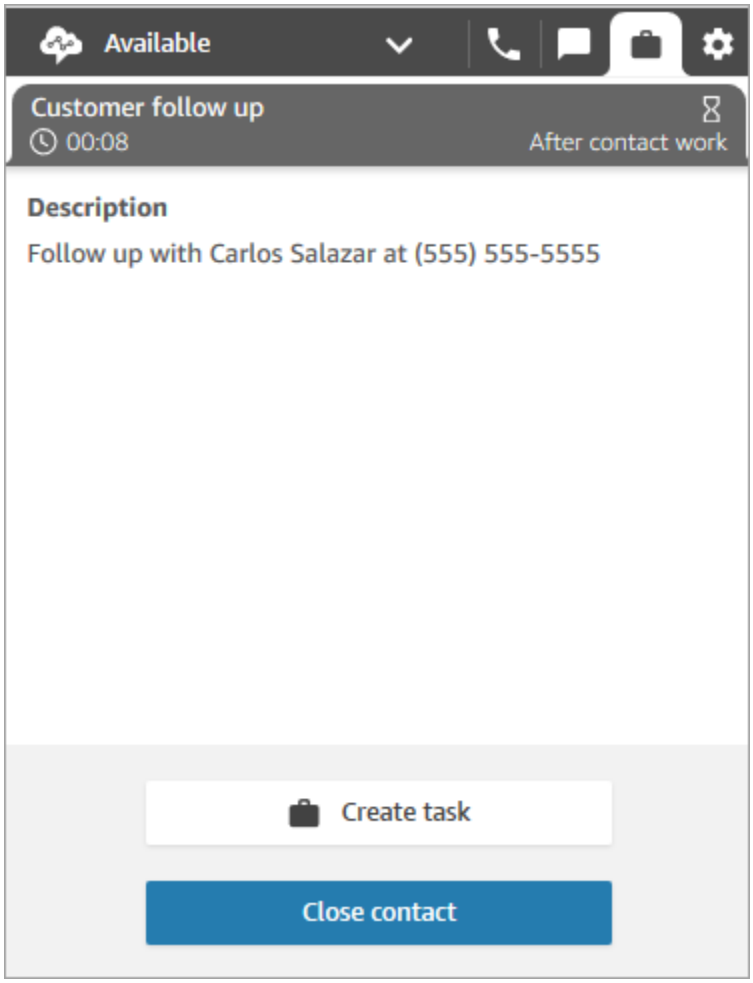
1. Whenever you set your status in the CCP to **Available**, Connect Customer can deliver tasks to you, based on the settings in your routing profile.



2. When a task arrives, choose **Accept task**. You have up to 30 seconds to accept a task (10 seconds more than accepting a call or chat).
3. Review the description of the task, and choose the links as needed to complete the task.



4. When you've completed the task, choose **End task**.
5. You will then be in ACW. When finished, choose **Close contact**.

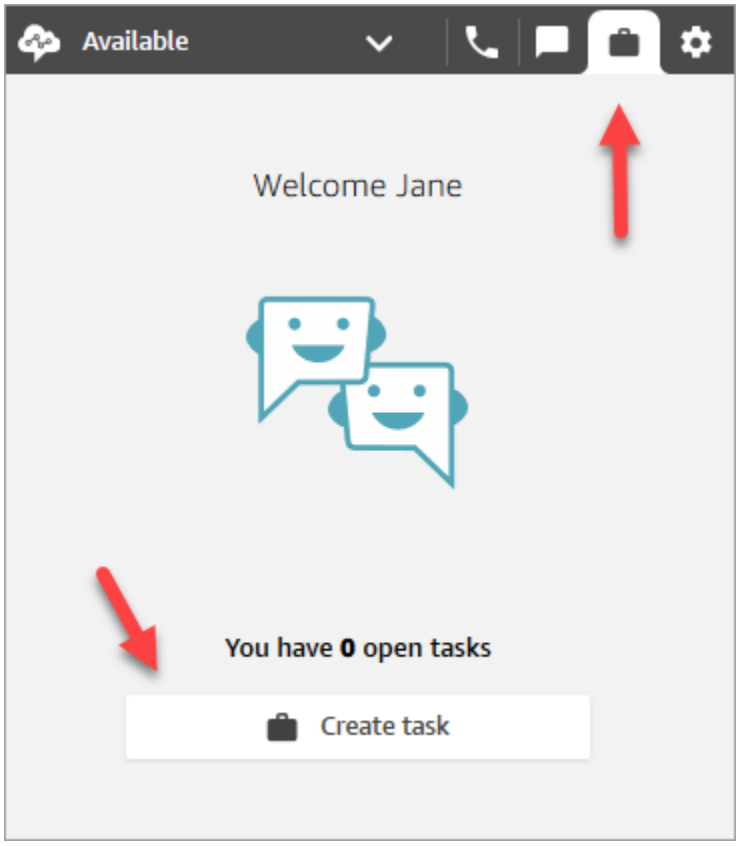


Create a new task in the Contact Control Panel (CCP)

You can create a task any time, even when your status is Offline. And you can assign a task to anyone who has a quick connect, including yourself.

You can create a task, which starts the task immediately. Or you can schedule the task to start on a future date and time.

1. Open the CCP. Select the **Task** tab, and then choose **Create task**.

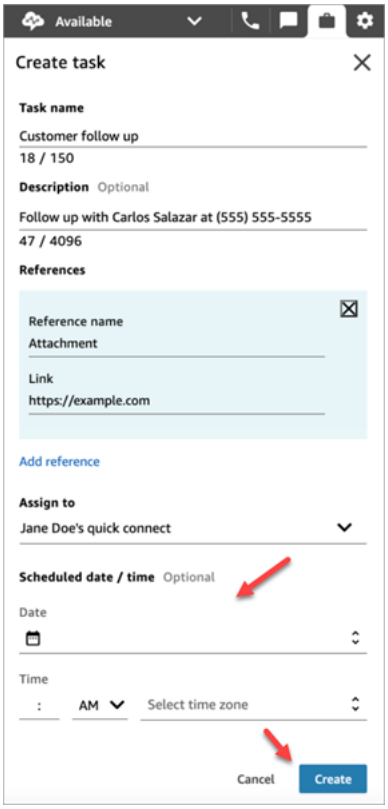


2. Complete the **Create task** page. When you choose **Assign to**, you can assign a task only to someone or a queue that has quick connect.

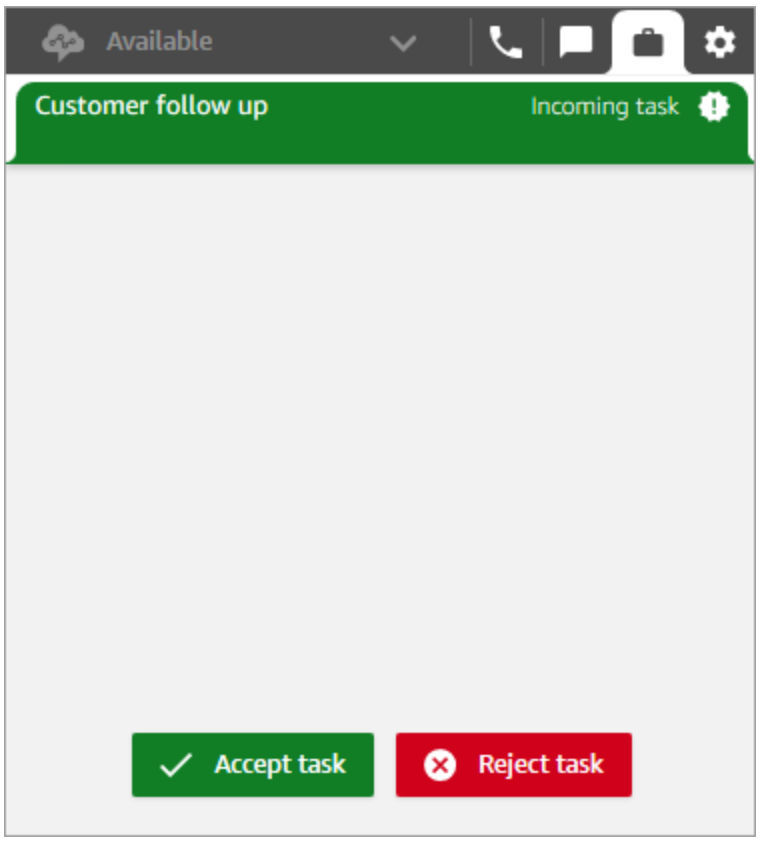
   Choose **Create**.

   CCP only

   The following image shows the option to create a task in the CCP.



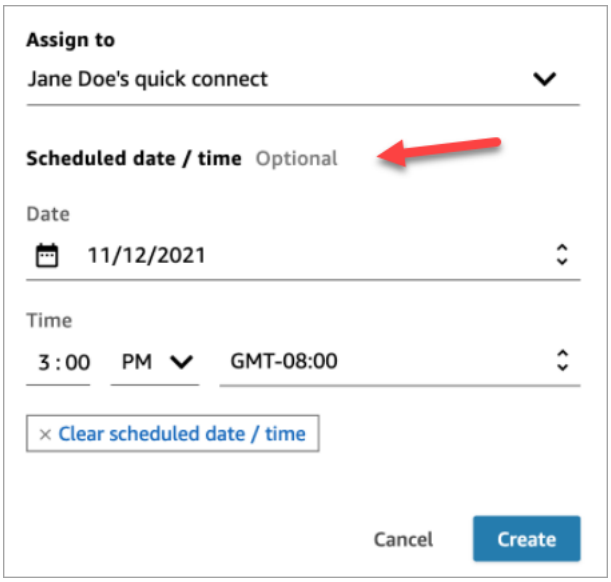
3. If you chose yourself, the task is routed to you. Choose **Accept task**.



Create a scheduled task

You can schedule a task to start on a future date and time.

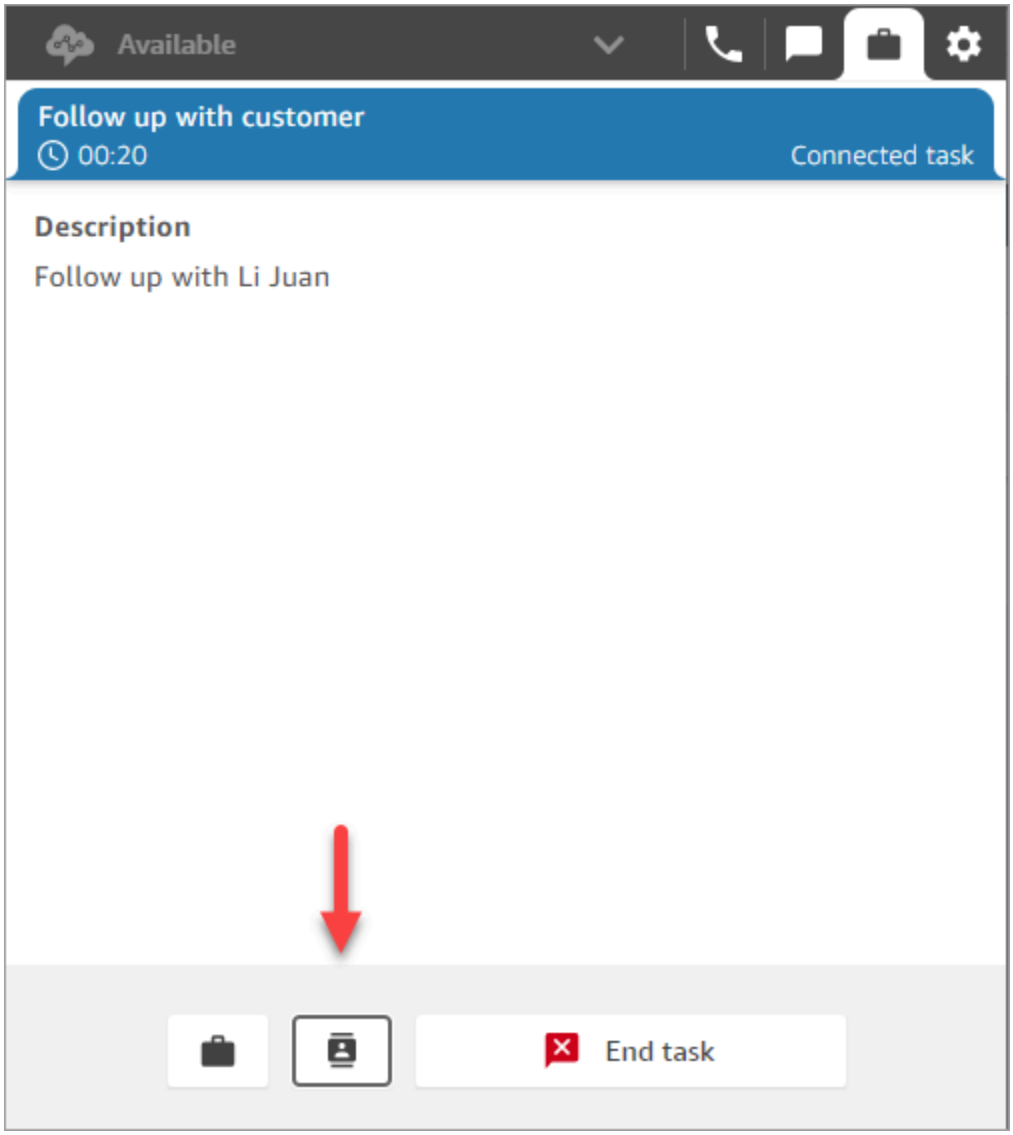
1. Complete the steps to create a task. For example, add a **Task name** and **Assign to** a quick connect.
2. In the **Scheduled date / time** section, choose a future date and time, and specify the timezone. You can schedule a task up to six days in future.
3. If you want to clear all values in the **Scheduled date / time** section and start over, choose **Clear scheduled date / time**.



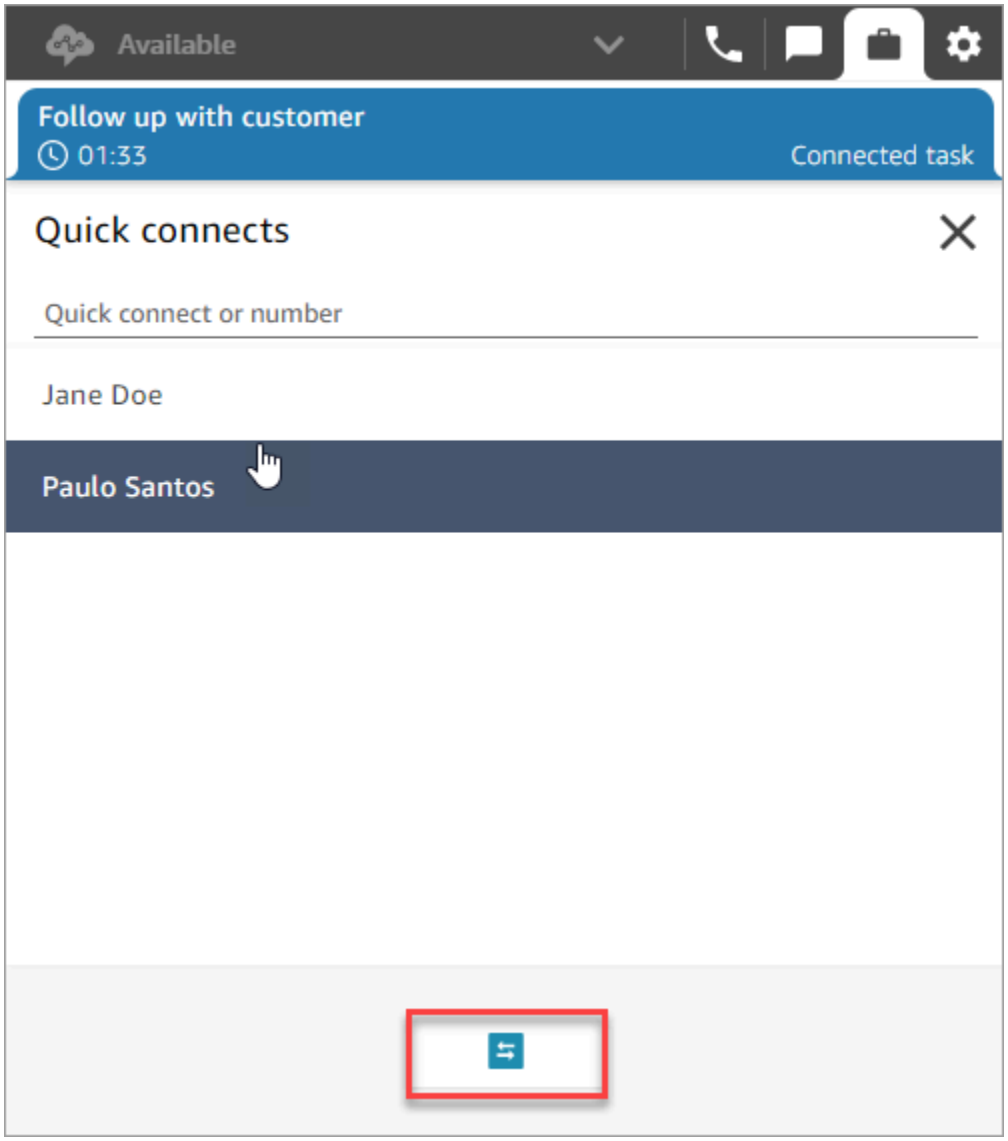
Transfer a task to another agent or queue in the Connect Customer Contact Control Panel (CCP)

You can transfer a task that's assigned to you to another agent or queue.

1. Open the task you want to transfer, and then choose the quick connect icon.



2. Choose from the list of people or destinations listed under **Quick connects**, and then choose the transfer icon.



Accept incoming contacts with Connect Customer Customer Profiles

When a call or chat is connected to your Contact Control Panel (CCP), Connect Customer Customer Profiles, in the same browser window, automatically populates the customer profile that might match the incoming phone number for a voice interaction and *Name* for a chat interaction.

> **Tip**
>
> You can change autopopulation behavior if you wish. For more information, see Use contact attributes to autopopulate customer profiles.

Before agents can access customer profiles, the Connect Customer administrator must enable the Customer Profiles feature and grant agents the appropriate permissions. For more information, see Enable Customer Profiles for your Connect Customer instance.

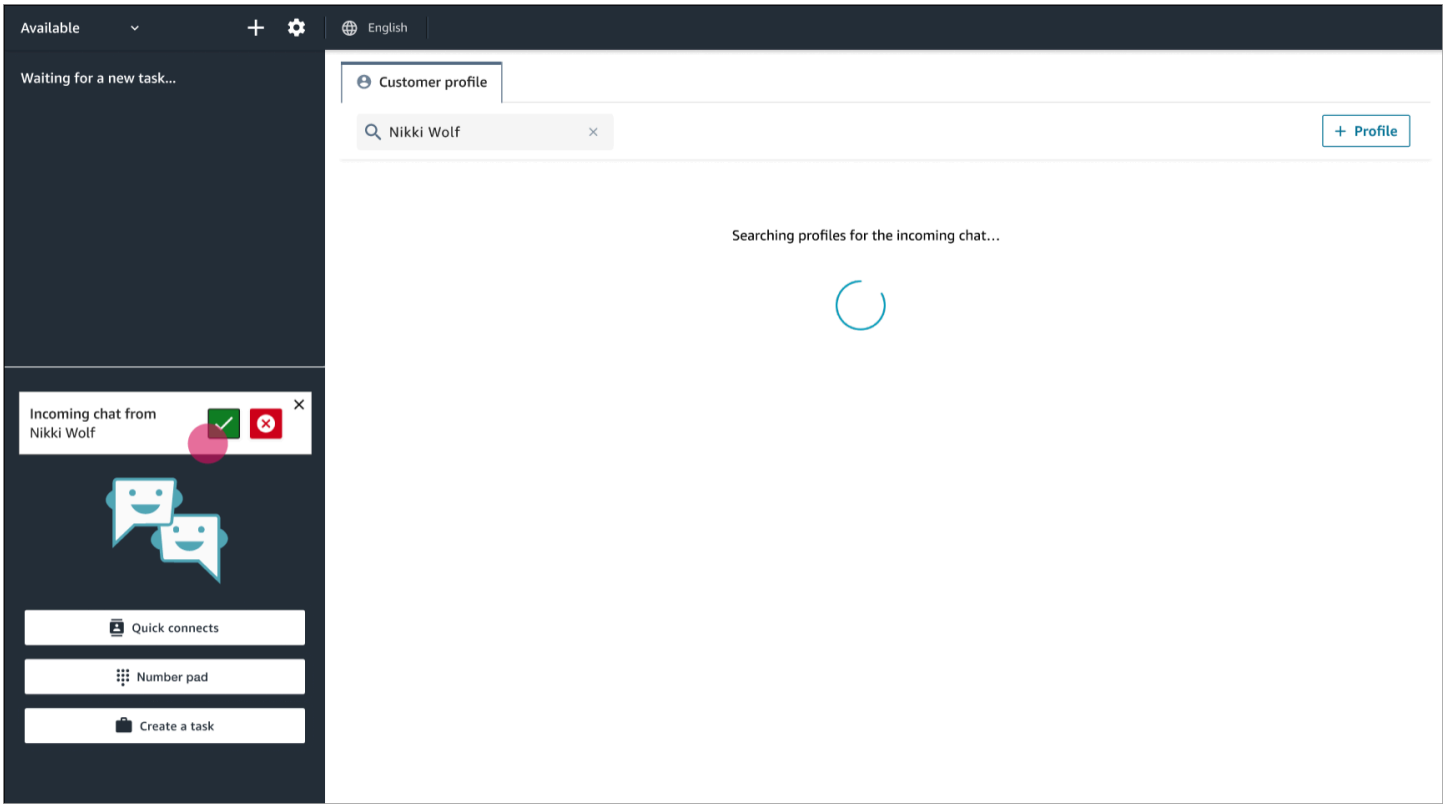
Topics

- Example 1: Auto-populate the customer profile
- Example 2: Accept incoming contact, no customer profile found
- Example 3: Search when not on contact
- Example 4: Autopopulate results in multiple profiles found
- Create a new customer profile in the Connect Customer agent workspace
- Search for a customer profile in the agent workspace

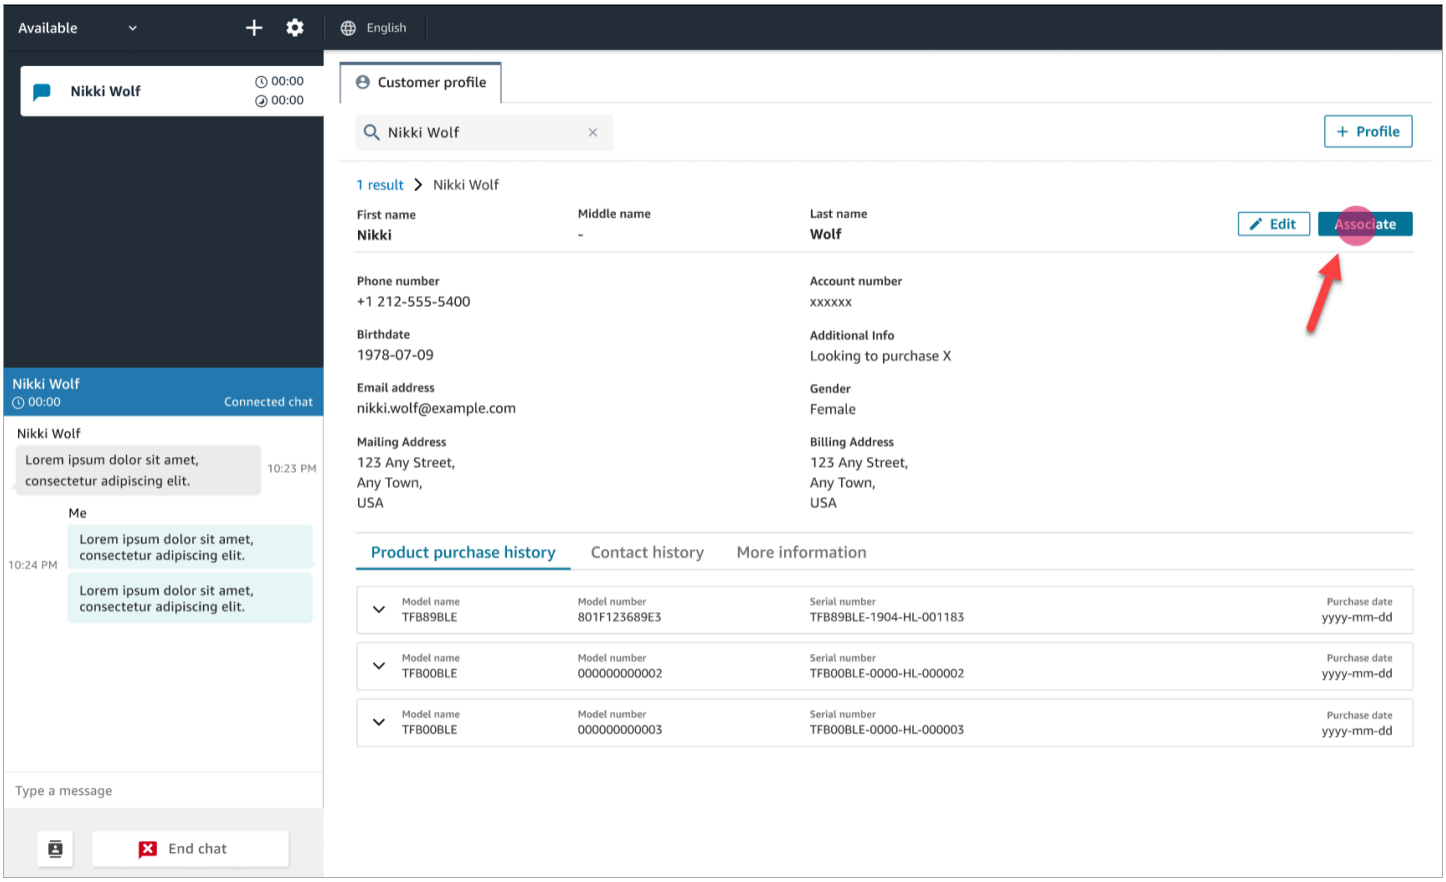
Example 1: Auto-populate the customer profile

As soon as Connect Customer Customer Profiles matches the phone number (voice) or customer name (chat) with an existing customer profile, it automatically displays the profile even though you might not have accepted the contact yet.

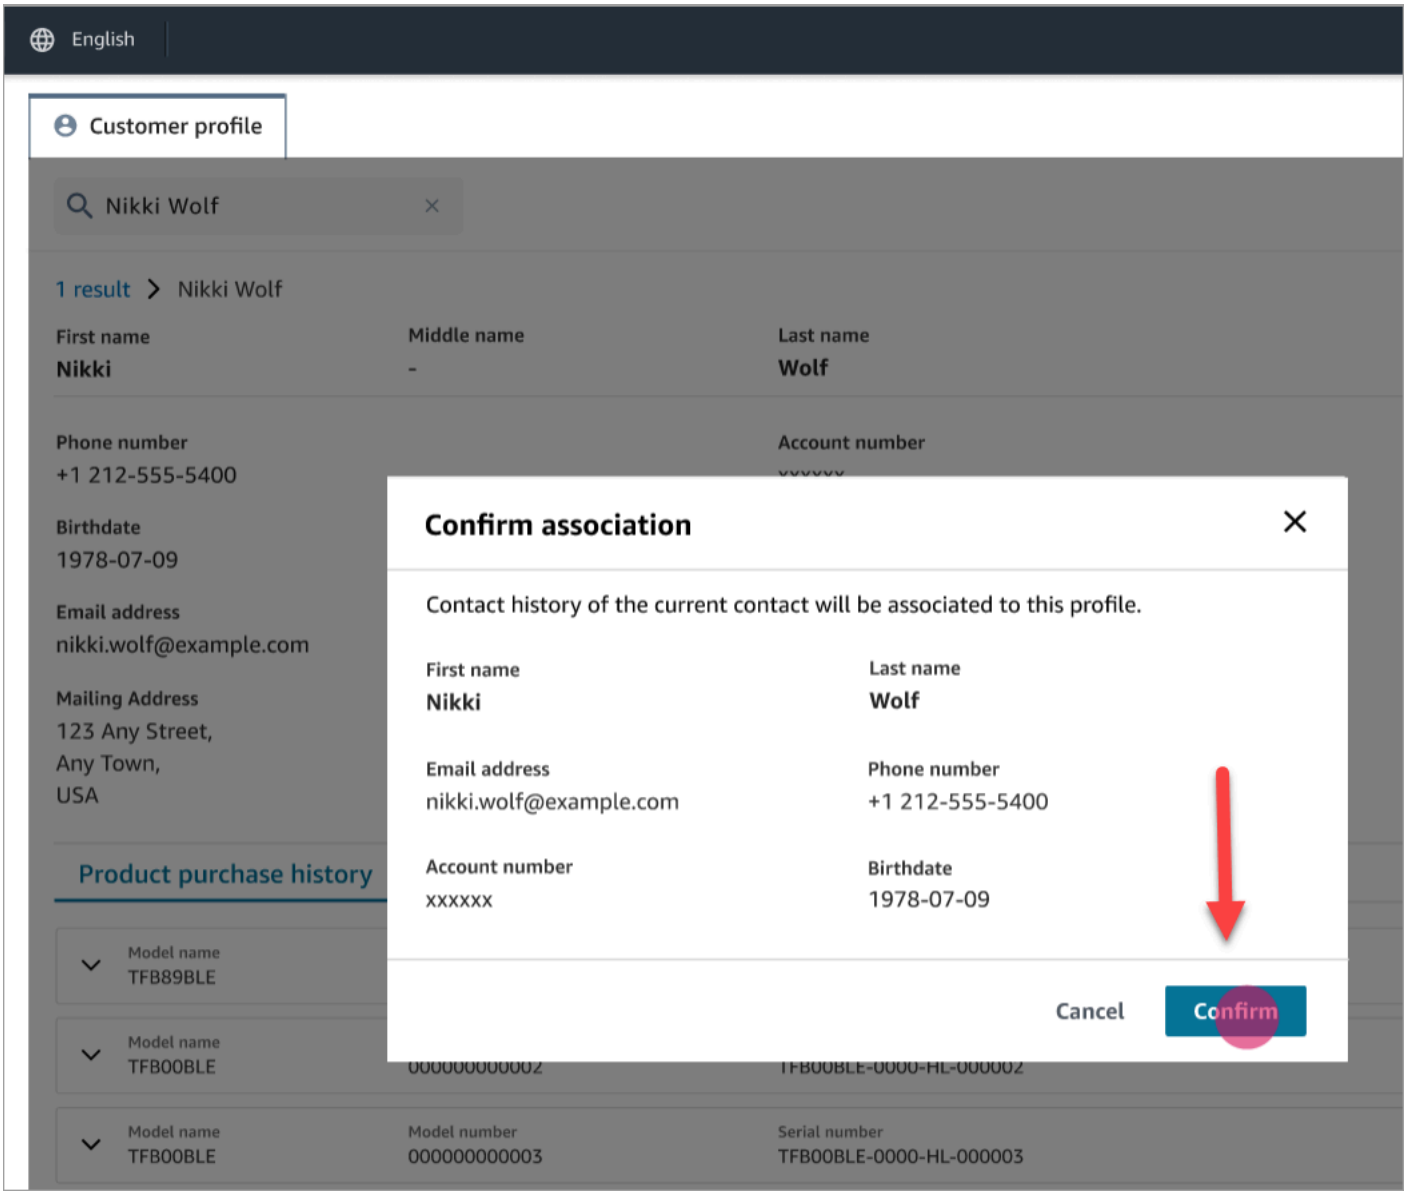
The following image shows what your Contact Control Panel (CCP) might look like when there's an incoming chat. A customer profile has been found that matches the customer, and Connect Customer is loading the data.



This next example shows what it might look like after you've accepted and joined the chat, and Connect Customer displays the customer's profile. In this case, Connect Customer found the customer's profile based on their email address. If this were a voice call, by default Connect Customer would match the customer's profile based on their phone number. Your IT department can customize this behavior to search for the profile based on other information about the contact.



- Choose **Associate** to associate the contact record of the current contact with the customer profile, and then choose **Confirm**.



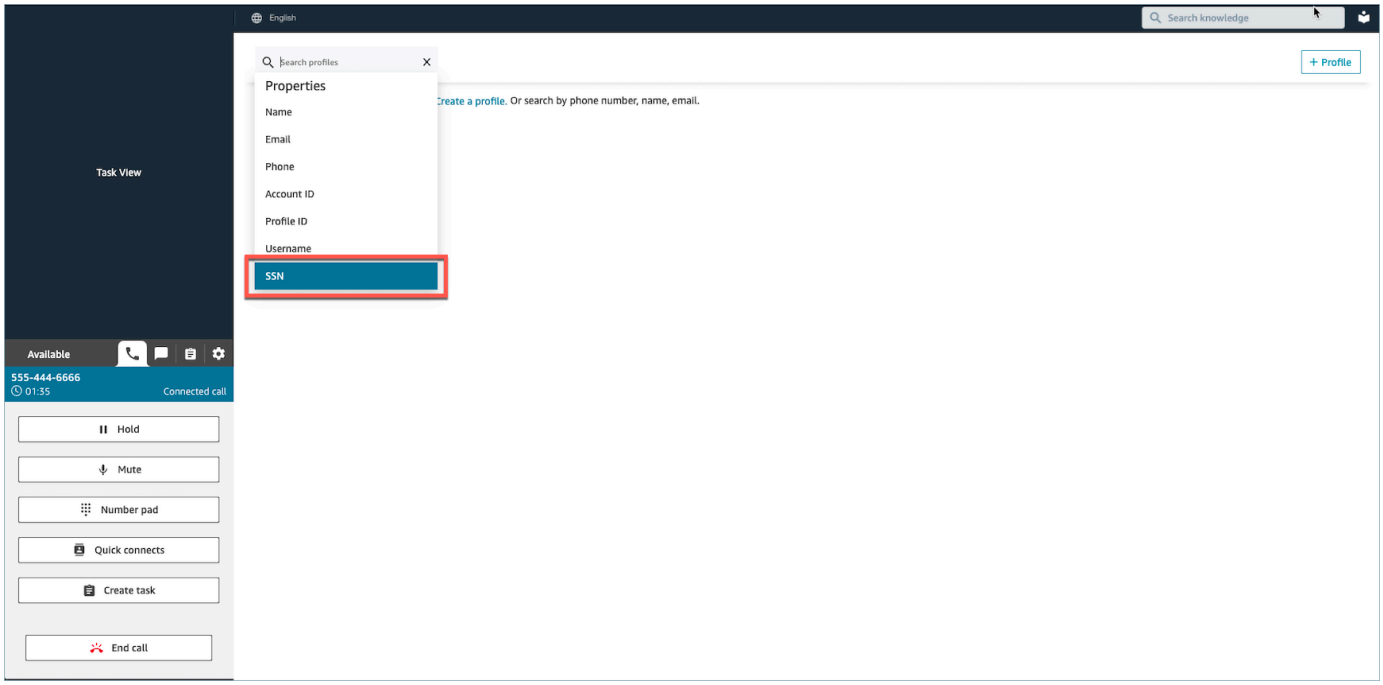
- If you choose **Associate** by mistake, you can continue to browse other customer profiles, and associate the contact with a different customer profile. Or, if you have been assigned Create permission, you can create a new profile.

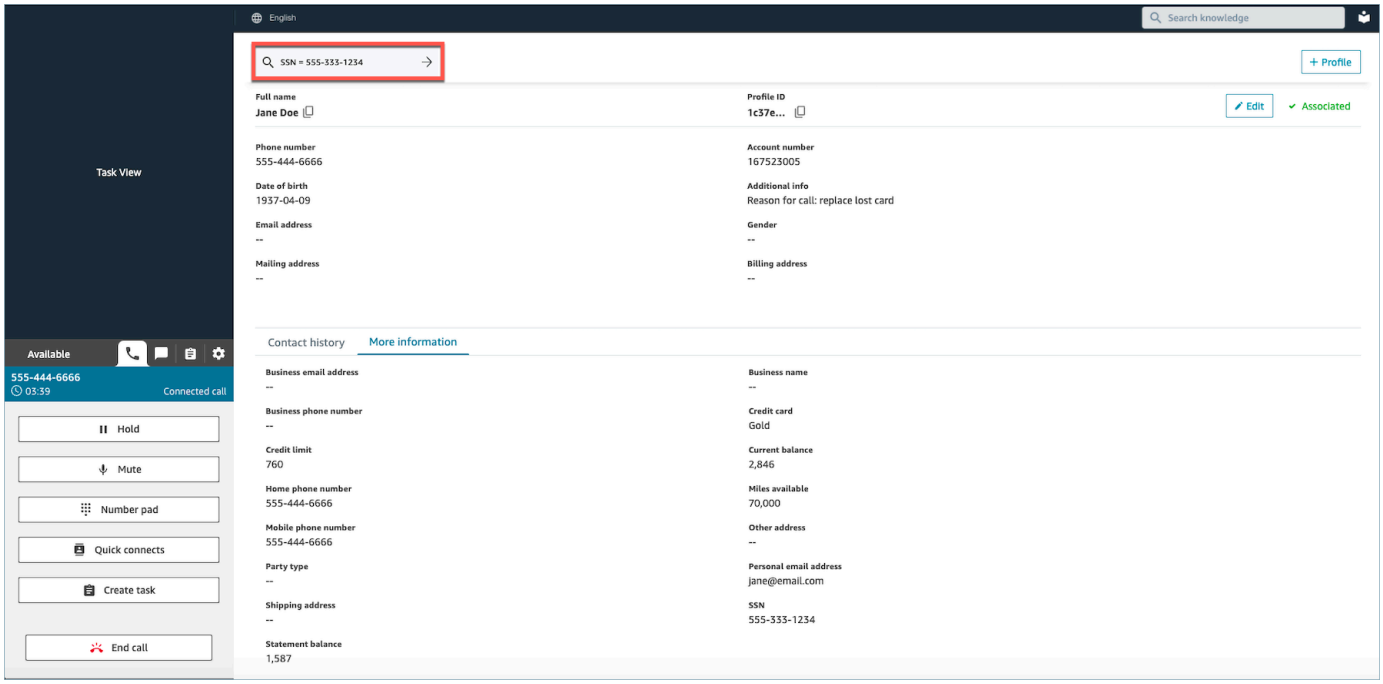
  You can associate a contact with customer profile multiple times during an interaction, including during After Contact Work (ACW) time. Only the most recent association remains, before you clear the contact.

Example 2: Accept incoming contact, no customer profile found

If no results are returned when a call or chat comes in, do the following:

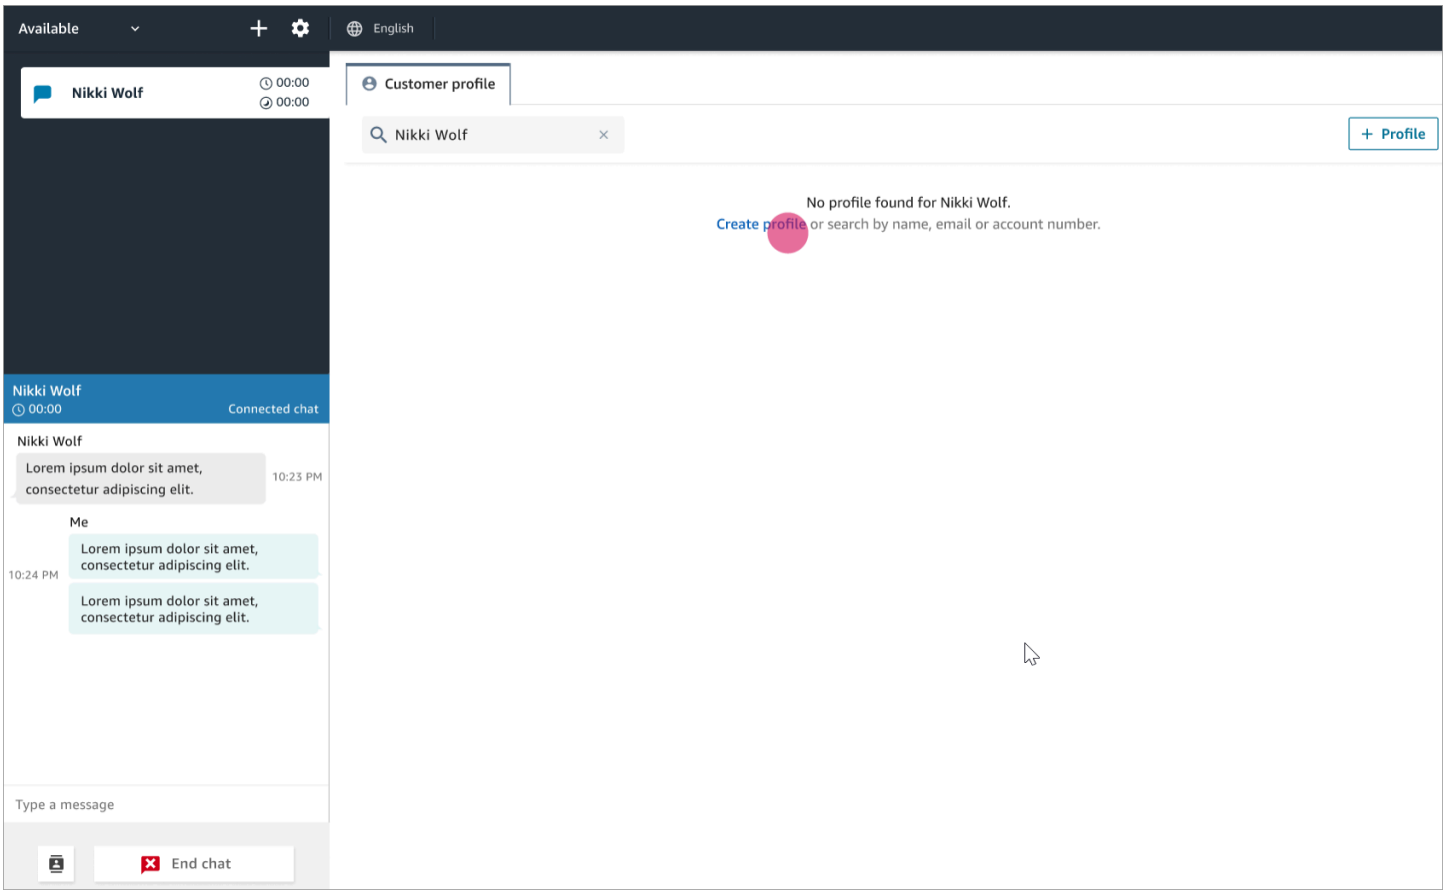
1. Search for the customer's profile using any search key available in the search drop down menu. For example: phone, name, email, account id, or any custom search terms you specify. For example, if you have *Social security number* (SSN) defined as one of your identifiers, SSN will automatically be available as a search term for agents to use in the agent workspace.





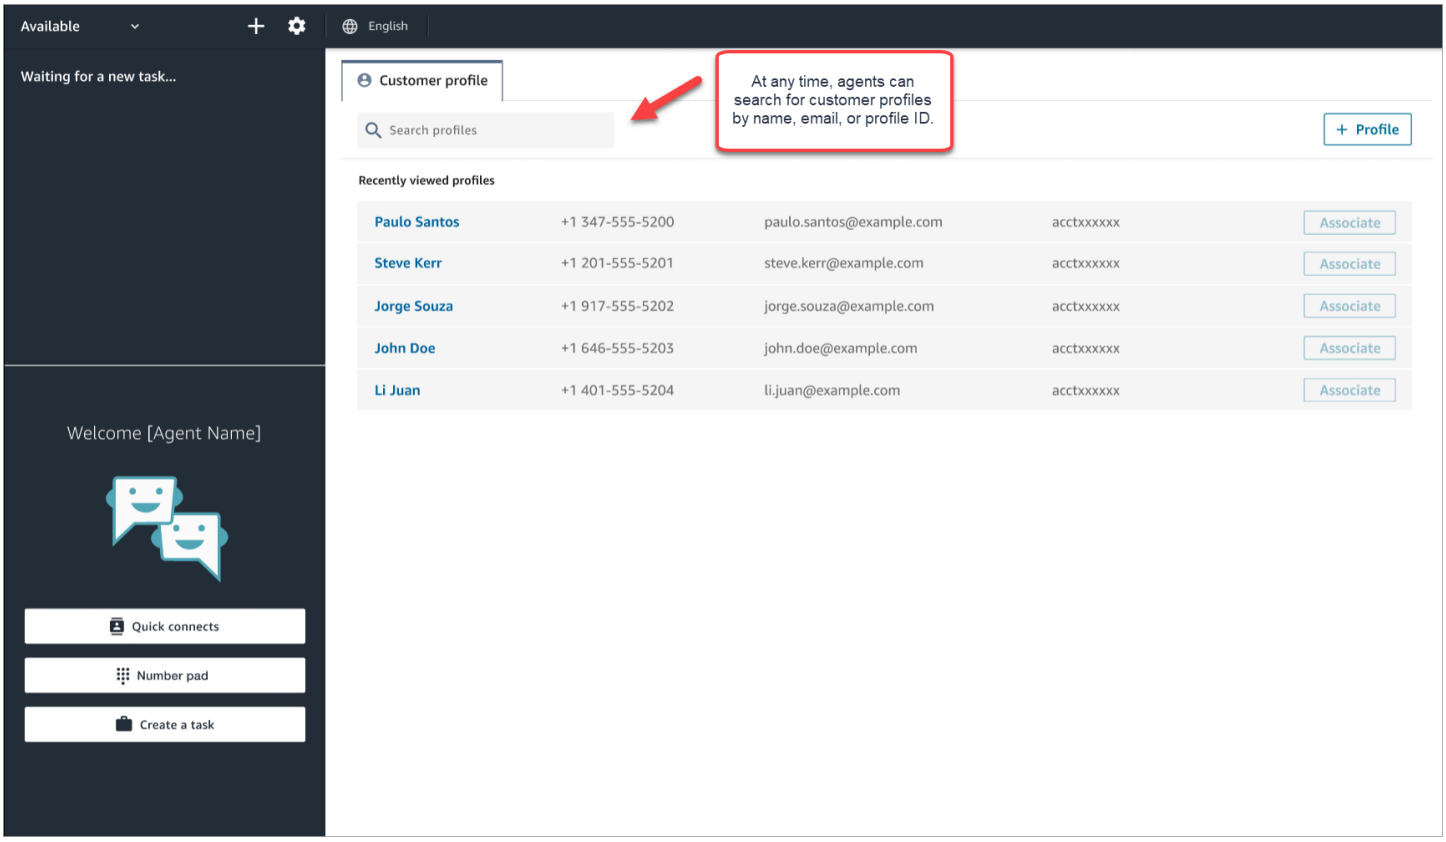
2. If no customer profile is found, create a new profile for the contact. The only required information is first name.

In the following image, the agent searched for **John Doe**. No matches were found so they chose **Create profile**.



Example 3: Search when not on contact

When there are no incoming contacts, you can search for customer profiles using any search key available in search drop down menu. For example, phone, name, email, or account id. For example, you might want to use this time to search for previous contacts, or completing a profile.



Example 4: Autopopulate results in multiple profiles found

In some cases, multiple profiles might be returned for the same call or chat. Use the profile information to verify the customer's identity. For example, ask the customer to verify their email address or account number, and then associate the contact with the right customer profile. Agents can also ask customers for additional information they can use in search and identify the right profile in order to associate it to the interaction.

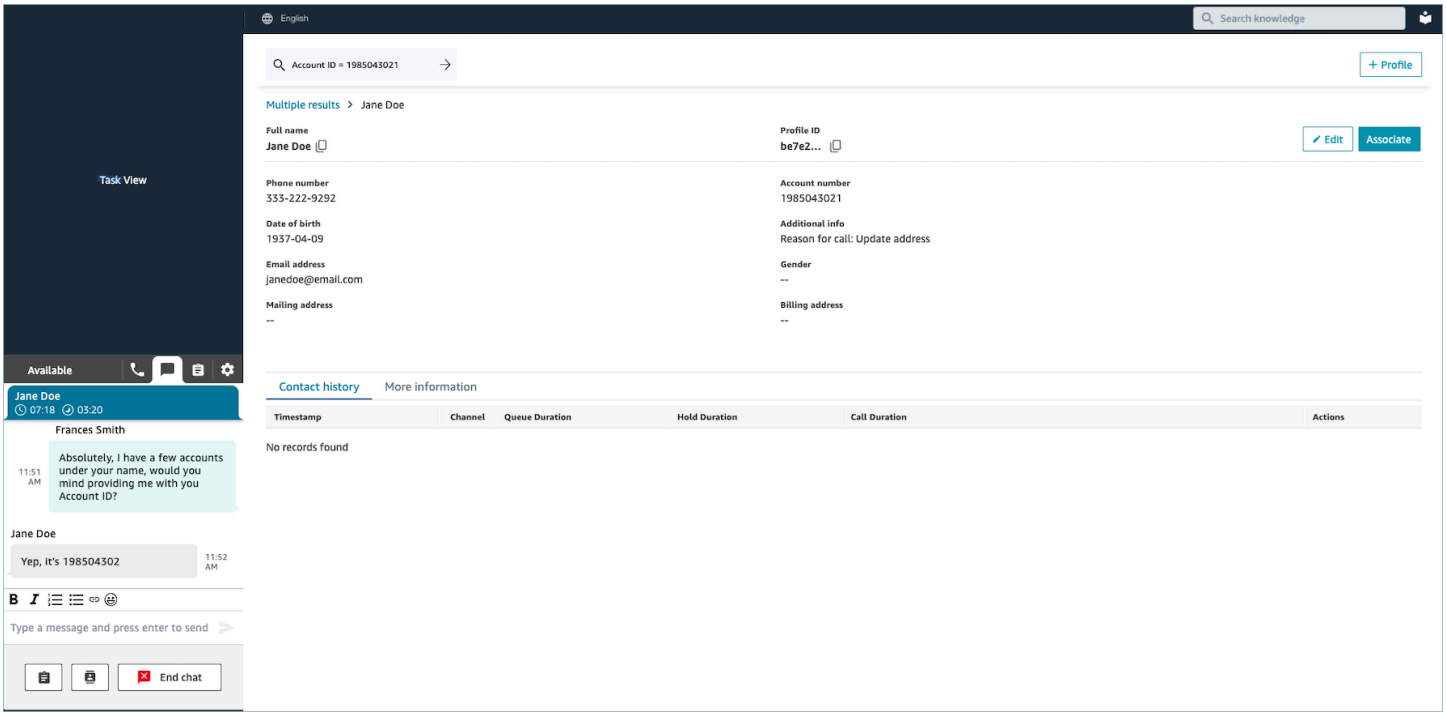
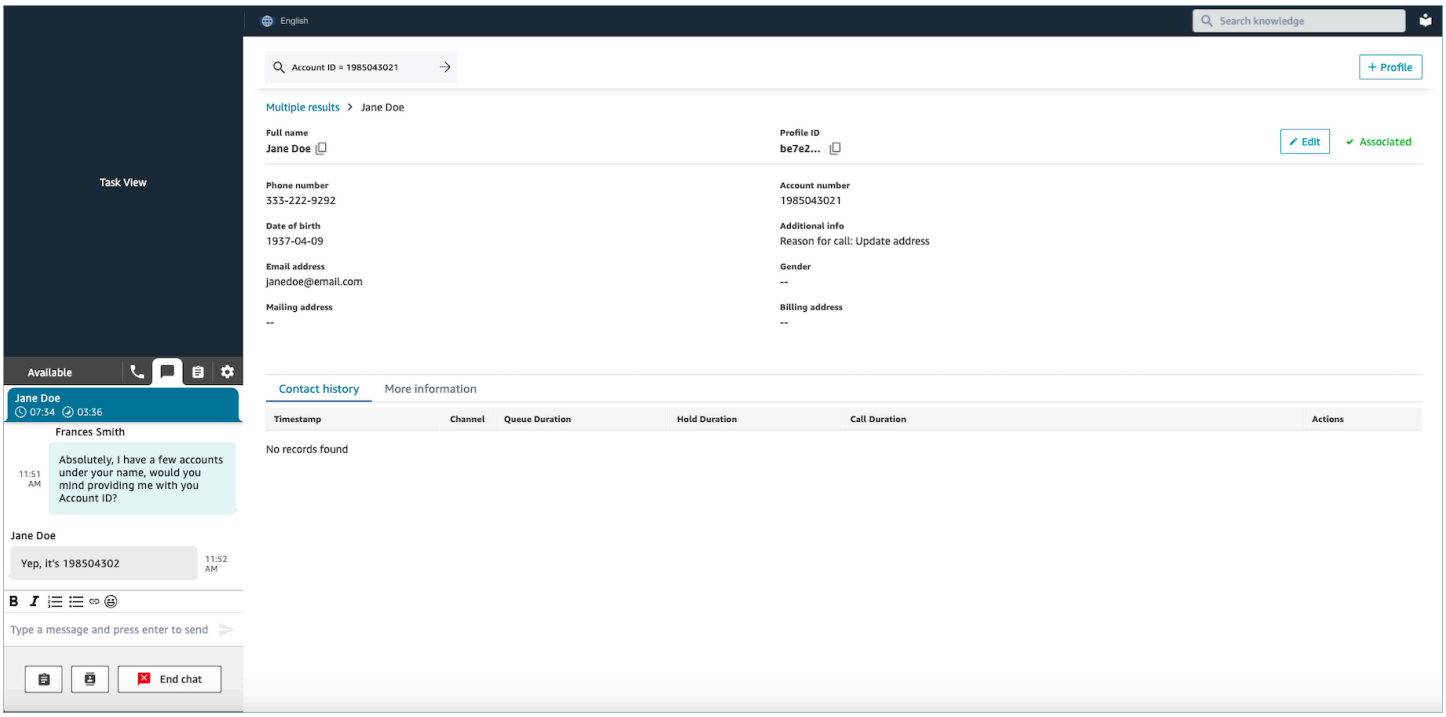
Absolutely, I have a few accounts under your name, would you mind providing me with you Account ID?
Type a message and press enter to send
End chat

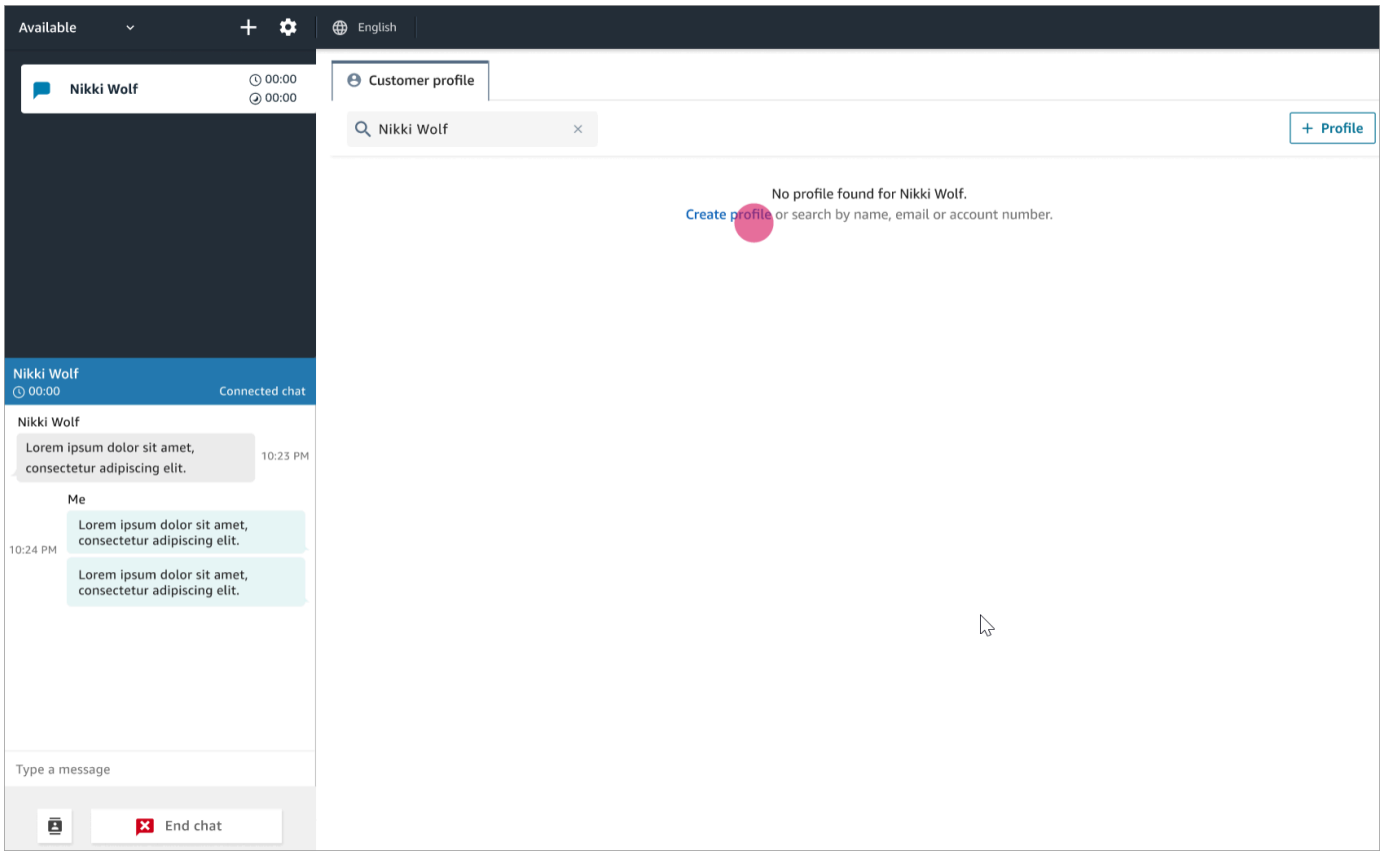




Create a new customer profile in the Connect Customer agent workspace

Let's say you're on a chat and there's no customer profile for the contact. You can create a new customer profile for them.

1. Choose **Create profile**.

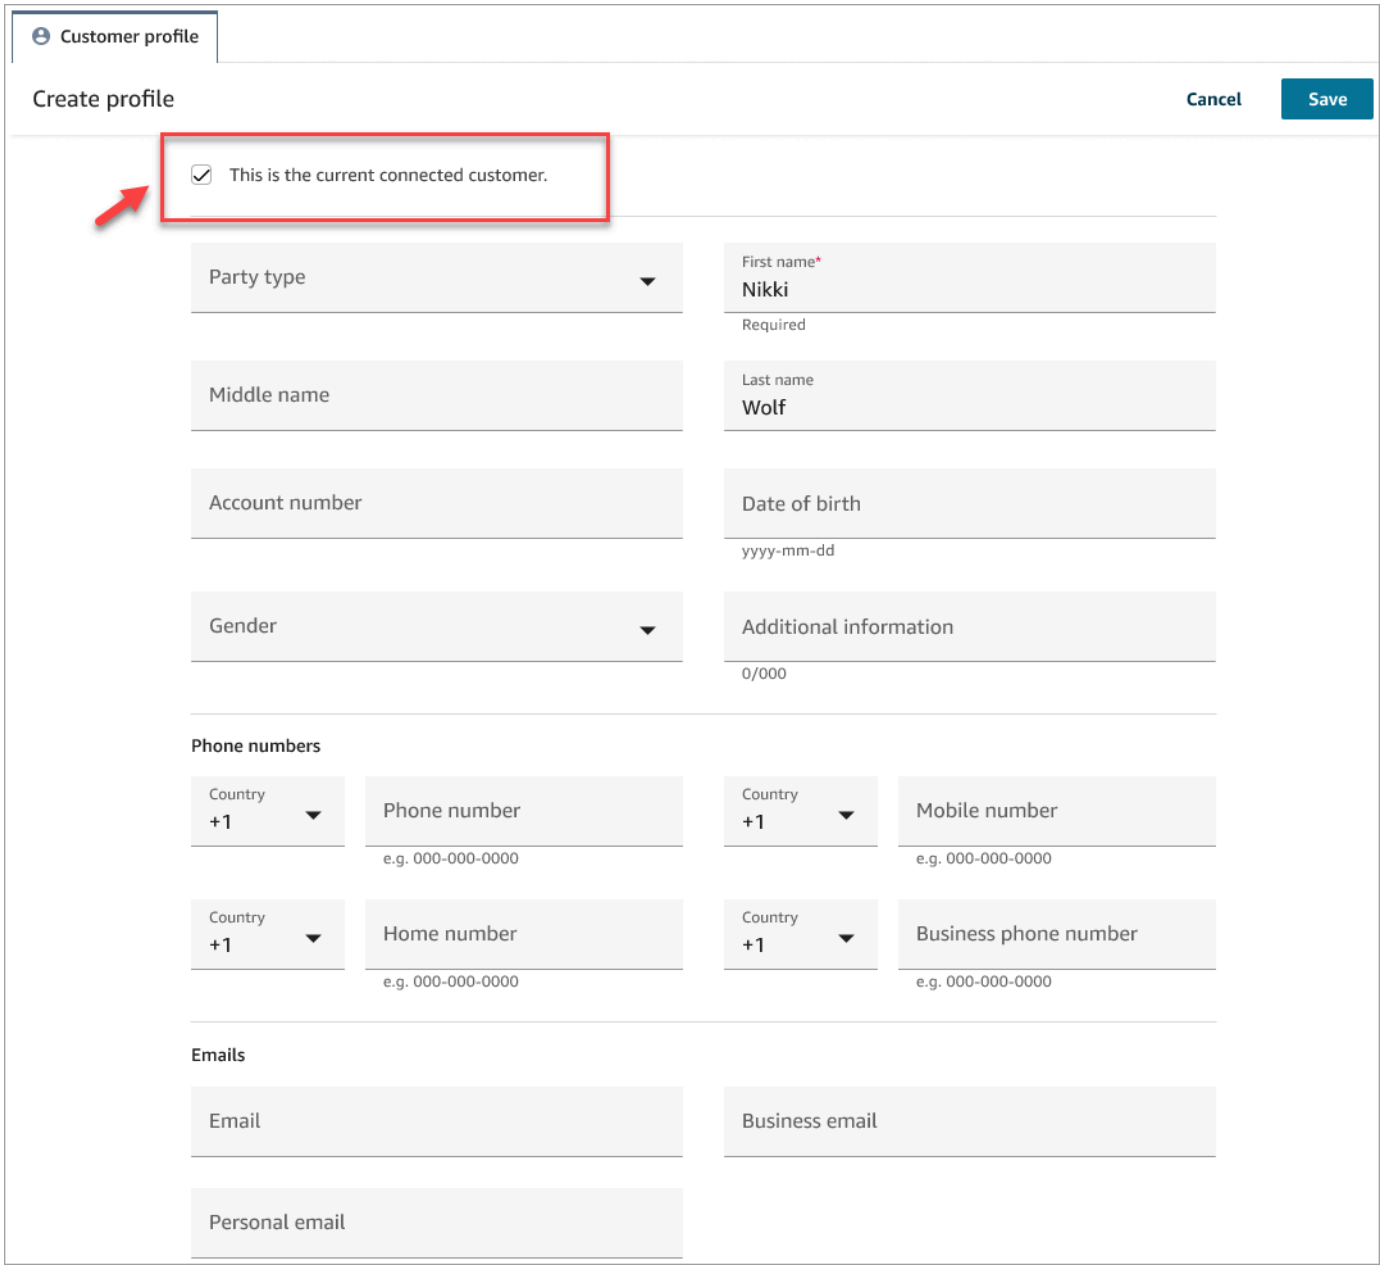


2. Choose **This is the current connected customer**. This tells Connect Customer to link the customer profile to the contact ID for the current customer.

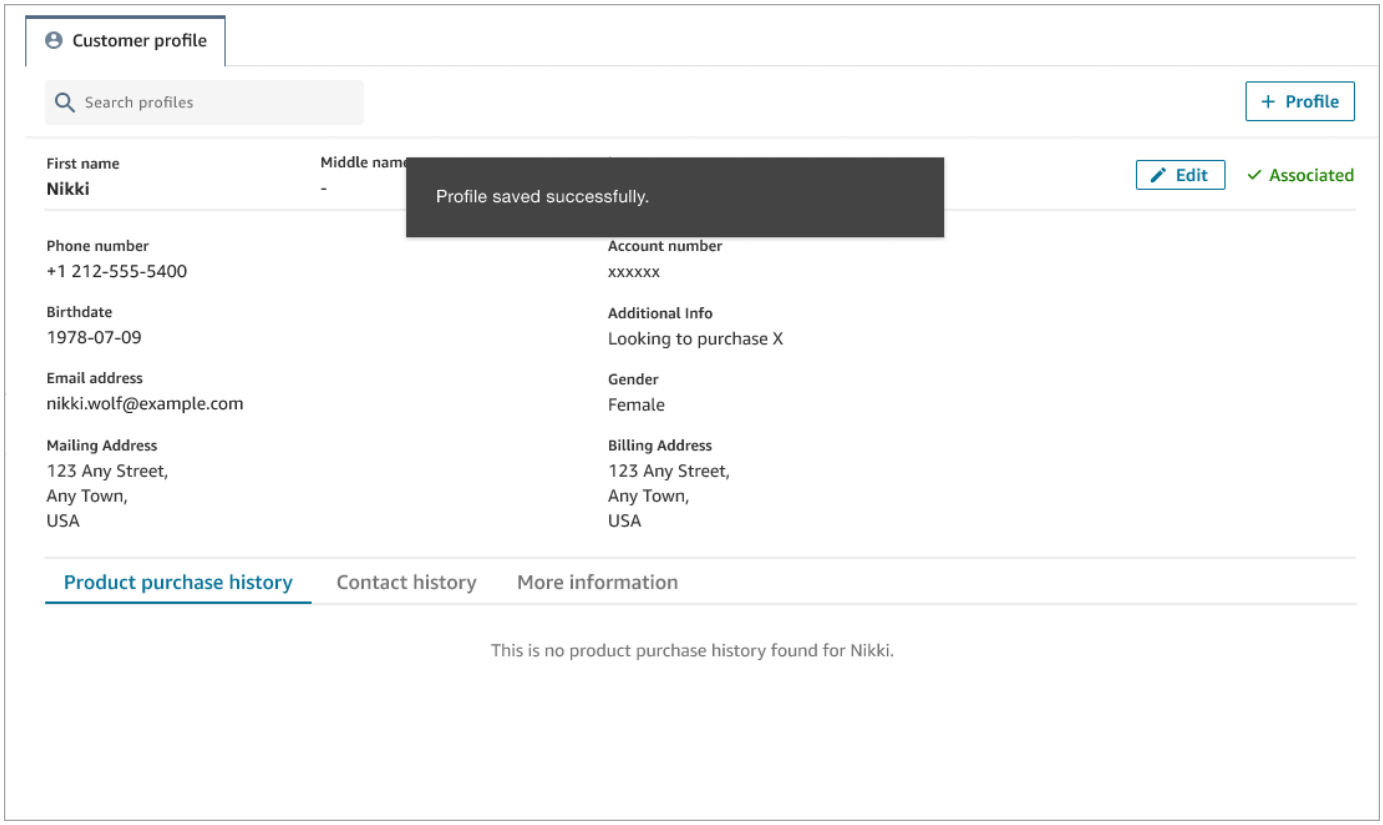
   If you don't select this check box, the profile isn't associated with the current contact. This is useful when a contact is calling from someone else's number.

   Enter information in the required boxes, and then choose **Save**.

> **Tip**
>
> Agents can use any of these customer Identifiers in the agent workspace to find the profile that belongs to the customer on the interaction.



3. You'll receive a verification page that the contact has been created.

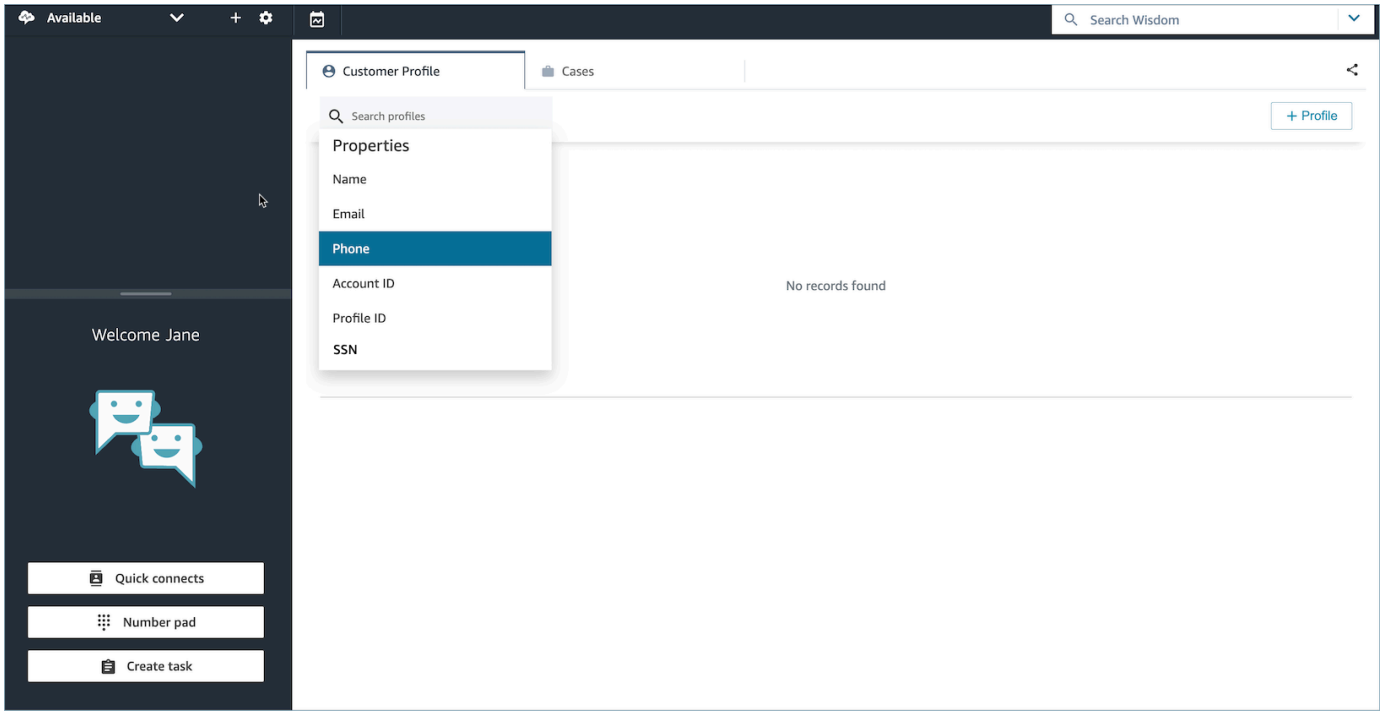


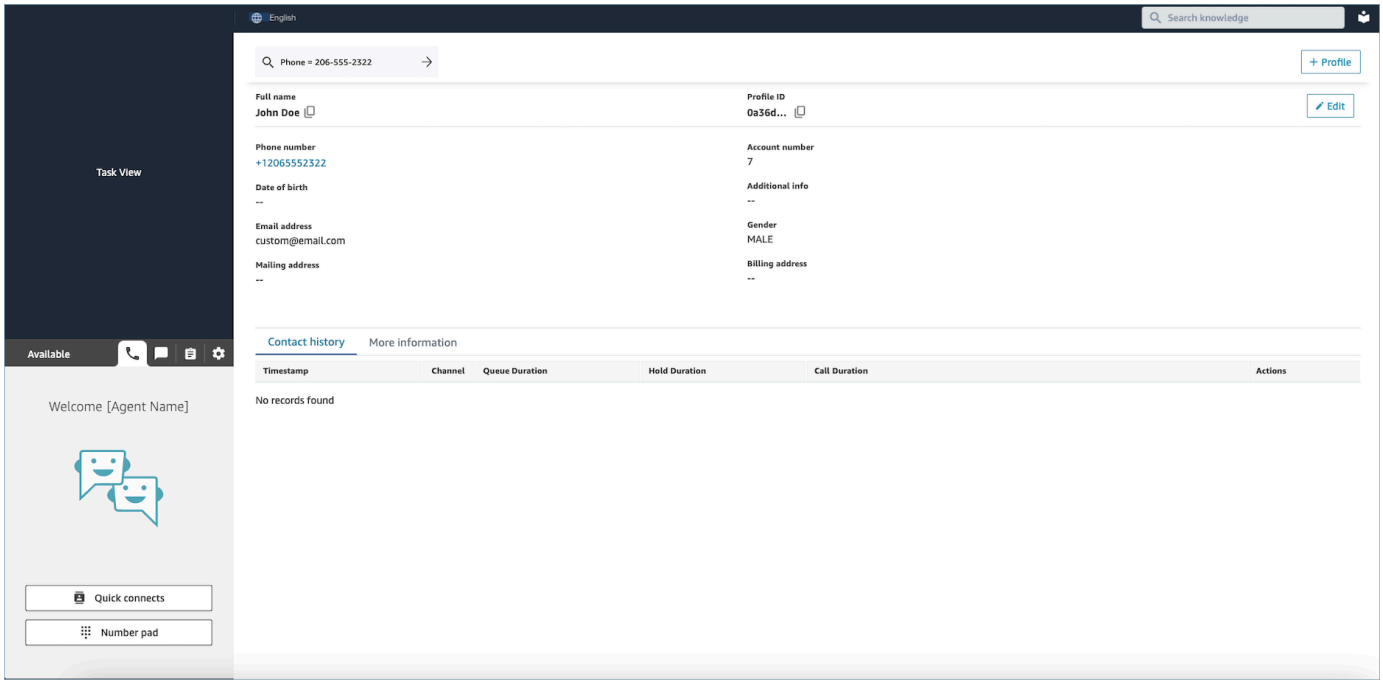
4. You can continue the conversation with the customer.

Search for a customer profile in the agent workspace

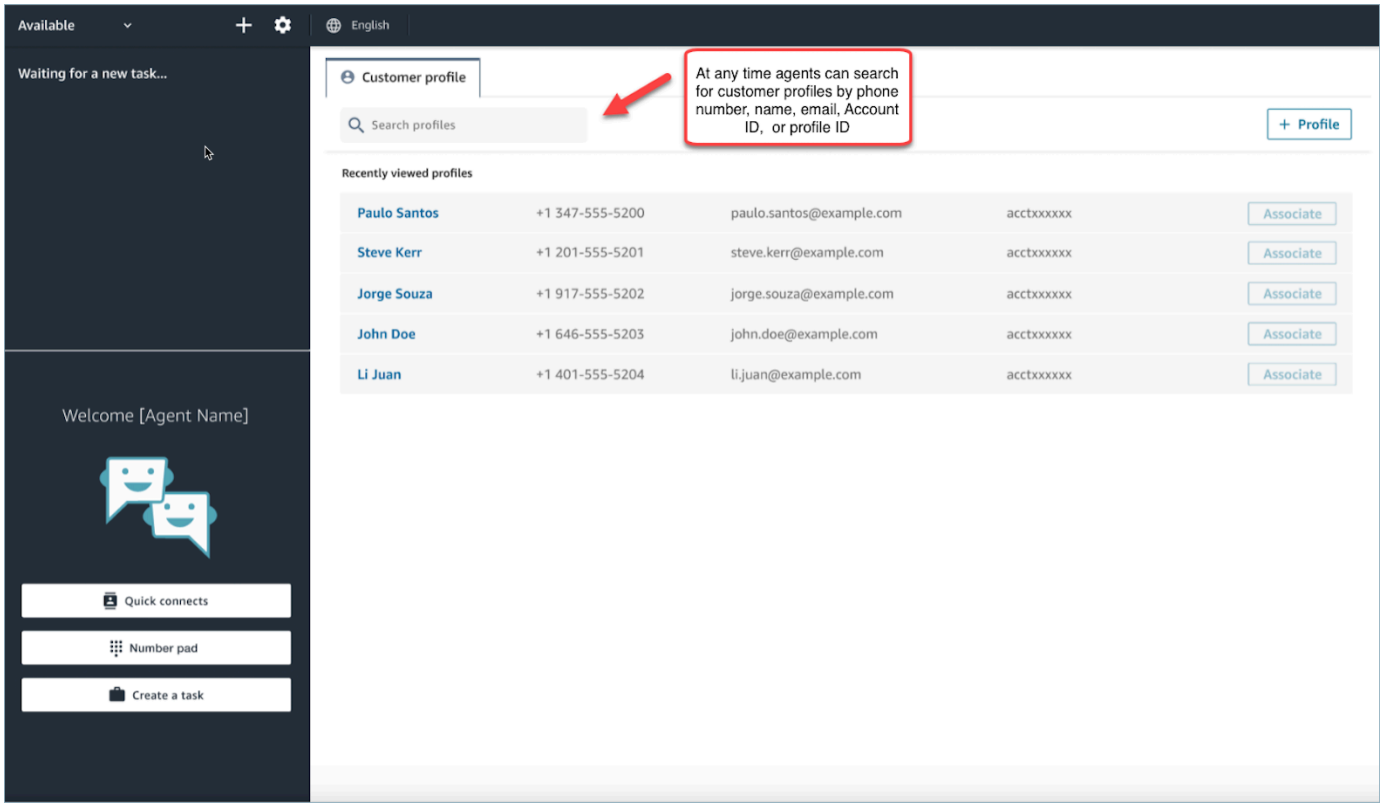
Even when you're not on a contact you can search customer profiles. This is helpful in cases where, for example, you want to return to a customer profile.

1. In the **Search** box, select the key you wish to use to search for a profile and enter the value you wish to search with. For example, you can select *phone* from the drop down menu and enter 206-555-2322 in the input field to search.





2. If more than one result is returned, you can review the profile information to identify the contact that you want.



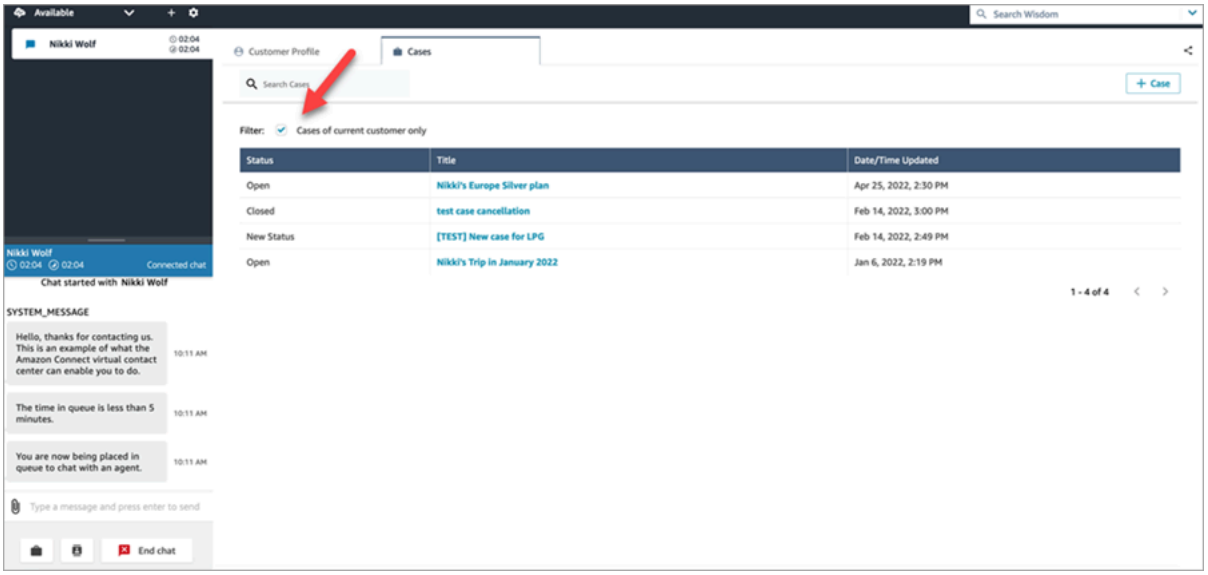
Tip

- You can enter a search term without having to select an attribute for phone number, name, email, Account ID, or profile ID. The agent workspace will automatically detect the values type and run a search for matching profiles.
- Searching for Profiles in the agent workspace will return profiles that match your exact search value.

Search cases in Connect Customer to view customer contact details

You can search cases using a keyword match. Connect Customer searches data across all system and custom fields. The results are sorted from most-recently to least-recently updated case.

If you are on a contact, and the contact has been associated to a customer profile, then search automatically filters to cases of current customer.

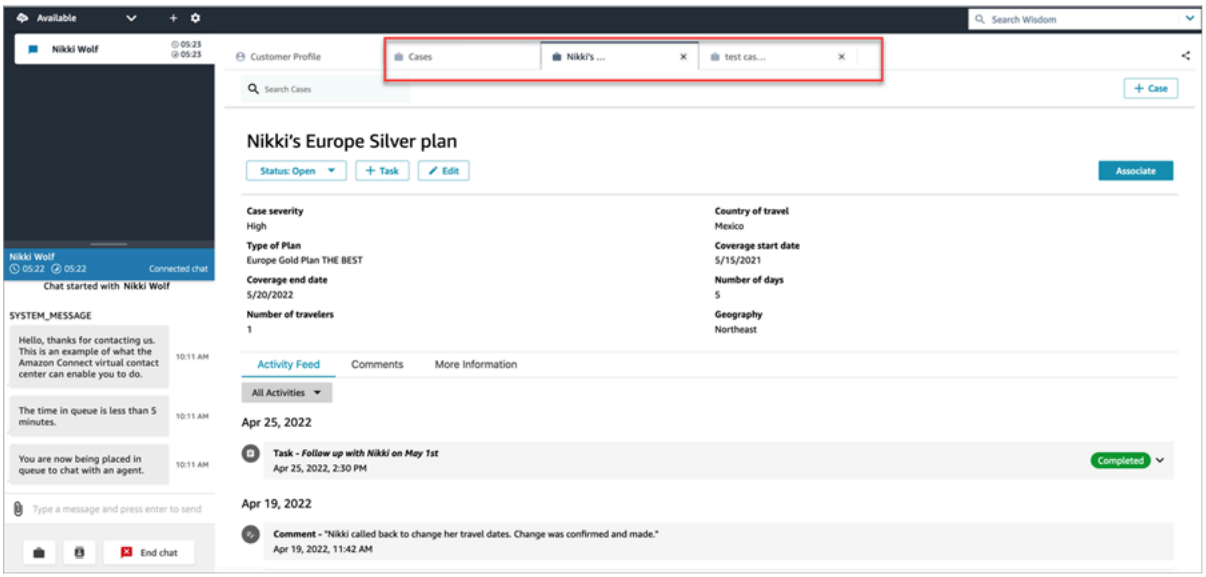


Regardless of whether you are on a contact, you have the option to do a general search. If you are on a contact and want to search beyond the current customer, clear the selection for **Cases of current customer only**.

View a case

When you select any of the cases in the search results to view the case, a new tab opens. With separate tabs, you can have multiple cases open at the same time.

If you add a Cases block to a flow, and configure it with **Link contact to case** enabled, then cases will open automatically when the agent accepts the contact.

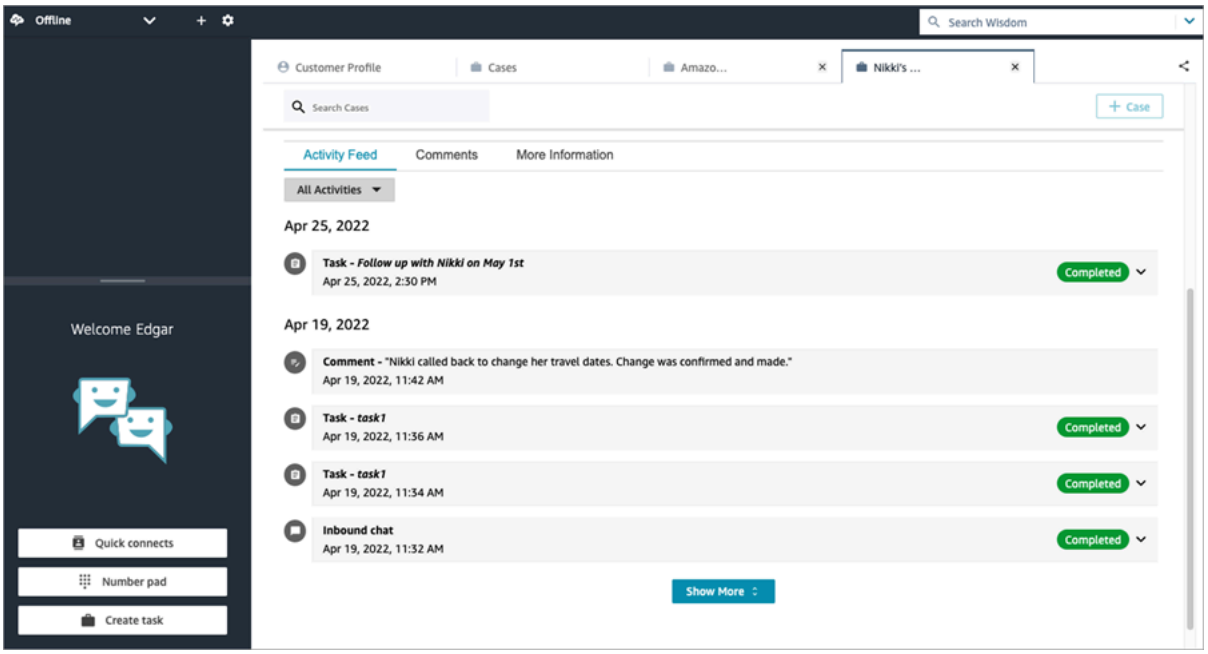


Activity feed

The activity feed shows calls, chats, tasks, and comments from the most recent to least recent Started data.

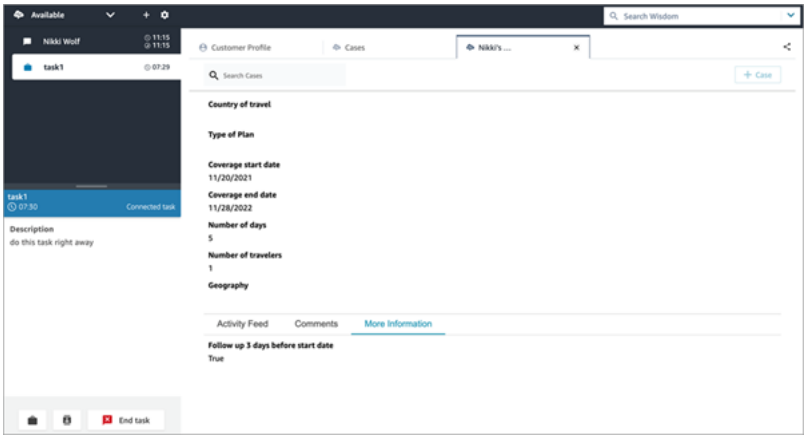
Contacts will have an indicator of Ongoing or Completed. If the contact was completed, there will a Completed/Terminated date/time and a link to **Contact details** that takes user directly to the **Contact details** page.

Only users who have access to this page will be able to see contact details for a given contact. Even within this page, there are more granular permissions so different users might see different information. Information might include: basic contact details/contact attachments, transcripts and recordings with conversational analytics categories, sentiment, and summaries.



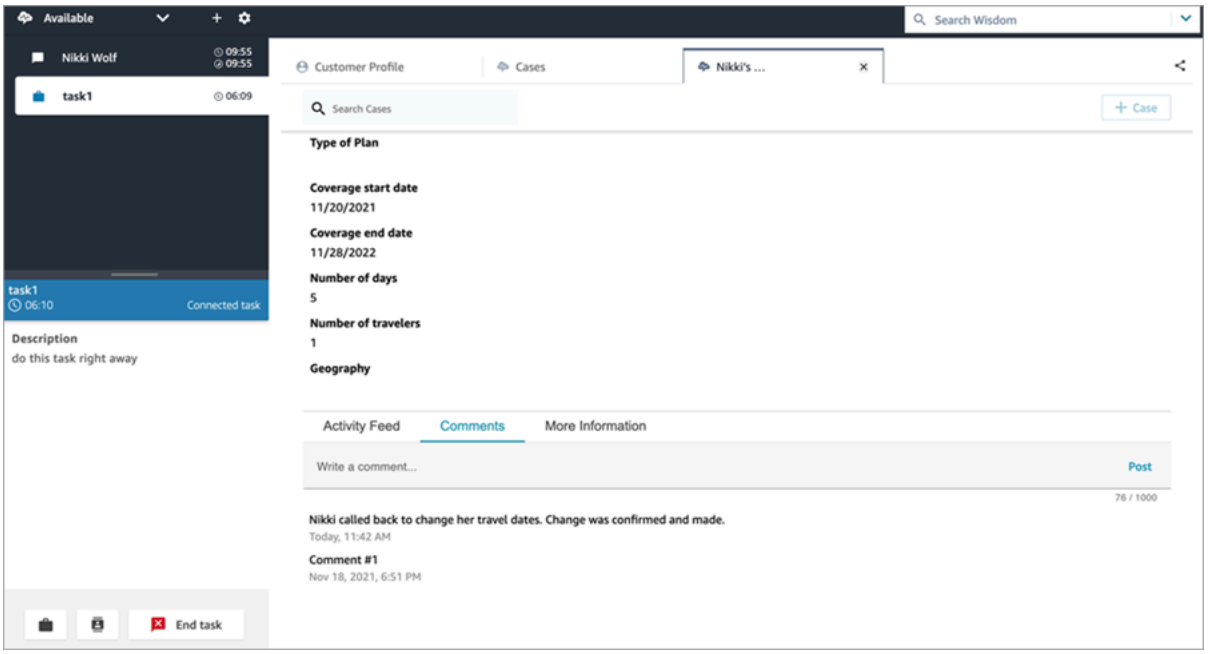
More information

There might be additional information for agents to view and populate on the **More information** tab, depending on the case template is designed.



Add comments to a case in Connect Customer

Agents have the ability to view and add comments to a case.

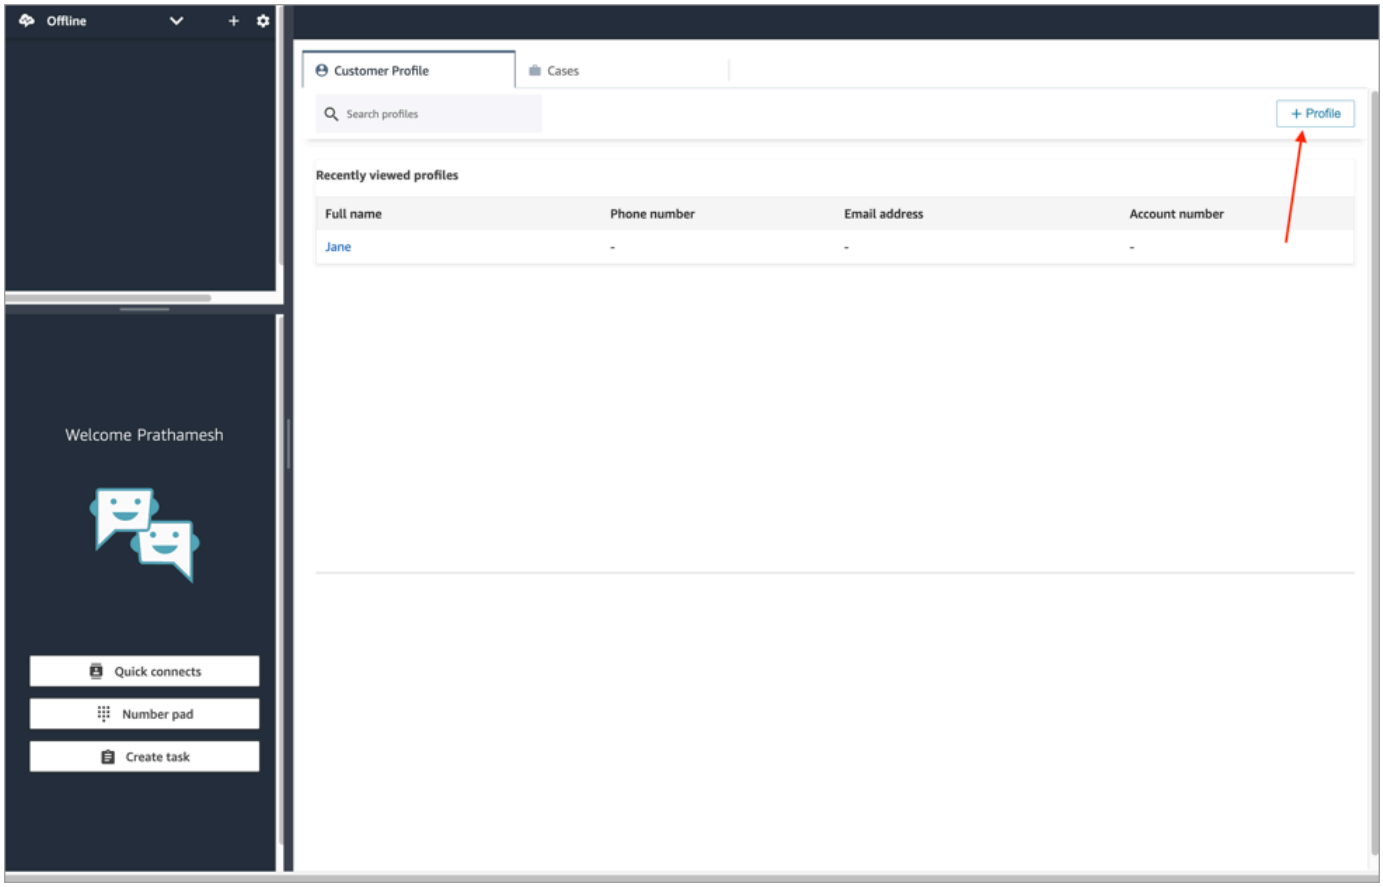


Create a case in Connect Customer Cases or a customer profile to document a customer's issue

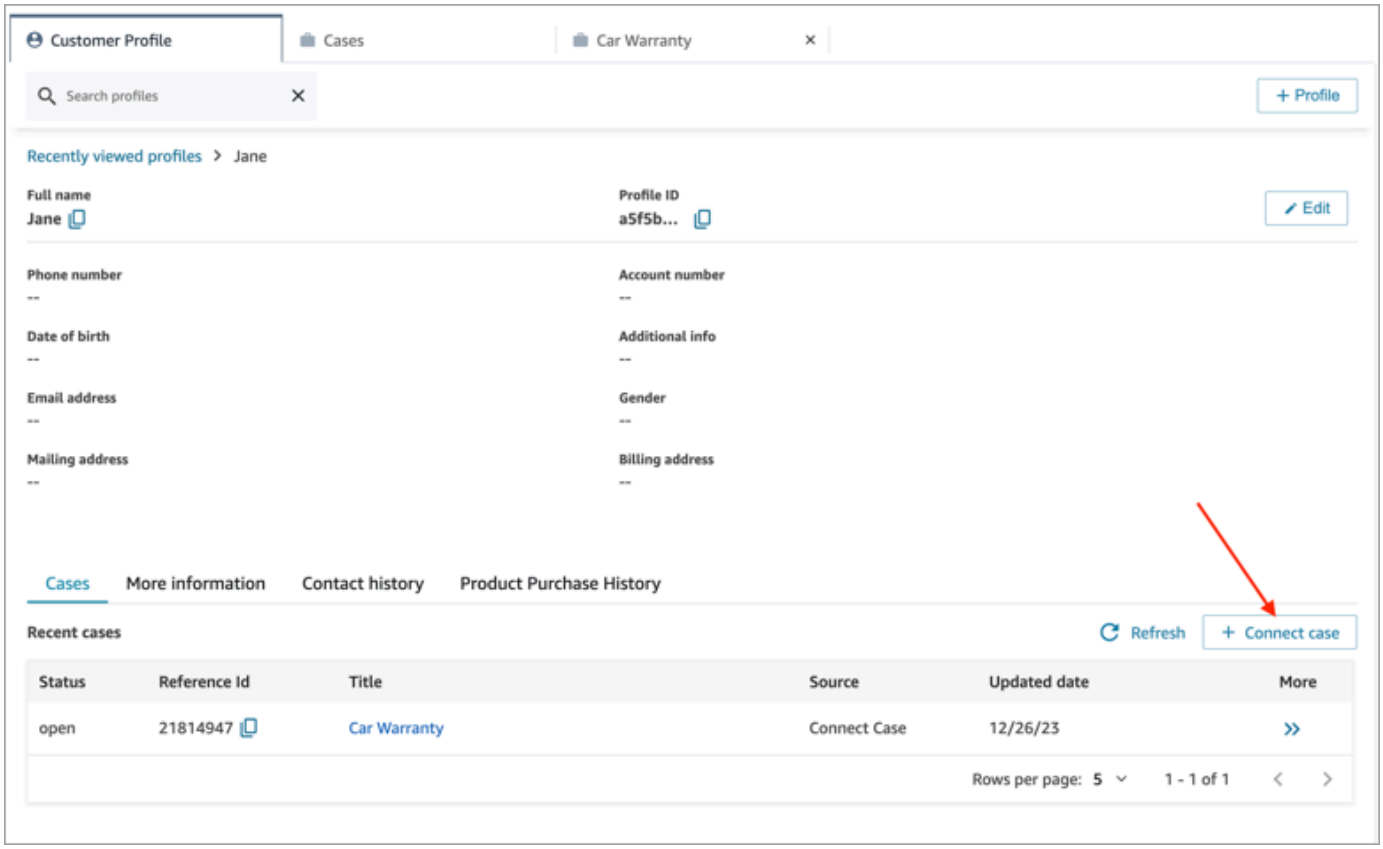
You can create a case either by choosing **+ Case** from the **Cases** page or by choosing **+ Connect case** directly from a customer profile. If you are not on active contact, you can still create a case directly from the customer profile.

To create a case while on the Customer Profile page

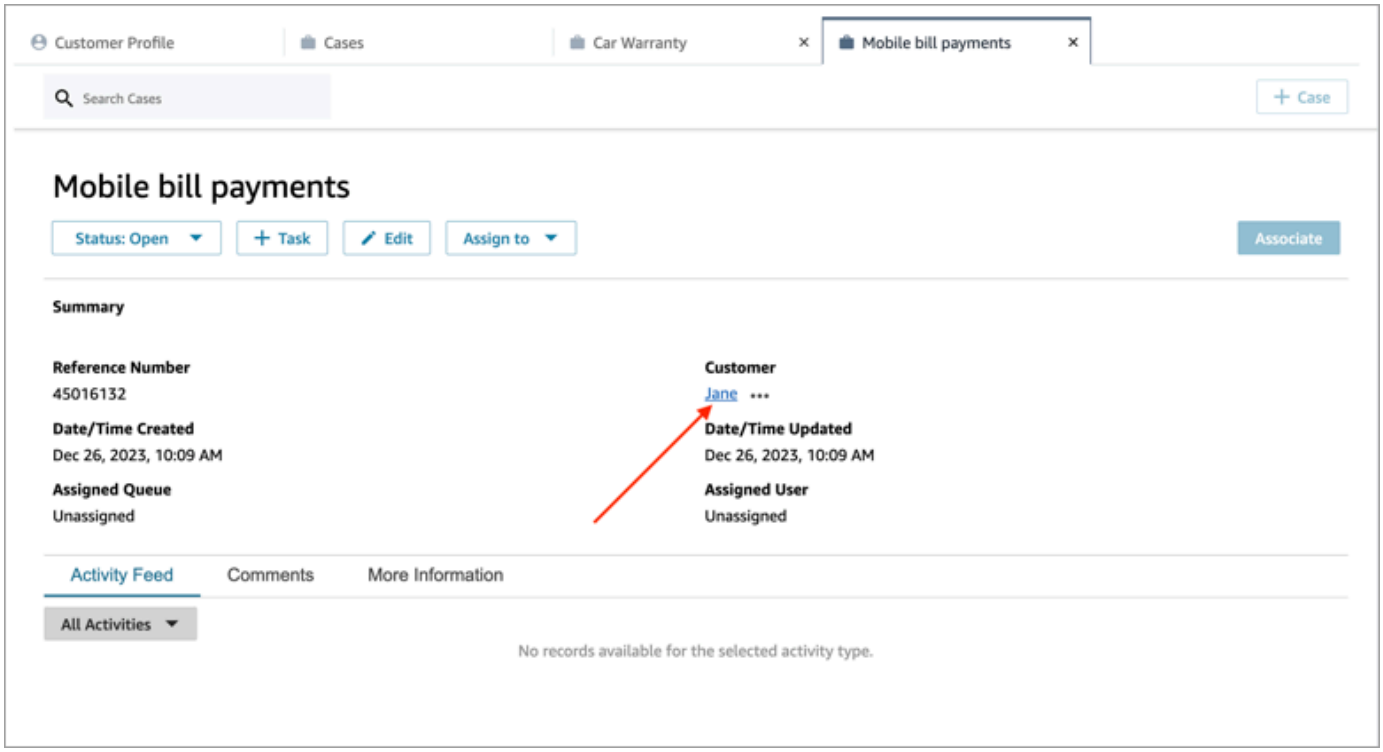
1. Choose **+ Profile** to create a customer profile, as shown in the following image.



2. Choose **+ Connect Case** to create a case, as shown in the following image.



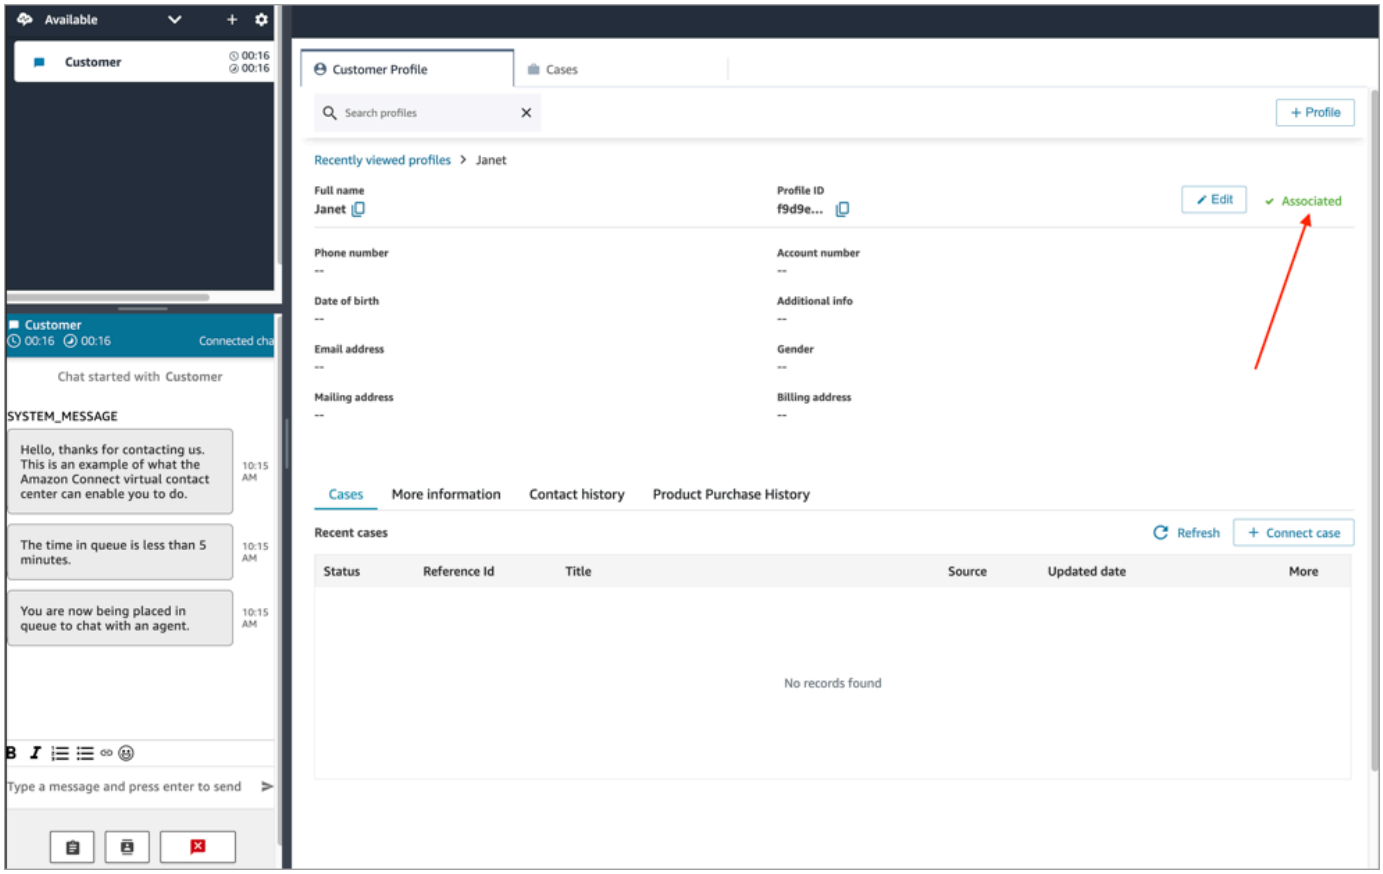
3. Complete the required information for the case, and then choose **Save**. A case is created for the customer, as shown in the following image.



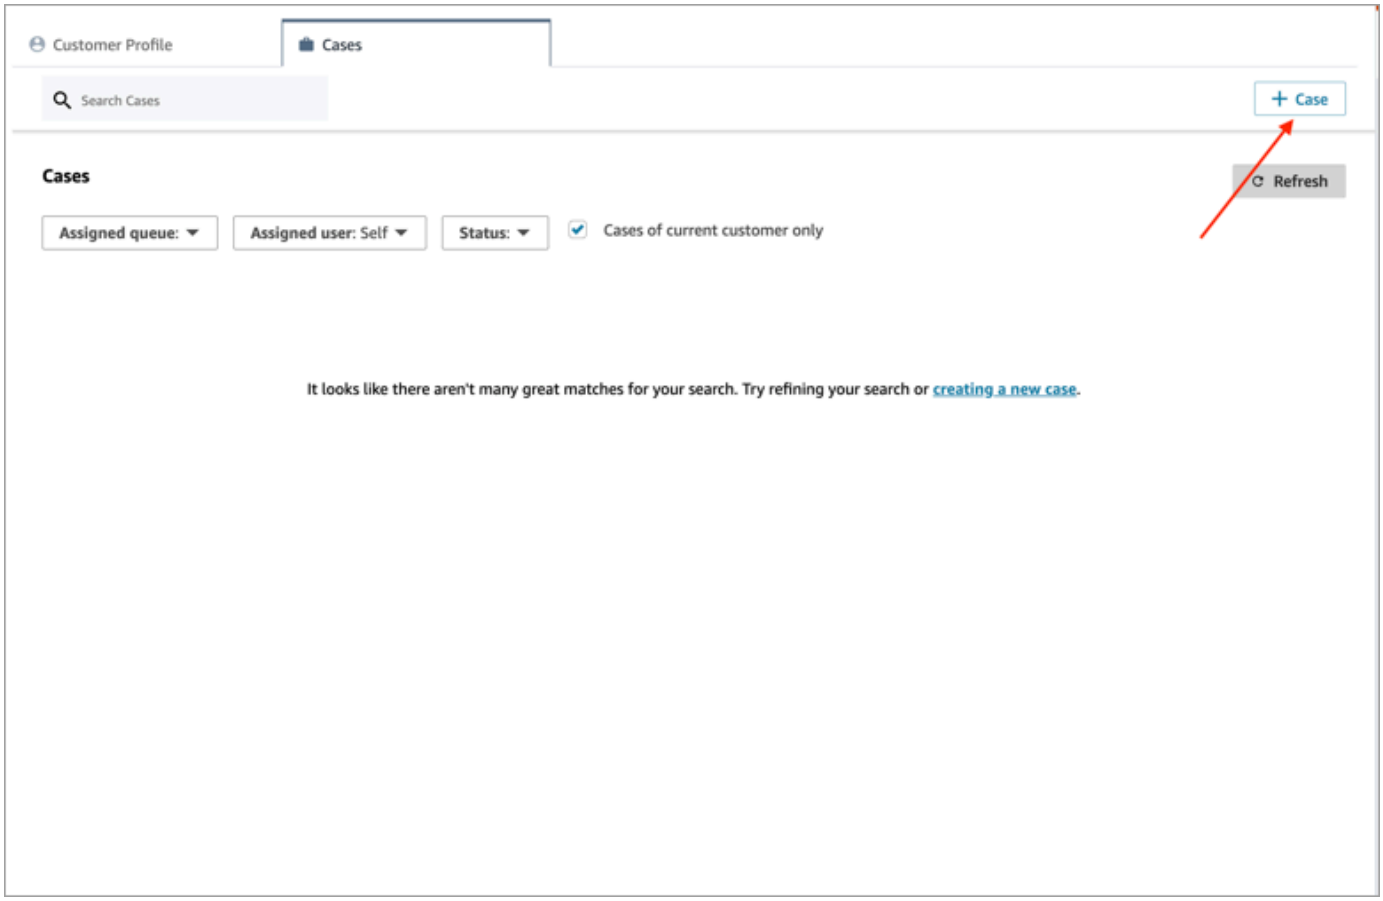
To create a case while on the Cases page

1. You must be on a contact (call, chat, or task).

   If `customer_id` is included in the template's `requiredFields`, the contact must already be **Associated** with a customer profile. Otherwise, you can create a case without a customer profile.



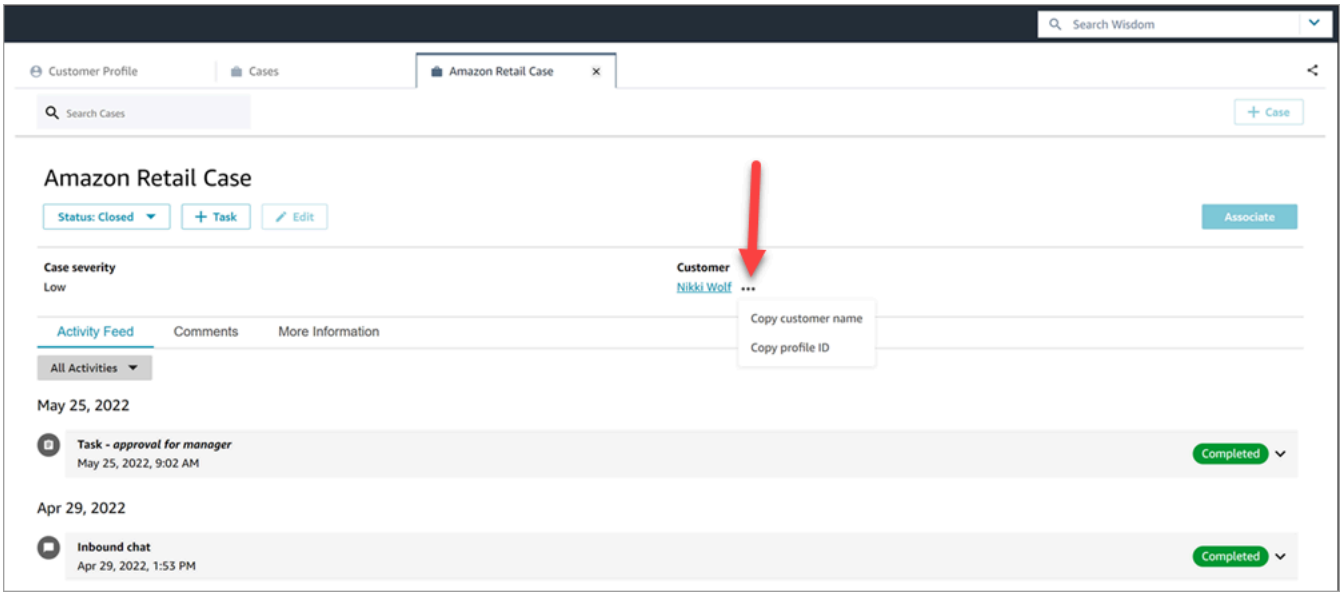
2. Choose the **Cases** tab and then choose **+ Case**, as shown in the following image.



3. Complete the required information for the case, and then choose **Save**. A case is created for the customer.

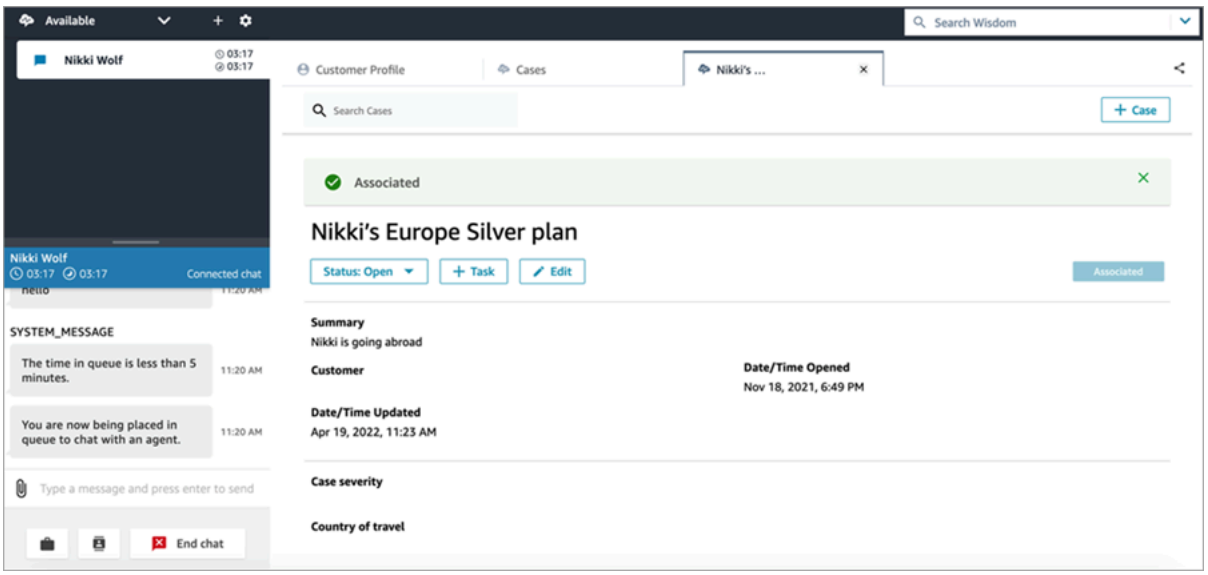
Customer name

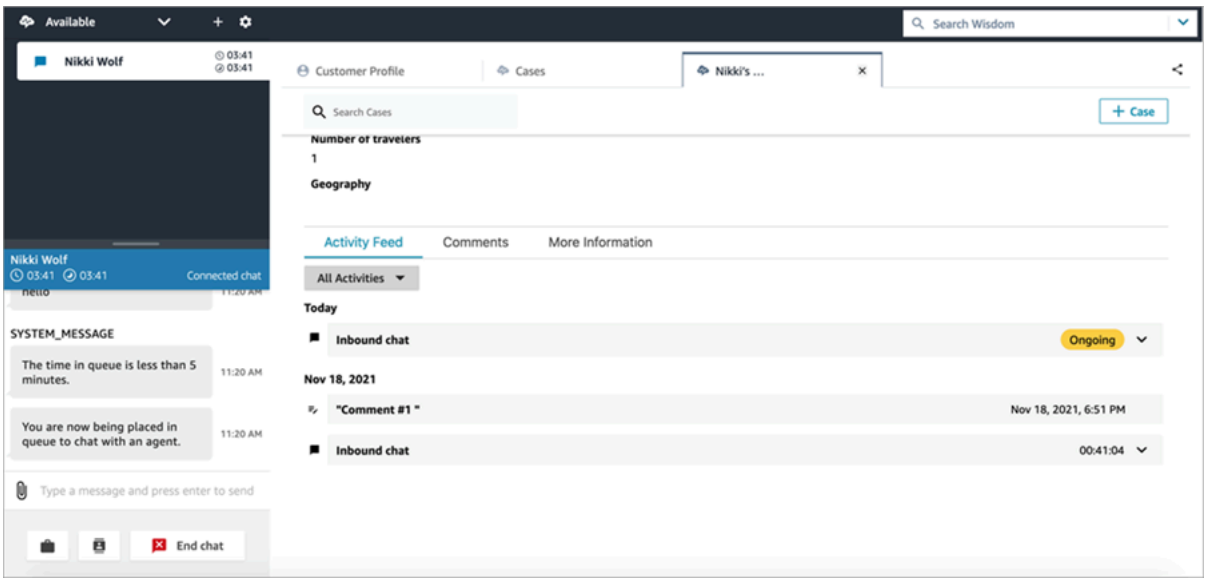
Each case that is created is connected to a customer profile from your Connect Customer instance. While viewing the case details page, an agent can choose or tap the customer's name to open the associated Customer Profile in a different tab. Or, the agent can choose **More (...)** to copy the customer name or profile ID to the clipboard. On new case templates, the customer name appears by default on the case details page. You can rearrange this field on your case template, or even remove it entirely.



Associate a contact with a case in Connect Customer

You can associate the contact to an existing case, such that the contact will appear on the activity feed of the case with indicator **Ongoing**.

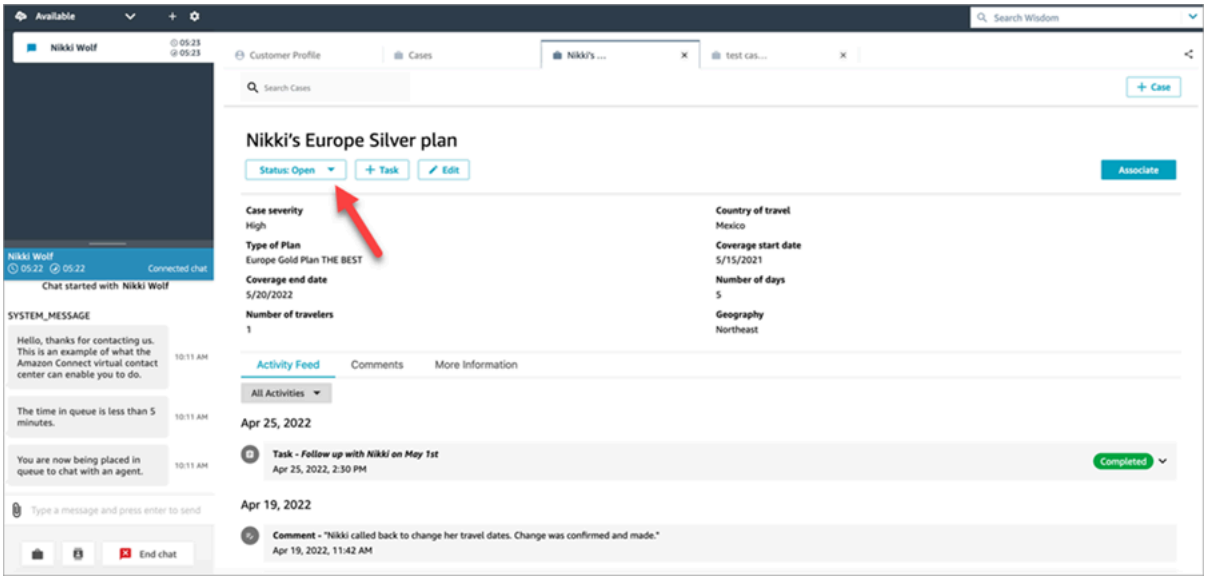


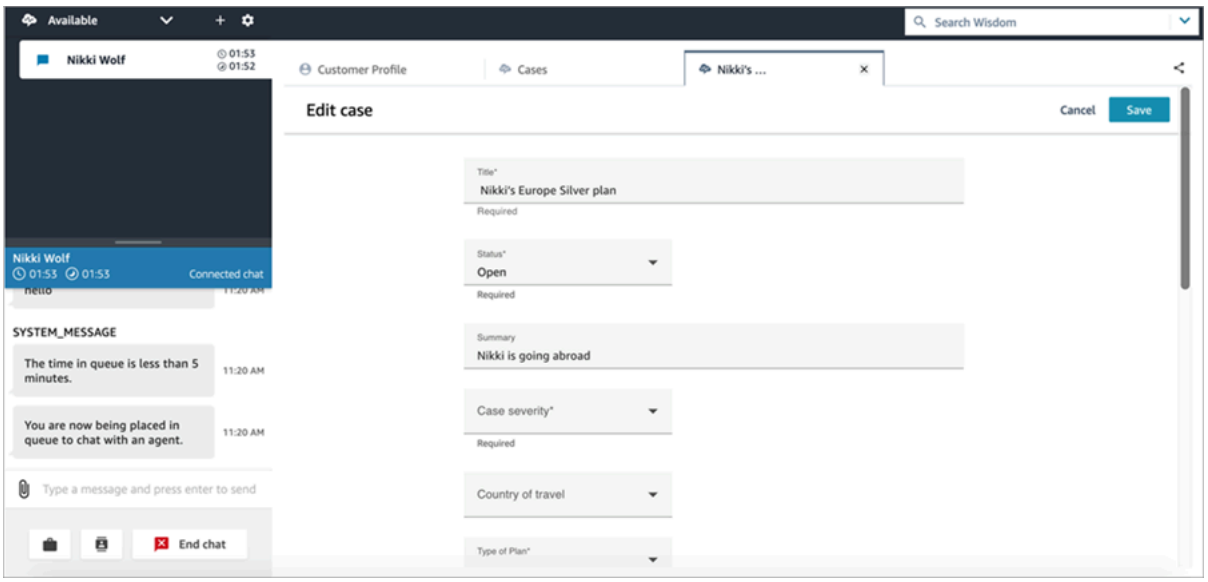


Edit a case in Connect Customer

To edit a case, the agent chooses **Edit** and **Save** to save any changes.

You can edit a case only when it is not in a **Closed** status. If the case is **Closed**, you must update the status, then choose **Edit** to make your changes.

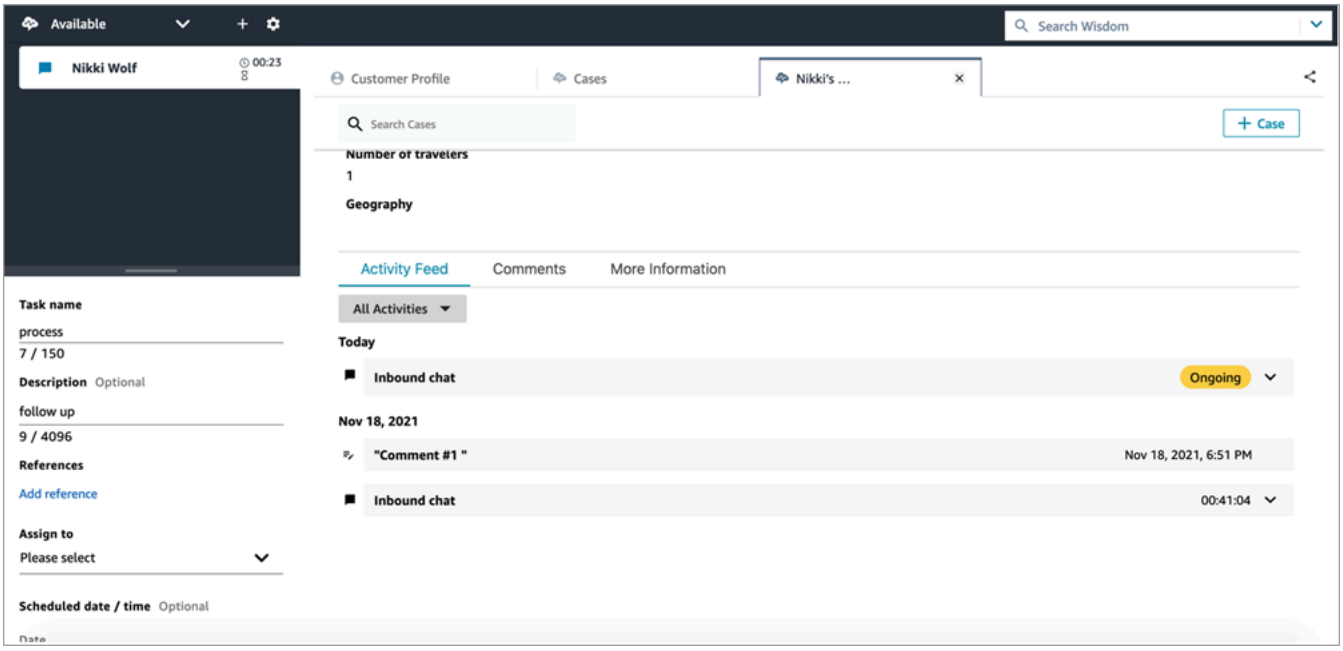




Create a task in the Contact Control Panel (CCP) or the agent workspace from a case

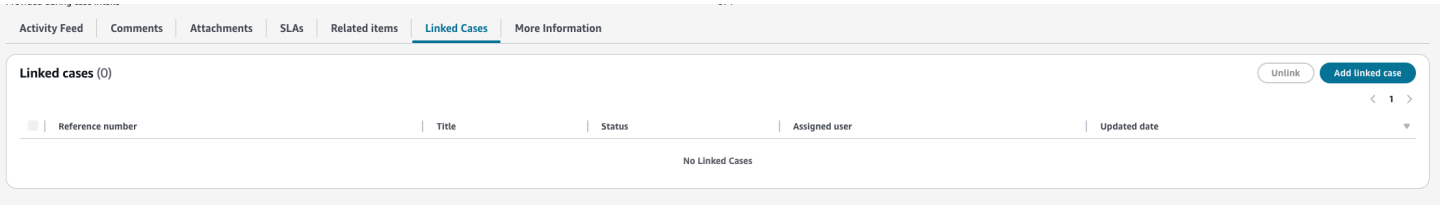
In the agent workspace, you can add a task from a case. In the Contact Control Panel (CCP), you will see the task creation form.

When you create a task from a case, the task is automatically associated with the case and it appears on the activity feed.



Link related cases in Connect Customer

The **Linked Cases** tab of a case lists the cases that are linked to it, with their reference number, title, status, assigned user, and last updated date. Choose a case title to open the linked case in a new tab.

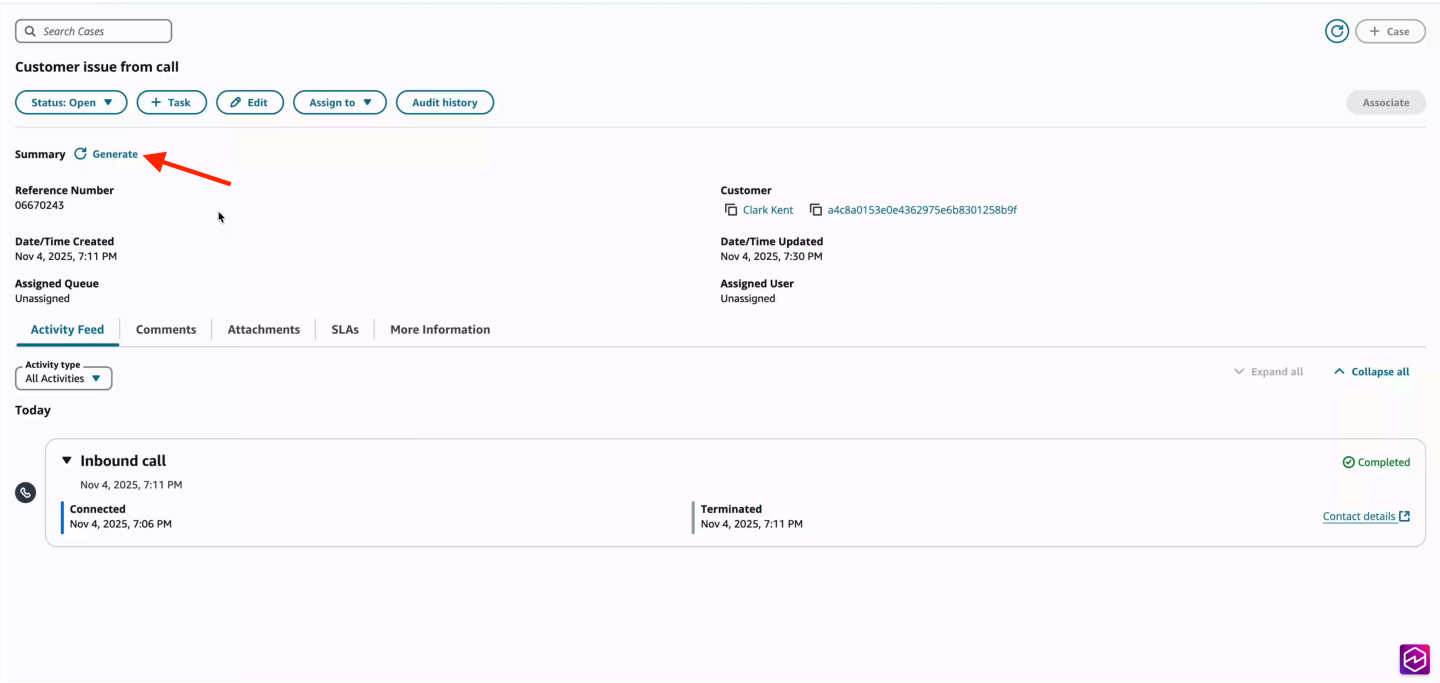


- To link another case, choose **Add linked case**. This requires the **Cases** - **Edit** permission.
- To remove links, select one or more linked cases, and then choose **Unlink**. This requires the **Linked cases** - **Delete** permission. You can't undo this action.

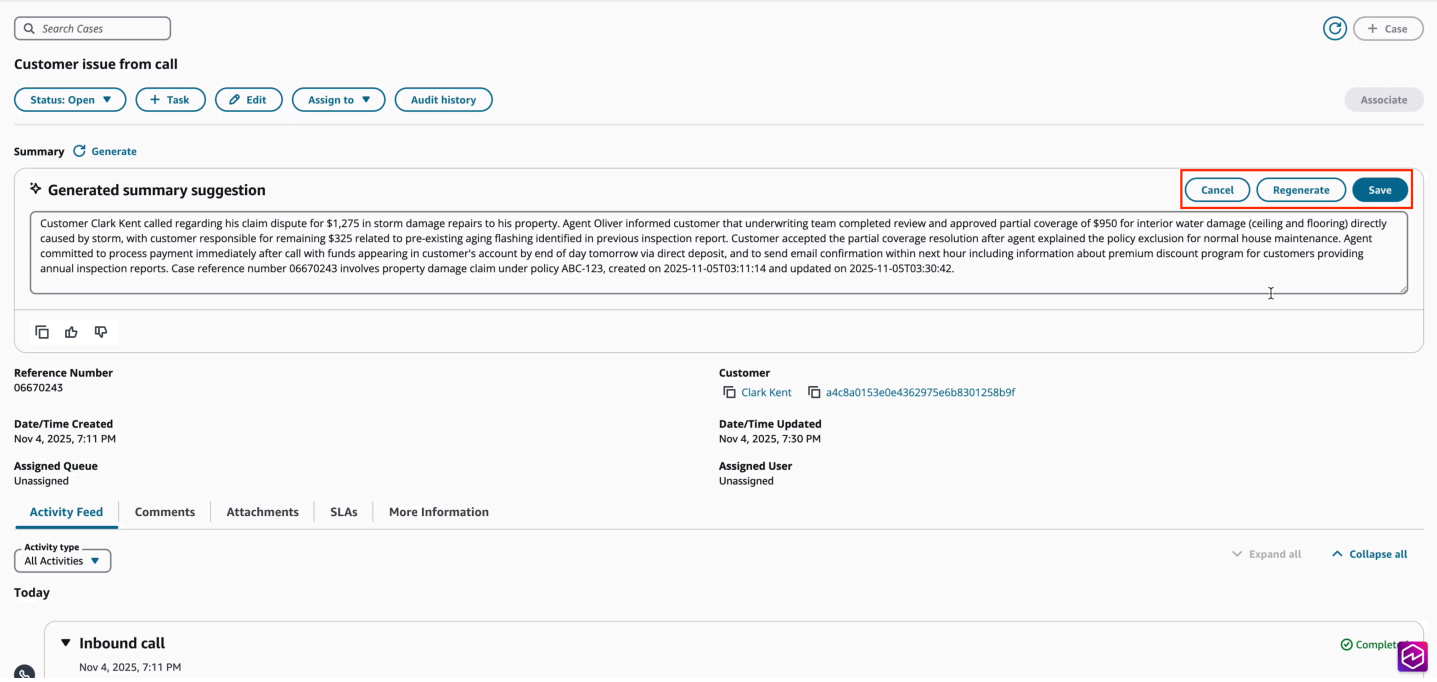
When you merge cases, the primary and secondary cases are linked to each other automatically. For more information, see Merge cases in Cases.

Generate AI-powered Case summary

Agents have the ability to generate an AI-powered Case summary by choosing Generate.



This displays a **Generated summary suggestion** which the agent can optionally edit and regenerate before saving the summary on the Case.



Search for content using Connect Customer agent assist

Powered by Amazon Bedrock: AI agents is built on Amazon Bedrock and includes automated abuse detection implemented in Amazon Bedrock to enforce safety, security, and the responsib le use of artificial intelligence (AI).

With Connect Customer agent assist agents can use natural language to search across connected knowledge sources to receive generated recommendations, like actions to take and links to more information.

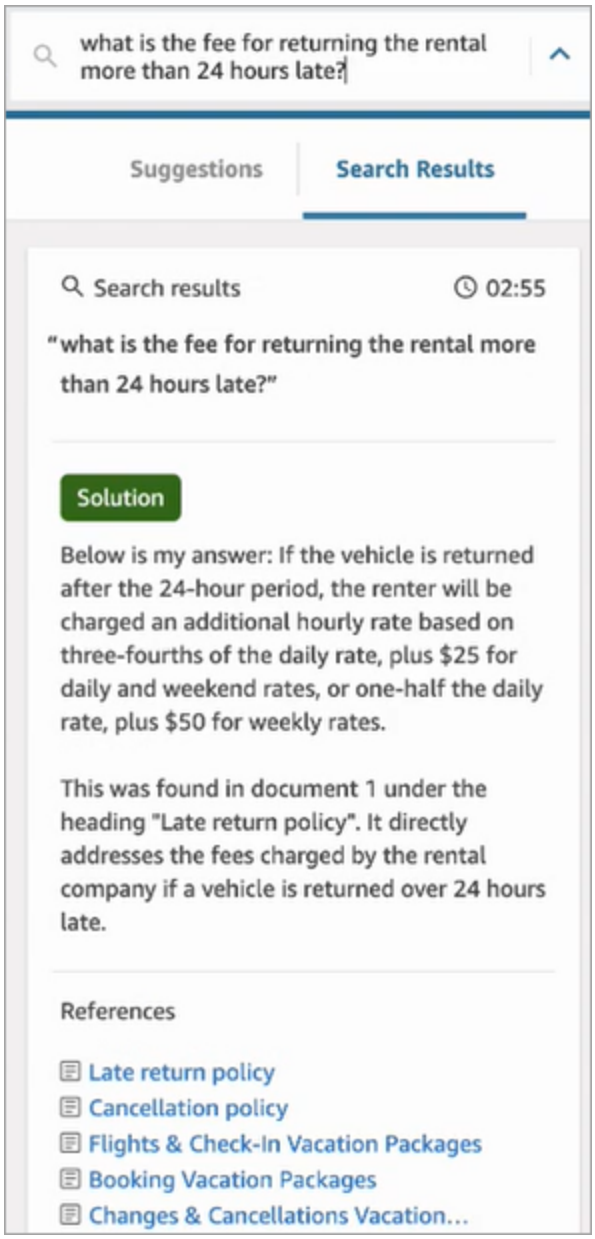
For example, you can type questions or phrases in the search box (such as, "how long after purchase can handbags be exchanged?") without having to guess which keywords will work. agent assist searches the connected sources, and returns a specific solution generated from your knowledge content along with links to relevant information.

You can search for content at any time: while on a contact, on After Contact Work, or between contacts.

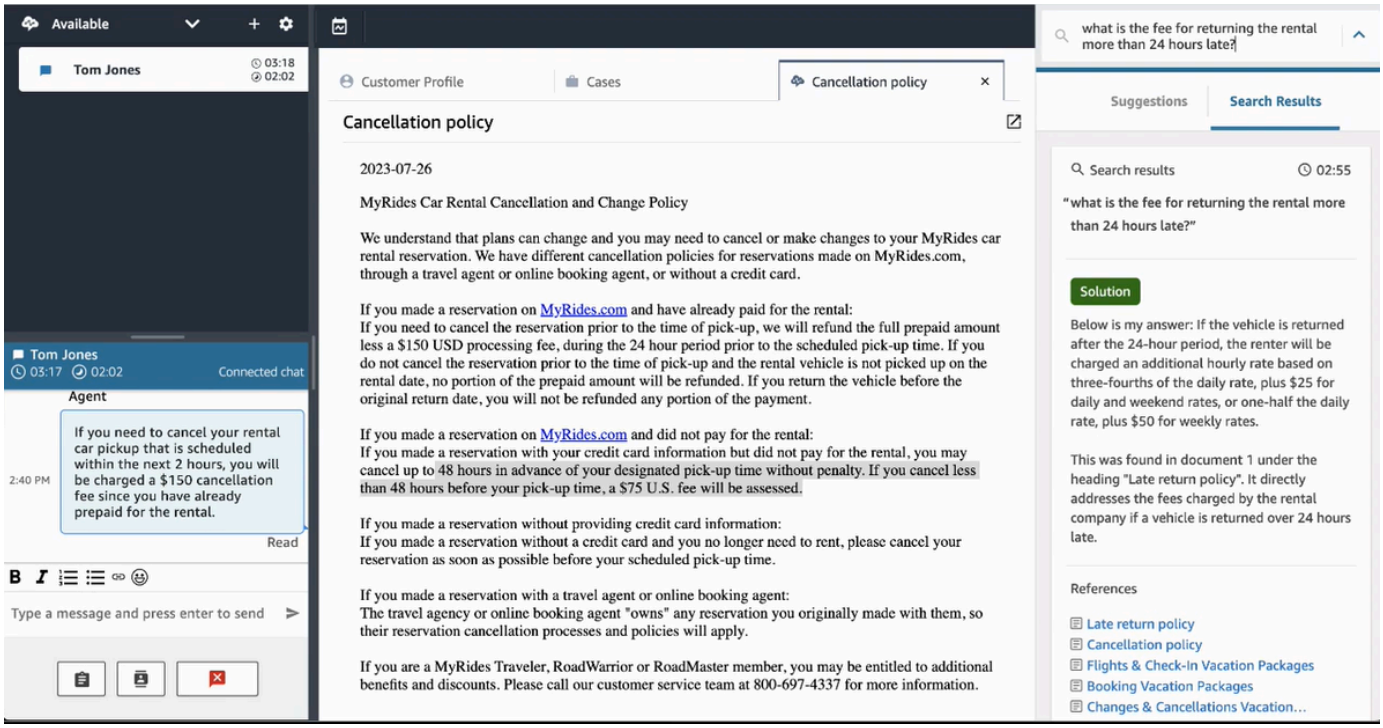
To search for content

1. In the search box, type words or phrases in natural language.

   The following image shows an example of a natural language query and the solution that is displayed.



2. If more information is needed, choose the article that you want to view.
3. The article appears in a new tab. For example, the following image shows the Cancellation policy article.



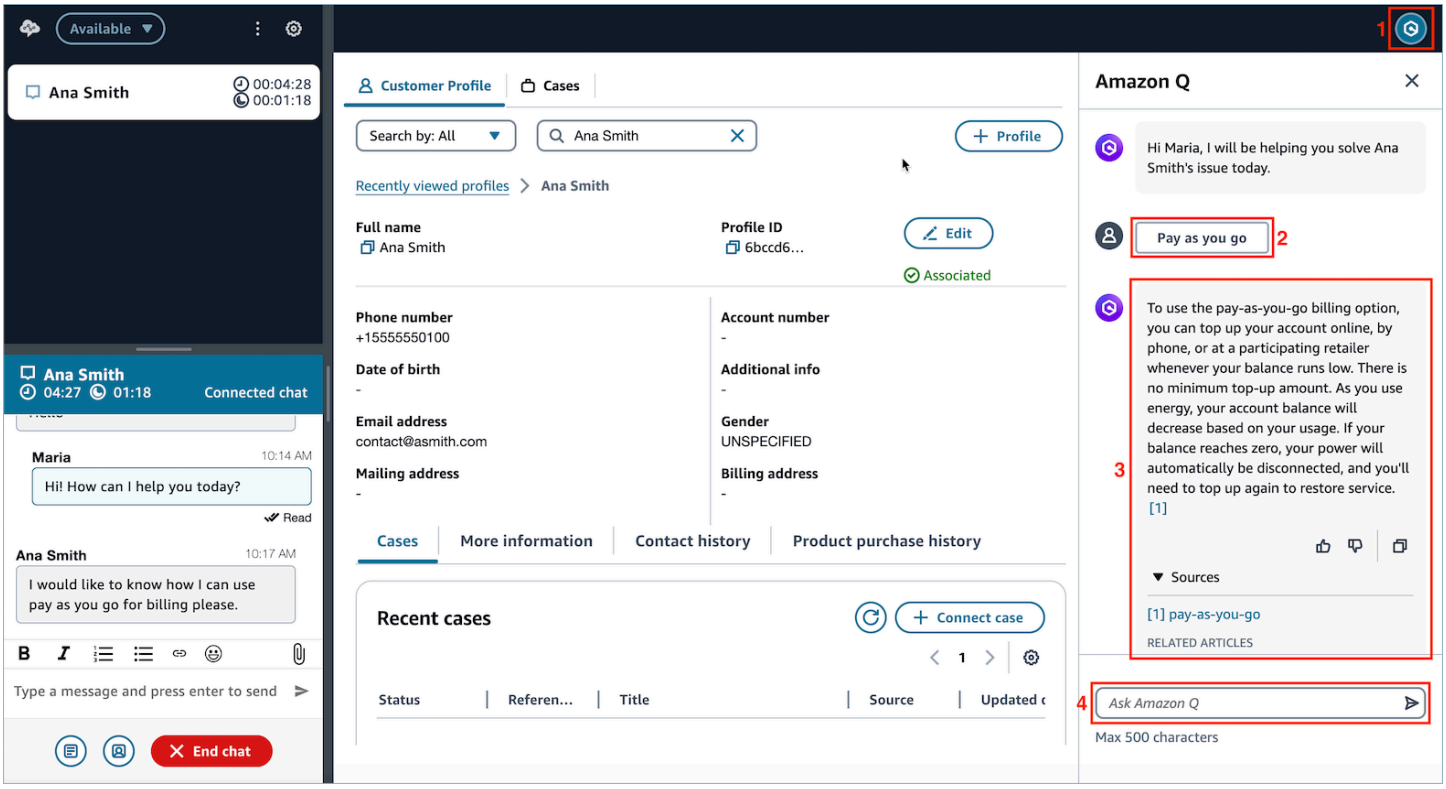
4. The list of search results is cleared only after you complete ACW and choose **Close contact**, or select the **Close** icon next to the search box.

Use real-time recommendations from Connect Customer agent assist

This topic explains how agents who are using Connect Customer agent assist in the agent workspace can interact with real-time recommendations that are generated for chats and emails. If conversational analytics is enabled, the recommendations appear for calls as well.

The recommendations point you to information related to the current conversation with the customer.

The following image shows how an article might appear in the agent workspace when you're on a call.



1. The AI agent toggle button on the top-right can be used to toggle the expansion of the AI agent widget.
2. A AI agent proactively generates clickable intents to assist the customer service agent handling the contact.
3. Upon choosing an intent, the AI agent generates a solution using an appropriate source from the knowledge base configured for it.
   - The AI agent provides a solution with citations.
   - Sources associated with the citations and other related articles are also displayed and can be clicked to dive into the knowledge base material.
4. The agent can ask natural-language questions to receive responses on demand from a AI agent using the input at the bottom of the widget.

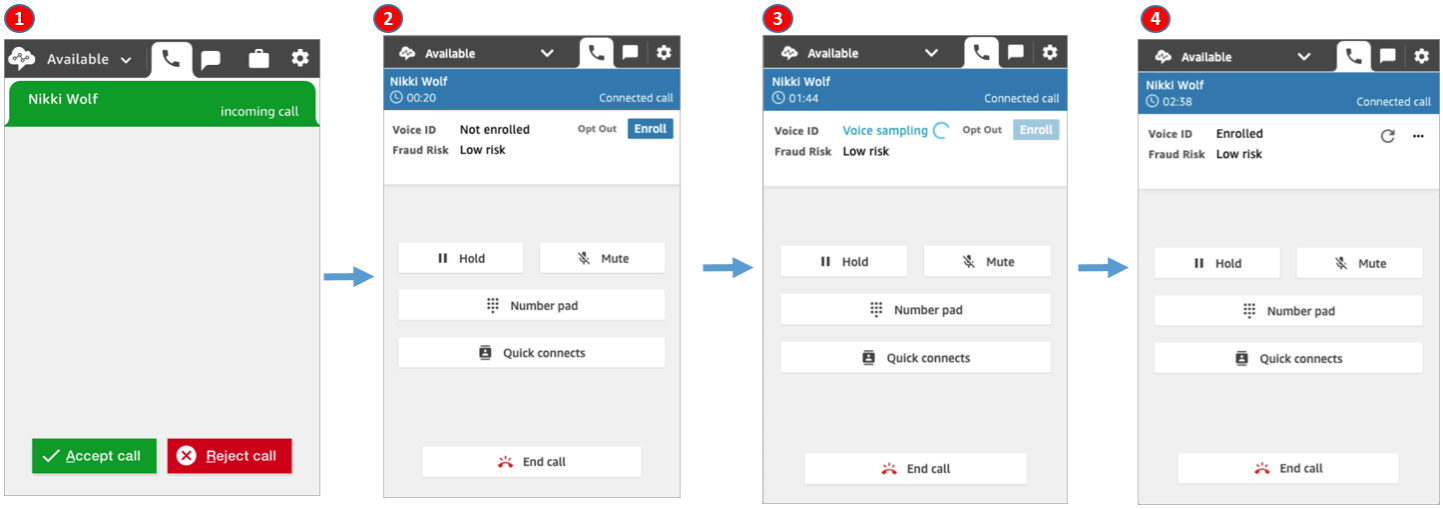
Enroll callers in Voice ID in the Contact Control Panel (CCP)

> **Note**
>
> End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on

the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

This topic shows how Voice ID features appear in your Contact Control Panel (CCP).

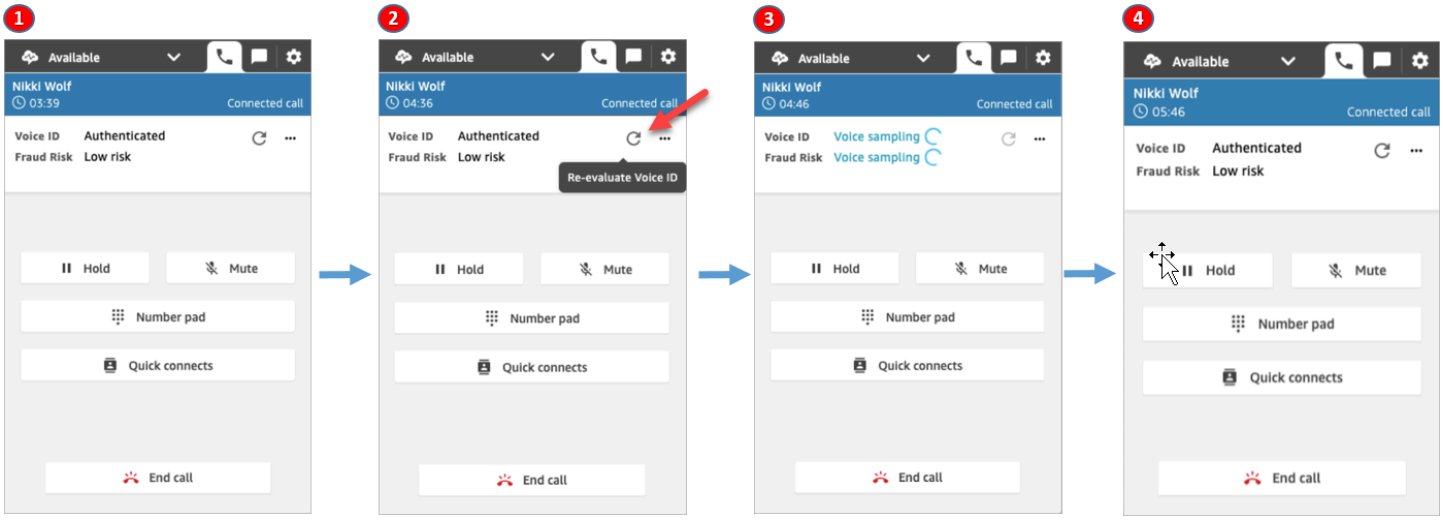
Enroll a caller in Voice ID



1. You receive an incoming call.
2. The caller is not yet enrolled in Voice ID so you choose **Enroll**.
3. A message is displayed that Voice ID is sampling the caller's voice. It requires 30 seconds of speech (excluding silence).
4. The caller is now enrolled in Voice ID. This example also shows the caller's **Fraud risk** as lower than the threshold.

Verification of an enrolled caller

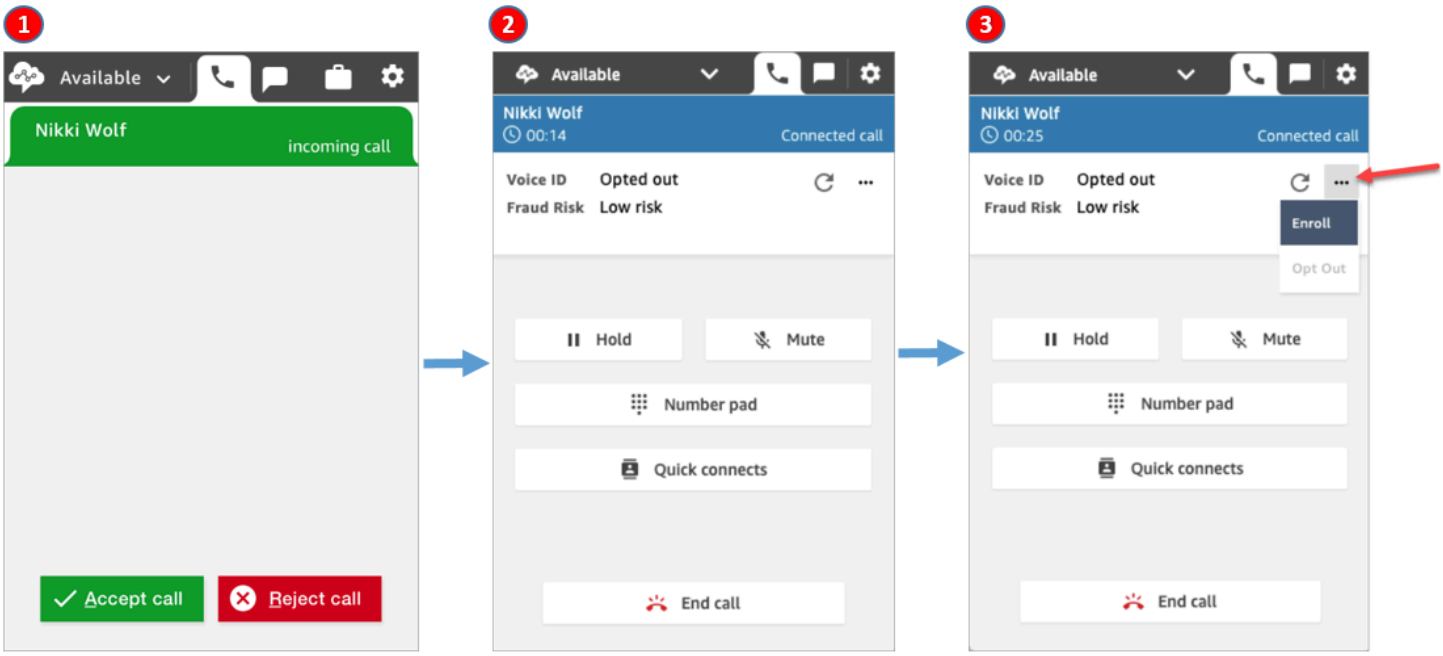
After a customer is enrolled in Voice ID, when they call your contact center again, you can verify they are who they say they are.



1. You receive an incoming call.
2. The caller is already enrolled in Voice ID, and their status is **Authenticated**. You can choose to re-evaluate authentication using Voice ID.
3. A message is displayed that Voice ID is evaluating the caller's speech. It requires between 5-10 seconds of speech, not including silences.
4. The caller has been authenticated by Voice ID. This example also shows the caller's **Fraud risk** is lower than the threshold.

Caller has opted out

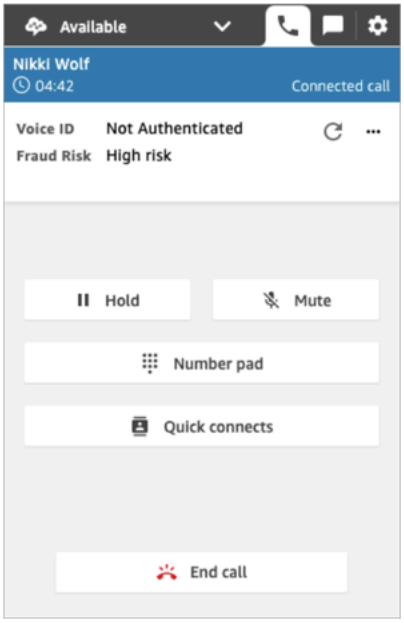
The following image shows what appears in your CCP when a caller has opted out of Voice ID.

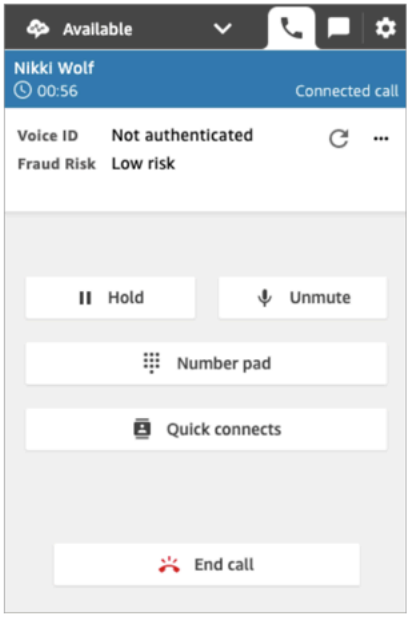


1. You receive an incoming call.
2. The caller has previously opted out of Voice ID.
3. You have the option to enroll them.

Authentication status = Not authenticated

When an enrolled caller calls your contact center, Voice ID might return a result of **Not authenticated**. This means Voice ID was unable to authenticate a caller's speech. The authentication score for the caller is lower than the configured threshold.

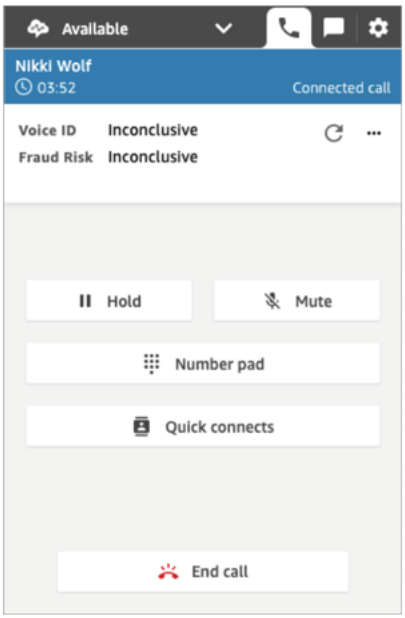




The previous images show that the **Fraud risk** can be **High** or **Low**, independent of whether the caller is authenticated.

Authentication status: Inconclusive

When an enrolled customer calls your contact center, Voice ID might return a result of **Inconclusive**: Voice ID was unable to analyze a caller's speech for authentication. This is usually because Voice ID did not get the required 10 seconds to provide a result for verification.



Troubleshooting Issues with the Contact Control Panel (CCP)

Troubleshooting Contact Control Panel (CCP) issues requires support from your network operations, system administrator, and virtual desktop (VDI) solution teams to collect the appropriate level of information to identify root cause and drive resolution. To help determine the appropriate resources to engage, it's important to categorize issues with similar symptoms. The following guidance has been helpful in assisting Connect Customer customers in resolving CCP issues with their operations support teams.

Topics

- Validate connectivity to Connect Customer with the Endpoint Test Utility
- Troubleshoot audio quality issues in Connect Customer
- Troubleshoot contact routing and handling in Connect Customer
- Contact Control Panel (CCP) Issues
- Download and review Connect Customer Contact Control Panel (CCP) logs
- Agent workspace and CCP do not support mobile phones (iPhone, Android) and iPads
- Problem using the CCP: Agents can't make outbound calls in the Contact Control Panel (CCP)
- Internal firewall or missing CORS policy prevents access to chat, email, task, or case attachments
- Humming sound in the agent's audio device: Verify the headset and browser sample rates
- Troubleshoot agent screen recording issues

Validate connectivity to Connect Customer with the Endpoint Test Utility

To validate connectivity to Connect Customer, or when your agents are experiencing problems with the Contact Control Panel (CCP), we recommend using the Connect Customer Endpoint Test Utility.

The Connect Customer Endpoint Test Utility performs the following checks:

- Validates that the browser being used supports WebRTC.
- Determines if the browser has appropriate access to media devices (microphone, speakers, etc).
- Performs latency tests for all active Connect Customer Regions.

- Performs latency tests to a specific Connect Customer instance, if provided.
- Validates network connectivity across required ports for media streams.

The complete results are available for download as a JSON file. You can copy the results to include in a support ticket. You can also load the results file into the tool by selecting the **Load previous results** option. This option displays the contents of the file visually and makes it easier to analyze the results. Additionally, you can download a bookmark specifically for the provided instance to make future tests easier to run.

Parameters to customize the Endpoint Test Utility

You can use the Endpoint Test Utility as is without any customizations. However, if you want to customize it, use the following URL parameters:

- **lng**: Change the language of the tool. Currently supported languages are English, Spanish, and French. It accepts the following values:
  - en (default)
  - es
  - fr
- **autoRun**: Run the tool automatically. It accepts the following values:
  - true
  - false (default)
- **connectInstanceUrl**: Not used by default. You can specify the Connect Customer instance in the URL. It must start with **https**.
- **regions**: A comma-separated list of region codes for the AWS Regions that you want to test. For example `regions=us-east-1,us-west-2`.

Example customized URL:

```
https://tools.connect.aws/endpoint-test/?
lng=es&autoRun=true&connectInstanceUrl=https://
myinstance.awsapps.com&regions=us-east-1,us-west-2
```

Troubleshoot audio quality issues in Connect Customer

Audio quality issues—choppy or robotic audio, echo, delay, one-way audio, humming, or dead air—can originate anywhere along the call path. This page is the starting point for diagnosing them. It helps you narrow down *where* in the path the problem occurs, then directs you to the specialized topic that resolves it.

Call disconnects

This page covers audio *quality*. If calls are dropping or disconnecting rather than sounding bad, see the section called “Troubleshoot call disconnects”.

Intended audience

This guide assumes you are an IT administrator with experience investigating network, telephony, and workstation issues, and that you can access data in a Connect Customer contact record.

Before you begin: gather this information

Collect the following for the affected calls before you start. You need it to investigate and, if necessary, to open a case with AWS Support.

- **Description of the symptom**—what the audio sounds like (choppy, robotic, echo, one-way, humming, dead air, delay) and whose voice is affected. You use this in Step 1.
- **Instance Amazon Resource Name (ARN)**—see the section called “Find your instance ID”.
- **ContactId** of each affected call (provide 3–5 examples, none older than 24 hours).
- **Time of occurrence**, including time zone (record in UTC where possible).
- **Call recording** for each example.

If you can't obtain a recording directly, ask the agent or customer to review one and confirm:

- Whose audio is degraded—the **agent** or the **end-customer**.
- Whether the reported degradation is **actually audible** in the recording.

Prerequisites

Before troubleshooting, make sure of the basics: the agent workstation meets the minimum hardware requirements and the agent uses a supported browser.

Step 1: Identify the symptom

Use the symptom to jump to the most likely cause. If your symptom isn't listed, or you're not sure, continue to Step 2.

Symptom	Most likely area	Where to go
No audio ("dead air") on the **first call after a Windows 11 reboot**	Workstation (network interface card/services)	the section called “CCP audio issues on first call after system reboot when using Windows 11”
No audio in **both directions** (neither party can hear the other), not after a reboot	Contact Control Panel (CCP) setup, microphone access, or ports	the section called “Contact Control Panel (CCP) Issues”, How do I troubleshoot stopped audio during calls in my Amazon Connect CCP? (AWS re:Post)
One party can't hear the other (one-way audio)	Exclusive mic/speaker control, or network address translation (NAT)	the section called “One-way audio from customers”, the section called “Troubleshoot your network”
Persistent **humming** in the agent's audio	Headset/browser sample-rate mismatch	the section called “Humming sound in headset”
Missed calls / "Microphone is not accessible" / "Initialization Failed" / Web Real-Time	CCP setup, permissions, or ports	the section called “Contact Control Panel (CCP) Issues”

Symptom	Most likely area	Where to go
Communication (WebRTC) timeout		
Echo (agent hears their own voice)	Mic/speaker feedback	the section called “Troubleshoot an agent's workstation”
Choppy/broken, delayed, or distorted/ robotic audio	Network or workstation	Continue to Step 2

Step 2: Determine the scope

The number of affected agents changes where you look first.

- **A single agent**—focus on that agent's **workstation** (Step 5, workstation path) and headset.
- **Multiple agents in the same location or hierarchy**—suspect a **local network** issue (router, internet service provider (ISP), or local area network (LAN)) or a software or OS update pushed to those machines.
- **Agents across multiple locations (remote and in-office)**—suspect an **organization-level** network change or a browser/OS auto-update.

Use the section called “AgentHierarchyGroups” and the section called “DeviceInfo” from the contact record to identify the impacted population. For more information about impact analysis, see the section called “Use QualityMetrics to diagnose audio issues”.

> **Tip**
>
> If the issue started on a specific date for all affected agents, check for network infrastructure changes, browser auto-updates, or OS patches pushed on that date.

Step 3: Localize the problem using the call path

When agents use the Contact Control Panel (CCP), calls traverse this path:

(1) Headset → (2) Agent device/CCP → (3) Agent network → (4) Connect Customer → (5) Telephony network → (6) End-customer device

Connect Customer records each call at point (4), so the recording captures the audio exactly as it arrived at Connect Customer. The recording is a dividing line. If the degradation **is audible** in the recording, the audio had already degraded **before** it reached Connect Customer (paths 1–3). If the recording **sounds clean** but a participant reported bad audio, the degradation occurred **after** point 4, on the path to the listener.

Use the following table to pair what you observe with the conclusion and where to go next.

Whose audio is degraded	Degradation is in the recording	Degradation is not in the recording
Agent (the agent's voice, as heard by the customer)	The audio degraded before reaching Connect Customer—headset, device, or agent network (1, 2, and 3). Go to Step 4.	Audio reached Connect Customer cleanly but customer heard degradation — telephony network or end-customer side (5 and 6). Go to Step 6.
End-customer (the customer's voice, as heard by the agent)	The audio degraded before reaching Connect Customer on the inbound side — telephony network or end-customer device (5 and 6). Go to Step 6.	Audio reached Connect Customer cleanly but agent heard degradation —agent network, device, or headset (1, 2, and 3). Go to Step 4.

Multi-party and conference calls

For conference or multi-party calls, apply this recording-localization logic per leg (per ContactId), not to the call as a whole.

No recording available

If you can't determine the affected path from the recording—or no recording is available—continue to Step 4 to pull the metrics, which can localize the issue independently.

Step 4: Collect diagnostic data (agent-side, paths 1, 2, and 3)

Run these in order. Each links to its full procedure.

1. **Endpoint Test Utility**—from the affected agent's machine, validate WebRTC support, media-device access, per-Region latency (target **under 300 ms**), and required ports. Download the JSON results. See the section called "Validate connectivity to Connect Customer".
2. **QualityMetrics from the contact record**—call DescribeContact and review:
   - **`QualityScore`** (1.00 = poor, 5.00 = excellent) for a quick read.
   - **`PotentialQualityIssues`**: `HighPacketLoss`, `HighJitterBuffer`, or `HighRoundTripTime`. An empty list means no issue was detected. See the section called "Use QualityMetrics to diagnose audio issues".
3. **CCP logs**—if available, download them and open them in the CCP Log Parser. Check for ERROR-level entries and WebRTC metrics during the affected call: `PacketLoss`, `JitterBufferMillis` (> 30 ms is abnormal), `RoundTripTime` (> 300 ms is abnormal). See the section called "Download and review CCP logs".
4. **Amazon CloudWatch**—check whether `ToInstancePacketLossRate` exceeded **20%** during the time of the issue. For more information about checking this metric, see Troubleshoot Amazon Connect audio quality issues (AWS re:Post). Audio quality can degrade at packet loss rates well below 20%; this threshold indicates a severe issue requiring immediate network team engagement.

Then branch on what you found:

- **Abnormal metrics found** → treat as a **network** issue (Step 5, network path).
- **No abnormal metrics** → treat as a **workstation** issue (Step 5, workstation path).

Step 5: Resolve agent-side issues

Network (path 3)

Abnormal `PacketLoss`, `JitterBuffer`, `RoundTripTime`, or a high `ToInstancePacketLossRate` point to the agent network. Check:

- **Virtual private network (VPN)**—does the issue reproduce without VPN (direct connection)? If VPN is required, is split-tunneling enabled for real-time traffic?

- **Wi-Fi compared to wired**—does it reproduce on a wired connection?
- **Firewall/proxy/NAT**—is UDP 3478 (media), TCP 443, and websocket traffic allowed? Use static NAT with keep-alives where possible.
- **Bandwidth contention**—are large file transfers or bandwidth-heavy apps running concurrently?
- **Distance to Region**—is the agent far from the AWS Region of the instance? (Correlates with high `RoundTripTime`.)

Full procedure: the section called "Troubleshoot your network". For more information about metric interpretation, see the section called "Use QualityMetrics to diagnose audio issues".

Workstation (paths 1/2)

No abnormal network metrics points to the headset, device, or software. Check:

- **Headset**—wired compared to wireless; does a wired headset resolve it? Confirm it meets the minimum headset requirements.
- **Audio Enhancement**—if enabled, does disabling it resolve the issue? Note these constraints:
  - **Voice Isolation must only be used with a wired headset.** For wireless or mixed setups, use **Noise Suppression** instead.
  - Audio Enhancement requires a **4-core CPU / 4 vCPU minimum**.
  - **Audio Enhancement is not supported when using Connect Customer audio optimization (WebRTC redirection); it is supported with VDI local-browser access.** If both Audio Enhancement and Connect Customer audio optimization are configured, that conflict is a likely cause. See the section called "Enable Audio Enhancement".
- **Humming**—verify headset/browser sample rate is 48000. See the section called "Humming sound in headset".
- **Browser or OS**—check for recent updates; does rolling back to the last working version resolve it? Confirm a supported browser.
- **Virtual desktop infrastructure (VDI)**—for Amazon WorkSpaces, Citrix, Omnissa, Azure Virtual Desktop, or Windows 365, make sure that WebRTC redirection is configured through the `VDIPlatform` parameter. See the section called "Use the agent workspace to optimize audio for Amazon WorkSpaces, Citrix, Omnissa, Azure Virtual Desktop, and Windows 365 cloud desktops".
- **Exclusive device control**—check whether another application has taken exclusive control of the mic/speaker. See the section called "One-way audio from customers".
- **Custom CCP**—if you use a custom CCP, does the issue reproduce on the default CCP?

- **Windows 11 first call after reboot**—if audio fails only on the first call after a reboot, apply the service startup-type fix (qWAVE, ndisuio.sys, dmwAppushSvc, SstpSvc, RasMan). See the section called “CCP audio issues on first call after system reboot when using Windows 11”.

Full procedure: the section called “Troubleshoot an agent's workstation” and Improve call quality on agent workstations in Amazon Connect contact centers (Prescriptive Guidance).

Step 6: Resolve end-customer/telephony issues (paths 4/5/6)

When the degradation is on the end-customer/telephony side, you can't fix it on the agent workstation. Try to isolate the source before opening a case:

- **Change the calling environment**—have the end-customer try a different device, network, or carrier.
- **Check for a common factor**—does the issue correlate with a specific carrier, direct inward dial (DID) number, or geographic region? If it correlates with a particular country or number type, confirm that country's coverage and any known telephony restrictions in the Amazon Connect Telecoms Coverage guide on the Amazon Connect website.
- **Check for call forwarding**—is another system forwarding calls to Connect Customer? If so, does the issue occur on direct dials to Connect Customer without forwarding?
- **Test multiple numbers**—try multiple destination and source numbers to see whether the issue follows a particular number.

If the issue persists across these changes, open a case with AWS Support.

Step 7: Before you contact AWS Support

If the issue persists after troubleshooting, open a case with **3–5 examples no older than 24 hours**, and include:

- Instance ARN and a description of the symptom (whose voice, and how—choppy, no audio, echo, and so on).
- ContactIds, timestamps (UTC), and contact-record snapshots.
- Call recordings attached to the case.
- For end-customer issues: the end-customer phone number (last 4 digits might be masked) and the Connect Customer phone number.

- Test results: browsers tested, networks tested, alternate-machine test, **Endpoint Test Utility JSON export**, and your **observations after running Ping and MTR**.
- Agent environment details: VPN/firewall/VDI configuration, headset type, and Audio Enhancement mode.
- CCP type (default compared to custom) and the downloaded CCP logs for the affected calls.
- Frequency of the issue and the date/time it started (UTC).

> ⚠ **Download CCP logs immediately after affected calls**
>
> CCP logs persist only within the current browser session. If the agent closes or refreshes the CCP tab, the browser discards the logs—download them as soon as possible after an affected call.

Troubleshoot audio quality issues by using `QualityMetrics` in the contact record

> ⚠ **Important**
>
> The topics and content in this section are for IT administrators who have experience with investigating network and telephony issues.
> You also need to be familiar with how to access data in a Connect Customer contact record.

Where to find QualityMetrics

Connect Customer provides QualityMetrics in the contact record for each connected call.

QualityMetrics is part of the contact object that you get as a response when you call the DescribeContact API. The following snippet from the `DescribeContact` response shows what it looks like:

```
"QualityMetrics": {
        "Agent": {
           "Audio": {
              "PotentialQualityIssues": [ "string" ],
              "QualityScore": number
```

```
            }
         },
         "Customer": {
            "Audio": {
               "PotentialQualityIssues": [ "string" ],
               "QualityScore": number
            }
         }
      },
```

QualityMetrics is also a sub-section of the QualityMetrics object that you receive through Kinesis CTR events.

QualityMetrics is not available by using the Connect Customer admin website to view the contact record.

QualityMetrics is not part of EventBridge events.

Symptoms of call quality issues

Following is a list of common symptoms that indicate call quality issues on a participant media connection. You can observe these symptoms on a Connect Customer call recording on the participant channel.

- Choppy/broken audio
  - Observation: The audio stream gets interrupted and sounds choppy or broken on the media connection as heard by the listener on the other end.
  - Potential causes: Potentially caused by packet loss due to poor network connectivity leading to a participant sounding choppy or broken to the other party.
- Delayed audio
  - Observation: Participant experiences a delayed audio from the other side. An effect of delayed audio is consistent overlapping in conversation between the caller and the agent.
  - Potential causes: This can be caused due to constrained network bandwidth/hardware/workstation congestion.
- Echo
  - Observation: Echo is when agent hears their own voice repeated back to them with a delay.
  - Potential causes: This is often due to audio feedback between the microphone and speaker.
- Background noise

- Observation: Extraneous background noise like fans, typing, or call center noise can make it difficult to hear the caller clearly.
- Distorted audio
  - Observation: Distorted, garbled, or robotic-sounding audio heard by one party coming from the other end.
  - Potential causes: This is typically a sign of a bandwidth issue or faulty hardware.

Analyze the impact on your agents and calls

We recommend using QualityMetrics data together with other fields on the contact record—such as `AgentHierarchyGroup` and `DeviceInfo`—to identify the impacted population and spot any trends. Use this information to answer the following questions to understand overall impact:

- What percentage of agents or calls are impacted?
  - Scenario 1: If only 1 agent is encountering the problem, it could be related to agent workstation including operating system and browser/network configuration of the agent.
  - Scenario 2: If multiple agents in the same hierarchy (for example, the same geographical location or office) experience audio quality issues, this could be a result of a local network issue (modem/ISP/Router/LAN connections) or recent software upgrades to the machines of agents.
  - Scenario 3: Multiple agents (working remote or at office location) might be experiencing the issue. Check the browser/system configurations for any updates along with any network changes that might have occurred at the organizational level.
- What percentage of calls are affected in a given day and out of how many calls?
- Is the issue observed on incoming calls, outgoing calls or both?
- Is an entity forwarding calls to Connect Customer? If so, does the audio quality issue occur in case of direct dials to Connect Customer without the call quality issue.

Use `QualityMetrics`

Connect Customer provides QualityMetrics in the contact record for each connected call. Use the metrics help you to identify the source of the issue.

`QualityMetrics` contain the following information:

- **QualityScore**: An estimate of overall audio quality using a numerical value.

- Minimum value: 1.00 (indicates poor quality)
- Maximum value: 5.00 (indicates high quality)

- **PotentialQualityIssues**: For calls with potential issues, `PotentialQualityIssues` is populated with a list of detected reasons which include `HighPacketLoss`, `HighRoundTripTime`, or `HighJitterBuffer`. An empty list suggests that no audio quality issues were detected.

The following list explains the potential values for `PotentialQualityIssues` and suggests causes to guide your investigation.

- `HighPacketLoss`: When this value occurs for `PotentialQualityIssues`, it suggests that there is packet loss observed on the outbound audio (egress) stream for the participant.
  - Causes:
    - This can occur in the path the packets traverse the network between the participant and the Connect Customer endpoint which could be due to a bad/poor network, congestion in network, constrained network bandwidth.
    - It can also occur when there could be other applications on the participant's system that might be causing network bandwidth starvation.
- `HighJitterBuffer`: This is the time delay introduced by a buffer built-in the browser to correct the order of audio packets after network traversal. Jitter buffer plays a major role in making sure that the packets received over network at a device are aligned appropriately to provide the audio without distortion.
  - Causes:
    - If a congestion (network or hardware) occurs at the participant's end, the `JitterBuffer` increases causing audio delays/distorted or choppy audio.
    - Jitter buffer is responsible for delaying the processing media packets just enough to smooth out delivery times but high jitter buffer can cause background noise or audio quality issue.
    - If jitter buffer is more than 30 ms or changing very frequently then it means network congestion or low network bandwidth of router. High jitter can also be caused due to hardware issues of the devices involved.
- `HighRoundTripTime`: This is the time it takes for a packet to travel through an IP network, from a sending endpoint to a receiving endpoint and back, not including the processing time at its destination. High RTT results in callers experiencing noticeable delays (speech overlap) on the call. RoundTripTime (RTT) is the estimated network round trip time between the participant's device and Connect Customer endpoint.

- Causes:
  - The most common cause of high round trip time is a low-bandwidth or constrained network.
  - You might also experience high round-trip time if a certain software program is causing a spike in round-trip time. In the past, some of our customers have reported VPN applications being cause of the issue.
  - If the agent's physical location is distant from the AWS Region of the Connect Customer instance, it results in an increase to RoundTripTime adding latency.
  - Routing audio through a virtualized desktop (as opposed to redirecting the WebRTC session directly to agent workstation) could also introduce high round trip time.

Next steps

After you have identified whether the issue is `HighPacketLoss`, `HighJitterBuffer`, `HighRoundTripTime`, use the information to troubleshoot the network or the agent's device. See the following topics:

- Troubleshoot your network
- Troubleshoot an agent's workstation

Troubleshoot your network for call quality and disconnect problems

Network issues are the number one reason for call quality and disconnect problems in contact centers. Before reading this topic, we recommend that you review Set up your network to use the Connect Customer Contact Control Panel (CCP) to verify that your network is set up correctly for Connect Customer.

Get started

Make sure your environment is set up as follows:

- If a router is experiencing congestion, increase its bandwidth or replace it with a router that can handle the full bandwidth of your internet connection.
- Use fixed Ethernet (not Wi-Fi) wherever possible.
- Reduce packet conflicts on Wi-Fi by reducing the number of devices operating on the same channel.
- Avoid large data file transfers going over the same Wi-Fi environment concurrently.

Run the Endpoint Test Utility

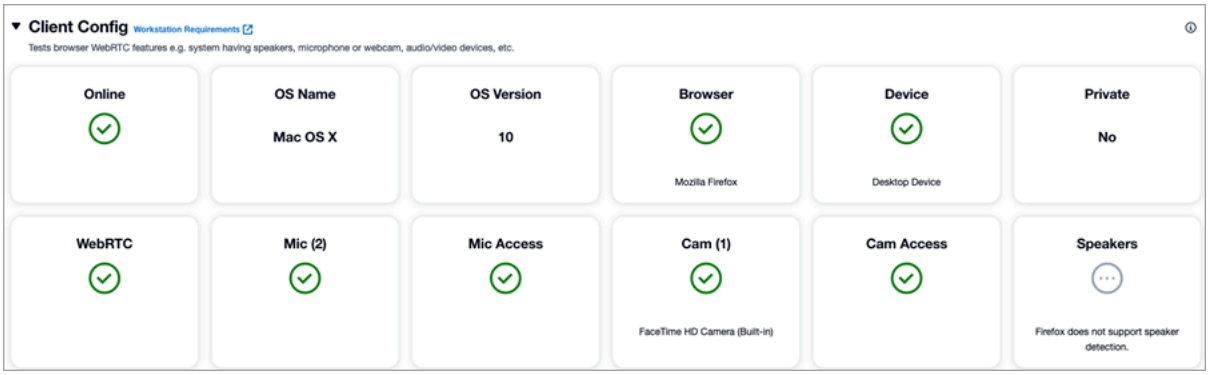
Run the Endpoint Test Utility tool from the affected agent's computer and check the results:

- This tool helps determine the latency between your Connect Customer instance and the agent browser. For a successful test, the status is **Success**. The average latency should not exceed 300 milliseconds (ms). Latency above this threshold might cause audio quality issues.

  The following image shows example results from a latency test.

  You can also test latency by selecting different AWS Regions to test connectivity from the agent's browser.

- Check whether the agent's workstation is set up correctly: verify they are using a supported browser and verify network connectivity across required ports for media streams. The following image shows the results for an agent workstation that meets all of the requirements for Connect Customer.



- Higher latency also leads to packet loss.

Investigate network components and devices

To investigate network components and devices, check the following:

- Confirm whether the agents who are experiencing the issue are signing in using the same network or are signing in remotely.

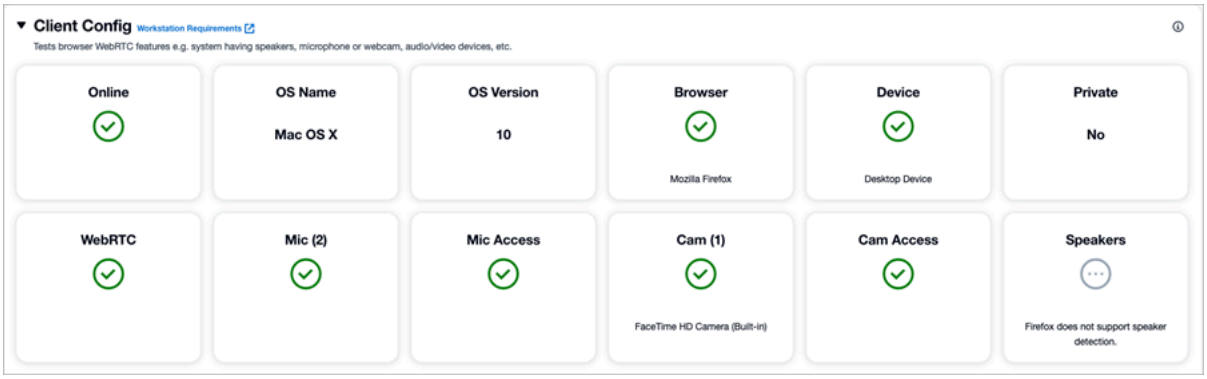
- If they are using a virtual private network (VPN) or firewall, does this issue happen only on the company VPN or over the public internet as well?
- If there is a virtual desktop infrastructure (VDI) setup, follow recommendations in Use Connect Customer in a VDI environment. Were there any changes made? Does the issue occur in a non-VDI setup (in a simple desktop environment)?
- Confirm that no antivirus software on the agent's machine or in the agent network impacts calls or causes audio quality issues.
- Verify that agents do not have network connectivity or bandwidth issues.
- Firewalls—Firewalls, proxies, or security groups blocking required ports and protocols can cause audio issues, drops, and delays. Make sure UDP 3478, TCP 443, and web sockets are allowed.
- Network address translation (NAT) devices—NAT traversal can cause one-way or no audio if not properly configured. Use static NAT when possible and enable keep-alives.
- VPNs—Encrypted VPN tunnels add overhead and latency that degrade audio. Prioritize quality over encryption for real-time traffic.
- Wi-Fi—Wireless connections are prone to interference and congestion leading to jitter and packet loss. Use wired connections when possible.

Troubleshoot an agent's workstation for call quality and disconnect problems

Before you read this topic, we recommend that you confirm your agent's workstation meets the minimum hardware requirements for using Connect Customer.

This topic explains how to investigate device problems:

- To investigate platform issues, do the following:
  - Run the Endpoint Test Utility from the affected agent's machine and check the results.
  - Check whether the agent workstation meets minimum hardware requirements for Connect Customer. For a workstation that meets the requirements, the results are similar to those in the following image.



- Review the DeviceInfo field in the contact record, which shows the participant's platform, platform version, and operating system. Use the `deviceInfo` parameter to identify the agent's workstation settings.

  ```
  "deviceInfo": { "platformName": "Chrome", "platformVersion": "116", "operatingSystem": "Windows" },
  ```

- Check whether there are any recent operating system or browser upgrades or patches applied for the affected agents. If so, confirm whether the issue can be resolved by rolling back to the last known working revision.
- Check whether the issue is reproducible across all browsers supported by Connect Customer.

- To investigate headset issues, do the following:
  - Make sure that the agent's headset meets the minimum headset requirements.
  - Check whether the issue occurs when a different headset (or no headset) is used.
    - If using a wireless headset, consider using a wired one.
  - If your audio input device supports noise cancellation, consider adjusting the noise cancellation settings as needed.
- To check for application incompatibility, do the following:
  - Check whether any recently installed software or application on the workstation might be doing one of the following:
    - Taking exclusive control of the agent's microphone or speaker. This issue is documented in Contact Control Panel (CCP) Issues
    - Consuming excessive network bandwidth and preventing Connect Customer from receiving the bandwidth it needs.

    If so, to find the problematic application, remove the recently installed applications one at a time until the issue is resolved.

- To investigate issues with your custom Contact Control Panel (CCP), do the following:
  - If you are using a custom CCP (not the default CCP), does the issue reproduce on a default CCP?

Troubleshoot call disconnects by using DisconnectDetails in the contact record

Step 1: Observe the issue

- No audio from agent:
  - Observation: If the customer cannot hear the agent, the customer generally disconnects the call.
  - Potential causes: A combination of network and hardware configurations can cause this issue.
- No audio from agent and customer:
  - Observation: If the customer cannot hear the agent, and the agent cannot hear the customer.
  - Potential causes: Network connectivity issues.

Step 2: Analyze the impact

Use the DisconnectDetails data together with other contact record fields, such as agent hierarchies and device info. This helps you identify which users are affected and spot trends. To understand the overall impact, answer the following questions:

- What percentage of agents are impacted?
  - Scenario 1: If only a single agent seems to be facing the problem, it might be related to agent workstation, hardware, system, or network configuration of the agent.
  - Scenario 2: If multiple agents in the same hierarchy (for example, same geographical location, or office) experience audio quality issues, this might be the result of a local network issue (modem, internet service provider (ISP), router, or local area network (LAN) connections) or recent software upgrades to these agent workstations.
  - Scenario 3: Multiple agents (working remotely or at office location) might experience this issue. Check the browser or system configurations for any updates along with any network changes that might have occurred at the organizational level.
- What percentage of calls are affected in a given day and out of how many calls?

- Is the issue observed on incoming calls, outgoing calls or both?
- Is there any call forwarding entity from which the calls are being forwarded to Connect Customer? If so, does the call disconnect issue occur in case of direct dials to Connect Customer?

Step 3: Gather information

To troubleshoot call disconnect issues, start by collecting the following information:

- The Connect Customer instance ARN: For instructions, see Find your Connect Customer instance ID or ARN.
- Contact ID of the affected call you're going to investigate.
- View the contact records for the contact ID. For instructions, see View a contact record in the Connect Customer admin website.
- The following additional resources can also help you identify the source of the issue:
  - Call recordings: Connect Customer call recordings are helpful in understanding deeper insights regarding call quality.
    - The agent audio is stored in the right channel.
    - All incoming audio, including the customer and anyone conferenced in, is stored in the left channel.
  - Download and review Connect Customer Contact Control Panel (CCP) logs: The logs help provide insights for a given call handled by an agent.
  - Endpoint Test Utility results: This browser-based tool helps you validate agent workstation settings in a JSON format.

Step 4: Use `DisconnectDetails`

When you're viewing the contact record for the affected contact, go to the DisconnectDetails section. It provides insights into calls that disconnect unexpectedly because of potential media connection or device issues.

For calls with `PotentialDisconnectIssue`, Connect Customer populates the field with the detected reason of `AGENT_CONNECTIVITY_ISSUE` or `AGENT_DEVICE_ISSUE`.

- `AGENT_CONNECTIVITY_ISSUE`: A network connectivity issue between the agent workstation and Connect Customer is causing the call to disconnect. For additional troubleshooting steps, see Troubleshoot your network.

- `AGENT_DEVICE_ISSUE`: A workstation or headset issue is preventing two-way audio, causing one party to disconnect. For additional troubleshooting steps, see Troubleshoot an agent's workstation.

Open a case for call quality issues

If your contact center has call quality issues that persist even after performing the recommended troubleshooting steps, open a case for Support to help you investigate the issue. Provide the following information in your case.

> **Important**
>
> Provide information for at least 3–5 examples of call quality issues. The examples must not be older than 24 hours.

1. The ARN of your Connect Customer instance. For instructions on finding your instance ARN, see Find your Connect Customer instance ID or ARN.
2. A description of the audio quality issue observed.
3. Contact IDs of the affected calls and a snapshot of the contact records that contains all the details.
4. Call recording attachments, attached to the case.
5. Share the findings from the tests you have performed, and your observations:
   a. Confirm whether you have followed all the requirements specified for the network, agent workstation and browser.
   b. Provide your observations from testing the following:
      i. Browsers. Specify which browsers you tested and the results.
      ii. Networks. Specify the different networks you tested and the results.
      iii. Ask the affected agent to sign in on a different machine to determine the behavior pattern. This helps isolate whether the issue is specific to one machine.
   c. Confirm whether the agent's workstation meets the minimum hardware requirements.
   d. Provide details about the agent's environment: virtual private network (VPN), firewall, and virtual desktop infrastructure (VDI) configuration, along with a description.

e. Specify the type of Contact Control Panel (CCP) your agent is using (is it customized with the Connect Customer Streams API or the default version). Share your observation from the default CCP along with the downloaded CCP logs of the affected calls.

6. Specify the frequency of the issue.
7. Provide an impact assessment and date and time when it started. Provide in UTC format.
8. Provide your observations after running Ping and MTR (My Traceroute).
9. Provide an export of your Endpoint Test Utility results.

Troubleshoot contact routing and handling in Connect Customer

Routing and contact-handling problems—contacts that don't reach the intended queue or agent, contacts routed to the wrong queue or agent, contacts stuck in a queue, contacts that disconnect before reaching an agent, contact flows that take an unexpected branch, transfers or quick connects that fail, or callbacks that reach voicemail—can originate at any point along the call path. The cause can be a routing profile, a queue, a priority or delay setting, Set routing criteria, a contact flow block, a Lambda function invoked from a flow, or a carrier or device outside Connect Customer. This page is the starting point for diagnosing them. It helps you narrow down *where* in the path the problem occurs, then directs you to the specialized topic that resolves it.

Audio quality issues

This page covers *where* and *to whom* a contact connects (routing and handling). If a contact connects but has an audio *quality* problem—one-way audio, echo, choppy or robotic audio, or delay—see the section called “Troubleshoot audio quality issues”.

Call disconnects

If a contact disconnects unexpectedly *after* it is routed, see the section called “Troubleshoot call disconnects”.

Intended audience

This guide assumes you are a Connect Customer administrator who can manage routing profiles, queues, and contact flows, and who can access contact records (CTRs) and contact flow logs.

Before you begin: gather this information

Collect the following for the affected contacts before you start. You need it to isolate the problem and, if necessary, to open a case with AWS Support.

- **Description of the symptom** – what happened (didn't reach the intended queue or agent, routed to the wrong queue, stuck in a queue, disconnected before reaching an agent, uneven distribution, flow took an unexpected branch, transfer or callback failed) and the affected channel (voice, chat, task, email, or callback). You use this in Step 1.
- **Instance Amazon Resource Name (ARN)** – see the section called “Find your instance ID”.
- **ContactId** of each affected contact (provide 3–5 examples).
- **Time of occurrence**, including time zone (record in Coordinated Universal Time (UTC) where possible).
- **Intended queue name, routing profile name, and agent** – both the routing target you expected and the actual values.
- Where applicable, the **target contact flow name and its export (JSON)**, and the **contact flow logs** for the affected ContactIds.

Prerequisites

Before troubleshooting, confirm the basics: the target queue is associated with a routing profile; the agent is assigned to that routing profile and is set to **Available**; the security profile of the administrator who changes or deletes settings has the required permissions (for example, Edit and Delete for the Routing section); and contact flow logs are enabled.

Step 1: Identify the symptom

Use the symptom to jump to the most likely cause. If your symptom isn't listed, or you're not sure, continue to Step 2.

Check for an active AWS event first

Before you work through the symptom table, rule out an active AWS service event. If multiple symptoms (misrouting, login failures, or no incoming contacts) appear at the same time with no change on your side, check the AWS Health Dashboard. This is the quickest, highest-impact cause to rule out. If none matches but the problem persists, open a support case.

Symptom	Most likely area	Where to go
Outbound calls fail and the CTR `DisconnectReason` is `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, or `TELECOM_TIMEOUT`, and `ConnectedToSystemTimestamp` is null (the destination never answered).	Destination or carrier (PSTN side)—outside Connect Customer	Confirm and open a support case—see the section called "Step 5: Delegate boundary issues (carrier, device, audio, or disconnect)".
Outbound calls are rejected or flagged as spam, and `DisconnectReason` is `TELECOM_POTENTIAL_BLOCKING`	Carrier spam or reputation blocking—outside Connect Customer	Register your numbers with carrier reputation services; see the section called "Optimize your reputation for outbound calling". AWS can't unblock carrier networks for you.

Symptom	Most likely area	Where to go
The CTR `DisconnectReason` is `TELECOM_ORIGINATOR_CANCEL`. For inbound calls, the caller cancelled before connecting to Connect Customer (often within a second or two). For outbound calls, either the destination didn't answer—in which case Connect Customer sends the cancel after about a 60-second timeout, not a carrier fault—or the agent or API cancelled before connecting. The about-60-second timeout applies only to the outbound-unanswered case.	Originating side—an inbound caller who cancelled, or an outbound no-answer or agent or API cancel	Check the destination path. If you transfer with the Transfer to phone number block, you can set its Timeout to control this below 60 seconds—see the section called "Transfer to phone number".
After a number is ported, inbound calls flow into the contact flow of a different number (the number the customer dialed and the contact record's `SystemEndpoint.Address`, shown as System address or number in contact search, don't match)	Carrier number mapping	See the section called "How to port your numbers to Connect Customer".
Contacts never reach a specific queue or agent, or get stuck in a queue	Routing profile association, concurrency, or the agent's status (Available, Offline, or a custom status)	the section called "Troubleshoot contacts not reaching an agent"

Symptom	Most likely area	Where to go
Contacts are routed to the wrong queue or agent	Set working queue in the contact flow (display name and ARN mismatch) or branching	Step 3. If the ARN is wrong, see the section called "Troubleshoot contact flow behavior". If the contact reaches the queue but isn't distributed, see the section called "Troubleshoot contacts not reaching an agent".
Contacts aren't distributed according to queue priority, overflow, or delay, or they concentrate on one agent	Routing order (Connect Customer first offers a new contact to the agent handling the fewest contacts across all channels, and compares time in Available status only to break a tie, routing to the agent who has been Available the longest; the routing profile's Set routing order setting determines whether outbound contacts reset that time), routing profile priority and delay, remaining after-contact work (ACW), or status changes from an external integration	the section called "Troubleshoot contacts not reaching an agent" (distribution section)

Symptom	Most likely area	Where to go
Contacts aren't distributed according to the specified skill or proficiency	Routing criteria has no effect if the contact is transferr ed into an agent queue; Set routing criteria takes effect when the contact is transferr ed to a standard queue (with Transfer to queue); an expiry set too short competes with default queue-based routing. (A non-expiring step is allowed only as the final step.)	the section called “Troubles hoot contacts not reaching an agent” (proficiency section)
Cross-channel routing isn't delivered (for example, an agent handling a chat doesn't receive a voice contact)	Cross-channel concurrency, or a missed contact that must be cleared before other channels route to that agent	the section called “Troubles hoot contacts not reaching an agent”
A contact flow takes an unexpected branch, attribute s don't take effect or aren't passed, or the flow disconnec ts the contact	Contact flow block behavior, prerequisites, published state, or channel compatibility	the section called “Troubles hoot contact flow behavior”
Input (DTMF or voice) is captured but the flow returns Timeout, Error, or an unexpected branch	Get customer input or Store customer input (timeout or Error branch)	the section called “Troubles hoot contact flow behavior” (customer input section)
A transfer or quick connect fails, or behavior is unexpecte d after a transfer	Transfer destination flow type, concurrent call slots, or quick connect association	the section called “Troubles hoot contacts not reaching an agent” (transfer section) and the section called “Troubles hoot contact flow behavior” (whisper and transfer section)

Symptom	Most likely area	Where to go
Callbacks, voicemail, or tasks don't work as expected (callbacks reach voicemail, contacts stall, or you want to set a time limit)	Voicemail can't be detected with agent-first callbacks, or in-queue callback design	the section called “Troubleshoot contact flow behavior” (callback section) and the section called “Troubleshoot contacts not reaching an agent”
Branching within a flow breaks, or contacts fall back to default routing	Invoke Lambda failure—for your Lambda function's responses, a call-level failure (500, throttling, or timeout) takes the Error branch after retries, while a status your function returns (such as 404 or 503) is a value on the Success branch; or a missing error branch	the section called “Troubleshoot contact flow behavior” (Lambda section)
Routing is limited by concurrent calls, instance limits, or quotas (for example, `ServiceQuotaExceededException`)	Service quotas or concurrency—verify the effective **Concurrent active calls per instance** value in Service Quotas (new-instance default quotas can be lower than production needs)	the section called “Troubleshoot contacts not reaching an agent” (the "contacts never reach a specific queue or agent" section for queue-channel quotas, and the transfer section for concurrent active calls)
Multiple symptoms (misrouting, login failures, and no incoming contacts) occur at the same time with no customer-side change	An AWS service event or a Regional service issue	Check the AWS Health Dashboard; if none, open a support case.

Step 2: Determine the scope

The extent of the impact changes where you look first.

- **A single agent** – suspect that agent's **routing profile association** and **status** (Available, Offline, or a custom status). See the section called “Troubleshoot contacts not reaching an agent”.
- **A single queue or line of business (LOB)** – suspect that queue's configuration, the target contact flow's **Set working queue, branching, or proficiency**, and any Lambda function that references the queue. See the section called “Troubleshoot contacts not reaching an agent”.
- **Multiple queues or sites, or multiple symptoms at once with no customer-side change** – suspect an **AWS service event** or a service-side regression, and check the AWS Health Dashboard. If you don't see a related event but the symptoms persist across queues or sites, open a support case.

To size the impact, use real-time metrics to see how many agents are affected. To inspect one agent's activity and status in detail, use the agent activity audit report, which covers a single agent at a time. The the section called “AgentHierarchyGroups” field in the contact record shows the hierarchy of the agent on an affected contact, which helps you correlate affected contacts to a team or location.

> **Check for changes made on a specific date**
>
> If the issue started on a specific date across all affected agents, check for **routing configuration changes, service updates, external integration changes** (for example, Salesforce Service Cloud Voice omni-channel), or **agent authentication changes** (SAML or SSO) made on that date.

Step 3: Localize the problem using CTRs and contact flow logs

Just as audio quality troubleshooting uses the call recording as a dividing line, routing troubleshooting uses **contact records (CTRs) and contact flow logs as the dividing line**. They help you determine whether the problem occurred inside Connect Customer routing and flows, or outside it (carrier or device).

For the fields to read and how to draw conclusions from them—along with the common pitfalls—see the dedicated isolation reference, the section called “Isolate routing problems with the CTR and flow logs”. The main pitfalls relevant to this page are:

- Set working queue is determined by the QueueId ARN, not the display name.
- The draft version of a contact flow can differ from the published version.
- A call transferred from an upstream carrier or private branch exchange (PBX) doesn't create a contact record until it reaches a phone number claimed in your Connect Customer instance, so a missing record is itself a diagnostic signal—not a failure to find the data.

Follow the conclusion from that page, then continue:

- If `DisconnectReason` is `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, `TELECOM_TIMEOUT`, or `TELECOM_POTENTIAL_BLOCKING`, or `ConnectedToSystemTimestamp` is null and the destination never answered, the problem is on the destination or carrier side (or, for `TELECOM_ORIGINATOR_CANCEL`, the originating side). A null `ConnectedToSystemTimestamp` on its own can also occur for a queued callback that is still waiting in queue (for a CALLBACK contact, this field is set only when the customer answers), which isn't a carrier problem—confirm the `DisconnectReason` first (as the spoke page notes). Continue to Step 5 (boundary).
- The contact enters the queue but isn't distributed to an agent → a **routing configuration problem**. See the section called “Troubleshoot contacts not reaching an agent”.
- An unexpected branch, `DisconnectReason=CONTACT_FLOW_DISCONNECT`, or a wrong QueueId ARN → a **contact flow problem**. See the section called “Troubleshoot contact flow behavior”.

Step 4: Collect diagnostic data

Run these in order. Each links to its full procedure.

1. **Contact flow logs (CloudWatch)** – with logging enabled, reproduce the problem, download the logs for the affected ContactId, and check which block returned which `Results` (Success, Timeout, Error, or a branch name), which **QueueId ARN** the Set working queue block set, and the response from Invoke Lambda—these are your Lambda function's responses, where a call-level failure (500, throttling, or timeout) takes the Error branch after retries, while a status your

function returns (such as 200, 404, or 503) is a value on the Success branch. See the section called "Search flow logs".

2. **CTR / DescribeContact** – call DescribeContact and review `DisconnectReason`, `ConnectedToSystemTimestamp`, the `Queue` and `Agent` reached, `InitiationMethod`, and `InitialContactId` or `PreviousContactId`. For how to read these, see the section called "Isolate routing problems with the CTR and flow logs".
3. **Real-time metrics and the agent activity audit report** – check the target agent's **status** (Available, Offline, or a custom status) and when it changed. The agent activity audit report and the agent event stream show *when* the status changed, but not *who* changed it. To find who changed it, check CloudTrail for a `PutUserStatus` event at that time: a change that a supervisor makes in the real-time metrics report, or that an application makes through the API, is recorded there, while an agent's own status change in the Contact Control Panel (CCP) is not. The CCP logs show the agent's own client-side actions.
4. **Routing configuration APIs** – check `DescribeRoutingProfile` (queue associations, per-channel concurrency, and `AgentAvailabilityTimer`).
5. **CloudTrail** – check for `UpdateContactFlowContent` (a misconfiguration from editing outside the UI).

Then branch on what you found:

- **Contact reaches the queue but isn't distributed to an agent, or drops out of the eligible set** → the section called "Troubleshoot contacts not reaching an agent".
- **Unexpected branch, attributes don't take effect, the flow disconnects, or a wrong ARN** → the section called "Troubleshoot contact flow behavior".
- **Abnormal metrics, a `TELECOM_*` `DisconnectReason`, or a null `ConnectedToSystemTimestamp` together with a `TELECOM_*` reason** → Step 5 (delegate to the boundary). A null `ConnectedToSystemTimestamp` on its own isn't enough—confirm the `DisconnectReason` first, because a null value can also come from a queued callback that is still waiting in queue (for a CALLBACK contact, this field is set only when the customer answers). Most `TELECOM_*` reasons point to the destination or carrier side; `TELECOM_ORIGINATOR_CANCEL` points to the originating side.

Step 5: Delegate boundary issues (carrier, device, audio, or disconnect)

Most of the following are outside Connect Customer routing and flow configuration. Confirm the cause, then delegate or open a support case. (One exception: for outbound transfers, you set the Transfer to phone number block Timeout in the flow—see the section called "Transfer to phone number".)

- **Rule out Connect Customer-side configuration first** (before you attribute a failure to the carrier). Confirm that:
  - Outbound calling is enabled on the instance.
  - The destination country is allowed (country allowlisting is default-deny; see the section called "Countries that call centers using Connect Customer can call by default").
  - The destination number is in E.164 format.
  - You're within the concurrent-active-calls quota (see the section called "Service quotas").
  - The agent has the CCP outbound-calls permission.
  - The queue has an outbound caller ID.

  A call can fail outside Connect Customer yet not be a carrier problem – for example, a customer-side PBX or an external voice connector path.
- **Destination or carrier causes** (`TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, or `TELECOM_TIMEOUT`, or a null `ConnectedToSystemTimestamp` when the destination never answered, a wrong flow after porting, or an unclaimed number)—these occur outside Connect Customer. Rule out Connect Customer-side configuration first (the preceding bullet). When a `TELECOM_*` reason appears in the CTR, all retry attempts have already failed; a successful retry would instead show an agent or customer disconnect. Confirm destination-country coverage and number-type restrictions in the Connect Customer Telecoms Coverage guide; if number porting is involved, see the section called "How to port your numbers to Connect Customer"; if the cause still isn't found, open a support case with the details listed in the Before you contact AWS Support section.
- **Carrier spam or reputation blocking** (`TELECOM_POTENTIAL_BLOCKING`)—register your numbers with carrier reputation services and review your outbound calling practices; see the section called "Optimize your reputation for outbound calling". AWS can't unblock carrier networks for you.
- **Originating-side causes** (`TELECOM_ORIGINATOR_CANCEL`)—for inbound calls, the caller cancelled before connecting to Connect Customer (often within a second or two), which is

unrelated to the 60-second timeout. For outbound calls, the destination didn't answer, or the agent or API cancelled before connecting; in the outbound-unanswered case the call ends after about 60 seconds. Check the destination path. For an outbound transfer, review the Transfer to phone number block Timeout; see the section called “Transfer to phone number”.

- **Audio quality problems** (continuous ringing, one-way audio, echo, or delay)—see the section called “Troubleshoot audio quality issues”.
- **Unexpected disconnects after routing** – see the section called “Troubleshoot call disconnects”.

Before you contact AWS Support

If the issue persists after troubleshooting, open a case with **3–5 examples**, and include:

- Instance ARN and a description of the symptom (didn't reach, wrong queue, stuck, disconnected before reaching an agent, uneven distribution, unexpected flow branch, or transfer or callback failure, and the affected channel).
- ContactIds, timestamps (UTC), and a contact-record snapshot (including `DisconnectReason`, `Queue`, `Agent`, `ConnectedToSystemTimestamp`, and `InitiationMethod`).
- The target contact flow export (JSON) and the contact flow logs for the affected ContactIds.
- The configuration of the routing profile, queue, and proficiency (Set routing criteria).
- The extent of the impact (single agent, single queue, or organization-wide) and the date and time the issue started (UTC).
- If you use Lambda: the function name and the response status or return value on failure.
- If you suspect a carrier cause: the source and destination numbers (the last 4 digits can be masked) and the times and ContactIds the carrier needs to investigate.

Isolate routing problems by using the contact record (CTR) and contact flow logs

The contact record (CTR) and contact flow logs are the **dividing line** that tells you whether a routing or contact-handling problem occurred inside Connect Customer (routing configuration and contact flows) or outside it (carrier or device). This is the same approach that audio quality troubleshooting uses when it treats the call recording as the dividing line. This page shows you which fields to read, what to conclude from them, and where to go next.

Intended audience

This reference assumes you are a Connect Customer administrator who can access contact records (CTRs) and contact flow logs and who can run APIs and CLI commands such as `DescribeContact`.

Use this reference as follows:

1. You arrive here from a step in the routing troubleshooting hub or one of its spokes.
2. You read the relevant fields in Section 1 (the CTR) and Section 2 (contact flow logs).
3. You use the dividing-line conclusion table in Section 3 to decide which page to go to next.
4. If a reading doesn't match what you expected, you check the isolation pitfalls in Section 4.

Section 1: Fields to read in the contact record (CTR) with DescribeContact

Call DescribeContact, or review the contact records that you stream to Kinesis, and check the following fields. For the field definitions, see the section called “Contact records data model”.

1.1 `DisconnectReason`

Read this field first to isolate where the disconnect occurred. Each value points in a different direction.

`DisconnectReason`	What it indicates	Where to look next
`TELECOM_PROBLEM` , `TELECOM_BUSY` , `TELECOM_NUMBER_INVALID` , `TELECOM_UNANSWERED` , or `TELECOM_TIMEOUT`	A destination or carrier cause on the PSTN side (a third-party network problem, a busy destination, an invalid destination number, an unanswered destination, or a network timeout). You can't resolve these with Connect Customer routing or flow configuration.	Rule out Connect Customer-side configuration first, then confirm coverage and number-type restrictions and open a support case if needed; see the section called “Step 5: Delegate boundary issues (carrier, device, audio, or disconnect)”.

DisconnectReason	What it indicates	Where to look next
TELECOM_POTENTIAL_BLOCKING	Possible spam or reputation blocking by the destination carrier. AWS can't unblock carrier networks for you.	Review your outbound calling practices; see the section called “Optimize your reputation for outbound calling”.
TELECOM_ORIGINATOR_CANCEL	An originating-side cause. For inbound calls, the caller cancelled before connecting to Connect Customer (often within a second or two). For outbound calls, either the destination didn't answer—in which case Connect Customer sends the cancel after about a 60-second timeout, not a carrier fault—or the agent or API cancelled before connecting. The about-60-second timeout applies only to the outbound-unanswered case.	Check the destination path. For an outbound transfer, review the Transfer to phone number block Timeout; see the section called “Transfer to phone number”.
CONTACT_FLOW_DISCONNECT	The flow ended the contact.	In the flow log, identify the terminal block that the contact reached—a Disconnect block, or an End flow / Resume block in an inbound or disconnect flow—and which branch routed to it. Then see the section called “Troubleshoot contact flow behavior”.
CUSTOMER_DISCONNECT	The caller disconnected. In most cases this isn't a flow or routing problem.	The customer side

DisconnectReason	What it indicates	Where to look next
AGENT_DISCONNECT	For voice contacts, the agent side of the call initiated the disconnect after the customer and agent were connected. This value identifies which side disconnected, not why. The the section called "Contact records data model" notes that CUSTOMER_DISCONNECT can't distinguish poor reception from deliberate disconnection; treat AGENT_DISCONNECT the same way.	For uneven distribution or contacts that don't reach an agent, see the section called "Troubleshoot contacts not reaching an agent". To determine whether a media or device problem caused the disconnect, check the DisconnectDetails section of the contact record: a PotentialDisconnectIssue of AGENT_CONNECTIVITY_ISSUE or AGENT_DEVICE_ISSUE identifies an agent-side network or workstation cause. See the section called "Troubleshoot call disconnects". Also compare with the agent activity audit report and the agent's status and activity state (see the agent audit report pitfall in Section 4: Isolation pitfalls).

DisconnectReason	What it indicates	Where to look next
OTHER	For voice contacts, OTHER covers disconnect reasons that the preceding codes don't address—for example, a disconnect that an API call initiates . Chat doesn't use OTHER: a reason outside its documented list is recorded as null. Chat, task, and email have a distinct API code.	Confirm which disconnec t reasons apply to the channel in the section called “Contact records data model”. Because OTHER doesn't identify the disconnecting party, isolate from the other fields in this section (ConnectedToSystem Timestamp, Queue, and Agent) and from the flow logs in Section 2.

1.2 ConnectedToSystemTimestamp

- null—for an outbound, callback, or API contact, the customer endpoint never answered. This often occurs together with a TELECOM_* DisconnectReason, but not always: when the call was never placed at all—for example, an outbound campaign contact that reports OUTBOUND_ATTEMPT_FAILED or OUTBOUND_PREVIEW_DISCARDED, or a call blocked by country allowlisting, a quota, or a missing outbound caller ID—this field is also null. Read DisconnectReason and this field together rather than inferring one from the other, and confirm which reasons apply to the contact type in the section called “Contact records data model”.
- A value is present—what this means depends on InitiationMethod:
  - For OUTBOUND, CALLBACK, and API, the customer endpoint answered, so the contact reached Connect Customer. Continue isolating the problem inside Connect Customer (routing or flow).
  - For INBOUND, this timestamp matches the initiation timestamp—the time the contact arrived—so a value being present carries no information about the far end and does not rule out an outside cause.

  Check DisconnectReason first: a TELECOM_* reason points outside Connect Customer even when this timestamp is present. For other initiation methods (for example, TRANSFER or QUEUE_TRANSFER), see the section called “Contact records data model”.

1.3 Queue and Agent

Read these two fields together: `Queue` is present only if the contact was queued, and `Agent` is present only if the contact was connected to an agent. The combination tells you how far the contact got.

Queue	Agent	What it indicates
Present	Present	The contact was queued and connected to an agent. Compare the queue and agent with the routing target you expected—a different queue points to misrouting (see the Set working queue pitfall in Section 4: Isolation pitfalls and the section called "Troubleshoot contact flow behavior").
Present	Absent	The contact reached the queue but was never connected to an agent. Read `DisconnectReason` before you conclude this is a routing problem: `CUSTOMER_DISCONNECT` means the customer hung up while waiting (an abandoned contact rather than a misconfiguration; see the section called "Contact records data model"). Other reasons point to routing configuration.
Absent	Absent	The contact never reached a queue. Look upstream in the flow—the contact was disconnected, or it never reached a Transfer to queue block. Use the flow logs in Section 2.
Absent	Present	The contact wasn't routed through a queue. Check `InitiationMethod`: `MONITOR` produces this shape (see 1.4 `InitiationMethod`).

1.4 `InitiationMethod`

This field shows how the contact was established. For the flow types associated with each initiation method, see the section called "Contact initiation methods and flow types".

- Use it to confirm that a contact for a specific path (for example, `CALLBACK_CUSTOMER_FIRST_QUEUED`) was created at all.

- MONITOR indicates a monitoring contact, which Connect Customer records separately from the contact that the supervisor monitored. On this contact record:
  - The Agent field describes the supervisor, not the agent who handled the customer. StateTransitions confirms this—it records the state transitions of a supervisor, with a state of SILENT_MONITOR or BARGE.
  - Queue is null, because the contact wasn't routed through a queue.
  - InitialContactId and PreviousContactId point to the monitored contact, so you can trace back to it.

  Use this to isolate reports that the agent field isn't what you expected.

1.5 InitialContactId and PreviousContactId

- InitialContactId and PreviousContactId are both null—this contact wasn't created from another contact. InitialContactId names the first contact in a chain; it isn't set to the contact's own id, so a contact that is itself the first one leaves it empty. To check whether another contact was created from this one—for example, a transfer destination—read NextContactId. Use all three together to isolate duplicate inbound contacts from a single contact that produced a second record. Each genuinely duplicated inbound contact is its own standalone record—both InitialContactId and PreviousContactId are null and it has no NextContactId—so duplicated inbound contacts each appear as a separate standalone record, distinct from one contact that produced a second record through a transfer.
- PreviousContactId or NextContactId has a value—the contact is part of a chain. Connect Customer sets both fields for the same events: an agent using a quick connect or the CCP number pad, a Transfer to flow, Transfer to queue, or Set disconnect flow block running, or an additional WebRTC participant being added. PreviousContactId names the contact this one came from; NextContactId names the contact created from this one.
- Follow the chain. For example, a customer first callback spans three contacts: the inbound customer contact (C1), the queued callback contact (C2, with the initiation method CALLBACK_CUSTOMER_FIRST_QUEUED), and the dialed callback contact (C3, with CALLBACK_CUSTOMER_FIRST_DIALED). Each retry creates another dialed callback contact. See the section called “Use customer first callback mode”.

Section 2: Items to read in contact flow logs (CloudWatch)

With contact flow logs enabled, reproduce the problem, and then download the logs for the affected ContactId. For how to retrieve them, see the section called “Search flow logs” and the section called “Enable flow logs”.

Read these main items:

- **The block execution order, and the `Results` on the blocks that report one** – `Success`, `Timeout`, `Error`, a branch name, or an exception message from the block. Not every block reports a `Results`; many emit only an entry line with their parameters. Treat a missing `Results` as "this block doesn't report one," not as a gap in the log. Identify unexpected branches and the point where the flow ended the contact. A single flow log line can contain both a Parameters object and a Results object; the two are not always on separate lines.
- **The QueueId ARN that Set working queue set** – routing is determined by the **QueueId ARN, not the display name**. Compare the ARN in the log with the `describe-queue` output to confirm it's the intended queue (see also the pitfall in Section 4: Isolation pitfalls).
- **The response status of Invoke AWS Lambda function**. The Invoke AWS Lambda function block has `Success` and `Error` branches (and a `Timeout` branch in synchronous mode); it has no default branch. Read the response status in two separate categories rather than as one flat list. A call-level failure—a `500`, throttling, or a timeout—is retried by Connect Customer (up to three times, up to the configured Timeout) and then takes the `Error` branch. A `404` or `503` that the function returns as a value means the invocation itself succeeded, so the block takes the `Success` branch. These codes are the customer's Lambda function responses, not Connect Customer-defined log fields. Where the contact goes next depends on how the flow author wired the branch.
- **The Loop count** – a high `LoopCount` can mean a no-input menu repeated until the contact disconnected (`CONTACT_FLOW_DISCONNECT`), making the call abnormally long.

2.1 When a transferred contact produces no logs

A transfer produces no contact flow logs for the child contact for two different reasons. Confirm which case you are in before you conclude that logging is misconfigured.

- **`EXTERNAL_OUTBOUND`** – a quick connect transfer to an external phone number, or the Transfer to phone number block. No flow type is associated with this initiation method, so the child contact

runs no flow and produces no contact flow logs. There is nothing to enable. A missing record here is itself a signal, not a logging misconfiguration.

- **TRANSFER** – an agent transfer through a CCP quick connect to an agent or queue. This creates a **new contact record**, and the transfer-destination flow (for example, the agent transfer flow) needs its own the section called “Set logging behavior” block for the child contact to emit logs. Logging is a per-contact state: within one contact it carries into the queue, whisper, and hold flows, but it does not carry into a separate (child) contact.

2.2 Retrieve all flow logs for a specific ContactId

To retrieve every block log for a specific ContactId without gaps, query CloudWatch Logs Insights with the ContactId as the key. Common reasons that logs aren't found are that Set logging behavior is disabled in the target flow, that logging isn't enabled in the flow for a child contact (the transfer destination), or that you're searching the wrong log group or time range.

What a healthy contact looks like

Before you look for an abnormal reading, know the baseline. The following annotated examples show a normal inbound voice contact that queued and connected to an agent. Values are examples.

Contact record (CTR) – only the relevant fields are shown:

```
{
    "ContactId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Channel": "VOICE",
    "InitiationMethod": "INBOUND",
    "DisconnectReason": "CUSTOMER_DISCONNECT",
    "ConnectedToSystemTimestamp": "2026-01-15T10:00:03Z",
    .
    .
    "Queue": {
        "Name": "BasicQueue"
    },
    "Agent": {
        "Username": "Agent1"
    },
    "InitialContactId": null,
    "NextContactId": null,
    "PreviousContactId": null
```

```
}
```

In this healthy reading:

- `ConnectedToSystemTimestamp` is present, so the contact reached Connect Customer.
- `Queue` and `Agent` are both present, so the contact was queued and connected to an agent.
- `DisconnectReason` is `CUSTOMER_DISCONNECT`—a normal end (the customer hung up), not a routing fault.

Contact flow log – the Set working queue block logs an entry line that records the QueueId ARN it set:

```
{
    "ContactId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ContactFlowModuleType": "SetQueue",
    "Timestamp": "2026-01-15T10:00:05.581Z",
    "Parameters": {
        "Queue": "queue-arn"
    }
}
```

A block that reports an outcome adds a result line. In a healthy flow, the `Results` value is `Success` (not `Timeout` or `Error`):

```
{
    "Results": "Success",
    "ContactId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ContactFlowModuleType": "block-type",
    "Timestamp": "2026-01-15T10:00:06.012Z"
}
```

Confirm that the `Queue` ARN matches the queue you intended (see the Set working queue pitfall in Section 4: Isolation pitfalls), that the blocks ran in the order you expect, and that no block reports `Timeout` or `Error`. Use this baseline when you compare a successful contact with a failed one. For the full set of contact record fields, see the section called “Contact records data model”; for more flow-log examples, see the section called “Enable flow logs”.

Section 3: Dividing-line conclusion table—go from observation to next step

Use the following table to map what you read in Sections 1 and 2 to a destination.

Observation (CTR or flow log)	Where the problem is	Where to go next
`DisconnectReason` is `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, `TELECOM_TIMEOUT`, or `TELECOM_POTENTIAL_BLOCKING`, or `ConnectedToSystemTimestamp` is null for a contact that was dialed but not answered—a queued callback that was never dialed also has a null value (see Section 1.2)	Destination or carrier (outside Connect Customer); for `TELECOM_POTENTIAL_BLOCKING`, carrier spam or reputation blocking	Rule out Connect Customer-side configuration first, then confirm coverage and number-type restrictions and open a support case if needed; see the section called "Step 5: Delegate boundary issues (carrier, device, audio, or disconnect)". For spam or reputation blocking, see the section called "Optimize your reputation for outbound calling".
`DisconnectReason` is `TELECOM_ORIGINATOR_CANCEL`	Originating side. For inbound calls, the caller cancelled before connecting to Connect Customer (often within a second or two). For outbound calls, the destination didn't answer (Connect Customer sends the cancel after about a 60-second timeout, which applies only to this outbound-unanswered case), or the agent or	Check the destination path. For an outbound transfer, review the Transfer to phone number block Timeout; see the section called "Transfer to phone number".

Observation (CTR or flow log)	Where the problem is	Where to go next
	API cancelled before connecting	
After porting, inbound calls flow into the contact flow of a different number (the number the customer dialed and the contact record's `SystemEndpoint.Address` —shown as System address or number in contact search—don't match)	Carrier number mapping	See the section called "How to port your numbers to Connect Customer".
The contact enters the queue but isn't distributed to an agent, and `DisconnectReason` isn't `CUSTOMER_DISCONNECT`	Routing configuration (routing profile association or concurrency) or the agent's status (Available, Offline, or a custom status).	the section called "Troubleshoot contacts not reaching an agent"
The contact never reached a queue (`Queue` is absent)	The flow—the contact was disconnected, or never reached a Transfer to queue block	the section called "Troubleshoot contact flow behavior"
`DisconnectReason=CONTACT_FLOW_DISCONNECT` , an unexpected branch, or a wrong QueueId ARN	Contact flow (block behavior, branching, Set working queue, or a dependent Lambda)	the section called "Troubleshoot contact flow behavior"
Invoke Lambda returns an error or an unexpected value, and the Error or No Match branch isn't wired to the intended queue	The flow (Lambda integration and the Error / No Match branch wiring)	the section called "Troubleshoot contact flow behavior"

Observation (CTR or flow log)	Where the problem is	Where to go next
The problem occurs across multiple queues or sites at once, with no customer-side change	An AWS service event or a Regional service issue	Check the AWS Health Dashboard and any service health notificat ions. If none matches but the problem persists, open a support case.

Section 4: Isolation pitfalls

These are points that are easy to misread. When a reading doesn't match what you expected, check here first.

4.1 The draft isn't the same as the published version (unpublished changes)

The visual editor shows the **draft**; the contact runs the **published version**. These can differ when a draft change (for example, a Set working queue change) was never published. For a flow that has been published, DescribeContactFlow returns the published version by default, and returns the draft when you pass the `:$SAVED` alias. Retrieve both and compare them to find unpublished changes; if they differ, republish from the UI. The flow `Status` field (`PUBLISHED` versus `SAVED`) does not indicate whether there are unpublished draft changes—a flow can be `PUBLISHED` yet still have a newer draft. A `Status` of `SAVED` means that the flow has never been published.

4.2 Set working queue is determined by the QueueId ARN, not the display name (out-of-UI edits can leave the display name stale)

When you update a flow through the UpdateContactFlowContent API or an import, the QueueId ARN can be replaced while the display name in the UI stays the same. The UI looks correct, but the contact is misrouted to a different queue. Compare the ARN in the exported JSON with `describe-queue`. To fix a stale queue reference, open the block and re-select the queue, and then save and publish.

4.3 Detect out-of-UI edits (CloudTrail `UpdateContactFlowContent`)

When behavior changed on a specific date after previously working, check CloudTrail for UpdateContactFlowContent calls. A UI edit is recorded with `invokedBy` = `connect.amazonaws.com` and a principal that is the service-

linked role `AWSServiceRoleForAmazonConnect` (its `userAgent` is also `connect.amazonaws.com`). An event with no `invokedBy` is a direct out-of-UI call (API, import, CI/CD, CloudFormation, or Lambda), and its `userIdentity.type` can be either `IAMUser` or `AssumedRole`. Note the exception: events from the service-linked role `AWSServiceRoleForAmazonConnectSynchronization` are Connect Customer managed cross-Region synchronization, not a UI edit.

4.4 A transfer from an upstream carrier or PBX doesn't create a CTR until it reaches a phone number claimed in your Connect Customer instance

A call transferred from an upstream carrier or PBX creates a `SearchContacts` entry and a CTR **only after it reaches a phone number claimed in your Connect Customer instance**. A call that fails before that point leaves no record in Connect Customer. Interpret "no record" as possibly meaning "the call failed before it reached Connect Customer."

4.5 The agent audit report status and the 20-second no-answer timeout

The Agent Activity Audit report distinguishes **Agent Disconnected**, **Contact Missed**, and **Rejected**. For voice, a contact that isn't answered and a contact that is rejected are both recorded as **Agent Disconnected**. For chat, both are recorded as **Contact Missed**. For task and email, a contact that isn't answered is recorded as **Contact Missed**, and a rejected contact is recorded as **Rejected**. For details, see the section called “When is the status Agent Disconnected, Contact Missed, or Rejected?”. The time an available agent has to answer before the contact is counted as not answered is 20 seconds for voice or chat, and 30 seconds for a task. This ring time is fixed and can't be configured. A contact that isn't answered is routed to the next available agent.

Because the audit report records both a no-answer and a reject as **Agent Disconnected** for voice (and both as **Contact Missed** for chat), the audit report status alone can't separate a missed contact from a rejected one on those channels. To distinguish them, use the Contact State in the agent event stream, where `MISSED` and `REJECTED` are separate states (`REJECTED` also covers a customer who abandoned the contact while it was connecting to the agent); the audit report is a report version of the same data. Read the CTR `DisconnectReason` together with these signals.

Troubleshoot contacts that are not routed, misrouted, or not reaching an agent in Connect Customer

Contacts that don't reach the intended queue or agent, that are routed to the wrong queue or agent, that get stuck in a queue, or that disconnect before reaching an agent can originate at any of several points on the call path: the routing profile, the queue, a priority or delay setting, Set routing criteria (proficiency), the per-channel concurrency, a contact flow branch, or a carrier, device, or authentication method outside Connect Customer. This page covers the cause-based resolution steps for the *routing-configuration* side. To narrow down *where* the problem occurs, start from the hub, the section called “Troubleshoot contact routing and handling”.

Contact flow block behavior

Problems that come from *flow configuration* – a contact flow block takes an unexpected branch, attributes don't take effect, or the flow disconnects the contact—are covered in the section called “Troubleshoot contact flow behavior”.

Audio quality issues

If a contact connects but has an audio *quality* problem—one-way audio, echo, choppy or robotic audio, or delay—see the section called “Troubleshoot audio quality issues”.

Enable contact flow logs before the problem occurs

This page relies on contact flow logs, which exist only if the Set logging behavior block was enabled in the flow before the contact you're investigating ran. If an intermittent problem

(for example, an occasional misroute) already happened while logging was off, you can't diagnose that specific contact from the logs. You can only enable logging and wait for the problem to recur. We recommend that you enable logging on your production flows proactively so the data is available when you need it. See the section called “Set logging behavior”.

Intended audience

This guide assumes you are a Connect Customer administrator who can manage routing profiles, queues, and contact flows, and who can access contact records (CTRs) and contact flow logs.

Before you begin: gather this information

Collect the following for the affected contacts before you start. You use it both to isolate the problem and, if necessary, to open a case with AWS Support.

- **Description of the symptom** – what happened (didn't reach the intended queue or agent, routed to the wrong queue, stuck in a queue, disconnected before reaching an agent, or uneven distribution) and the affected channel (voice, chat, task, or callback).
- **Instance Amazon Resource Name (ARN)** – see the section called “Find your instance ID”.
- **ContactId** of each affected contact (provide 3–5 examples).
- **Time of occurrence**, including time zone (record in Coordinated Universal Time (UTC) where possible).
- **Intended queue name, routing profile name, and agent** – both the routing target you expected and the actual values.
- **Contact flow logs** for the affected contacts. Steps 3 and 4 rely on these logs to isolate the problem. For more information, see the section called “Enable flow logs”.

Prerequisites

Before you isolate the problem, confirm the basics: contact flow logging is enabled (see the section called “Set logging behavior”); the target queue is associated with a routing profile; the agent is assigned to that routing profile and is set to **Available**; and the security

profile of the administrator who changes or deletes settings has the required permissions (for example, Edit and Delete for the Routing section).

Step 1: Identify the symptom (quick reference)

The hub has a more complete symptom table. This table lists only the symptoms that the routing-configuration side handles. Use it to jump to the most likely cause.

Symptom	Where to go
Contacts never reach a specific queue or agent, or get stuck in a queue	the section called “Contacts never reach a specific queue or agent”
Contacts are routed to the wrong queue	the section called “Contacts are routed to the wrong queue (Set working queue)” (for flow-block detail, see the section called “Troubleshoot contact flow behavior”)
Contacts aren't distributed according to queue priority, delay, or overflow	the section called “Contacts aren't distributed according to priority, delay, or overflow”
Contacts aren't distributed according to the specified skill or proficiency (skilled agents aren't preferred, or contacts don't wait)	the section called “Contacts aren't distributed according to proficiency or skill (Set routing criteria)”
Contacts concentrate on one agent, or the distribution isn't as even as you expect	the section called “Contacts concentrate on one agent, or the distribution isn't as even as you expect”
Cross-channel routing doesn't deliver (for example, no voice contact arrives while an agent handles a chat)	the section called “Cross-channel routing doesn't deliver”
The CTR `DisconnectReason` is `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`,	Hub Step 5 (delegate to the boundary): the section called

Symptom	Where to go
`TELECOM_UNANSWERED` , `TELECOM_TIMEOUT` , or `TELECOM_POTENTIAL_BLOCKING` , `ConnectedToSystemTimestamp` is null together with one of these reasons, or a flow is wrong after number porting	"Troubleshoot contact routing and handling"

Step 2: Determine the scope

The extent of the impact changes where you look first.

- **A single agent** – suspect that agent's routing profile association and the agent's status (Available, Offline, or a custom status). See the section called "Contacts never reach a specific queue or agent".
- **A single queue or line of business (LOB)** – suspect that queue's configuration, the target contact flow's Set working queue, branching, or proficiency settings, and any Lambda function that references the queue. See the section called "Contacts never reach a specific queue or agent" and the section called "Contacts aren't distributed according to proficiency or skill (Set routing criteria)".
- **Multiple queues or organization-wide, or multiple symptoms at once with no customer-side change** – suspect an AWS service event, and review your service health notifications and the AWS Health Dashboard. If you don't see a related event but the symptoms persist across queues or sites, open a support case.

To size the impact, use real-time metrics to see how many agents are affected. To inspect one agent's activity and status in detail, use the agent activity audit report, which covers a single agent at a time. The the section called "AgentHierarchyGroups" field in the contact record shows the hierarchy of the agent on an affected contact, which helps you correlate affected contacts to a team or location.

> **Check for changes made on a specific date**
>
> If the issue started on a specific date across all affected agents, check for a routing configuration change, a service update, an external integration change (for example, Salesforce Service Cloud Voice omni-channel), or an agent authentication change made on that date.

Step 3: Localize the problem using CTRs and contact flow logs

Routing troubleshooting uses **contact records (CTRs) and contact flow logs as the dividing line**. They help you determine whether the problem occurred inside Connect Customer routing, or outside it (carrier or device).

For the fields to read, how to draw conclusions from them, and the common pitfalls—Set working queue is determined by the QueueId ARN, not the display name, and the draft can differ from the published version—see the dedicated isolation reference, the section called "Isolate routing problems with the CTR and flow logs".

Follow the conclusion from that page, then continue:

- The contact enters the queue but isn't distributed to an agent → continue to the section called "Step 4: Collect diagnostic data" and the section called "Step 5: Resolve the problem by cause" on this page.
- `DisconnectReason` of `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, `TELECOM_TIMEOUT`, or `TELECOM_POTENTIAL_BLOCKING` together with a null `ConnectedToSystemTimestamp` → a carrier or number problem. Confirm the `DisconnectReason` before you delegate: a null `ConnectedToSystemTimestamp` alone isn't a carrier signal. For a CALLBACK contact, it stays null until the customer answers (for example, while a queued callback is still waiting for an agent). See hub Step 5 (boundary), the section called "Troubleshoot contact routing and handling".
- A wrong QueueId ARN or an unexpected branch → a contact flow problem. See the section called "Troubleshoot contact flow behavior".

Step 4: Collect diagnostic data

Run these in order. Use them to isolate cases where a contact doesn't reach an agent or a queue at all. For how to read each field, see the section called "Isolate routing problems with the CTR and flow logs".

1. **Real-time metrics and the agent activity audit report** – check the target agent's status (Available, Offline, or a custom status) and when it changed. The agent activity audit report and the agent event stream show *when* the status changed, but not WHO changed it. To find who changed it, check CloudTrail for a `PutUserStatus` event at that time: a change that a supervisor makes in the real-time metrics report, or that an application makes through the API,

is recorded there, while an agent's own status change in the CCP is not. The CCP logs show the agent's own client-side actions.

2. **`DescribeRoutingProfile` (API or CLI)** – check the queue associations, the per-channel concurrency, and the routing order (the API field is `AgentAvailabilityTimer`). You can also set the routing order in the console on the routing profile—see the section called “Create a routing profile”.
3. **CloudTrail** – check for `UpdateContactFlowContent` (a misconfiguration from editing outside the UI).
4. **Contact flow logs** – check the QueueId ARN that the Set working queue block set, the `Results` of the Set routing criteria block, and the status of any Invoke Lambda block.

Then branch on what you found:

- The agent doesn't appear for an eligible queue → the section called “Contacts never reach a specific queue or agent” (quota or association).
- Distribution doesn't match the specified skill or proficiency → the section called “Contacts aren't distributed according to proficiency or skill (Set routing criteria)”.
- A wrong QueueId ARN or an unexpected branch → the section called “Troubleshoot contact flow behavior”.

Step 5: Resolve the problem by cause

Find your cause in the following sections, then apply the resolution.

Contacts never reach a specific queue or agent

Check the following.

- **Routing profile queue association** – confirm that the target queue is associated with the agent's routing profile and that the association is applied.
- **Per-channel concurrency** – confirm that the target channel (for example, voice with a concurrency of 1) isn't already occupied by another contact.
- **Queue-channel combination quota** – the **Queues per routing profile per instance** quota counts the number of queue-and-channel combinations, not the number of unique queues. The default value is 50, and queues that use manual assignment have a separate limit of the same

size. Request a limit increase in Service Quotas. For the current defaults, see the section called "Service quotas".

- **You can't perform an administrative action** (for example, you can't delete a queue)—the administrator's security profile might lack the permission. Enable the target action (for example, Delete) in the Routing section under **Users**, **Security profiles**.
- **A dependency in the flow fails** – if the customer's Lambda function that determines the queue fails and breaks routing, see the Lambda dependency guidance in the section called "Troubleshoot contact flow behavior". A call-level failure (a 500, throttling, or a timeout) takes the Error branch after retries, while a 404 or 503 that the function returns as a value takes the Success branch.

Contacts are routed to the wrong queue (Set working queue)

Contacts are misrouted to a different queue—even when the UI looks correct—when the Set working queue change isn't applied to the flow (unpublished or stale), or when the display name doesn't match the actual QueueId ARN. Editing outside the UI with the `UpdateContactFlowContent` API can replace the ARN while leaving the display name unchanged. To fix a stale queue reference, open the block and re-select the queue, then save and publish. For detail, see the Set working queue guidance in the section called "Troubleshoot contact flow behavior", and for the isolation procedure, see the section called "Isolate routing problems with the CTR and flow logs".

Contacts aren't distributed according to priority, delay, or overflow

Changing a queue's priority or delay in a routing profile changes the order in which agents are offered contacts. When two queues have different priorities and the same delay of 0, agents are offered contacts from the Priority 2 queue only when the Priority 1 queue has no contacts. When two queues have the same priority and different delays, a contact in the delayed queue is treated as the same priority once it ages past the delay. Before you reconfigure, review the examples in the section called "Queues: priority and delay examples".

Contacts aren't distributed according to proficiency or skill (Set routing criteria)

With proficiency-based (skills-based) routing, the following are common causes.

- **All steps use timed expiry.** When every step expires, the contact becomes unconstrained and is distributed by standard queue routing, regardless of skill. Connect Customer first offers the contact to the agent who is handling the fewest contacts across all channels, and it compares

how long each agent has been in **Available** status only to break a tie (the routing profile's Set routing order setting—the `AgentAvailabilityTimer` field in the API—determines whether outbound contacts reset this time). For more information about priority and delay, see the section called "Queues: priority and delay examples". To keep the contact waiting for a skilled agent, set only the final step to **Never expire** (for example, steps 1–3 at 10s, 60s, and 60s, and step 4 at proficiency 1–5 with Never expire).

  - You can set **Never expire** only on the final step. If you set it on a non-final step, the configuration is rejected when you save it.

- **A step's expiry is shorter than the ring timeout.** A voice contact is treated as not answered if it rings for 20 seconds with no answer (see the section called "Isolate routing problems with the CTR and flow logs", Section 4.5). When a step's expiry is shorter than that, the routing criteria advance to the next step before it is settled whether the first agent answered, so Connect Customer can't properly route the contact to the next most proficient agent when the first agent misses the call. The default queue-based routing then competes with proficiency-based routing, and distribution becomes inconsistent between the two methods.
- **The overflow time is too short.** A setting that falls back to a non-skilled agent after, for example, 90 seconds sends contacts to non-skilled agents during busy periods. Consider extending the expiry time, adding multiple steps that lower the skill threshold gradually, using Never expire, or controlling routing explicitly with skill-specific queues.
- **The contact was transferred into an agent queue.** Routing criteria has no effect when the contact is transferred into an agent queue. Route the contact to a standard queue for proficiency-based routing to apply.
- **Set routing criteria isn't paired with Transfer to queue.** Use the Set routing criteria block with the Transfer to queue block: routing criteria take effect when the contact is transferred to a standard queue.

For more information, see the section called "Set routing criteria".

Contacts concentrate on one agent, or the distribution isn't as even as you expect

- Connect Customer first offers the contact to the agent who is handling the fewest contacts across all channels, and compares how long agents have been in **Available** status only to break a tie. When agents are tied, routing prefers the agents that have been in **Available** status the longest (the routing profile's Set routing order setting—the `AgentAvailabilityTimer` field in the API—determines whether outbound contacts reset this time); contacts aren't spread evenly turn by turn. Under identical conditions, distribution can appear to concentrate on one agent.

Each time an agent accepts a contact, that agent's availability timer resets and the agent moves to the end of the list, even when the agent has remaining concurrency.

- What looks like concentration on one agent can be the result of the other agents not being truly Available (for example, remaining After call work (ACW)). When you test, confirm that every agent is truly Available with no ACW.
- **ACW consumes a concurrency slot.** With a chat concurrency of 2, a second chat can still be delivered while one contact is in ACW. A slot with a contact in ACW is unavailable, but a free slot can still take a new contact (see the Availability metric in the real-time metrics report). If remaining ACW is skewing distribution, set the ACW timeout in the agent's user settings under **Contact handling**, separately per channel—see the section called “Configure agent settings”.
  - If ACW continues for a long time, the contact doesn't become **Completed**. An ACW timeout resolves this.

Cross-channel routing doesn't deliver

If cross-channel concurrency is enabled but contacts still aren't delivered (for example, no voice contact arrives while an agent handles a chat), check for a missed contact that hasn't been cleared. For an agent configured for cross-channel concurrency, a missed contact must be cleared before contacts on other channels can be routed to that agent. Confirm that the cross-channel concurrency settings and the queue priority and delay match.

Transfer and quick connect (routing side)

- A quick connect transfer needs a second concurrent call slot. If **Concurrent active calls per instance** is 1, internal transfers to a queue or agent fail. External transfers—a quick connect to an external phone number—aren't counted against this quota.
- For which flows run for each type of quick connect, see the section called “How quick connects work”.
- Outside the US, use a Connect Customer number as the outbound caller ID. Toll-free numbers are designed for national use, and in some countries (for example, Australia) a toll-free caller ID can be rejected. See the section called “Toll-free numbers for caller ID” and the section called “Transfer to phone number”.

Callback, voicemail, and task (routing side)

- The priority of the callback queue in the routing profile determines whether callbacks keep their place relative to inbound calls. At the same priority as the original inbound queue, Connect Customer offers the oldest call first across both queues, using the original call start time, so a callback keeps its position. At a lower priority, agents are offered callbacks only after contacts in the higher-priority inbound queue—unless a delay is set, in which case a contact that ages past the delay is treated as the higher priority. See the section called "Set up queued callback" and the section called "Queues: priority and delay examples".
- For an example architecture that schedules callbacks within your hours of operation, see the callback section in the section called "Troubleshoot contact flow behavior".
- In customer-first callback mode, Connect Customer dials the customer before an agent is confirmed available; agent-first callback mode (the default) offers the callback to an agent first. If callbacks are dialing customers when no agent is ready, confirm which dial mode the Transfer to queue block uses. See the section called "Set up queued callback".

Step 6: Isolate carrier, device, or audio problems (boundary)

Most of the following are outside Connect Customer routing and flow configuration. Confirm the cause, then delegate or open a support case. These include a `DisconnectReason` of `TELECOM_PROBLEM`, `TELECOM_BUSY`, `TELECOM_NUMBER_INVALID`, `TELECOM_UNANSWERED`, `TELECOM_TIMEOUT`, or `TELECOM_POTENTIAL_BLOCKING` together with a null `ConnectedToSystemTimestamp` (as Step 3 notes, a null `ConnectedToSystemTimestamp` on its own isn't a carrier signal), a wrong flow after number porting, an unclaimed number, or a difference in the audio experience. The hub collects the boundary delegation targets in its Step 5, the section called "Troubleshoot contact routing and handling".

- **Carrier or number causes** – see the hub Step 5 (boundary), the section called "Step 5: Delegate boundary issues (carrier, device, audio, or disconnect)". Confirm coverage and number-type restrictions in the Amazon Connect Telecoms Coverage guide on the Amazon Connect website.
- **A difference in the audio experience** (for example, continuous ringing)—see the section called "Troubleshoot audio quality issues".
- **Unexpected disconnects after routing** – see the section called "Troubleshoot call disconnects".

Before you contact AWS Support

If the issue persists after troubleshooting, open a case with **3–5 examples**, and include:

- Instance ARN and a description of the symptom (didn't reach, wrong queue, stuck, disconnected, or uneven distribution, and the affected channel).
- ContactIds, timestamps (UTC), and a contact-record snapshot (including `DisconnectReason`, `Queue`, `Agent`, `ConnectedToSystemTimestamp`, and `InitiationMethod`).
- The target contact flow export (JSON) and the configuration of the routing profile, queue, and proficiency (Set routing criteria).
- The contact flow logs for the affected contact ids.
- The extent of the impact (single agent, single queue, or organization-wide) and the date and time the issue started (UTC).
- If you suspect a carrier cause: the source and destination numbers (the last 4 digits can be masked) and the times and ContactIds the carrier needs to investigate.

Troubleshoot contact flows that don't behave as expected in Connect Customer

A contact flow can look correct in the visual editor and still behave unexpectedly: it takes an unexpected branch, contact attributes don't take effect or aren't passed, a contact disconnects when you didn't intend it to, the contact enters the wrong queue, or an announcement plays to only one party. The cause is usually a block's behavior, prerequisites, published state, channel compatibility, an edit made outside the UI (through the API or an import), or a dependency such as a Lambda function. Some symptoms come from a block's design constraints, a known issue, or a service-side regression. This page covers the resolution steps by block and dependency. To first isolate *where* the problem occurs, start from the hub.

Parent page (symptom-based entry point)

For the full picture of narrowing down a symptom, determining scope, and delegating boundary issues, see the hub, the section called “Troubleshoot contact routing and handling”.

Routing-configuration issues

If contacts don't reach an agent at all, or are distributed to the wrong agent because of your *routing configuration*, see the section called “Troubleshoot contacts not reaching an agent”.

Audio quality issues

If a contact connects but the audio quality is poor (one-way audio, echo, choppy audio, or delay), see the section called “Troubleshoot audio quality issues”.

Intended audience

This guide assumes you are a Connect Customer administrator who can create and edit contact flows, and who can access contact flow logs (in CloudWatch) and contact records (CTRs).

Before you begin: gather this information

Collect the following before you start. You need it to isolate the problem and, if necessary, to open a case with AWS Support.

- **Description of the symptom** – what happened (an unexpected branch, attributes that don't take effect, a disconnect, the wrong queue, or an announcement you can't hear), the block you suspect, and the affected channel (voice, chat, or task).
- **Instance Amazon Resource Name (ARN)** – see the section called “Find your instance ID”.
- **ContactId** of each affected contact (provide 3–5 examples).
- **Time of occurrence** in Coordinated Universal Time (UTC).
- **The target contact flow name and its export (JSON)** – export the latest version from the editor so you can review the content of the published flow.
- **Confirmation that contact flow logs are enabled** – if they aren't, enable logging with the Set logging behavior block in the flow, then reproduce the problem. See the section called “Set logging behavior”.

Step 1: Identify the symptom (quick reference)

The hub has a more complete symptom table. This table lists only the flow-side symptoms that this page resolves. If your symptom isn't listed, or you're not sure, continue to Step 2.

Symptom	Where to go
Input (DTMF or voice) is captured, but the flow returns Timeout, Error, or an unexpected branch	the section called “Input is captured but the flow returns Timeout, Error, or an unexpected branch (Get or Store customer input)”
Attributes don't take effect, values aren't passed, or they appear duplicated	the section called “Attributes don't take effect, aren't passed, or appear duplicated (Set or Check contact attributes)”
The contact enters the wrong queue, or a change to the queue setting has no effect	the section called “The contact enters the wrong queue, or a queue-setting change has no effect (Set working queue)”
A contact disconnects unexpectedly, skips the queue wait, or the call runs abnormally long	the section called “A contact disconnects unexpectedly, skips the queue wait, or runs abnormally long”
Branching breaks, or a Lambda dependency sends the contact down an unexpected branch	the section called “Branching breaks or takes an unexpected path (a Lambda dependency in the flow)”
You deleted a flow by mistake, or you want to restore one from a backup	the section called “You deleted a flow by mistake, or want to restore one from a backup”
An announcement (Play prompt or whisper) plays to only one party, or a whisper doesn't fire	the section called “An announcement or whisper plays to only one party, or doesn't fire”

Symptom	Where to go
A callback reaches voicemail, or you want to restrict outbound hours	the section called “Callback, voicemail detection, or time restriction”

Step 2: Determine the scope

- **A single flow or a single block** – suspect that block's configuration, its published state, and the attributes or Lambda function it references. See the matching section in Step 5.
- **Multiple flows, or organization-wide, with no customer-side change** – suspect a service-side regression or a Regional service issue, and check the AWS Health Dashboard. If you don't see a related event but the symptoms persist across flows or sites, open a support case.

> **Check what changed on a specific date**
>
> If the flow worked before but stopped on a specific date, check what changed that day: the **flow's edit history** (a UI edit, or an edit made outside the UI with the `UpdateContactFlowContent` API), or a **service update**. For how to detect edits made outside the UI, see the section called “Isolate routing problems with the CTR and flow logs”.

Step 3: Localize the problem using contact flow logs and CTRs

The fields to read—and the common pitfalls—in contact flow logs (block execution order, branch `Results`, the QueueId ARN set by Set working queue, the Invoke Lambda response, and the Loop count) and in CTRs (such as `DisconnectReason`) are consolidated in the dedicated isolation reference. See the section called “Isolate routing problems with the CTR and flow logs”.

The key points for this page (see that reference for details):

- `DisconnectReason=CONTACT_FLOW_DISCONNECT` indicates that the flow ended the contact. In the flow log, identify the terminal block that the contact reached—a Disconnect block, or an End flow / Resume block in an inbound or disconnect flow—and which branch routed to it. Step 5 covers the common causes.

- The draft can differ from the published version (a change that wasn't published), and Set working queue is determined by the **QueueId ARN and not the display name**.

Step 4: Collect diagnostic data

For how to read each field, see the section called “Isolate routing problems with the CTR and flow logs”.

1. **Contact flow logs (CloudWatch)** – with logging enabled, reproduce the problem, download the logs for the affected ContactId, and check which block returned which `Results`.
2. **CTR / DescribeContact** – review `DisconnectReason` and the queue or agent reached.
3. **Compare the published flow with the exported JSON** – match the QueueId ARN in the Actions section against the output of `describe-queue`.
4. **CloudTrail** – check for `UpdateContactFlowContent` calls. A UI edit is recorded with `invokedBy` = `connect.amazonaws.com` and a principal that is the service-linked role `AWSServiceRoleForAmazonConnect` (the `userAgent` is also `connect.amazonaws.com`). An event with no `invokedBy` is a direct call made outside the UI (through the API, an import, CI/CD, CloudFormation, or Lambda), and its `userIdentity.type` can be `IAMUser` or `AssumedRole`. As an exception, events from the service-linked role `AWSServiceRoleForAmazonConnectSynchronization` are managed cross-Region synchronization, not a UI edit.
5. **Compare a successful contact with a failed contact** – when the same flow or block produces different results, identify the difference (attribute key, line of business, or a direct call compared with a transfer).

Step 5: Resolve by cause

Input is captured but the flow returns Timeout, Error, or an unexpected branch (Get or Store customer input)

Use the Get customer input and Store customer input blocks to resolve these symptoms. For more information about these blocks, see the section called “Get customer input”.

- **The timeout is too short.** The Set timeout on the Get customer input block is the time the block waits for the first DTMF digit. It must be a static integer between 1 and 180 seconds. If it's too short, the block can time out before the caller responds; increase the Set timeout value.

- **You need to see what the customer actually pressed and when.** To confirm the keypad selections and their timing relative to the prompt, review the automated interaction logs. They appear on the Contact details page, list the keypad selections and the prompts that played, and let you play a specific prompt against the call recording. Customer timeouts also appear there. Automated interaction logs require Enable Automated Interaction Logs on the instance and call recording storage, and viewing keypad inputs requires the Automated interaction voice (IVR) transcripts (unredacted) security profile permission. Allow up to 30 minutes after the contact ends for the log to appear. See the section called “Enable flow logs”.
- **DTMF isn't detected on some calls.** Check whether the calls where input isn't detected are forwarded to Connect Customer from another system. If so, check whether the issue also occurs when you dial the Connect Customer number directly, without forwarding.

Attributes don't take effect, aren't passed, or appear duplicated (Set or Check contact attributes)

For more information about these blocks, see the section called “Set contact attributes”.

- **A mismatch in the key name, type (string compared with number), or namespace** (such as External or User Defined) sends Check contact attributes down an unexpected branch. Compare the values and correct them. Don't use $ in attribute keys. Connect Customer treats $ as a special character: text-to-speech reads it literally, and you can't retrieve a value whose key contains $. If you set attributes by using the `UpdateContactAttributes` API, keys can include only alphanumeric, dash, and underscore characters. For more information, see the section called ““$" is a special character”.
- **Attributes appear to be written more than once.** The same key can appear on more than one line in the CloudWatch flow logs (see the section called “Isolate routing problems with the CTR and flow logs”). Make downstream processing idempotent by key name (last-write-wins), and consume the **final attribute from the CTR (Kinesis stream)** rather than counting log entries.

The contact enters the wrong queue, or a queue-setting change has no effect (Set working queue)

This can be caused by a Set working queue change that wasn't published (the flow still uses the old state), or by a display name that doesn't match the QueueId ARN. An edit made outside the UI with the `UpdateContactFlowContent` API can replace the ARN while leaving the display name unchanged. The flow logs show no error. Set working queue is determined by the QueueId ARN. Match the ARN in the exported JSON against `describe-queue`. If the ARN isn't the intended

queue, open the Set working queue block, re-select the queue, and then save and publish the flow. For details, see the section called “Isolate routing problems with the CTR and flow logs”.

A contact disconnects unexpectedly, skips the queue wait, or runs abnormally long

- **The menu repeats many times when there's no input.** If you repeat Get customer input by using a Loop block, the menu is replayed according to the loop count that's set on the Loop block when the caller doesn't respond. Check the loop count and the block that the Complete branch connects to when the loop finishes.
- **An Error on a channel-incompatible block leads to a disconnect.** The Loop prompts block is voice-only. When a chat contact hits a Loop prompts block that has voice prompts, the block returns Error, and a connected Disconnect block ends the contact immediately. This happens when the main flow doesn't explicitly set a customer queue flow and falls back to the instance default (voice-only). Create a chat-compatible customer queue flow, and place a Set customer queue flow block explicitly before Transfer to queue. Connect Customer resolves the customer queue flow in this order: first the Set customer queue flow block, then the instance default.
- **An orphaned or stalled callback.** A callback that's created when no agent is available can remain in the queue unassigned. If a custom prompt reads out the longest wait time, it announces an enormous wait (for example, hundreds or thousands of minutes) to new callers. Disconnect the stalled contact with **End** on the contact details page or with the `StopContact` API, and remove the cause.

Branching breaks or takes an unexpected path (a Lambda dependency in the flow)

- The status codes in the Invoke Lambda block's log are the responses from your own Lambda function, and Connect Customer treats a call-level failure differently from a value that the function returns. A call-level failure—an HTTP `500`, throttling, or a timeout—causes the Invoke Lambda block to retry and then take the **Error** branch. Always connect the Error branch of the Invoke AWS Lambda function block to a block that handles the error. A status code that the function returns in its response payload, such as `404` or `503`, comes back on the **Success** branch, and your flow branches on that value. Compare the logs of a successful contact and a failed contact to find the difference in the values that the function returned. For the IAM permissions that a Lambda function in a flow requires (including KMS), see the section called “AWS Lambda function”.
- **The 8-second timeout on a synchronous Lambda invocation.** If execution exceeds this limit, consider an asynchronous pattern.

You deleted a flow by mistake, or want to restore one from a backup

Deleted flows can't be restored, but archived flows can be restored. To import a flow from a JSON export, choose **Routing**, **Contact flows**, and then choose **Save**, **Import flow**. See the section called "Import and export flows between flow designers". To prevent loss, implement a periodic backup with the `describe-contact-flow` API.

An announcement or whisper plays to only one party, or doesn't fire

- **The agent whisper doesn't play.** Create an agent whisper flow. For voice, the default agent whisper flow (Default agent whisper) runs even if you don't add a Set whisper flow block. For chat, there's no default whisper, so the agent whisper plays only if you add a Set whisper flow block.
- **On outbound calls, the agent whisper doesn't play for some dialing methods.** On inbound calls, the agent whisper flow plays when the agent accepts the contact. On outbound calls, it plays for callbacks, and for calls placed with the `StartOutboundVoiceContact` API when the flow transfers the contact to an agent. It doesn't play for calls that an agent places manually from the CCP or for campaign preview dialing (in preview dialing, the outbound whisper flow can play the whisper to the agent).
- **The Transfer to Agent (beta) block isn't visible.** It's available only in the Transfer to Agent and Transfer to Queue flow types, not in the standard contact flow type.
- On a voice call, the **beep** that the customer hears when the contact is connected to an agent is the initial behavior of the default customer whisper flow (Default customer whisper). You can override or disable it with the Set whisper flow block.

Callback, voicemail detection, or time restriction

- **A queued callback reaches voicemail.** In the default agent-first callback mode, the Check call progress block isn't supported and the contact routes to its Error branch, so voicemail can't be detected. The Check call progress block supports only outbound campaign calls and customer-first callbacks. Switch to customer-first callback mode (available only in next-generation Connect Customer instances), and connect to the agent only after you detect a live answer. Treat the Not detected branch of Check call progress as possibly either voicemail or a live person.
- **You want to restrict callback dialing to certain hours.** For an example architecture that lets callers choose a time within your hours of operation and schedules the callback for that time, see Caller Scheduled Callback in Amazon Connect on the AWS Contact Center Blog.

Step 6: Isolate carrier issues (boundary)

You can't resolve the following with contact flow configuration. The hub's Step 5 lists where to delegate each boundary issue.

- **Rule out Connect Customer-side configuration first.** Before you attribute a failure to the carrier, check the Connect Customer-side configuration. For example, Connect Customer doesn't allow anonymous calls (calls without caller ID), so if the queue's Outbound caller ID number isn't set to a number that you've claimed or ported to your instance, the call fails. When an agent places the call from the CCP, the CCP shows an Invalid outbound configuration error. For how to fix it, see the section called “CCP outbound configuration issues”. For the other items to check, see Step 5 of the hub.
- **Routing-configuration issues.** If the contact reaches the queue but isn't distributed to an agent, see the section called “Troubleshoot contacts not reaching an agent”.

Before you contact AWS Support

If the issue persists after troubleshooting, open a case with **3–5 examples**, and include:

- Instance ARN and a description of the symptom (which block, which branch, and what happened).
- ContactIds, timestamps (UTC), and a contact-record snapshot (including `DisconnectReason`).
- The target contact flow export (JSON) and the contact flow logs for the affected ContactIds.
- A comparison of a successful contact and a failed contact (when the same flow produces different results).
- If you use Lambda: the function name and the response status or return value on failure.
- The frequency of the issue and the date and time it started (UTC).

Contact Control Panel (CCP) Issues

This topic is for IT administrators who are experienced with investigating issues with their network. It discusses the most common issues agents might encounter when using the Contact Control Panel (CCP).

For example, the most common issues are typically poor audio quality due to the network, and hardware issues, such as microphone access.

This topic explains how to investigate, diagnose, and fix the most common CCP issues.

The following list shows the error messages that appear as red banners in the CCP, and provides links to their solutions:

Microphone is not accessible

The CCP cannot access the agent microphone, which can cause missed calls. To resolve this error, see CCP browser microphone access.

Initialization Failed

The agent environment is missing required allowlist domains or IP addresses. To resolve this error, see CCP initialization issues.

Failed to establish softphone connection

The browser cannot establish a media channel with Connect Customer softphone media, often because the agent network blocks the TurnNLB domain or cannot resolve DNS. To resolve this error, see CCP WebRTC issues.

Call failed due to a browser-side WebRTC issue

The CCP cannot collect ICE candidates because a request to Connect Customer softphone media times out. To resolve this error, see CCP WebRTC issues.

Invalid outbound configuration

The instance does not have outbound calling enabled, or the queue has no outbound caller ID. To resolve this error, see CCP outbound configuration issues.

Invalid number

The dialed number does not use E.164 format, or your instance does not allow the destination for outbound calling. To resolve this error, see CCP invalid number issues.

Topics

- CCP browser microphone access
- CCP initialization issues
- CCP WebRTC issues
- The agent workspace or CCP freezes or is unresponsive
- Connection failures and disconnections caused by network or firewall
- CCP audio issues on first call after system reboot when using Windows 11

- CCP outbound configuration issues
- CCP invalid number issues
- One-way audio from customers

CCP browser microphone access

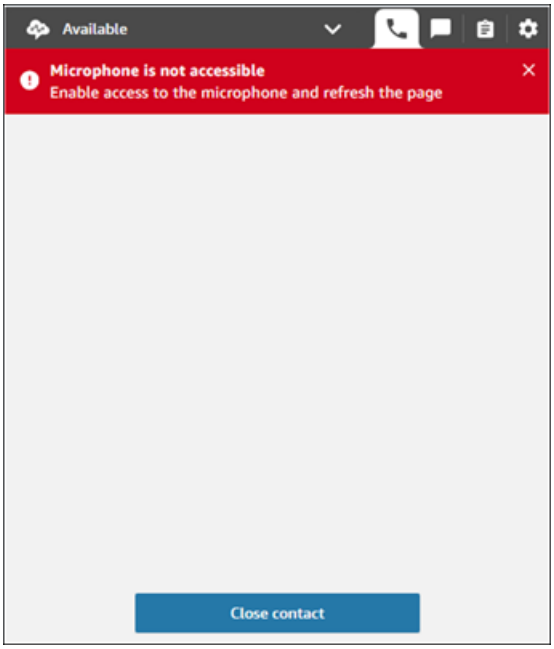
The CCP conforms to microphone usage guidance that's specific to their browser.

- The CCP has access to connect to the agent's microphone only when the permission is granted for the current session. The permission is stored in the browser's memory.
- In addition, Firefox requires the CCP tab to be in focus in order for microphone and audio to be passed through.

Agents might encounter missed call scenarios when the CCP tab has no microphone access. Missed calls can also happen when the CCP tab is not in focus, for example, when the agent is focused on a different tab or application.

- Error message title: **Microphone is not accessible**
- Message: **Enable access to the microphone and refresh the page**

The following image shows an example of a missed call scenario due to the CCP tab not having access to agent's microphone.



How to fix

- If your agents are using Firefox, make sure they know to focus on the CCP tab when they accept and connect to a voice contact.
- Use the End Point Connectivity Tool to determine if the browser has appropriate access to media devices such as microphone, speakers, or headset.

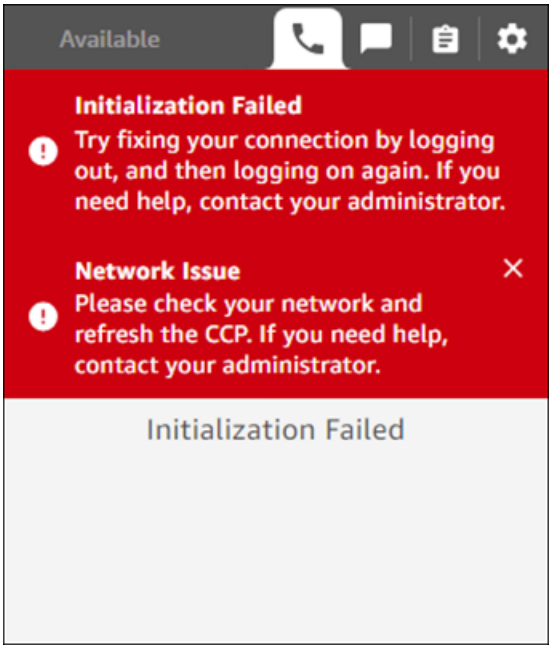
CCP initialization issues

Initialization issues are most commonly caused by missing domain or port/IP allowlist entries in your agent environment. This results in missed calls.

The CCP initialization process depends on the API and signalling endpoints. These are accessed by using the allow-listed domains, such as `*myInstanceName.awsapps.com/connect/api` and `*.transport.connect.region.amazonaws.com`, or subsequent IP addresses.

- Error message title: **Initialization Failed**
- Message: **Try fixing your connection by logging out, and then logging on again. If you need help, contact your administrator.**

The following image shows an example of a missed call scenario due to missing allowlisted domains.



How to fix

- Check that you have added all domains and IP addresses listed in Option 1 of Set up your network.
- Use the End Point Connectivity Tool to determine if the browser has appropriate access to all required endpoints.
- Because errors can occur due to poor networking conditions, and then result in latency or outages, we recommend also checking your agent networking connections.

CCP WebRTC issues

WebRTC issues occur when a request to Connect Customer Soft-phone Media (`TurnNlb-xxxxxxxxxxxxx.elb.region.amazonaws.com:3478?transport=udp`) times out and the CCP is unable to collect ICE candidates to establish a connection. The result is missed calls.

- Error message title: **ice_collection_timeout title, WebRTC issue**
- Messages: **ice_collection_timeout message, Call failed due to a browser-side WebRTC issue.**

How to fix

- Check Firewall or NAT settings to see if UDP 3478 outbound traffic to Amazon Connect Softphone Media is allowed. See Set up your network.
- Use the End Point Connectivity Tool to determine if agents are able to successfully connect to all the required endpoints.
- Because errors can occur due to poor networking conditions, and then result in latency or outages, we recommend also checking your agent networking connections.

The agent workspace or CCP freezes or is unresponsive

The agent workspace or CCP becomes unresponsive during operation. Buttons don't respond, or the UI freezes for an extended period when accepting a contact. This occurs in the following situations:

- The UI freezes for tens of seconds to several minutes when accepting a contact because of a network problem such as high latency.
- Insufficient CPU or memory on the agent workstation causes freezes or out-of-memory crashes.

How to fix

- Check the CCP logs for high latency (use the API Call Metrics section in the CCP Log Parser). Verify that network latency is acceptable. Latency outside the acceptable range indicates a possible network problem. For instructions on downloading CCP logs, see Download and review CCP logs.
- If you run software such as screen recording software, noise-suppression software, or VDI at the same time, check whether the concurrently running software is causing insufficient CPU and memory.
- Browser extensions (such as translation extensions) might cause this problem. Disable extensions and test whether the issue persists.

Connection failures and disconnections caused by network or firewall

The CCP requires stable connectivity to the required endpoints and ports, including signaling and softphone media on UDP port 3478. When firewalls, proxies, VPNs, or network instability prevent reachability to these endpoints, agents experience failure to connect, missed calls, or mid-call disconnections.

> **Note**
>
> This section covers connection failures, disconnections, and missed calls caused by network or firewall issues. For audio-quality degradation (choppy audio, echo, one-way audio, silence, or delay) when a connection is already established, see Troubleshoot audio quality issues.

When the connection to the media endpoint is lost during a call, CCP logs show entries similar to the following:

```
softphone INFO {contact ID} SESSION Lost ICE connection
```

How to fix

- Verify that outbound traffic is allowed to UDP port 3478 (softphone media), TCP port 443, and WebSocket connections. For more information, see Set up your network.

- To simplify management, set up your network to use Option 1 (recommended): Replace Amazon EC2 and CloudFront IP range requirements with a domain allowlist.
- If you use a corporate proxy, add Connect Customer domains to the allowlist and verify that DNS resolution is correct. If WebSocket disconnections are frequent, test without the proxy to determine whether the proxy is causing the issue.
- If you use a VPN, test without it to determine whether the VPN is causing the issue.
- Review the `ToInstancePacketLossRate` CloudWatch metric over the time period when the issue occurred. This metric is expressed as a ratio between 0 and 1. A ratio greater than 0.2 indicates a significant network issue that can cause disconnections or missed calls.
- If the agent is located far from the AWS Region of the Connect Customer instance, latency increases. Verify that the average latency measured by the Endpoint Test Utility doesn't exceed 300 ms.

To isolate workstation-specific issues, see Troubleshoot an agent's workstation.

CCP audio issues on first call after system reboot when using Windows 11

Issue Description

After performing a Windows 11 system reboot, your agents might experience complete audio failure ("dead air") during your first call, where neither your agent nor the customer can hear each other.

Root Cause

This issue occurs due to two Windows 11 system behaviors:

1. The network interface card (NIC) unexpectedly restarts when Chrome/Edge browsers request audio packet prioritization.
2. Volume control adjustments trigger network-related services, which can cause NIC restarts.

Affected Systems

- Windows 11 workstations
- Chrome and Edge browsers

- Contact Center softphone applications

Resolution

To prevent this issue, you must modify the startup type of several Windows services from **Manual** to **Automatic**:

Required Service Changes:

- qWAVE (Quality Windows Audio/Video Experience)
- ndisuio.sys
- dmwAppushSvc (Device Management Wireless Application Protocol (WAP) Push message Routing Service)
- SstpSvc (Secure Socket Tunneling Protocol Service)
- RasMan (Remote Access Connection Manager)

Contact your IT support team to implement these changes, as they require administrative privileges.

Additional Notes

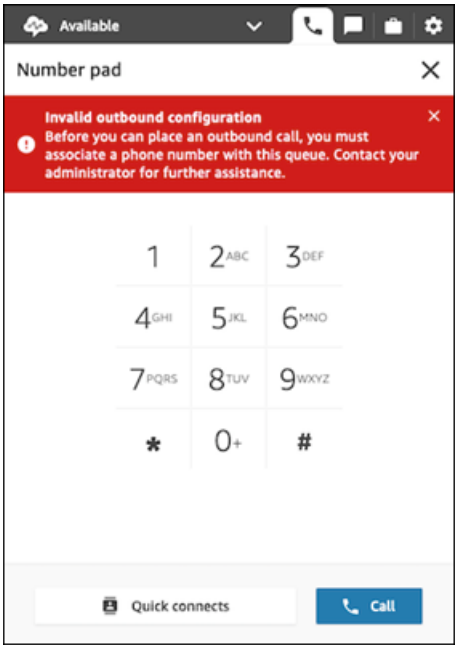
- This solution ensures critical services which could restart the network interface controller (NIC) if launched at run time are launched before the the agent's first call.
- No further action is required after these changes are implemented.
- If you continue to experience issues after this fix, contact technical support.

CCP outbound configuration issues

Outbound configuration issues often arise when the instance is not enabled for outbound calling, or when there is no outbound caller ID specified for making calls.

- Error message title: **Invalid outbound configuration**
- Message: **Before you can place an outbound call, you must associate a phone number with this queue. Contact your administrator for further assistance.**

The following image shows an example of a invalid outbound configuration message on the CCP.



How to fix

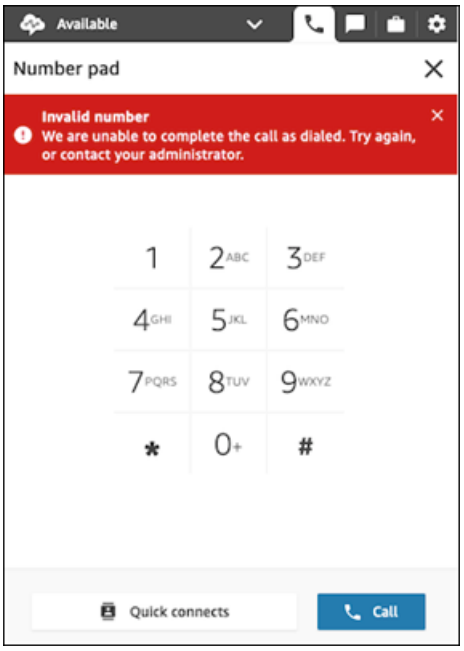
- Check that the instance-level setting is enabled for outbound calls. For instructions, see Update telephony and chat options.
- Check that outbound caller ID name and number have been set for your default outbound queue. Set the outbound caller ID name and number if they are missing. For instructions, see Set up outbound caller ID.
- Ensure agents have the **Contact Control Panel (CCP) - Make outbound calls** permission in their security profile. For instructions, see Assign a security profile for Connect Customer to a contact center user.

CCP invalid number issues

Invalid number issues are primarily seen when an agent enters a phone number that is not in E.164 format. Or, if the phone number destination has not been allow-listed for outbound calling on the Connect Customer instance.

- Error message title: **Invalid number**
- Message: **We are unable to complete the call as dialed. Try again, or contact your administrator.**

The following image shows an example of a invalid number message on the CCP.



How to fix

- Check that the phone number dialed is in E.164 format.
- Check whether the phone number country you are calling is an allowed destination for your Connect Customer instance. See Countries that call centers using Connect Customer can call by default.
- If the issues persist, contact AWS Support.

One-way audio from customers

If an agent can hear the customer, but the customer can't hear the agent, this might be the result of an application taking exclusive control of agent's mic/speaker.

How to fix

- You can search the internet for articles that explain how to turn off exclusive-mode for a Windows audio playback device. For example, Turning off Exclusive Mode in Windows 10 Home Edition.
- To fix sound problems on a Mac, see Change the sound input settings on Mac.

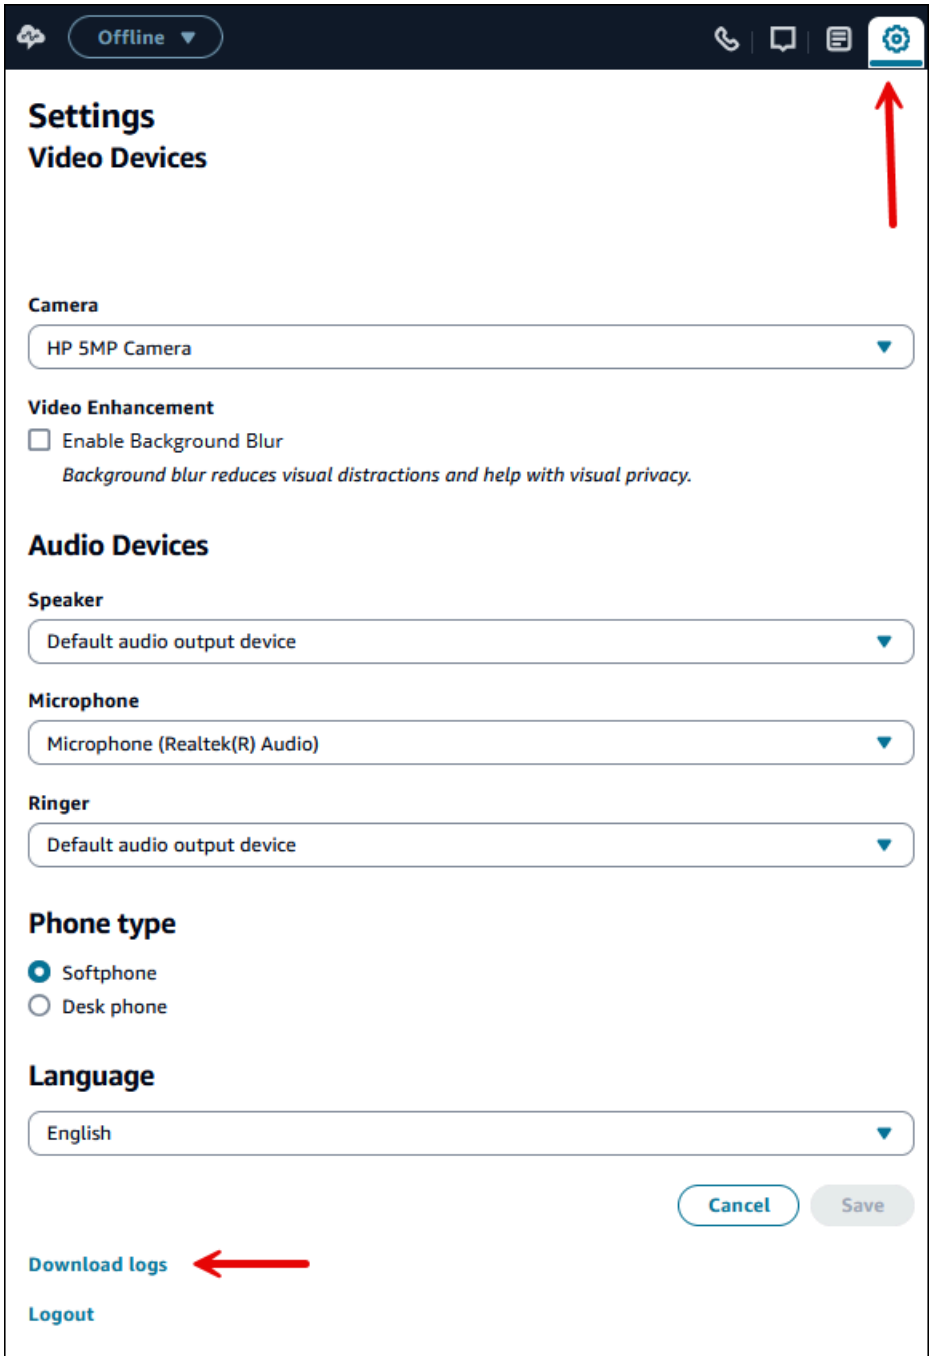
To troubleshoot call quality issues, see Troubleshoot audio quality issues by using `QualityMetrics` in the contact record.

Download and review Connect Customer Contact Control Panel (CCP) logs

This topic is for IT admins and developers who need to troubleshoot issues with an agent's Contact Control Panel (CCP).

Download CCP logs

1. On the agent's desktop, in their CCP, choose **Settings**, **Download logs**.



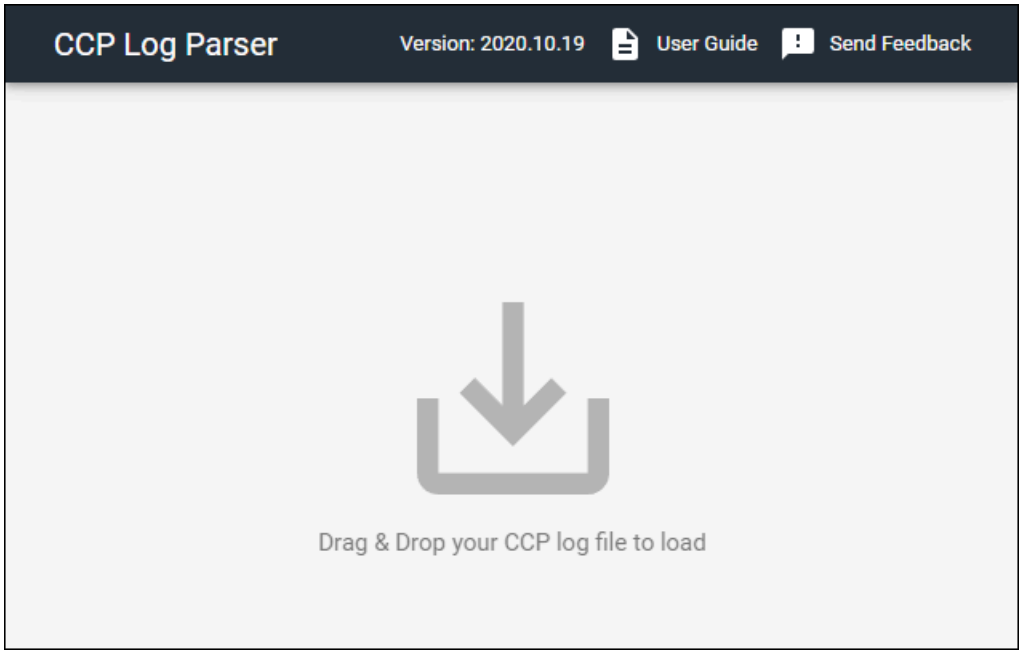
2. The `agent-log.txt` file is saved to your browser's default directory. After the file is downloaded, you can change the name of the file the same way you rename any other file on your computer. You can't customize the file name before the file is downloaded.

Review CCP logs using Connect Customer CCP Log Parser

After downloading the agent's CCP logs, you can use the Connect Customer CCP Log Parser to troubleshoot further and get a better view of the errors and verbose details on how the error occurs. By viewing CCP logs, you can also identify errors and resolve where possible.

To load the CCP log file into the CCP log parser and view logs

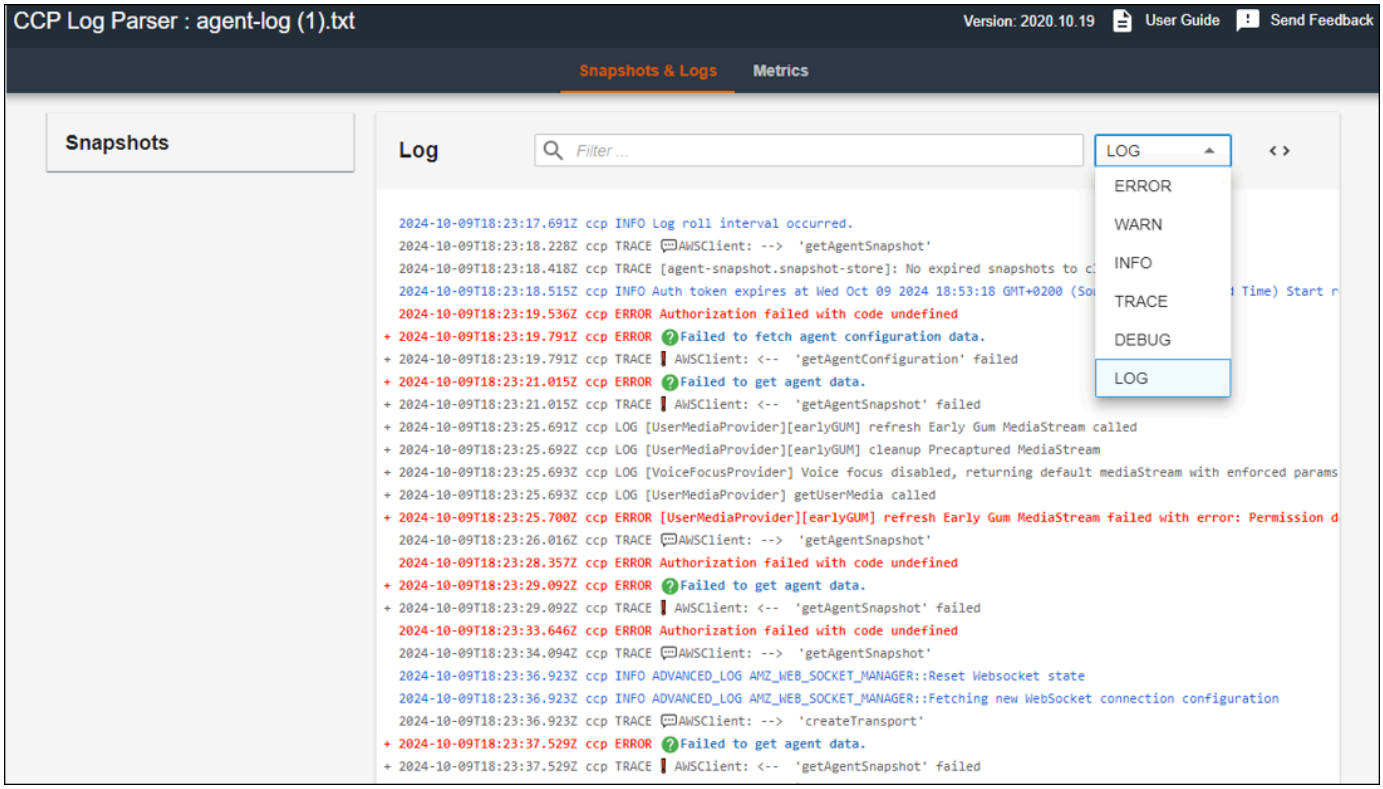
1. Open the CCP Log Parser (`https://tools.connect.aws/ccp-log-parser/`).
2. Drag and drop your log file, for example, `agent-log.txt` into the parser. The following image shows the log parser.



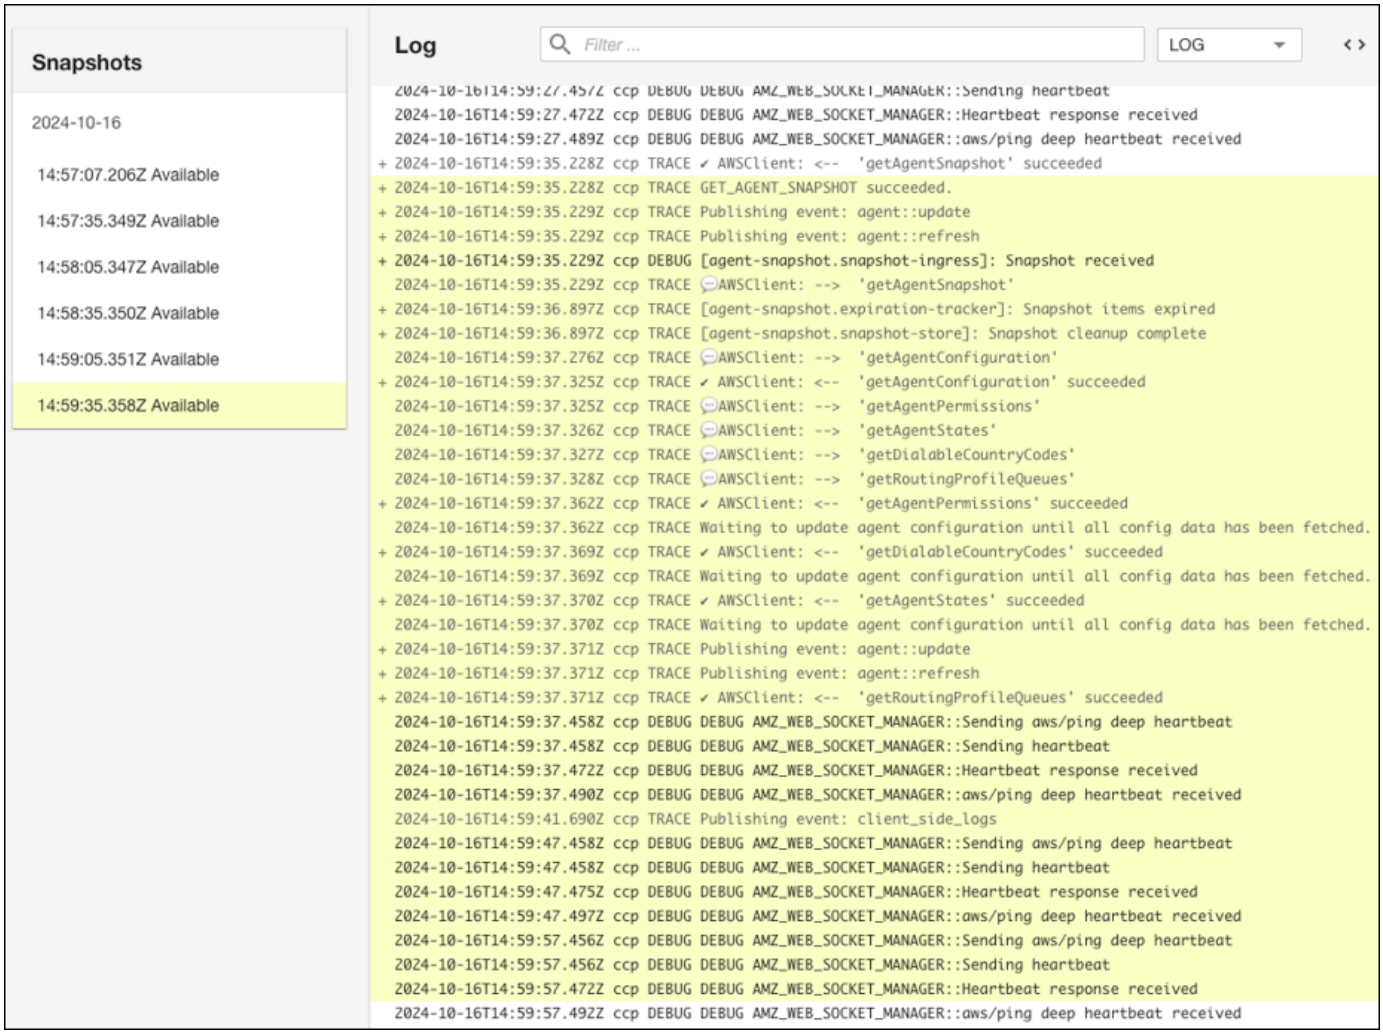
3. On the **Snapshots & Logs** tab you can see the logs recorded during the agent session.

   Normally log entries are collapsed but most log entries contain more information. To see the original log object in JSON format, choose the + to expand or collapse the log lines with more information.

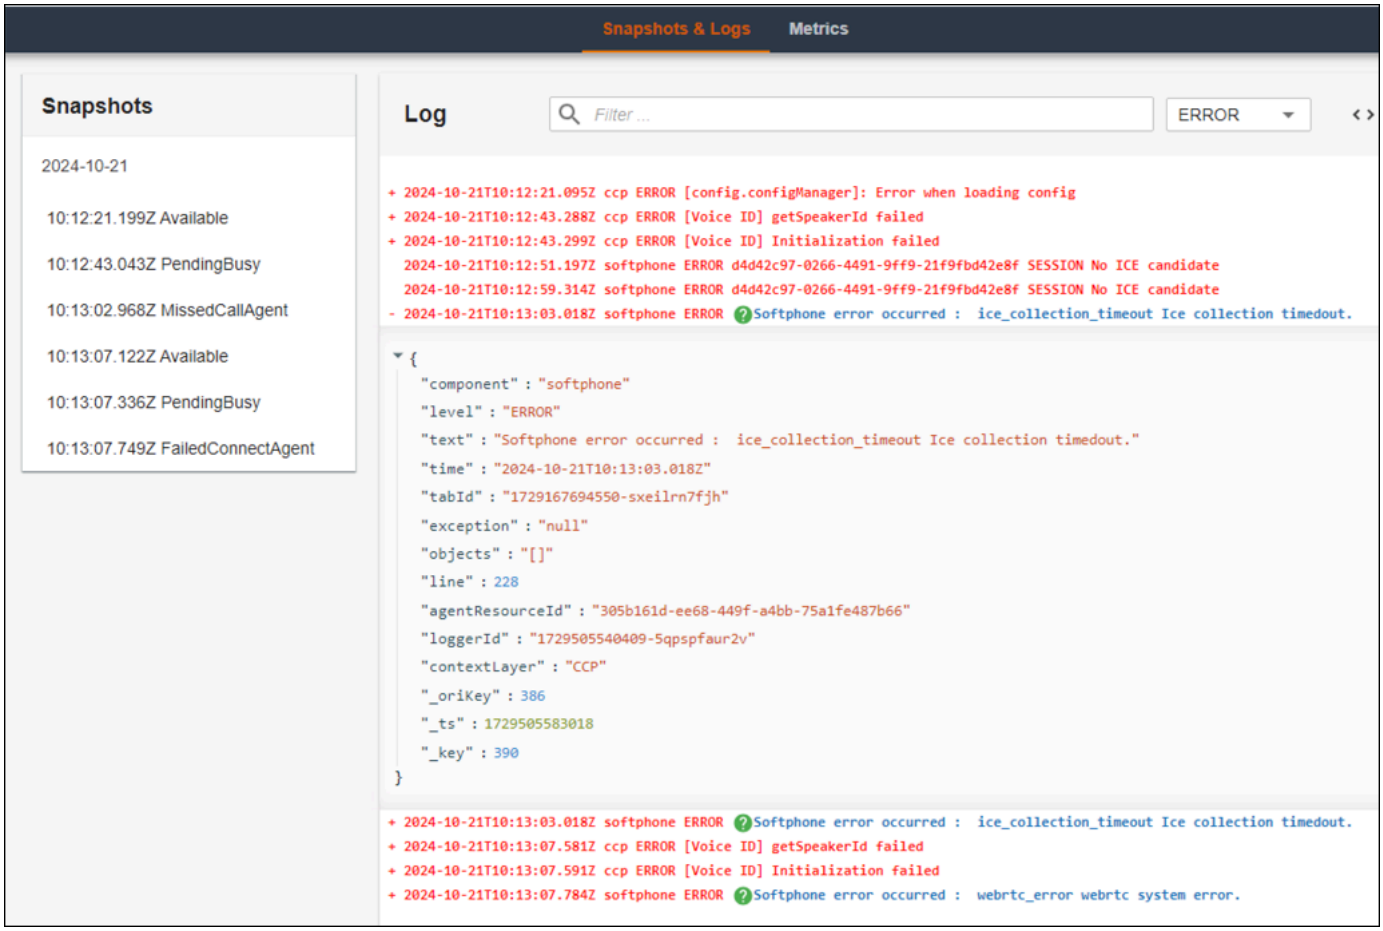
> **Note**
>
> CCP logs do not persist through browser refreshes.



4. On the left side of log entry, you can choose Snapshots. CCP periodically retrieves an AgentSnapshot from Connect Customer. The Snapshot displays the agent status that was captured during these retrieval periods. Choosing on one Snapshot highlights the section from that snapshot until the subsequent snapshot.



5. The following image shows a Snapshot log, with a softphone error.



6. On the **Metrics** tab, you can view the following metrics:

   - **Skew Metrics** shows difference between the client-side (agent's workstation) local timestamp and server-side (Connect Customer service) timestamp in milliseconds.
   - **API Call Metrics** shows the latency of the API call from CCP.
   - **WebRTC Metrics**: Available if the call was made with CCP. **WebRTC Metrics** shows the media stream condition during a call.

For instructions about troubleshooting call quality issues, see [Troubleshoot audio quality issues by using `QualityMetrics` in the contact record].

Agent workspace and CCP do not support mobile phones (iPhone, Android) and iPads

The Connect Customer admin website, Contact Control Panel (CCP), and agent workspace do not support mobile browsers / mobile devices such as iPhones and iPads.

You can set up your CCP to forward the audio portion of the call to your mobile device. For instructions, see Forward calls in the Connect Customer CCP to a mobile device (iPhone, Android).

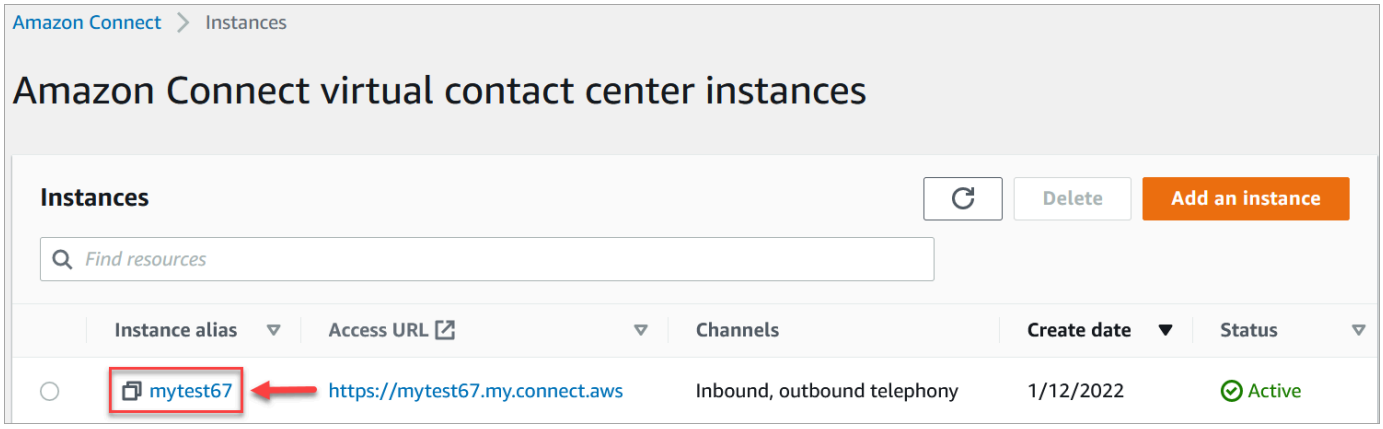
Problem using the CCP: Agents can't make outbound calls in the Contact Control Panel (CCP)

This topic is for experienced IT administrators who need to investigate why agents in their contact center can't make outbound calls.

The top reason most agents can't make outbound calls from the CCP is because their instance of Connect Customer has not been set up to make outbound calls.

To enable agents to make outbound calls

1. Open the Connect Customer console at https://console.aws.amazon.com/connect/.
2. On the instances page, choose the instance alias. The instance alias is also your **instance name**, which appears in your Connect Customer URL. The following image shows the **Connect Customer virtual contact center instances** page, with a box around the instance alias.



3. In the navigation pane, choose **Telephony**.
4. To enable outbound calling from your contact center, choose **I want to make outbound calls with Connect Customer**.
5. Choose **Save**.

Internal firewall or missing CORS policy prevents access to chat, email, task, or case attachments

This topic is for developers who need to investigate issues that might occur when using attachments with the chat, email, or task channels in Connect Customer, or when using attachments to upload files to cases.

The following issues might cause attachments to not display for your agents using Connect Customer chat, email, or tasks, or Connect Customer Cases.

Configure a CORS policy on your attachments bucket

A common reason for attachments not appearing in chats, emails, or tasks is that the CORS policy hasn't been configured on your attachments bucket. For instructions, see Step 4: Configure a CORS policy on your attachments bucket.

Internal firewall settings are preventing access

Check that your firewall isn't preventing agents from accessing the files in your Amazon S3 bucket. You might need to add the Amazon S3 bucket where your files are stored to your domain allowlist. For more information, see Set up your network to use the Connect Customer Contact Control Panel (CCP).

Attachments are too large, too many, or don't meet file type requirements

Check that the attachments meet the size, number, and file type requirements. For more information, see Connect Customer feature specifications.

The maximum attachment size is configurable up to 100 MB. The default is 20 MB. If attachments are being rejected, verify the configured size limit for your instance through the Connect Customer admin website or the Connect Customer API.

To calculate the size of an attachment (artifactSizeInBytes), use a third-party tool such as File.size.

File type is rejected even though it is expected to be allowed

If a file type is rejected when uploading an attachment, verify that the file extension has been added to the allowed file extensions list for your instance. For information about configuring custom file extensions, see Enable attachments in your CCP so customers and agents can share and upload files.

For a list of default supported file types, see Connect Customer feature specifications.

Humming sound in the agent's audio device: Verify the headset and browser sample rates

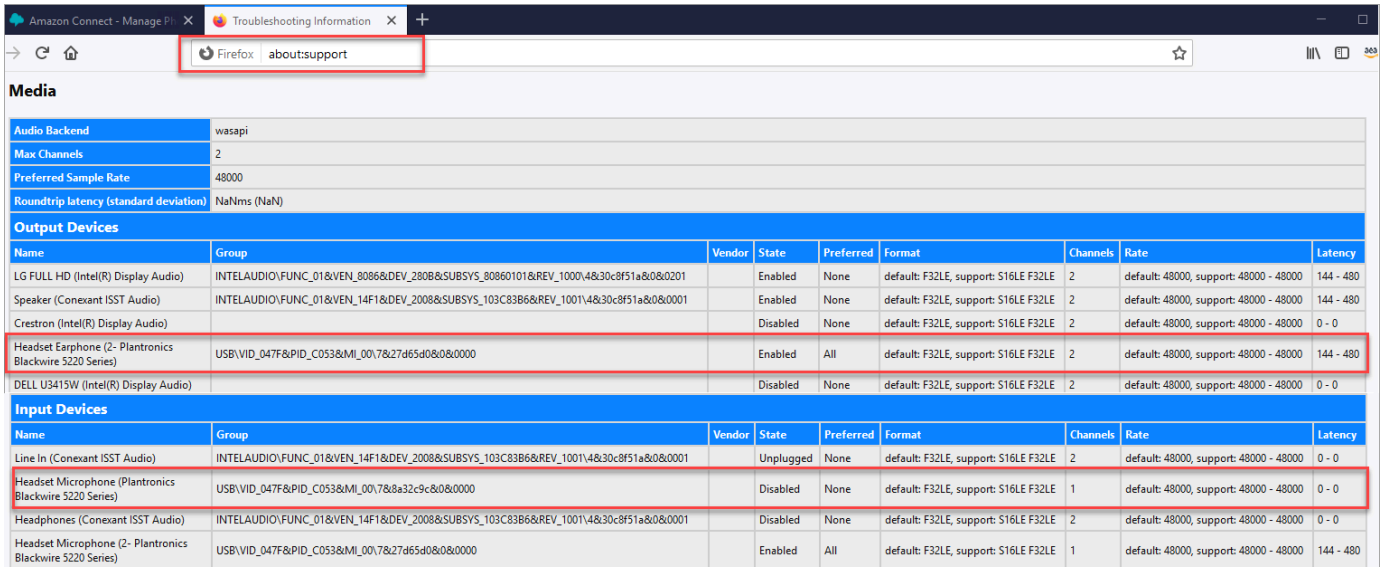
This topic is for IT administrators who are experienced with investigating audio device issues.

If the agent's audio device does not support up to 48khz and the browser asserts a sample rate of 48khz, audio issues such as an audible humming sound might be present in the agent's outgoing audio. This has been seen with Firefox but not with Chrome. For example, when an agent has used a headset with a preferred sample rate of audio to 16000, it causes issues.

Perform the following steps to verify your headset and browser sample rates.

Verify Firefox sample rate

1. Open the agent's CCP in FireFox, and set their status to **Available**.
2. Accept a call.
3. Open a second Firefox tab, and type **about:support** in the Search box.
4. Scroll down the page to **Media**.
5. Verify that the sample rates for the input and output devices are **48000**, as shown in the following image.

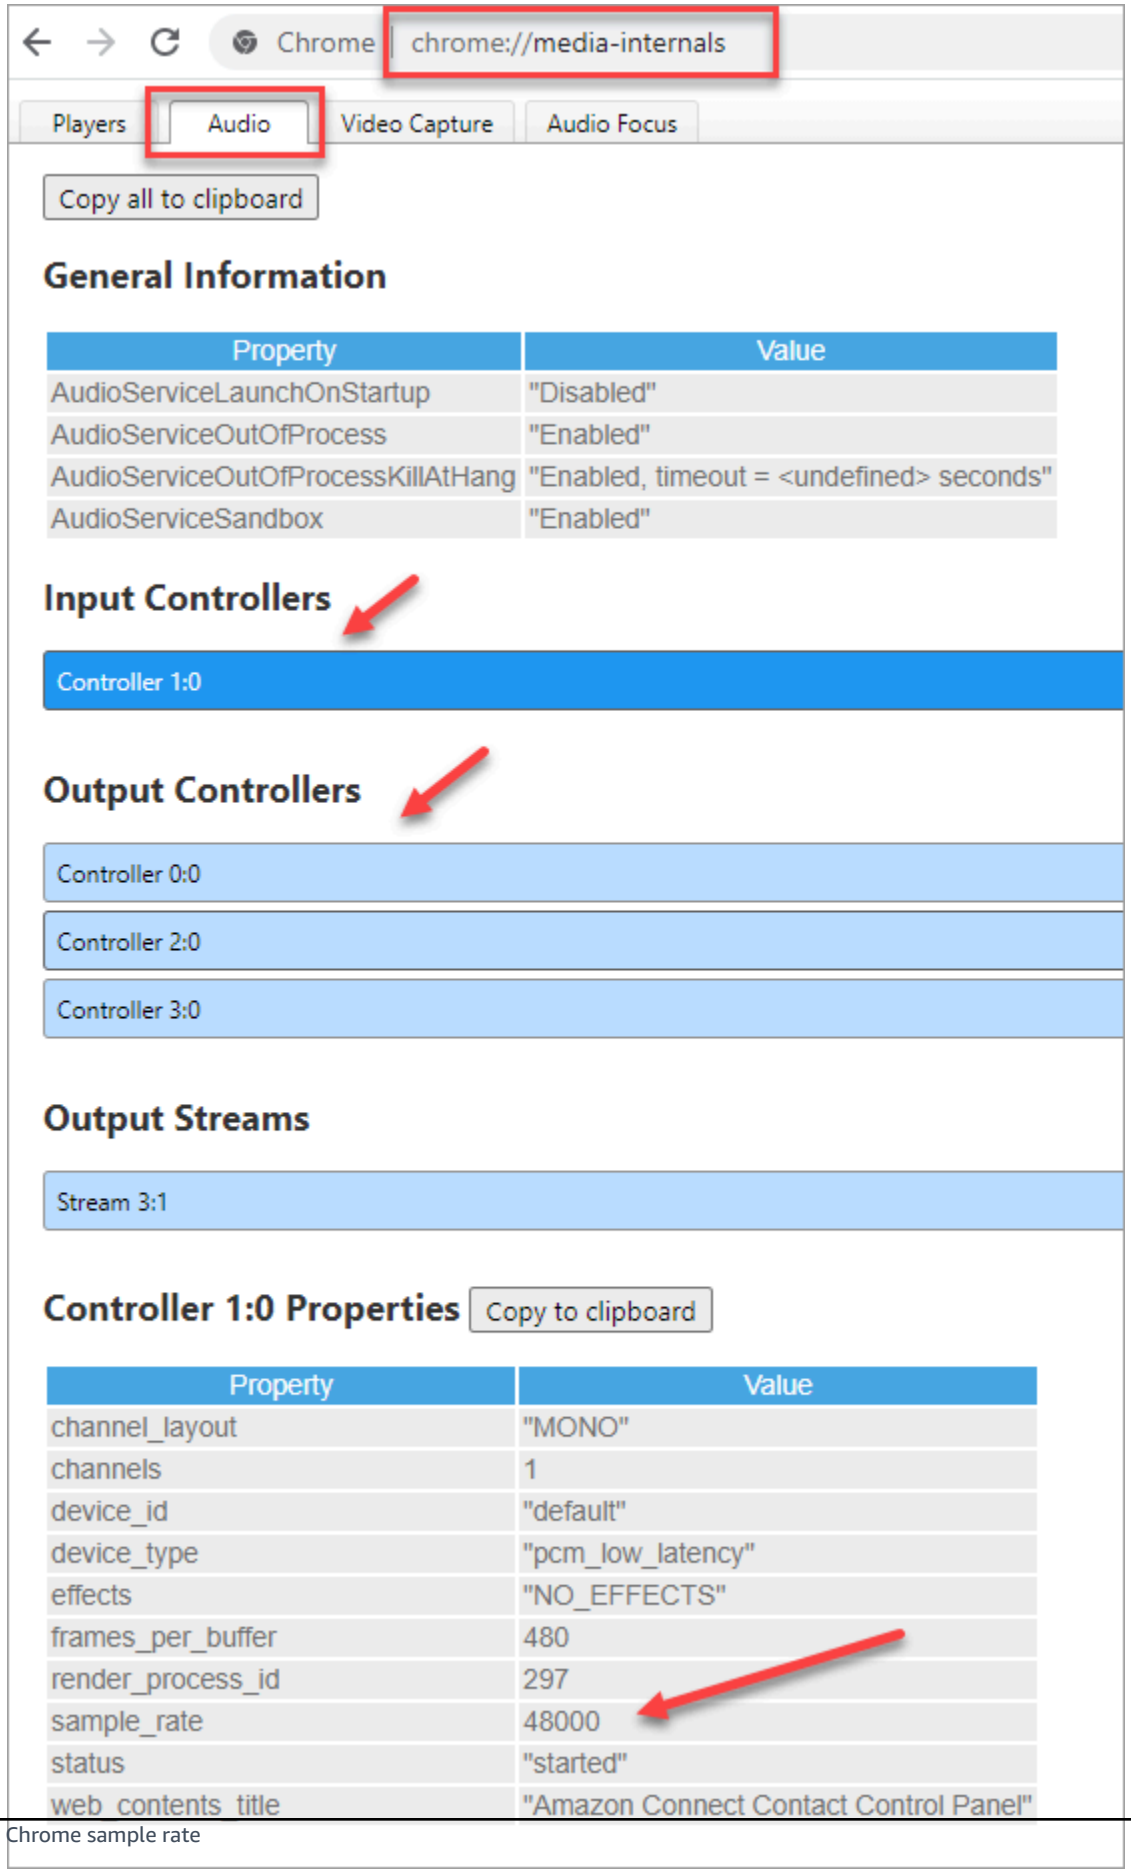


6. The sample rate is primary controlled by the operating system sound settings. Go to the computer's sound settings and change the sample rate if it isn't 48000. For specific instructions for your operating system, search the internet.

If you can't change the sample rate in your audio device settings, for example, because your headset doesn't support 48000, we recommend switching to a headset with a preferred sample rate 48000.

Verify Chrome sample rate

1. Open the agent's CCP in Chrome, and set their status to **Available**.
2. Accept a call.
3. Open a second Chrome tab, and type **chrome://about** in the Search box.
4. Scroll down the page and choose **chrome://media-internals**.
5. On the **Audio** tab, choose the **Input Controllers** and verify that the sample rate is **48000**. Then verify the sample rate for the Output Controllers.



Verify Chrome sample rate

6. The sample rate is primary controlled by the operating system sound settings. Go to the computer's sound settings and change the sample rate if it isn't 48000. For specific instructions for your operating system, search the internet.

   If you can't change the sample rate in your audio device settings, for example, because your headset doesn't support 48000, we recommend switching to a headset with a preferred sample rate 48000.

Troubleshoot agent screen recording issues

Troubleshoot screen recording failures caused by browser Local Network Access restrictions

Modern browsers enforce Local Network Access (LNA) restrictions on WebSocket connections. This blocks the local WebSocket connection between the Contact Control Panel and the Connect Customer Client Application, causing screen recordings to fail. Affected recordings cannot be recovered. These restrictions apply to Chrome version 147 and later, Edge version 147 and later, and Firefox version 154 and later.

Symptoms

- Screen recording does not start for agents using Chrome 147+, Edge 147+, or Firefox 154+.
- Screen recording works correctly on older browser versions or when using a browser that does not enforce LNA restrictions.
- The shared worker logs show: `IPC connection terminated with status code 1006 (translated to failure code X)`. The translated failure code indicates the cause:
  - Failure code `802` definitively indicates the connection was blocked by browser LNA restrictions. This failure code is currently available only on Chrome and Edge; on Firefox, LNA-blocked connections report failure code 1006.
  - Failure code `1006` indicates the cause could not be determined. This could be LNA restrictions or the Connect Customer Client Application not being installed or not running on the agent machine.
- On Chrome and Edge, the shared worker or CCP logs show: `ERR_BLOCKED_BY_LOCAL_NETWORK_ACCESS_CHECKS`. Firefox does not emit this specific error string.

Confirm the issue

To confirm whether an agent is affected by this issue, temporarily disable the LNA check on a single impacted workstation:

- **Chrome**: Navigate to `chrome://flags/#local-network-access-check` and set the flag to "Disabled", then restart Chrome.
- **Edge**: Navigate to `edge://flags/#local-network-access-check` and set the flag to "Disabled", then restart Edge.
- **Firefox**: Navigate to `about:config`, set `network.lna.websocket.enabled` to `false`, then restart Firefox.

If screen recording resumes after disabling the check, this confirms the issue is caused by LNA enforcement.

Resolution

Deploy the browser enterprise policy that pre-grants local network access for your Contact Control Panel domain, so agents are not blocked or prompted:

- **Chrome and Edge**: Deploy the **LoopbackNetworkAllowedForUrls** policy. See LoopbackNetworkAllowedForUrls (Chrome) and LoopbackNetworkAllowedForUrls (Edge).
- **Firefox**: Deploy the **LocalNetworkAccess** policy and add the loopback address `127.0.0.1` to **SkipDomains**. See LocalNetworkAccess.

For configuration examples and Windows registry commands, see the section called “Browser enterprise policy for local network access”.

For additional troubleshooting steps, including how to collect log files from the Connect Customer Client Application and shared worker, see Download the Connect Customer Client Application log files for troubleshooting.

Related information

For help with rule-based redaction issues, see the section called “Troubleshoot rule-based redaction”.

Testing the new Connect Customer sign-in experience

Overview

Connect Customer is implementing an enhanced sign-in experience with improved security features. This topic explains how to test the new sign-in interface before the mandatory transition.

> **Important**
>
> The new sign-in experience applies only to non-SAML (Connect Customer managed or existing directory) instances. If your instance uses SAML 2.0-based authentication, this change does not apply to you.

New sign-in experience features

The enhanced sign-in experience introduces the following features:

- Comprehensive AWS CloudTrail event logging for sign-in activities
- Enhanced accessibility features for all users
- Additional security measures to protect your instance

Starting April 7, 2026, all newly created instances will use the new sign-in experience by default. Existing instances can begin testing the new experience on this date.

Migration timeline

The migration to the new sign-in experience will occur in the following phases:

- **April 7, 2026** – All newly created instances will use the new sign-in experience by default.
- **July 7, 2026** – Instances that can already reach the new sign-in endpoints will be automatically migrated.
- **October 7, 2026** – Migration of all remaining instances begins and is rolled out in phases. Ensure your network configuration is updated by this date to avoid delays in migrating your instance.

Testing instructions

Before testing the new sign-in experience, allowlist the following endpoints to make sure they are accessible from your network:

- `*.apps.signin.aws`
- `*.signin.aws`
- `*.threat-mitigation.aws.amazon.com`
- `*.s3.dualstack.[Region].amazonaws.com`

  Replace *[Region]* with us-east-1, us-west-2, and the location of your Connect Customer instance.

If you are an AWS GovCloud (US) user, also allowlist the following endpoints:

- `*.signin-fips.amazonaws-us-gov.com`
- `*.apps.signin-fips.aws-us-gov.com`
- `*.apps.signin.aws-us-gov.com`

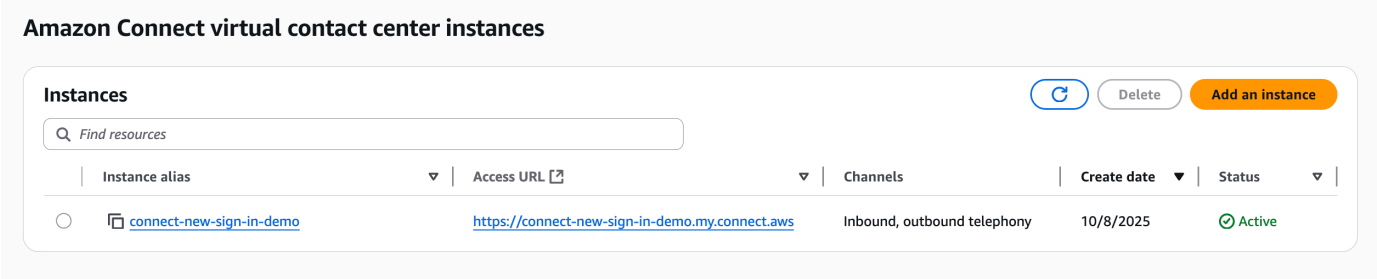
To test the new sign-in experience

1. Navigate to the Connect Customer console `https://[region].console.aws.amazon.com/connect/v2/app/instances?region=[region]`

   For example, if operating in the us-west-2 region, the URL will be `https://us-west-2.console.aws.amazon.com/connect/v2/app/instances?region=us-west-2`
2. **Locate your instance URL** – Your Connect Customer instance URL will be in one of these formats:

   - `https://[instance-alias].my.connect.aws`
   - `https://[instance-alias].awsapps.com/connect`

   You can find this in the AWS console as shown in the following image.



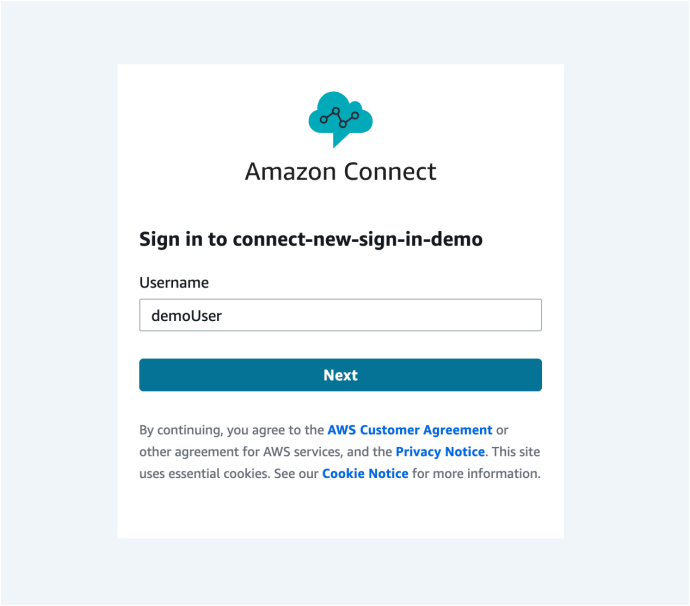
3. **Add the testing parameter** – To access the new sign-in experience, append `?use-new-experience=true` to your instance's login URL:

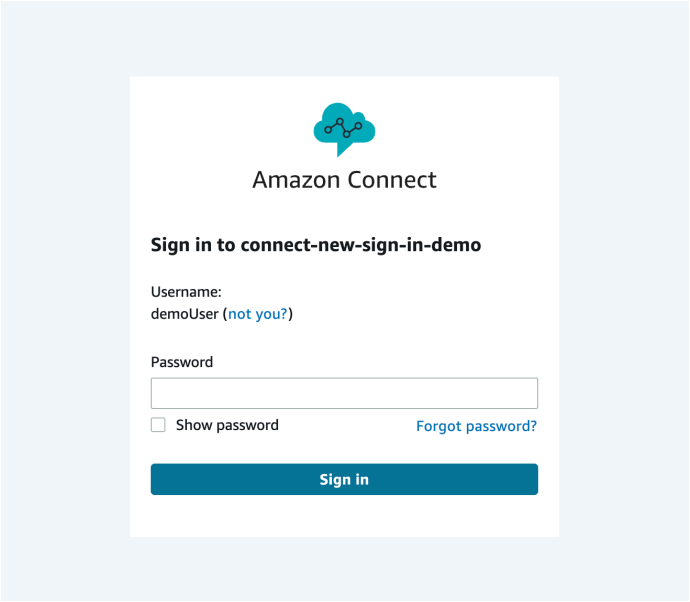
   - `https://[instance-alias].my.connect.aws/login?use-new-experience=true`

   or

   - `https://[instance-alias].awsapps.com/connect/login?use-new-experience=true`

   The new experience looks like the following:





4. **Verify access** – Navigate to the modified URL and attempt to sign in using your existing credentials. Confirm that you can successfully access your Connect Customer instance.

Testing recommendations

We recommend the following when testing the new sign-in experience:

- **Browser coverage** – Test across the browsers your agents and administrators commonly use, including Chrome, Firefox, Safari, and Edge.
- **Browser autofill** – Test your browser's saved credentials and autofill behavior on the new unified sign-in page. Confirm that your browser or password manager correctly populates the username and password fields, and that you can sign in successfully. If the fields do not autofill as expected, update your saved credentials for the new sign-in URL.
- **Network configurations** – Test from behind your corporate firewall and VPN to confirm the required URLs are accessible.
- **User roles** – Verify sign-in with different user roles, including agents, supervisors, and administrators.
- **Password reset flow** – Test the password reset process to confirm that reset emails from `no-reply@signin.aws` are received and not blocked by email filters.

Resetting a forgotten password

If you do not remember your password, you can reset it directly from the new sign-in page. You do not need to contact your administrator to regain access.

To reset your password

1. On the sign-in page, choose **Reset password**.
2. Enter your username when prompted, and then follow the on-screen instructions.
3. Check your email for a password reset message from `no-reply@signin.aws`. If you do not see the email, check your spam or junk folder. Confirm that messages from this address are not blocked by your email filters.
4. Follow the link in the email to create a new password, and then sign in using your new credentials.

Support resources

When seeking support, prepare your instance ID and document any error messages you encounter. Screenshots of issues can be helpful for faster resolution. For more information about contacting AWS Support, see the section called “Administrative support”.

FAQs

Will I need to update any configuration on my end to support this new page?

You might need to allowlist the URLs listed in the the section called “Testing instructions” section to ensure the new sign-in endpoint is accessible from your network.

Will my existing users credentials be affected in any way by this update?

No, your existing users can continue signing in with their existing credentials using the new experience.

Will the password reset email come from a different email address?

Yes, you'll receive reset password emails from `no-reply@signin.aws` going forward.

Do I need to add new IP ranges to my allowlist for the new sign-in endpoints?

Yes. You need to add the S3 IP ranges to your allowlist for us-east-1, us-west-2, and the Region where your Connect Customer instance is located. The existing EC2 and CLOUDFRONT IP ranges in the AWS ip-ranges.json file already cover the other new sign-in endpoints (`*.apps.signin.aws`, `*.signin.aws`, `*.threat-mitigation.aws.amazon.com`).

For more information about IP-based allowlisting for Connect Customer, see *Set up your network*.

Release notes for Connect Customer

We recommend subscribing to the RSS feed so updates to these notes are delivered to your Inbox. Choose the **RSS** link (under the topic title **Release notes**), and then copy the URL (it ends with `doc-history.xml.rss`) into your RSS reader. For example, you can subscribe to an RSS feed in Outlook.

November 2026 Updates

Amazon Connect Customer agent assist now supports interactive responses

Amazon Connect Customer agent assist now responds with interactive components, including cards, carousels, buttons, and input fields. The AI agent analyzes conversation context in real time, recommends actions, retrieves information, and executes tasks on behalf of contact center agents using MCP tools in Connect Customer and from third-party services. Interactive responses let agents review information, provide details, select options, and confirm actions without having to type a manual request to the AI agent for each action. The AI agent can also recommend step-by-step guides, cases, customer profiles, and third-party applications, which agents can open with the click of a button.

To learn more and get started, see agent assist.

Amazon Connect Customer rules can now end associated email contacts from a case

You can now create a rule that ends the email contacts associated with a case when the case is updated, in addition to associated tasks.

For more information, see Create a rule that ends associated email contacts from a case.

Connect Customer now supports batch actions on up to 100 cases at once

Cases in Connect Customer now lets agents and supervisors assign, comment on, and update the status of up to 100 cases at once, so teams spend less time on repetitive case updates. When one

issue affects many customers, such as a shipping delay or a service outage, teams no longer need to update each case one at a time. Agents and supervisors with the appropriate permissions can select the related cases and change the assignee, add a comment, or close them in a single action. Developers can also use batch APIs to make the same updates programmatically.

For more information, see Batch actions on Cases.

October 2026 Updates

Amazon Connect Customer now provides evaluation review data in the analytics data lake

Amazon Connect Customer now provides evaluation review data in the analytics data lake, so you can report on how agents and supervisors appeal performance evaluations. Each record shows who requested the review, who reviewed it, and whether the reviewer changed the evaluation. Use Amazon Athena and Amazon QuickSight to track review volume, approval rates, and how long reviews take to complete. For example, a quality manager can find evaluators whose evaluations are often changed on review and target them for calibration.

For more information, see Evaluation review record in the Connect Customer Administrator Guide.

Available in all AWS Regions where the Connect Customer analytics data lake is offered.

Connect Customer now publishes agent time off events to EventBridge

Connect Customer now publishes a time off event to EventBridge each time an agent's time off request changes status, so you can integrate Connect Customer scheduling with external HR systems. For example, you can route these events to a human resources system to drive a leave-approval workflow. Each event includes the request's status (one of AWAITING_APPROVAL, APPROVED, REJECTED, or CANCELLED), the agent, the time off period, and related identifiers.

For more information, see Time off event stream.

Connect Customer now automatically saves email drafts in the agent workspace

Connect Customer now automatically saves an agent's in-progress email as they compose a reply or a new outbound email in the agent workspace, so agents don't lose their work to a closed

browser or an interrupted network connection. Connect Customer saves the draft every few seconds and when the agent chooses **Save draft** from the options menu, and restores it when the agent reopens the contact. Draft auto-save requires no configuration beyond enabling the email channel.

Draft auto-save reduces the risk of agents losing work in progress. For example, an agent's network connection might drop while they compose a long reply. The agent can reopen the contact and continue from the recovered draft instead of starting over.

For more information, see Email draft auto-save in the agent workspace in the Connect Customer Administrator Guide.

Email draft auto-save is available in all commercial AWS Regions where Connect Customer email is offered.

Amazon Connect Customer now supports customizing the Customer Profiles app on the agent workspace

Amazon Connect Customer Profiles now allows administrators to customize which customer data that agents see in the agent workspace, and how it is displayed, using layouts they build in Profile Explorer. Within Profile Explorer, administrators can create and save each layout of Customer Profiles widgets, such as contact history, contact information, and lifetime value calculated attributes, and assign it to agents in place of the legacy Customer Profiles view. For example, an airline baggage claims agent sees contact history, active flights, and baggage ticket information, while a loyalty agent sees loyalty status, preferences, and upcoming flights. Layouts can also include an AI Profile Summary that focuses the agent's attention on key customer insights by summarizing the customer profile.

For more information about Profile Explorer, see Profile Explorer.

Amazon Connect Customer launches two new layouts for the agent workspace

Amazon Connect Customer now offers two different layouts that optimize screen space on the agent workspace. On the Modern layout, contact controls are at the top of the workspace, maximizing screen space for the applications beneath during voice calls. When agents handle chat, email, and task contacts on the Modern layout, they now have a taller, wider area to read and respond. The Classic layout offers a familiar experience for agents already using the agent

workspace, now with contact controls that expand and contract by channel and a resizable agent assist application.

For more information, see Choose a layout.

Connect Customer Global Resiliency now provides visibility into resiliency readiness across linked AWS Regions

Connect Customer Global Resiliency now provides a **Global Resiliency** page in the admin website, giving administrators a single place to review their Region switch readiness. The page shows an overall readiness status and lists the resources that Global Resiliency natively replicates, including which resource types are in sync, which are still pending synchronization, and which need action. For example, if a phone number or user is not associated with a traffic distribution group, the page flags it and lets the administrator associate the affected resources directly from the page. With this readiness overview, administrators can review their resiliency posture at any time and verify that their instance is ready for a Region switch.

For more information, see View your resiliency readiness in Connect Customer Global Resiliency.

Available in all AWS Regions where Connect Customer Global Resiliency is supported.

Amazon Connect Customer now prefills step-by-step guides for after contact work

Amazon Connect Customer can now fill in the step-by-step guides that agents complete after a contact, using information extracted from customer conversations, such as booking identifiers, claim numbers, and conversation summaries. Managers can set which information populates each form field. Agents can review and submit rather than manually typing in each field, saving time and improving data accuracy during after contact work.

For more information, see Prefill guides for after contact work using conversational analytics.

Connect Customer dashboards now include business outcome metrics, plus customer segments as filters and groupings

Business outcome metrics: When you use evaluation forms with business outcome questions, each contact is evaluated and scored on metrics such as CSAT, churn propensity, self-service resolution,

and successful sale. These evaluations are used to compute new metrics on your dashboards, available in the metric picker and in the business outcomes widget category. For example, you can add the Evaluated CSAT percent metric to your queue performance dashboard to see the percentage of contacts that received a satisfied CSAT score.

Customer segment filters and groupings: Two customer segment filters and groupings are available on metrics associated with individual contacts: Lifetime Value (High, Medium, or Low) and Repeat Caller. These segments are driven by default segments in Customer Profiles. The High lifetime value and Low lifetime value calculated attributes determine the lifetime value tier. Customers matching neither are classified as Medium. The Call count calculated attribute identifies repeat callers. These segments appear as new filters and groupings on metrics that are associated with individual contacts. For example, you can group the queue performance table by lifetime value to compare handle time and CSAT for high value versus low value customers.

These features are available in Connect Customer. They are not available in Connect Customer Basic.

For more information about configuring evaluation forms, see Create an evaluation form. For information about using these metrics and segments on dashboards, see Queue and agent performance dashboard. For information about the calculated attributes that drive the lifetime value and repeat caller segments, see Default calculated attributes.

Amazon Connect Customer now provides automated checks to improve performance evaluation forms

Amazon Connect Customer now checks performance evaluation forms for questions that AI cannot score reliably. A question clear to a person can still lack the context AI needs, and managers had no quick way to find those gaps. While setting up a form, a manager runs a one-click check against best practices and receives a list of questions to make more specific. For example, the check might flag "Did the agent provide a sales disclosure?" and prompt the manager to define exactly what must be disclosed before a sale.

For more information, see Create an evaluation form in the Connect Customer Administrator Guide.

Available in US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Singapore), Asia Pacific (Sydney), and Asia Pacific (Tokyo).

September 2026 Updates

Amazon Connect Customer now supports invoking a flow module as a data request in the agentic CX designer

With Connect Customer, you can now invoke an Connect Customer flow module as a data request in the agentic CX designer. This lets a conversational AI application reuse existing flow module logic during a voice or chat conversation instead of rebuilding that logic. For example, a data request can call a flow module that looks up a customer's account details and returns the result to the conversation.

For more information, see Data requests.

Available in US East (N. Virginia), US West (Oregon), Asia Pacific (Tokyo), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), Europe (Frankfurt), and Europe (London).

Amazon Connect Customer now lets agents preview attachments in the agent workspace

Agents can now preview attachments on an email contact, a chat contact, or a case directly in the Connect Customer agent workspace, without downloading them to their device. Previewing reduces the risk of customer files being retained on agent machines, and it is faster than a download-then-open round trip. PDF, image, and common text file types are rendered inline. Any other file type is shown with its details and a download button, and can still be downloaded as usual.

Preview requires no configuration beyond enabling attachments for your instance. For more information, see Preview attachments in the agent workspace in the Connect Customer Administrator Guide.

Available in the AWS Regions where Connect Customer is offered.

Connect Customer Global Resiliency now routes contacts across two active AWS Regions

Connect Customer Global Resiliency now supports routing contacts to agents across paired ACGR Regions. For example, a contact arriving in US East (N. Virginia) is offered to the longest-available

matching agent whether that agent is in US East (N. Virginia) or US West (Oregon), while managers view analytics and search contacts across both Regions as a unified contact center. When agents and contacts are distributed across both Regions, your full configuration and any integrations are continuously validated with live traffic in both Regions at all times, providing confidence that either environment is ready to absorb the full workload. You retain full control over how traffic is distributed, and can shift new contacts and agents to a single Region or disable cross-region routing at any time.

To request access to this feature, contact your AWS account team. Unified routing, analytics, and contact search are now enabled by default for all new ACGR instances created on or after September 1, 2026. Existing ACGR instances can opt into this feature set on request. For more details, see Global routing across ACGR Regions.

Amazon Connect Customer now sets concurrency limits by workload type for Tasks and Emails

With Connect Customer, you can now set concurrency and interruption limits for specific kinds of Task and Email work instead of applying one limit to an entire channel. A single channel-level limit forced a tradeoff: set it low to protect agents on complex contacts and you throttle throughput on simple ones; set it high and agents get buried in the hard ones. You can now classify Task and Email contacts into workload types by complexity, priority, or business function, and give each its own limits. For example, agents can take up to 3 simple, low-effort Tasks at once while complex, high-attention Tasks are capped at 1.

On the channels and concurrency page, define your workload types and set each one's limits. For more information, see the Amazon Connect Administrator Guide.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer is offered.

Amazon Connect Customer announces general availability of Agentic CX designer

With Connect Customer, you can now build voice and digital customer experiences on Agentic CX designer, a no-code conversational canvas, without the rigid menus that leave complex problems unsolved. On a visual canvas, business teams pair the open-ended conversations of agentic AI with deterministic steps for the moments that must go exactly right, such as authentication, verification, and required disclosures. This handles cases rigid menus never could, like a complex insurance

claim or a transaction dispute, while keeping control where it matters. For example, a business team can take an experience from design to production in weeks rather than months.

For more information, see Agentic CX designer.

Available in US East (N. Virginia), US West (Oregon), Asia Pacific (Tokyo), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), Europe (Frankfurt), and Europe (London).

Amazon Connect Customer now supports compact mode on analytics dashboards

With Connect Customer, supervisors can now see more operational data at once without scrolling, using compact mode on analytics dashboards. Compact mode reduces widget size and font and minimizes filters to maximize screen space. For example, a supervisor on a 13-inch laptop can toggle compact mode to view all team agents on a single widget and spot non-adherent agents faster.

On the dashboard page, turn on the Compact mode toggle.

For more information, see Analytics dashboards.

Available in all AWS Regions where Connect Customer is offered.

Amazon Connect Customer now supports Malay for automated performance evaluations

Connect Customer now supports Malay for generative AI performance evaluations of human and AI agents, so multilingual contact centers can apply a consistent evaluation framework across more of their workforce. Managers specify their evaluation criteria in natural language and receive AI-generated evaluations with justifications.

For more information, see generative AI performance evaluations.

Available in the AWS Regions where Connect Customer performance evaluations are offered.

Connect Customer now returns chat connection information from StartChatContact

With Connect Customer, you can now get a chat participant's connection information in the same call that starts the chat. Request the connection types you want on `StartChatContact`, and

the response returns a websocket URL, a connection token, or both. Requesting a websocket URL saves your back end a round trip. Your client connects to that URL instead of calling `CreateParticipantConnection` to connect the participant. Your customers wait less time before the chat window is ready to use.

The same request can also start real-time message streaming. Supply a streaming configuration, and the response returns a streaming identifier. Your back end does not call `StartContactStreaming`.

Both request members are optional, so existing chat integrations are unaffected.

For more information, see the StartChatContact API.

Available in all AWS Regions where Connect Customer is offered.

Amazon Connect Customer Customer Profiles now sends events when customers enter or exit a segment

Amazon Connect Customer Customer Profiles now sends an event the moment a profile enters or exits a segment. Detecting those changes previously meant exporting whole segments on a schedule and running custom scripts to compare them, adding hours of delay.

Customer Profiles now streams each change to your Amazon Kinesis data stream, in near real time for Classic segments and at scheduled intervals for Enhanced (Spark SQL) segments. Each event carries the profile ID, segment name, and whether the customer joined or left. For example, the instant a customer who abandoned their cart enters a win-back segment, your contact center can launch a proactive offer.

For more information, see Track segment membership changes in the Connect Customer Administrator Guide.

Available in all AWS Regions where Amazon Connect Customer Customer Profiles is offered.

Amazon Connect Customer now enables agents to bid on preferred shifts

Amazon Connect Customer now lets agents bid on the shifts they prefer, reducing the manual assignment work schedulers did before. Schedulers set an agent ranking by CSV or randomized order, Connect Customer generates available shifts from forecasted demand and shift profiles, and agents rank their preferences in the agent workspace before the deadline. When the window

closes, each agent is assigned their highest-ranked available shift, with the ranking as tiebreaker. For example, a scheduler opens a bid across nine-hour shifts in a weekday 6 AM to 10 PM profile, and agents rank them.

For more information, see Shift bidding in the Connect Customer Administrator Guide.

Available in all AWS Regions where Connect Customer agent scheduling is offered.

Amazon Connect Customer can now import evaluation form PDFs using AI

Amazon Connect Customer can now import a PDF of an evaluation form from a third-party quality application and recreate it using AI, instead of rebuilding it question by question. You upload the PDF, choose percentage or points-based scoring, and Connect Customer extracts the sections, questions, answer options, and scoring into a draft form. Natural language instructions refine the import as it runs. For example, you can ask it to split one broad question into two simpler ones while the form is generated.

For more information, see Create an evaluation form in the Connect Customer Administrator Guide.

Available in US East (N. Virginia), US West (Oregon), Canada (Central), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Europe (Frankfurt).

Amazon Connect Customer now lets you create, manage, and search custom metrics through APIs

Amazon Connect Customer now lets you create, manage, and search custom metrics through APIs, so definitions stay consistent instead of drifting as you manage them by hand across instances. Seven new operations (CreateMetric, DeleteMetric, DescribeMetric, ListMetrics, SearchMetrics, UpdateMetricContent, UpdateMetricMetadata) let you define a metric once and manage it programmatically across queues, teams, and environments, with every change tracked in AWS CloudTrail. For example, you can define a metric for interactions where customers abandon and request a live agent within 90 seconds, then create and publish it to a dashboard through the API.

For more information, see the Connect Customer API Reference and the Connect Customer Administrator Guide.

Available in all AWS Regions where Connect Customer is offered.

Amazon Connect Customer now supports tag-based access control for custom metrics

Amazon Connect Customer now supports tag-based access control for custom metrics, so you can govern who can view, create, or modify each one as more teams share the same library. Tag each metric and use those tags to set access: a team gets full control of its own metrics, view-only access to another team's, and no visibility into the ones you restrict. Search follows the same rules, so people only see what they are allowed to. For example, you can give a partner team view-only access to your metrics while hiding a restricted set entirely.

For more information, see the Connect Customer API Reference and the Connect Customer Administrator Guide.

Available in all AWS Regions where Connect Customer is offered.

Amazon Connect Customer launches agent-to-agent collaboration

Amazon Connect Customer now supports agent-to-agent collaboration, so you can bring specialized AI agents into a live interaction to resolve a request. Connect Customer AI agents can collaborate with each other, and with AI agents outside Connect Customer, over the open A2A protocol through text or bidirectional voice, while Connect Customer coordinates context passing with unified observability, guardrails, and escalation.

Administrators see one contact record showing what each agent said, which tools it called, and how long each step took. For example, a bank's frontline AI agent can delegate a fraud risk assessment to a specialist scoring agent, approve the transaction on the result, then hand a complex dispute to another AI agent that resolves it with the customer.

For more information, see the Connect Customer Administrator Guide.

Available in the AWS Regions where Connect Customer is offered.

Amazon Connect Customer now provides routing step data in the analytics data lake

Amazon Connect Customer now provides routing step data in the analytics data lake, so you can analyze routing decisions without building complex data pipelines. Use Amazon Athena and Amazon QuickSight to report on trends such as contacts queued and contacts joined at each routing step. For example, an analyst can trace how contacts progressed through each step,

identify where agent matching criteria were relaxed, and measure the effect on wait times and agent utilization.

For more information, see the Connect Customer Administrator Guide.

Available in all AWS Regions where the Connect Customer analytics data lake is offered.

Amazon Connect Customer now supports larger data tables and bulk editing with CSV import and export

Amazon Connect Customer now supports larger data tables and CSV import and export. Data tables hold the reference information that drives contact flows, such as operating hours, escalation rules, AI agent prompts, and queue assignments, but they could not hold everything flows needed and every record had to be edited by hand.

Business users can now work with up to 20,000 values per table, four times the previous limit. Administrators can export a table, edit it in a tool such as Excel, and re-import it, which also moves a table between staging, QA, and production without rebuilding it and provides a point-in-time backup. For example, you can export a production table, revise hundreds of queue assignments in a spreadsheet, and re-import to apply them at once.

For more information, see Create and configure data tables in the Connect Customer Administrator Guide.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer is offered.

Amazon Connect Customer announces Live Sync and Touchpoint

Amazon Connect Customer announces the general availability of Live Sync and Touchpoint. Live Sync drives a customer's web or mobile experience in real time during a voice or chat conversation, turning a spoken exchange into a guided task. Touchpoint is an embeddable conversational surface that combines voice and chat with rich visual elements including carousels, cards, forms, and video. For example, a customer calling to start a loan application can have Live Sync's AI walk them through the form and fill fields on their behalf, confirming each step by voice without leaving the call.

For more information, see Using the Live Sync agent node in the Connect Customer Administrator Guide.

Available in US East (N. Virginia), US West (Oregon), Canada (Central), Asia Pacific (Tokyo), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Europe (Frankfurt), and Europe (London).

August 2026 Updates

Connect Customer now supports pagination on analytics dashboard widgets

Connect Customer now supports paginating directly within dashboard widgets, enabling you to navigate through large datasets without leaving the widget view. With this launch, table-based widgets display built-in page navigation controls, allowing users to browse through records page by page. For example, a supervisor monitoring hundreds of queues can now page through the full queue list directly within the widget, identifying queues that need attention faster.

For more information, see Widget pagination.

Connect Customer now supports viewing chart widgets as tables on analytics dashboards

Connect Customer now enables you to view chart widgets as tables on analytics dashboards, allowing you to see exact metric values broken down by time intervals. With this capability, you can toggle any chart widget to a table view to analyze precise metric data across 15-minute, daily, weekly, or monthly intervals. For example, a workforce manager reviewing the average queue answer time trend can switch to table view to see exact handle times for each date interval, making it easier to identify specific periods of performance degradation and take corrective action.

For more information, see Toggle between table and bar chart.

Connect Customer now establishes the persistent connection when the agent logs in

When you select **Enable persistent connection** for an agent, the agent's softphone maintains its media connection to Connect Customer for a few minutes after login and after each call ends. This enables subsequent calls to connect faster. If the agent remains idle for an extended period of time, the softphone drops the media connection to reduce agent workstation and network resource consumption. This does not impact the agent's ability to receive calls. The media connection is re-established when the agent receives the next call.

To learn more, see Enable persistent connection.

Amazon Connect Customer now lets managers chat with their data (Preview)

With Connect Customer, managers can now ask questions about their contact center in plain language and get back the answer, the evidence behind it, and a recommended next step in seconds, instead of digging through dashboards to work out what is driving performance. It searches across more than 150 metrics spanning self-service, agent performance, and queue performance to surface what matters, explain why, and recommend what to do next. For example, a manager can ask which queues are the best candidates for automation and receive a prioritized list with confidence scores and projected impact, based on where handle time and after-contact work run highest.

This capability is in preview. For more information, see Manager assist in Connect Customer.

Available in all AWS Regions where Connect Customer AI Agents are supported.

Amazon Connect Customer now automatically refreshes scheduling metrics

With Connect Customer, managers now see the impact of a schedule change right away, because schedule metrics on the scheduling page refresh on their own in under a minute instead of requiring a manual refresh. Metrics such as net available headcount and projected service level update automatically as changes are made. For example, when a new team meeting is added for 10 agents from 10 AM to 11 AM, the affected metrics update on their own so managers can make faster, informed decisions throughout the day.

For more information, see Forecasting, capacity planning, and scheduling.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Amazon Connect Customer now supports unplanned shrinkage in agent schedules

With Connect Customer, managers can now account for unscheduled absences such as late logins or unplanned sick leave, giving a more accurate picture of staffing than a schedule that assumes everyone is present. Managers upload unplanned shrinkage assumptions directly into a schedule

and immediately see scheduled headcount, net staffing, and projected service level adjusted for it. For example, if 10% of the agents scheduled at 8 AM next Monday are expected to be unavailable, projected service level falls from 90% to 85%, so managers can proactively address the gap.

On the Published calendar page under Scheduling, upload unplanned shrinkage data from the Actions menu, and scheduling metrics refresh automatically.

For more information, see Forecasting, capacity planning, and scheduling.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Amazon Connect Customer now supports points-based scoring in performance evaluations

With Connect Customer, managers can now score evaluations by assigning points to each criterion based on its importance to the business, rather than balancing weights that must add up to 100% as in percentage-based scoring. The score is the sum of the points earned, and managers can combine criteria into one question, exclude the call reason from scoring, or award bonus points. For example, an evaluation might award 40 points for resolving the customer's problem, 20 for meeting compliance requirements, and 10 for a proper greeting.

For more information, see points-based scoring.

Available in the AWS Regions where Connect Customer performance evaluations are offered.

Amazon Connect Customer now lets you update the customer profile on a case

With Connect Customer, agents can now change the profile on a case or add one after the case is opened, so case histories stay accurate even when the wrong profile was linked or none was identified at creation. If a case is linked to the wrong customer, agents can update the profile, and for a contact such as a call from a shared phone number, agents can add the profile once the customer is identified. For example, an agent verifying a caller's identity partway through a contact can attach the correct profile once confirmed.

For more information, see Cases in Connect Customer.

Available in US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Africa (Cape Town).

Amazon Connect Customer now supports information extraction for voice and chat conversations

With Connect Customer, you can now capture key data from voice and chat interactions automatically, reducing manual data entry and freeing agents and supervisors to focus on the customer. Information extraction captures verbatim values such as account numbers, reservation IDs, and product names, as well as derived insights such as reason for contact, resolution provided, and next steps promised. You define conversational analytics rules for what to extract, and because extraction runs on raw content before redaction, you can capture the values you need while still redacting sensitive data. For example, an extracted account number can flow directly into a rule action that creates a case, turning an unstructured conversation into an automated workflow.

For more information, see Information extraction.

Available in the AWS Regions listed in availability of Connect Customer features by Region.

Amazon Connect Customer now supports reporting on routing steps and agent proficiencies

With Connect Customer, supervisors can now monitor and optimize how contacts are matched to agents, using new dashboard reporting on routing steps and agent proficiencies. Supervisors can filter agents by their assigned proficiencies, group metrics by routing step, and track new metrics such as the number of contacts queued in a routing step. For example, a supervisor who sees a spike in contacts queued at a step requiring highly skilled agents can relax the routing criteria to expand the agent pool and reduce wait times.

For more information, see Analytics dashboards.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer is offered.

Amazon Connect Customer now supports manual assignment of queued agent-first callbacks

With Connect Customer, agents can now view and self-assign queued agent-first callbacks alongside emails, tasks, and chats, so they can prioritize follow-ups that need immediate attention or where they already have context. No new permissions are required, because the same security

profile and routing profile settings that enable manual assignment for emails, tasks, and chats now apply to agent-first callbacks. For example, an agent already familiar with a customer's issue can assign the callback to themselves from the Worklist app, avoiding another handoff.

For more information, see Set up queued callbacks.

Available in the AWS Regions where Connect Customer manual assignment is offered.

Amazon Connect Customer launches a performance dashboard for Cases

With Connect Customer, managers can now monitor case volume, resolution trends, and performance against service level agreement (SLA) targets from a dedicated Cases performance dashboard. Managers can compare current and prior-period performance across metrics such as cases created, average resolution time, first-contact resolution percentage, and SLA achievement rate, and analyze trends by case template, assigned user, or assigned queue. For example, a manager can see that the billing team missed more SLA targets for refund cases than in the prior period and prioritize process improvements.

For more information, see Cases performance dashboard.

Available in US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Africa (Cape Town).

Amazon Connect Customer now provides schedule adherence metrics on dashboards

With Connect Customer, supervisors can now see how well agents followed their schedules, using historical adherence metrics on dashboards including scheduled time, adherent time, non-adherent time, and adherence percentage. You can group these metrics by shift activity, such as work, break, or training, to understand adherence patterns across an agent's day. For example, a supervisor reviewing weekly performance can identify that an agent consistently returns late from lunch and follow up with targeted coaching.

For more information, see Analytics dashboards.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Amazon Connect Customer now supports one-click drill-down on real-time metrics dashboards

With Connect Customer, you can now move from a summary view to a pre-filtered routing profile, queue, agent, or routing step widget in one click, without building a new widget. When a widget is grouped by queue or routing profile, a drill-down menu next to each resource creates the filtered widget you choose. For example, a supervisor who sees a spike in queue wait times can drill down to agent activity for that queue and reassign agents to reduce the backlog.

For more information, see Analytics dashboards.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer is offered.

Amazon Connect Customer now supports capacity planning in 15 or 30 minute intervals

With Connect Customer, workforce planners can now see staffing requirements at the interval level, generating capacity plans in 15-minute or 30-minute intervals across voice, chat, task, and email. Interval-level plans capture how demand shifts through the day, such as a lunchtime surge in chats or an end-of-day change in call volume, so you can staff precisely for each part of the day and reduce over- and under-staffing. For example, a planner can provide shrinkage assumptions and available headcount per interval and see required headcount and net staffing with and without shrinkage applied.

For more information, see Capacity planning in Connect Customer.

Available in all AWS Regions where Connect Customer agent scheduling is available.

July 2026 Updates

Connect Customer now supports bulk user management enhancements

With Connect Customer, you can now reskill your workforce during volume spikes without repetitive individual edits or custom API scripting. Make granular bulk edits to proficiencies, contact handling settings, and tags, by using add, remove, or partial replace operations.

On the **User management** page, select all users with a single click, choose an attribute, and submit your changes. Edits run in the background while you queue more batches, and the **Activity** page tracks operations with stop, resume, and retry controls.

For more information, see Edit users in bulk.

Available at no additional cost in all AWS Regions where Connect Customer is offered.

Connect Customer now supports external recording analytics

With Connect Customer, you can now import voice recordings from third-party systems, store them as contacts, and run conversational analytics on them, consolidating insights across every voice interaction in one place regardless of where the call originated. This is especially useful during a migration, where you can bring analytics to Connect Customer on day one without changing your voice traffic and import historical recordings so agents find earlier contacts directly in Connect Customer.

The feature uses a simple API workflow to import recordings from Amazon Simple Storage Service and run analytics jobs.

To learn more, see the Connect Customer API Reference.

Available in all AWS commercial Regions where Connect Customer is available. Standard external voice charges apply. This feature is not available in Connect Customer Basic.

Connect Customer adds workforce forecasting and scheduling for tasks and emails

Connect Customer now supports forecasting, capacity planning, and scheduling for tasks and emails. You can plan and optimize your entire workforce across voice, chat, tasks, and emails in a single solution, eliminating the need for manual spreadsheets or third-party tools. Connect Customer accounts for the distinct characteristics of each channel—including concurrent work handling, durations that range from minutes to months, and separate service-level requirements—so a single unified forecast and schedule reflect how your operation actually runs.

To learn more, see Forecasting, capacity planning, and scheduling.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Connect Customer now delivers more natural agentic voice experiences

Connect Customer now delivers more natural, human-sounding agentic voice experiences, so AI agents can hold smoother, more responsive conversations with your customers. This launch expands support to more than 50 languages, including Spanish, French, Italian, Japanese, Korean, Portuguese, and Thai, and adds over 100 new voice options.

Conversational improvements make interactions feel immediate rather than halting: seamless response pacing fills natural pauses, more accurate turn-taking keeps agents and customers from talking over each other, and speech controls let you adjust speed, volume, and emotion to match your brand's tone.

To learn more, see Supported languages.

Available in the AWS Regions listed in the availability of Connect Customer features by Region.

Connect Customer now displays agent queue metrics on analytics dashboards

Connect Customer analytics dashboards now display real-time and historical metrics for agent queues. Agent queues route contacts directly to a specific agent, so supervisors can track how individual agents perform in their own queues and respond to buildups before they cause long wait times. For example, a supervisor who notices a spike of contacts queued to a specific agent after a series of scheduled callbacks can reassign them to keep service levels on track.

To view these metrics, open the **Current queue performance** widget, select the **Queue** filter chip, and choose **Agent queue**. Then select one or more agents or an agent hierarchy level and choose **Apply**.

To learn more, see Analytics dashboards.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer is offered.

Optimize Connect Customer audio for Azure Virtual Desktop and Windows 365

You can deliver high-quality voice experiences in Azure Virtual Desktop (AVD) and Windows 365 Virtual Desktop Infrastructure (VDI) environments. Using Microsoft Multimedia Redirection (MMR),

Connect Customer redirects audio from the session host to the agent's local device, improving audio quality by reducing network hops. Connect Customer now supports Azure Virtual Desktop as an audio optimization VDI platform, alongside Citrix, Omnissa, and Amazon WorkSpaces. To learn more, see Azure Virtual Desktop and Windows 365.

Export cases to CSV

You can export cases from the agent workspace to CSV files. Search for cases, select one or more, and choose **Export**. Use the exported CSV file with spreadsheet applications such as Microsoft Excel or Google Sheets.

When you export cases, you can choose which columns to include, such as status, title, and custom fields. The columns you select determine which case data appears in the file.

You can use the exported CSV file to do the following:

- Generate reports from case data
- Share case data with stakeholders outside the agent workspace
- Analyze case data offline in a spreadsheet application

To use this feature, you must have the **Cases - Export** permission in your security profile. To learn more, see Export cases to CSV.

Amazon Connect Customer now automatically finds example evaluations for coaching

With Connect Customer, managers preparing coaching feedback now get relevant examples of an agent's evaluations surfaced automatically, so they can ground coaching in specific contacts without searching for them by hand. For example, a manager coaching an agent on compliance can immediately see recent evaluations where that criterion was missed and walk through them together.

For more information, see performance evaluations.

Available in the AWS Regions where Connect Customer performance evaluations are offered.

Amazon Connect Customer Outbound Campaigns now supports digital channels in the Africa (Cape Town) Region

With Connect Customer, businesses in the Africa (Cape Town) Region can now run proactive, personalized outreach over digital channels, as Outbound Campaigns support for SMS, WhatsApp, and email is now available in the Region. You configure and manage campaigns through the Connect Customer admin website and Outbound Campaigns APIs, with built-in analytics and event-based triggers. For example, a retail business can segment customers by purchase behavior and start a campaign automatically when a customer completes a purchase or misses an appointment.

For more information, see Outbound campaigns.

Available in the Africa (Cape Town) Region.

June 2026 Updates

Connect Customer now supports up to seven security profiles with access control per user

You can now assign up to seven security profiles with access control to a single user, increased from the previous limit of two. A user can have additional security profiles beyond seven, as long as those profiles do not contain access control tags or enforce hierarchy-based access control. An agent who serves multiple lines of business can hold a distinct, scoped permission set for each one rather than relying on a single overly broad profile. Each profile grants access only to the resources for its division, keeping permissions aligned to least privilege and reducing the administrative overhead of workarounds such as duplicating agents across instances.

To learn more, see Security profiles.

Available in all AWS Regions where Connect Customer is offered.

Connect Customer now supports rule-based redaction for agent screen recording

With Connect Customer, you can now protect sensitive information in agent screen recordings by defining rules that redact specific applications or URLs. PII and payment details stay hidden from

anyone who later reviews recordings for compliance or coaching. Previously, the only option was to pause screen recording entirely through customer-built triggers. That approach over-redacted by stopping all recording rather than targeting the sensitive content, and it added onboarding complexity.

You configure redaction in a **Set recording, analytics, and processing behavior** block by specifying which URLs or applications to mask. When an agent views a matching page or window, Connect Customer masks only that window in the recording. The rest of the screen remains visible, with no custom development required. A redacted recording is stored alongside the unredacted original under separate Amazon Simple Storage Service prefixes, so you can grant access to each version independently through security profile permissions.

To learn more, see Rule-based redaction for agent screen recordings.

Available in all AWS Regions where Connect Customer screen recording is offered.

Connect Customer now supports the Interrupt agent flow block

Connect Customer now lets you route a contact to a specific agent even if that agent is at maximum concurrency or in a custom status, ensuring time-sensitive interactions reach the right person without waiting for availability. For example, an agent handling routine service calls can still receive a callback on their personal extension the moment it comes in, then decide whether to place their current caller on hold to take it.

You configure the behavior in a Customer queue flow by specifying the target agent manually or dynamically through contact attributes, and the routing engine handles the override. This works across voice, chat, task, and email channels.

Available in all AWS Regions where Connect Customer is offered. To learn more, see Interrupt agent.

Connect Customer now uses generative AI to evaluate self-service interactions

Connect Customer now enables managers to use generative AI to automatically evaluate the quality of self-service (AI agent) interactions, using the same evaluation framework already available for human agents. As AI agents handle a growing volume of customer contacts, this gives you a scalable way to monitor quality and identify where your AI agents need improvement without manual review of every transcript.

You define evaluation criteria in natural language within evaluation forms, such as “Were all of the customer’s issues resolved by the AI agent?” Connect Customer applies that criteria across self-service interactions automatically, providing detailed reasoning and relevant reference points from the conversation transcript for each score. Managers can review results in aggregate to identify systemic issues, or drill into individual contacts alongside interaction recordings and transcripts.

To learn more, see generative AI performance evaluations.

Available in all AWS Regions where Connect Customer performance evaluations are available.

Connect Customer now provides schedule update notifications

Agents and supervisors now receive automatic notifications when schedules change, rather than having to repeatedly check for updates themselves. You can define rules to send email or text notifications when new schedules are published, when existing schedules are updated, or when an agent’s leave request status changes. This eliminates manual notification effort for schedulers and ensures agents know immediately when something that affects their day has changed.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Connect Customer now supports up to 5,000 agents per schedule

You can now schedule entire business units, or multiple units that share agents, within a single schedule run. Connect Customer agent scheduling now supports up to 5,000 agents per schedule, up to 350 agents per staffing group, and up to 300 staffing groups per forecast group. Previously, organizations with large or multi-skilled workforces had to split scheduling across multiple runs or maintain separate schedules for shared agent pools, which introduced operational complexity and prevented the optimizer from working across the full workforce.

To learn more, see Amazon Connect feature specifications.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Connect Customer now optimizes placement of ad-hoc activities in agent schedules

When adding non-productive activities such as training sessions or team meetings to agent schedules, Connect Customer now automatically identifies the optimal time for each activity while minimizing impact to service level goals. You specify constraints (anytime within the shift, within a

specific time window, or relative to shift start/end) and the system handles placement. Previously, supervisors had to manually scan schedules for available windows, which was time-consuming and often resulted in unnecessary service-level degradation.

To learn more, see Add activities to agent schedules.

Available in all AWS Regions where Connect Customer agent scheduling is available.

Connect Customer now offers AI agent trace details for self-service voice

Connect Customer now provides step-by-step traces showing how AI agents reason, act, and respond during self-service voice interactions, giving you full visibility into every decision an AI agent makes on a customer call. If an AI agent fails to resolve a request, you can drill into the trace directly from the contact details page, alongside the full transcript, and see whether it reasoned incorrectly, called a tool with bad parameters, or timed out waiting for a response.

From the AI agent performance dashboard, you can filter contacts by AI agent name, escalation status, or intent, then navigate into any individual interaction to inspect each reasoning step, including the model used, latency, tool parameter inputs, and model output. No developer access or raw API log parsing is required.

To learn more, see AI agent traces.

Available in all AWS Regions where Connect Customer is offered.

Connect Customer now supports real-time dashboard alerts from conversational analytics

Connect Customer now alerts supervisors directly on the real-time analytics dashboard when specific keywords, phrases, or sentiment patterns are detected during live calls and chats. When a customer says something like “cancel my account,” a supervisor sees the alert on the Current agent performance widget, can listen in to the live conversation while viewing the real-time transcript and sentiment analysis, and coach the agent to resolve the issue before the customer churns. You set up alerts by enabling real-time analytics in your flow and creating rules that define which conversational signals should trigger a notification.

To learn more, see real-time conversational analytics alerts.

Available in all AWS commercial Regions and the AWS GovCloud (US-West) Region where Connect Customer conversational analytics is offered.

Connect Customer expands post-contact summaries to eight new languages

If your contact center handles conversations in multiple languages, agents and managers no longer need to read full transcripts or request translations to understand what happened on a call. Connect Customer now generates AI-powered post-contact summaries in eight additional language families: Portuguese, French, Italian, German, Spanish, Chinese, Japanese, and Korean. Summaries are produced in the language of the original conversation automatically, and also now support non-US English variants including British English and Australian English, reflecting locally appropriate spelling and terminology.

To learn more, see post-contact summaries.

Available in all AWS Regions where Connect Customer is offered.

May 2026 Updates

Connect Customer now supports conversational analytics for email

Connect Customer now brings the same analytics capabilities available for voice and chat to the email channel, giving managers visibility into email interactions without manual review. Emails are automatically categorized, summarized, and scanned for sensitive data, so you can spot trends, maintain compliance, and evaluate agent performance consistently across every channel.

You can configure automatic redaction of sensitive information like credit card numbers or social security numbers before storage. You can create rules that act on analytics results, for example auto-categorizing billing disputes or generating follow-up tasks when a complaint is detected. To enable, add the *Set recording, analytics and processing behavior* block to your email flows.

For more information, see Set recording, analytics and processing behavior.

This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), and Asia Pacific (Tokyo).

Cases now lets you edit related items and delete cases from the agent workspace

Agents can now update comments, unlink contacts associated with the wrong case, delete cases opened in error, and manage custom related items (such as orders, returns, or invoices) directly from the agent workspace. Previously, correcting these kinds of errors required API calls by an administrator, meaning agents had to submit a request and wait for manual cleanup. Agents can now fix their own mistakes in real time, reducing time to resolution and eliminating unnecessary escalations to internal admin teams.

For more information, see Edit a case in Amazon Connect.

This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Africa (Cape Town).

Connect Customer now lets agents view only their own performance evaluations

You can now give agents access to their own performance evaluations without also exposing peer evaluations or restricting which contacts they can see. Previously, evaluation access and contact access were coupled, meaning senior agents who needed access to peer contacts for escalation handling or training were forced to either see everyone's evaluations or see only their own contacts. This launch separates the two, so you can grant broad contact visibility while keeping performance data private to each individual.

For more information, see Evaluation forms security profile permissions.

Available in all AWS Regions where Connect Customer is offered.

Connect Customer now supports granular access controls for the agent login/logout report

You can now restrict the agent login/logout report so team managers only see data for their own direct reports, rather than every agent in the instance. Connect Customer supports both tag-based and hierarchy-based access controls for this report, so you can enforce privacy and compliance requirements that match your organizational boundaries without removing access to the report entirely.

For more information, see Login/Logout reports for agents.

Available in all AWS Regions where Connect Customer is offered, including the AWS GovCloud (US-West) Region.

Connect Customer Service-Linked Role now supports all Customer Profiles APIs automatically

New Connect Customer Customer Profiles features are now available to you the moment they launch, with no waiting period. Previously, each new Customer Profiles API required a separate permission update to the Connect Service-Linked Role (SLR) before customers could use it, meaning new capabilities were often inaccessible for weeks after launch even when the underlying feature was ready. The SLR now uses a consolidated permission model that covers all current and future Customer Profiles APIs automatically.

For more information, see Service-linked roles for Amazon Connect Customer Profiles.

Available in all AWS commercial Regions where Connect Customer Customer Profiles is offered.

Default Step-by-Step Guides now available for After Contact Work

Connect Customer now supports default Step-by-Step Guides for After Contact Work (ACW), enabling administrators to automatically launch a guide when an agent enters the ACW state. This eliminates the need for agents to manually navigate to the correct application during wrap-up, standardizing post-contact workflows such as logging disposition codes, updating cases, and completing follow-up actions. Organizations can improve consistency, reduce errors, and accelerate agent productivity across contact center operations.

This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (London), and the AWS GovCloud (US-West) Region. For more information, see Enable smart default guides for ACW.

Outbound Campaigns now supports multi-contact time zone detection

Connect Customer Outbound Campaigns now detects customer time zones using all phone numbers and addresses on a customer profile, not just the primary contact fields. When a profile's contact information spans multiple time zones, the system delivers messages only during hours that fall within the configured window across every detected time zone, and skips profiles when no overlap exists. For example, if a customer has a mobile number in Eastern time and a business

number in Pacific time with a 9 AM–5 PM delivery window, messages are sent only between 12–5 PM ET when both time zones overlap.

This capability is available in all AWS Regions where Connect Customer Outbound Campaigns is offered at no additional cost.

Cases now supports customer profile identity resolution

Connect Customer Cases now automatically reassociates cases when duplicate customer profiles are merged through Identity Resolution in Customer Profiles. When the same customer has multiple profiles—such as when they reach out through different channels or provide different contact details—Identity Resolution detects and merges those duplicates, and Cases brings all associated cases together under the unified profile. Agents see a complete case history for each customer without searching across profiles or piecing together history manually.

This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Africa (Cape Town).

Amazon Connect Customer AI assistant is now available in the UI builder

With Connect Customer, you can now create and modify agent workspace views using natural language, as the Connect assistant is now integrated within the UI builder. You describe the view you want, and the assistant generates the corresponding UI components for you to review before saving. For example, a manager can ask for a feedback form with rating and comment fields and get a ready-to-review layout without hand-building each component.

For more information, see Use the Connect assistant in the UI builder.

Available in the AWS Regions where the Connect Customer UI builder is offered.

April 2026 Updates

Connect Customer increases attachment file sizes and adds custom file types

Connect Customer now supports attachment file sizes up to 100 MB for chat, cases, and tasks, up from the previous 20 MB limit. Administrators can enable these higher limits and configure custom

file extensions for attachments across chat, email, cases, and tasks through the Connect Customer admin website or Connect Customer APIs.

For more information, see Enable Attachments.

Supervisor agent activity status changes now logged to AWS CloudTrail

Connect Customer now provides audit logging for agent activity status changes made through analytics dashboards to AWS CloudTrail. This enhancement provides visibility into who changed agent activity status and when changes occurred, helping contact centers maintain clear audit trails. For example, if a supervisor changes an agent's status from "Available" to "Break," this action is now captured in AWS CloudTrail with details including the supervisor's identity, timestamp, and the specific status change.

This feature is available in all AWS commercial and AWS GovCloud (US) regions where Connect Customer is offered.

Eight new metrics to measure and improve AI agent performance

Connect Customer now provides eight new metrics to measure and improve AI agent performance, including goal success rate, faithfulness score, and tool selection accuracy. These metrics offer visibility into the quality of AI-driven customer interactions, enabling measurement and continuous improvement of AI agent outcomes. With this launch, you can monitor whether AI agents successfully resolved customer requests, assess faithfulness and detect contextual hallucinations, evaluate tool selection and use accuracy, and capture customer feedback through thumbs up/down ratings when enabled.

You can access these new metrics through Connect Customer's AI Agent Performance dashboard, or through the GetMetricDataV2 API and zero-ETL data lake for custom reporting.

This feature is available in all AWS Regions where Connect Customer AI Agents is supported.

Outbound Campaigns now supports contact priority ordering

Connect Customer Outbound Campaigns now allows you to dial contacts in configurable priority order based on up to 10 profile attributes for voice campaigns and voice activities in journeys. This helps you focus agent time on the most valuable customers or time-sensitive opportunities, improving campaign effectiveness and conversion rates. Initial dial attempts always take precedence over reattempts, ensuring your priority order is maintained throughout campaign execution.

To get started, configure sort attributes when building segments in Connect Customer Customer Profiles. For more information, see Outbound Campaigns best practices.

Outbound Campaigns now supports hourly segment refresh

Connect Customer Outbound Campaigns now allows you to refresh campaign segments as frequently as every hour, reduced from the previous minimum of 24 hours. This enables campaigns to reach newly eligible customers throughout the day rather than waiting for the next daily run. For example, a collections team can start outreach to newly delinquent accounts the same afternoon they are flagged, and a multi-step journey can enroll new customers throughout the day instead of in a single daily batch.

This capability is available in all AWS Regions where Connect Customer Outbound Campaigns is offered at no additional cost.

Automatically pass customer context into calls for AI-powered self-service

Connect Customer now enables you to automatically pass customer context to personalize self-service experiences from the moment a call connects. When a customer initiates a call from a website, mobile app, or notification link, you can automatically pass context—such as customer IDs, session references, and campaign codes—into the call. AI agents use this context to recognize the caller, understand the reason for the call, take action, and resolve issues without requiring callers to re-identify themselves or repeat why they are calling.

This feature is available in all AWS Regions where Connect Customer is available. For more information, see the Connect Customer Administrator Guide.

Flow modules now work across all flow types and within other modules

Connect Customer now supports the use of flow modules across all Connect flows, allowing you to reuse common logic and functionality beyond inbound customer experiences. For example, you can now use a module to share information about a customer's recent transactions in an agent whisper flow, preparing the agent with relevant details and using functionality that was previously only available as part of inbound flows.

Additionally, you can now use flow modules within other modules, enabling you to build complex logic by stitching together pre-built intermediary steps under a single module. For example, a

credit card eligibility module can invoke other modules that check credit scores, verify income, and review payment history before making a final determination.

For more information, see Flow modules for reusable functions in Connect Customer.

March 2026 Updates

Amazon Connect now provides case data in analytics data lake

Amazon Connect now provides case data in the analytics data lake, making it easier for you to generate reports and insights from this data. With case data available alongside other Amazon Connect analytics, you can use Amazon Athena and Amazon QuickSight to build custom reports and analyze trends such as case volume by type, case handling across agent shifts, or contact sentiment across cases without building and maintaining complex data pipelines.

AI-powered manager assistance (Preview)

Connect Customer announces the preview of an AI-powered assistant that enables contact center managers to get instant answers to operational questions using natural language. You can query across 150+ Connect Customer metrics—including agent scheduling, self-service experience, and performance evaluations—with historical data for all of these, and receive results in seconds, eliminating hours of manual data gathering. The assistant can also diagnose underlying issues, such as identifying which queues are at risk of missing service level targets and recommending specific recovery actions.

This feature is available as a preview. To request access, contact your AWS account team or an AWS Representative.

Conversational analytics for email

Connect Customer now supports conversational analytics for email contacts, enabling contact center managers to automatically categorize emails, redact personally identifiable information (PII), and generate contact summaries. This allows you to quickly identify emerging trends, better maintain compliance by protecting sensitive information, and reduce the time spent reviewing agent performance.

To enable this feature, add the Set recording, analytics and processing behavior block to your flows before an email contact is assigned to your agent or sent to your end customer. You can customize which PII types to redact, choose whether redacted content shows specific PII type indicators (for

example, [SSN]) or generic markings ([PII]), opt to store both original and redacted versions in separate storage, and enable contact summaries.

Connect Customer conversational analytics is available in the US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London) regions. For more information, see the help documentation.

Integrated workflows for managers to coach agents

Connect Customer now delivers integrated agent coaching workflows that enable contact center managers to provide timely, targeted feedback directly within the Connect UI. When managers identify improvement opportunities through evaluation scorecards, they can immediately create coaching plans with specific customer interaction examples. After coaching sessions, agents acknowledge feedback and add notes to confirm understanding of expectations and next steps. Both managers and agents access all coaching history on a single page, enabling systematic progress tracking and improved coaching effectiveness.

For more information, see the Connect Customer Administrator Guide.

Agents can now select different From email addresses when sending emails

Connect Customer now enables you to choose the “From” email address when replying to inbound emails or sending new outbound messages, helping contact centers ensure the correct brand or business identity is used for every customer interaction. Administrators can configure multiple sender addresses per queue, allowing agents to search and select the appropriate email address based on the queue they are working in.

Connect Customer email is available in the US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London) regions. For more information, see the help documentation.

Agents can now forward email contacts to external email addresses

Connect Customer now enables agents to forward email contacts to external email addresses and distribution lists directly from the Agent workspace and Contact Center Panel. When an email is forwarded, agents still retain ownership and the complete communication trail of the original

contact. This makes it easy for your agents to seamlessly loop in back-office teams, subject matter experts, partners, and other stakeholders while remaining a single consistent point of contact for your customers.

For more information, see Set up email in Connect Customer.

Tag-based access control for quick responses

Connect Customer now applies tag-based access controls (TBAC) to routing profile assignments in quick responses. Previously, quick responses configured by administrators with tag-based access controls were available to all agents, regardless of routing profile tags. Administrators can now assign quick responses to specific routing profiles based on their TBAC permissions, giving them the same level of access control they use across other Connect Customer resources.

For more information, see Quick Responses and Tag-based Access Control in the Connect Customer Administrator Guide.

Testing and simulation capabilities now support chats

Connect Customer now allows you to test and simulate chat experiences in just a few clicks, making it easy to validate self-service chat interactions, customer service workflows, and their outcomes. For each test, you can configure the test parameters including the channel as chat, customer attributes, the reason for the chat, the expected responses, and business conditions like after-hours scenarios or full queues. After executing tests, results show success or failure based on your defined criteria, along with the path taken by the simulated interaction and detailed logs to quickly diagnose potential issues.

For more information, see Connect Customer Testing and Simulation.

AI-powered predictive insights enhancements (Preview)

Connect Customer announces enhancements to AI-powered predictive insights that make it easier for businesses to deliver proactive, personalized customer experiences at scale. AI-powered predictive insights now support up to 40 million product catalog items (8X increase), are available in message templates for trigger-based campaigns, and deliver up to 14% improved model accuracy.

Businesses can now deliver trigger-based campaigns to initiate personalized outreach based on customer behavior and predictive signals—such as sending product recommendations when a

customer abandons their cart or offering complementary services after a purchase. Improved model accuracy and reduced training time mean businesses can deploy personalized experiences faster with greater confidence.

Public preview for AI-powered predictive insights enhancements is available in Europe (Frankfurt), US East (N. Virginia), Asia Pacific (Seoul), Asia Pacific (Tokyo), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Canada (Central).

February 2026 Updates

Amazon Connect Cases now supports AWS Service Quotas

Amazon Connect Cases now supports AWS Service Quotas, giving administrators a centralized way to view applied limits, monitor use, and scale case workloads without hitting unexpected service constraints. You can request quota increases directly from the Service Quotas console, and eligible requests are automatically approved without manual intervention.

Connect Customer Cases now supports larger, multi-line text fields

Connect Customer Cases now supports larger, multi-line text fields with up to 4,100 characters. Administrators can use the Admin UI to select the appropriate configuration (single-line or multi-line) on a per-field basis, improving case documentation capabilities.

Amazon Connect now enables per-channel auto-accept and After Contact Work (ACW) timeouts

You can now configure agents with auto-accept and after contact work timeout settings for chat, tasks, emails, and callbacks to optimize how agents spend their time. Previously, these settings were available only for inbound voice contacts. To learn more, see Configure agent settings.

Please note that if you currently integrate with the UpdateUserPhoneConfig API, we recommend you migrate to the newly released UpdateUserConfig API instead. Per-channel auto-accept and ACW timeouts can only be updated through UpdateUserConfig API.

Audio Enhancement for agents

Connect Customer now offers Audio Enhancement to improve audio quality on the agent's side by reducing background noise and isolating the agent's voice during calls. Administrators can enable

noise suppression or voice isolation modes for agents through user management settings. Agents with the appropriate security profile permissions can also adjust their own Audio Enhancement settings during work sessions.

For more information, see Enable Audio Enhancement.

Connect Customer Cases now supports CSV upload for dependent field options

Connect Customer Cases now enables you to bulk configure cascading dropdown menus for case fields by uploading CSV files containing field option mappings. This capability significantly reduces manual configuration time for complex hierarchical data structures such as geographic hierarchies (Country → State → City) or product categorizations (Category → Subcategory). You can include multiple field pairs in a single CSV file.

For more information, see CSV upload for dependent field options.

In-app notifications keep users informed of urgent updates and actions

Connect Customer Now users in the Amazon Connect admin website can be provided notifications in their header, so urgent updates and follow-on actions can be seen from any page within the Amazon Connect admin website. APIs allow services and customers to publish brief messages (including URLs) to a specified audience, and a new header icon will indicate when unread messages are available. On choose, the user can read the message, mark as unread if necessary, and follow links to reports or other UIs if follow-on actions are advised.

For more information, see In-app notifications keep users informed of urgent updates and actions.

January 2026 Updates

Amazon Connect Launches Wait Time Estimates to Improve Customer Experience

Connect Customer now delivers improved estimated wait time metrics for queues and enqueued contacts, empowering organizations to enhance customer satisfaction. This allows contact centers to set accurate customer expectations, provide convenient options such as callbacks when hold times are extended, and balance workloads effectively across multiple queues. By using the

estimated wait time metric, contact centers can make strategic routing choices across queues while gaining enhanced visibility for better resource planning. For example, a customer calling about billing during peak hours with a 15-minute wait is seamlessly transferred to a cross-trained team with 2-minute availability, getting help faster without repeating their issue. The metric works seamlessly with routing criteria and agent proficiency configurations.

This feature is available in all AWS Regions where Amazon Connect is offered. For more information about estimated wait time, see Estimated wait time in the Connect Customer Administrator Guide. To learn more about Amazon Connect, the AWS cloud-based contact center, please visit the Amazon Connect website.

Connect Customer now supports file attachments for tasks through StartTaskContact API

Connect Customer now enables you to include file attachments when creating tasks using the StartTaskContact API. You can attach up to 5 files per task in various formats such as .pdf, .docx, .csv, .txt, .png, .jpg, .mp4, and more. This capability allows you to provide agents with relevant documents, images, or other files directly within the task context, streamlining workflows and improving agent efficiency.

Connect Customer now supports tag-based access controls for cases

Connect Customer now enables you to use tag-based access controls to define who can access specific cases. You can associate tags with case templates and configure security profiles to determine which users can access cases with those tags. For example, you can restrict access to fraud-related cases so that only agents in the fraud department can view or edit them.

Amazon Connect now simplifies linking related contacts to cases using flows

Connect Customer now makes it easier to link related contacts such as email replies, call transfers, persistent chats, and queued callbacks to the same case so agents can view the complete customer journey and resolve issues faster. You can use flows to search for a case associated with a prior contact in the chain to follow-up contacts more easily.

In addition, you can now use flows to link a related contact to a case. For example, when you create a case through a Step-by-Step Guide, you can link that case to the main contact (for example, voice, chat, email, or tasks) directly using flows.

Recurring overrides and visual calendar for hours of operation

Connect Customer now makes it easier to manage contact center operating hours for recurring events like holidays, maintenance windows, and promotional periods, with a visual calendar that provides at-a-glance visibility by day, month, or year. You can set up recurring overrides that automatically take effect weekly, monthly, or every other Friday, and use them to provide customers with personalized experiences, all without having to manually revisit configurations. For example, every January 1st you can automatically greet customers with "Happy New Year!" and route them to a special holiday message before checking if agents are available, then on January 2nd your contact center automatically returns to normal operations.

For more information, see Set overrides for extended, reduced, and holiday hours.

Cases now supports AWS CloudFormation

Connect Customer Cases now supports AWS CloudFormation, enabling you to model, provision, and manage case resources as infrastructure as code. With this launch, administrators can create CloudFormation templates to programmatically deploy and update their Cases configuration—such as templates, fields, and layouts—across Connect Customer instances, reducing manual setup time and minimizing configuration errors.

For more information, see AWS::Cases in the *AWS CloudFormation Template Reference*.

Agent screen recording status tracking

Connect Customer now offers customers the ability to view status of agent screen recordings in near real time in CloudWatch using Amazon EventBridge. With screen recording, supervisors can identify areas for agent coaching (for example, non-compliance with business processes) by not only listening to customer calls or reviewing chat transcripts, but also watching agents' actions while handling a contact (that is, a voice call, chat and task). Using Amazon EventBridge, customers can see status of each agent screen recording including success/failure, failure codes with description, installed client version, agent web browser version, agent operating system, screen recording start and end times from CloudWatch.

Customers can start using Connect Customer screen recording status tracking by subscribing to Screen Recording Status Changed event type in Amazon EventBridge event bus.

For more information, see Set up and review agent screen recordings in Connect Customer.

Store nested JSON object and looping arrays

Connect Customer now enables you to store and work with complex data structures in your flows, making it easy to build dynamic automated experiences that use rich information returned from your internal business systems. You can save complete data records, including nested JSON objects and lists, and reference specific elements within them, such as a particular order from a list of orders returned in JSON format.

Additionally, you can automatically loop through lists of items in your customer service flows, moving through each entry in sequence while tracking the current position in the loop. This allows you to easily access item-level details and present relevant information to end-customers. For example, a travel agency can retrieve all of a customer's itineraries in a single request and guide the caller through each booking to review or update their reservations. A bank can similarly walk customers through recent transactions one by one using data retrieved securely from its systems. These capabilities reduce the need for repeated calls to your business systems, simplify workflow design, and make it easier to deliver advanced automated experiences that adapt as your business requirements evolve.

For more information, see Flows in Connect Customer.

December 2025 Updates

Workspace and data table resources provide business users with greater control over daily operations

Connect Customer now gives business users greater control over daily contact center operations without requiring technical resources. With new capabilities to adjust queues, routing behavior, and customer experience settings in real time, business users can respond to changing conditions immediately while maintaining enterprise-grade governance and security. Contact center administrators can start by defining key business configurations such as queue assignments, operating hours, skill mappings, and escalation rules, in data tables that directly drive contact flows. Guides can then be configured to surface role-specific actions for each business user within persona based workspaces. Together, these updates enable a business-led operating model that keeps contact center operations fast, consistent, and secure, all without relying on IT.

For more information, see Set up workspaces for your business users.

Dashboards now support filtering metrics based on custom business dimensions

Connect Customer dashboards now support filtering metrics based on custom business dimensions such as business divisions, product lines, or customer segments. Using predefined attributes, you can create business dimensions to filter metrics helping you customize the dashboards based on your unique business need. For example, if your queue handles contacts across product lines, you can filter metrics by product line to compare handle times and determine where agents need product training.

For more information, see Dashboards in Connect Customer for getting contact center performance data.

Automated agent performance evaluations support 5 additional languages

Connect Customer now automates agent performance evaluations in Portuguese, French, Italian, German, and Spanish using generative AI. Managers define custom evaluation criteria in natural language and receive AI-generated evaluations with justifications in their preferred language. Performance evaluations also supports cross-language evaluation and can complete assessments in English, even when the conversation is in another language. This enables multilingual contact centers to use a standardized evaluation framework across languages.

For more information, see Evaluate agent and self-service interaction performance in Connect Customer.

Additional details available within real-time metric alerts

Connect Customer alerts on real-time metrics now provide the specific agents, queues, flows, or routing profiles that exceeded thresholds and triggered the alert. This enables managers to respond faster to customer experience and operational issues by eliminating the need to manually investigate the root cause of the alert. For example, alerts on elevated queue wait times now include the exact queues affected, so managers can reassign agents to those queues. These detailed alerts can be sent through email, tasks, and Amazon EventBridge.

For more information, see Create alerts on real-time metrics in Connect Customer.

Multiple choice and date questions now possible in evaluation forms

Connect Customer provides two new evaluation question types to capture deeper insights on human and AI agent performance. Managers can now create questions that allow multiple answer selections, such as the products that the customer was interested in during a sales conversation. Additionally, managers can capture dates for customer and agent actions within evaluation forms. For example, you can record when a customer applied for a loan and when it was approved.

For more information, see Create an evaluation form in Connect Customer.

WhatsApp channel for Outbound Campaigns

Connect Customer Outbound Campaigns now supports WhatsApp, expanding on the WhatsApp Business messaging capabilities that already allow customers to contact your agents. You can now engage customers through proactive, automated campaigns on their preferred messaging platform, delivering timely communications such as appointment reminders, payment notifications, order updates, and product recommendations directly through WhatsApp. Setting up WhatsApp campaigns uses the same familiar Connect Customer interface, where you can define your target audience, choose personalized message templates, schedule delivery times, and apply compliance guardrails, just as you do for SMS, voice, and email campaigns.

Previously, Outbound Campaigns supported SMS, email, and voice channels, while WhatsApp was available only for customers to initiate conversations with your agents. With WhatsApp support in Outbound Campaigns, you can now proactively reach customers through an additional messaging platform while maintaining a unified campaign management experience. You can personalize WhatsApp messages using real-time customer data, track delivery and engagement metrics, and manage communication frequency and timing to ensure compliance. This expansion provides greater flexibility to connect with customers on their preferred platforms while streamlining your omnichannel outreach strategy.

For more information, see Create an outbound campaign using the admin website.

November 2025 Updates

Conditional case field visibility and dependent options

Connect Customer Cases now supports conditional field visibility and dependent field options, so you can simplify case layouts and ensure agents capture the right information faster. For example,

you can show a Return Reason field only when the case involves a return, and limit Issue Type choices to hardware-related options when Issue Category is set to Hardware.

For more information, see Add case field conditions to a case template in Connect Customer.

Custom metrics

Connect Customer now supports creation of custom metrics, enabling contact center supervisors to analyze tailored performance measurements without requiring technical skills. This feature provides a simple, no-code interface for performing mathematical operations (for example, addition, subtraction, sum, average) on existing Connect data to build metrics that align with your organization's specific business requirements. Custom metrics are available to use in the dashboards and APIs.

For more information, see Custom metric primitives.

Native testing and simulation capabilities

Connect Customer now allows you to test and simulate contact center experiences in just a few clicks, making it easy to validate workflows, self-service voice interactions, and their outcomes. For each test, you can configure the test parameters including the caller's phone number or customer profile, the reason for the call (such as "I need to check my order status"), the expected responses (such as "Your request has been processed"), and business conditions like after-hours scenarios or full call queues. After executing tests, results show success or failure based on your defined criteria, along with the path taken by the simulated interaction and detailed logs to quickly diagnose potential issuesWith this launch, you can run multiple tests simultaneously to validate scenarios and workflows at scale, reducing testing time. Companies can view test results and identify common failure patterns across all their tests in the analytics dashboards of Connect Customer. These capabilities enable you to rapidly validate changes to your workflows and confidently deploy new experiences to adapt to your ever-changing business needs.

For more information, see Connect Customer Testing and Simulation.

New criteria to automatically select relevant contacts for performance evaluation

Connect Customer provides managers with new criteria while setting up automated evaluations, making it easier to identify relevant contacts for evaluation, and providing additional insights

to automatically populate evaluation forms. For example, managers can specify that inbound contacts with no connectivity issues, handled by agents in a specific department, should be automatically evaluated using a particular evaluation form. Additionally, managers can use new metrics criteria on agent call avoidance, contact handling efficiency, and audibility, to automatically fill the selected form.

For more information, see Evaluate agent and self-service interaction performance in Connect Customer.

Support for third-party speech-to-text and text-to-speech AI models for end-customer self-service

Connect Customer now supports third-party speech providers for end-customer self-service, giving you greater flexibility in how you deliver voice experiences. You can integrate Deepgram for speech-to-text and ElevenLabs for text-to-speech directly within Connect Customer, using them together with the native speech capabilities of Connect Customer, built-in orchestration, analytics, and compliance controls. This feature is available in Connect Customer instances and in all commercial AWS Regions where Connect Customer is offered.

For more information, see Configure third-party speech-to-text (STT) providers.

Enhanced agent assistance capabilities

Connect Customer now provides customer service representatives with new AI agents that guide them through customer interactions by recommending actions, retrieving information, and executing tasks on their behalf. For example, an AI agent can guide a representative through processing a product return by automatically pulling order history, calculating refund amounts, and initiating the return process. These AI agents analyze conversation context and customer sentiment in real-time, actively completing tasks such as preparing documentation and handling routine processes. This enables representatives to focus on building customer relationships and handling complex situations while AI manages the background work, enhancing productivity and ensuring consistent outcomes. You can get started with out-of-the-box agents provided by Connect Customer or easily customize AI agent behavior and actions to align with your business needs.

For more information, see Create AI agents in Connect Customer.

Granular access controls for performance evaluations

Connect Customer now enables businesses to restrict access to specific performance evaluation forms, preventing unauthorized access to evaluation form templates and completed evaluations. Businesses can provide managers access to modify or use only the evaluation form templates that are relevant to their business line or function, improving security and making it easier for managers to select the right form while completing evaluations. Additionally, both managers and agents can be restricted from viewing certain completed evaluations. For example, you can restrict agents from viewing test evaluations filled with a form template that is yet to be finalized.

For more information, see Assign security profile permissions for performance evaluations and coaching.

Simplified linking of related contacts to cases using flows

Connect Customer now makes it easier to link related contacts such as email replies, call transfers, persistent chats, and queued callbacks to the same case so agents can view the complete customer journey and resolve issues faster. You can use flows to link a follow-up contact to an existing case, eliminating the need for custom logic or manual linking.

For more information, see Flow block in Connect Customer: Cases.

Chat now supports agent-initiated workflows

Connect Customer now supports agent-initiated workflows, enabling agents to send interactive forms to collect sensitive data or share general policies and disclosures within customer chat conversations, increasing efficiency and improving customer experience. For example, when a customer needs to update their address, agents can now send a form that customers complete without leaving the chat interface.Agents can trigger these workflows at any point during a chat conversation, making interactions more dynamic and responsive to customer needs. By handling everything within the ongoing chat conversation, businesses can maintain security and compliance standards while helping customers get faster solutions.

For more information, see Enable agent-initiated flows during active chat sessions.

Agentic self-service with more natural, expressive, and adaptive voice interactions

Connect Customer is introducing agentic self-service capabilities that enable AI agents to understand, reason, and take action across voice and messaging channels to automate routine and complex customer service tasks. Connect enables you to blend deterministic and agentic experiences, allowing you to deploy these AI agents at scale, reliably and safely. With integration with advanced speech models from Amazon Nova Sonic, voice self-service experiences now deliver more natural and adaptive interactions. The self-service voice AI agents of Connect Customer understand not only what customers say but how they say it, adapting voice responses to match customer tone and sentiment while maintaining natural conversational pace across multiple languages and accents. For example, when a customer calls about an order issue, your AI agent can greet them by name, ask clarifying questions, look up their order status, and process a refund, with voice interactions that adapt to the customer's tone and respond expressively throughout the conversation. This enables your contact center to automate complex troubleshooting, account management, and consultative interactions while maintaining the ability to escalate to a live representative at any point.Nova Sonic support with Amazon Connect is available in two commercial AWS Regions: US East (N. Virginia) and US West (Oregon) and fully available in English and Spanish and in preview for French, Italian, and German.

For more information, see Introducing Amazon Nova 2 Sonic on the AWS News Blog.

Chat now supports in-flight data redaction and message processing

Connect Customer now supports message processing that intercepts and processes chat messages before they reach any participant. This new capability enables automatic redaction of sensitive data and custom message processing, helping businesses maintain compliance and security standards while delivering personalized customer experiences.The built-in sensitive data redaction can automatically detect and remove sensitive information like credit card numbers and social security numbers across multiple languages, including English, French, Portuguese, German, Italian, and Spanish variants. You can choose to redact selected or all sensitive data entities, with options to replace them with generic or entity-specific placeholders (for example, [PII] or [NAME]). Businesses can also integrate custom processors for use cases such as language translation or profanity filtering, ensuring compliant and effective communications for their specific business needs.

For more information, see Enable in-flight sensitive data redaction and message processing.

Automated email responses using conditional keywords and phrases

Connect Customer now allows you to automate email responses and agent routing logic using keyword and phrase conditions, helping organizations increase self-service, reduce manual handling time, and improve routing accuracy. For example, if a customer sends an email asking if a certain product is in stock, or is checking on their shipment status, an automated response can be sent without involving an agent.To enable this feature, add the Get stored content block to your flows and use accompanying flow blocks such as Check contact attributes and Send message to configure automated email responses and routing.

For more information, see How Connect Customer email works.

AI agent assistance and summarization for Agentforce Service

Connect Customer launches real-time AI agent assistance and contact summarization for Salesforce Contact Center with Amazon Connect (SCC-AC). It enables Connect AI agents to automatically use customer information and knowledge base articles from Salesforce CRM for accelerated issue resolution and consistent outcomes across voice and chat interactions.When human intervention is required, the seamless integration within SCC-AC connects customers to agents who have a unified view of customer data, issue context, and interaction history within Agentforce Service and Agentforce Sales. Agents receive real-time voice transcripts and contextual recommendations, while supervisors gain enhanced call monitoring capabilities directly in Salesforce. Upon resolution, automated post-contact summarization enables agents to easily update Salesforce cases, streamlining administrative tasks. Administrators can deploy and configure this integrated contact center solution in minutes, using the voice, digital channels, and intelligent routing capabilities of Connect Customer.

Support for multiple knowledge bases and integrates with your Amazon Bedrock Knowledge Bases

Connect Customer now allows you to bring your own Amazon Bedrock Knowledge Bases and supports multiple knowledge bases per AI agent, giving you greater flexibility in how you organize and access knowledge content for your AI agents. You can now connect your existing Bedrock Knowledge Bases directly to Amazon Connect AI agents in just a few clicks, with no additional setup or data duplication required. This allows you to use your current data sources and the Amazon Bedrock Knowledge Base connectors, including Adobe Experience Manager, Confluence, SharePoint, and OneDrive, giving you flexibility to use existing content repositories.With support for multiple knowledge bases per AI agent, you can configure AI agents to query multiple sources

in parallel for more comprehensive responses. For example, a financial services company can easily connect separate knowledge bases for compliance documentation, product information, and internal policies, enabling AI agents to provide complete guidance across all relevant content during customer interactions.This feature is available in all AWS Regions where Amazon Connect AI agents and Amazon Bedrock Knowledge Bases are offered.

For more information, see Amazon Bedrock Knowledge Base configuration.

Stream messages for AI-powered interactions

Connect Customer now supports message streaming for AI-powered chat interactions. This new capability shows Connect AI agent responses as they're being generated, which reduces perceived wait times and improves the customer experience.When using Amazon Connect AI agents, customers see status updates like "One moment while I review your account" during processing, and watch responses appear progressively. This experience gives customers confidence their request is actively being worked on while AI agents reason, invoke tools, and craft comprehensive solutions.

For more information, see Enable message streaming for AI-powered chat.

Model Context Protocol (MCP) support

Connect Customer now supports Model Context Protocol (MCP), enabling AI agents for end-customer self-service and employee assistance to use standardized tools for retrieving information and completing actions. With this launch, businesses can enhance their AI agents with extensible tool capabilities that improve issue resolution. For example, an AI agent can automatically look up order status, process refunds, and update customer records during a self-service interaction without requiring human intervention.With this launch, Amazon Connect provides out-of-the-box MCP tools for common tasks such as updating contact attributes and retrieving case information. You can also use flow modules as MCP tools to reuse the same business logic across both deterministic and generative AI workflows. Additionally, you can integrate custom tools or third-party services through flow modules or the Amazon Bedrock AgentCore Gateway.

For more information, see Using MCP with Amazon Connect to monitor operational readiness on the AWS Contact Center Blog.

Agent workspace now supports custom visual themes

Connect Customer now allows you to customize the visual appearance of the agent workspace. You can apply a custom theme, including a logo, font, and color palette for light and dark modes,

so the agent workspace aligns with the brand identity of your company or business unit.Contact center agents spend hours each day in the Amazon Connect agent workspace, which provides them with all of the customer information, applications, and step-by-step guidance they need to deliver superior customer experiences. With today's launch, organizations can change the default Amazon Connect theme to their own branded experience, creating a more familiar and intuitive experience for agents who use the agent workspace and other company applications. The agent workspace also has a new header bar where agents can easily access their settings, including their preference of light and dark mode, contributing to greater agent satisfaction and efficiency.

For more information, see Customize the Connect Customer agent workspace.

AI-powered case summaries

Connect Customer now provides AI-powered case summaries that give agents complete context into customer issues, reduce manual wrap-up work, and help resolve cases faster. With a single choose, agents can generate a concise case summary even when the case spans multiple interactions, follow-up tasks, and teams, capturing key details such as issue background, actions taken, and next steps. Administrators can configure custom prompts and guardrails to make sure that summaries align with organizational style and preferences.

For more information, see Connect Customer Cases.

Outbound Campaigns now supports multi-step, multi-channel customer engagement journey builder

Connect Customer Outbound Campaigns now supports visual journey builder, a new feature that lets you create multi-step, multi-channel customer engagements directly in the Amazon Connect console. You can design end-to-end engagement experiences that combine voice, SMS, email, and WhatsApp interactions to reach customers proactively and reduce inbound contact volume.Outbound Campaigns help you automate personalized communication flows based on customer behavior or time-based triggers. For example, you can send an appointment reminder by SMS, follow up with a voice call if the customer does not respond, and send a confirmation email after the appointment is booked. You can also configure steps in the journey builder that offer customers the option to connect with a live agent through Amazon Connect when additional support is needed. You can use existing Amazon Connect Flow integrations, AI capabilities, and customer data from Amazon Connect Customer Profiles to tailor each interaction. This helps contact centers improve engagement rates, reduce manual effort, and deliver more consistent customer experiences.

For more information, see Set up Connect Customer outbound campaigns.

Automated performance evaluations for self-service interactions

Connect Customer now provides businesses with the ability to automatically evaluate the quality of self-service interactions and get aggregated insights to improve customer experience. Managers can define custom criteria to assess the quality of self-service interactions, that can be filled manually or automatically using insights from conversational analytics, and other Connect data. For example, you can automatically assess if the AI agent repeatedly fails to understand the customer, resulting in poor customer sentiment and transfer to a human agent. Managers can review these insights in aggregate and on individual contacts, alongside self-service interaction recordings and transcripts, to identify opportunities to improve AI agent performance.Manually filled evaluations of self-service interactions are available in all regions where Amazon Connect is offered. Automated evaluations of self-service interactions are available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Europe (Frankfurt).

For more information, see Evaluate agent and self-service interaction performance in Connect Customer.

Improved analytics and monitoring for AI agents

Connect Customer now provides analytics and monitoring capabilities for AI agents across self-service and agent assistance experiences. With this launch, you can measure and continuously improve AI agent performance and customer outcomes through easy to customize dashboards that provide key metrics like number of AI agent led interactions, hand-off rates, conversation turns, and average handle time. You can also compare AI agent performance across versions to identify optimal configurations and review insights to understand where AI agents are performing well and where improvements are needed. Additionally, with this launch, you can configure rules to trigger automated actions, such as sending alerts when self-service contacts are transferred to human agents with low sentiment scores. Amazon Connect also provides AI agent traces through APIs with detailed information such as request and response payloads and tool invocations, enabling you to easily understand AI agent actions and decision-making for faster troubleshooting.

For more information, see Dashboards in Connect Customer for getting contact center performance data.

Business users can create custom UIs to adjust contact center configurations in real time

Connect Customer now gives business users greater control over daily contact center operations without requiring technical resources. With new capabilities to create customer UIs that adjust queues, routing behavior, and customer experience settings in real time, business users can respond to changing conditions immediately while maintaining enterprise-grade governance and security. For example, during a weather disruption, an airline contact center operations manager can shift agents to rebooking queues, update after-hours routing, and activate a pre-approved protocol that refreshes IVR prompts and triggers customer notifications, all in minutes and without technical team intervention. This reduces wait times, increases agent productivity, and improves the customer experience at moments of peak demand.Contact center administrators can start by defining key business configurations such as queue assignments, operating hours, skill mappings, and escalation rules, in data tables that directly drive contact flows. Guides can then be configured to surface role-specific actions for each business user within persona based workspaces. Together, these updates enable a business-led operating model that keeps contact center operations fast, consistent, and secure, all without relying on IT.

For more information, see Set up workspaces for your business users.

Lex now supports LLMs as the primary option for natural language understanding

Amazon Lex now allows you to use Large Language Models (LLMs) as the primary option to understand customer intent across voice and chat interactions. With this capability, your voice and chat bots can better understand customer requests, handle complex utterances, maintain accuracy despite spelling errors, and extract key information from verbose inputs. When customer intent is unclear, bots can intelligently ask follow-up questions to fulfill requests accurately. For example, when a customer says "I need help with my flight," the LLM automatically clarifies whether the customer wants to check their flight status, upgrade their flight, or change their flight.

For more information, see Intent structure in the *Amazon Lex Developer Guide*.

Flow modules now support custom inputs, outputs, and version management

Connect Customer flow modules now support custom inputs, outputs, and branches, along with version and alias management. With this launch, you can now define flexible parameters for

your reusable flow modules to math your specific business logic. For example, you can create an authentication module that accepts a phone number and PIN as inputs, then returns the customer name and authentication status as outputs with branches such as "authenticated" or "not authenticated". All parameters are customizable to meet your specific needs.Additionally, advanced versioning and aliasing capabilities allow you to manage module updates more seamlessly. You can create immutable version snapshots and map aliases to specific versions. When you update an alias to point to a new version, all flows using that module automatically reference the updated version. These new features make flow modules more powerful and reusable, allowing you to build and maintain flows more efficiently.

For more information, see Flow modules for reusable functions in Connect Customer.

Agents can send follow-up replies to email contacts

Connect Customer now allows agents to send follow-up replies to email contacts, making it easier to share additional information or continue assisting customers without starting a new thread. This capability preserves the full conversation history, helping agents maintain context and deliver consistent, seamless support.

For more information, see Set up email in Connect Customer.

Monitor contacts queued for callback

Connect Customer now provides you with the ability to monitor which contacts are queued for callback. This feature enables you to search for contacts queued for callback and view additional details such as the customer's phone number and duration of being queued within the Connect UI and APIs. You can now pro-actively route contacts to agents that are at risk of exceeding the callback timelines communicated to customers. Businesses can also identify customers that have already successfully connected with agents, and clear them from the callback queue to remove duplicative work.

For more information, see Search for in-progress contacts in Connect Customer.

Amazon Lex extends wait & continue feature in 10 new languages

Amazon Lex now supports wait & continue functionality in 10 new languages, enabling more natural conversational experiences in Chinese, Japanese, Korean, Cantonese, Spanish, French, Italian, Portuguese, Catalan, and German. This feature allows deterministic voice and chat bots

to pause while customers gather additional information, then seamlessly resume when ready. For example, when asked for payment details, customers can say "hold on a second" to retrieve their credit card, and the bot will wait before continuing.

For more information, see Wait and continue in the *Amazon Lex Developer Guide*.

Multi skill agent scheduling

Connect Customer now enables you to optimize scheduling based on agent's multiple specialized skills. You can now maximize agent use across multiple dimensions such as departments, languages, and customer tiers by intelligently matching agents with multiple skills to forecasted demand. You can now also preserve multi-skilled agents for high-value interactions when needed most. For example, bilingual agents can now be strategically scheduled to cover peak periods for high-value French language queues that frequently experience staffing shortages, while handling general inquiries during off-peak times.

For more information, see Scheduling in Connect Customer.

Persistent agent connections for faster call handling

Connect Customer now offers the ability to maintain an open communication channel between your agents and Amazon Connect, helping reduce the time it takes to establish a connection with a customer. Contact center administrators can configure an agent's user profile to maintain a persistent connection after a conversation ends, allowing for subsequent calls to connect faster. Amazon Connect persistent agent connection makes it easier to support compliance requirements with telemarketing laws such as the U.S. Telephone Consumer Protection Act (TCPA) for outbound campaigns' calling by reducing the time it takes for a customer to connect with your agents.

For more information, see Enable persistent connection for Connect Customer agents.

Conversational analytics for voice and chat bots

Connect Customer now provides conversational analytics for end-customer self-service interactions across voice and digital channels, helping you better understand and improve your customers' self-service experiences. This includes across PSTN/telephony, in-app and web-calling, web and mobile chat, SMS, WhatsApp Business messaging, and Apple Messages for Business.With this launch, Connect now provides rich conversational analytics across both human-agent interactions and end-customer self-service interactions. You can now automatically analyze the quality of automated

self-service interactions including customer sentiment, redact sensitive data, discover top contact drivers and themes, identify compliance risks, and proactively identify areas for improvement through easy-to-customize dashboards. The conversational analytics of Connect Customer also enables you to use semantic matching rules to categorize interactions based on customer behavior, keywords, sentiment, or issue types, such as billing inquiries or agent escalation requests.

For more information, see Enable persistent connection for Connect Customer agents.

Outbound campaigns supports ring time configuration for unanswered calls

Connect Customer outbound campaigns now offers campaign managers the ability to configure how long voice calls should ring—between a range of 15 and 60 seconds—before marking a call as "no answer" and moving to the next contact. Each contact also records when ringing began and ended for precise reporting and traceability.When ring duration is static, businesses struggle to balance calling efficiency and customer reach. Calls that ring too briefly might miss customers who take longer to answer, while excessive ring times delay overall campaign pacing. This lack of control leads to inconsistent contact rates and reduced agent productivity.With configurable ring time, campaign managers can tune dialing behavior to their audience for each campaign, use analytics to see exactly how long each call rang, and understand where connections were missed. This visibility helps identify patterns, refine calling strategies, and continuously improve campaign effectiveness.

For more information, see Set up Connect Customer outbound campaigns.

Metrics on completion of agent performance evaluations by managers

Connect Customer now provides metrics that measure completion of agent performance evaluations, improving manager productivity and evaluation consistency. Businesses can monitor if the required number of evaluations for their agents have been completed, ensuring compliance with internal policies (for example, complete 5 evaluations per agent per month), regulatory requirements, and labor union agreements. Additionally, businesses can analyze evaluation scoring patterns across different managers, to identify opportunities to improve evaluation consistency and accuracy. These insights are available in real-time through analytics dashboards in the Connect UI, and APIs.

For more information, see Evaluate agent and self-service interaction performance in Connect Customer.

Configuration of email address aliases

Connect Customer now lets you configure aliases for email addresses, so customers see trusted identities when sending or receiving messages, helping maintain a consistent brand experience and simplify email management. For example, when forwarding a customer-facing address such as support@company.com to an address in Amazon Connect, you can configure an alias to ensure customers continue to see support@company.com as the sender.

For more information, see Create email addresses.

October 2025 Updates

Preview dialing mode for outbound campaigns

Outbound campaigns support preview dialing, allowing agents to review customer information before placing calls. Campaign managers can configure review time limits and enable contact removal. New analytics dashboards provide visibility into agent behavior and campaign performance.

For more information, see Set up Connect Customer outbound campaigns.

Configure thresholds for schedule adherence

You can configure thresholds for schedule adherence, giving you more flexibility in how you track agent performance. You can define thresholds for how early or late agents start or end their shifts, as well as for individual activities. For example, agents can start their shift 5 minutes early and end 10 minutes late, or end their breaks 3 minutes late, without negatively impacting their adherence scores.

You can further customize these thresholds for individual teams. For example, teams that handle contacts with long handle times can be given more flexibility in when they start their breaks. This enables you to focus on true adherence violations and eliminates the impact of minor schedule deviations on agent performance.

For more information, see Schedule Adherence.

Use granular permissions for conversation recordings and transcripts

You can use granular permissions to manage access to conversation recordings and transcripts in the Connect Customer admin website. You can separately configure access to recordings and

transcripts, allowing users to listen to calls while preventing unauthorized copying of transcripts. Connect Customer provides flexible download controls, enabling users to download redacted recordings while restricting downloads of unredacted versions.

For more information, see List of security profile permissions.

Set up agent schedule adherence notifications

You can set up agent schedule adherence notifications to make it easier for you to proactively identify when agents aren't adhering to their scheduled activities. You can define rules to automatically send email or text notifications (using EventBridge) to supervisors when agents exceed adherence thresholds. For example, if agent adherence drops below 85% in a trailing 15-minute window, supervisors can receive an email alert.

For more information, see Set up schedule adherence notifications.

Search for related items across all cases within a domain

You can use the SearchAllRelatedItems API to search for related items across all cases within a domain. This is a global search operation that returns related items from multiple cases, unlike the case-specific SearchRelatedItems API.

Generative AI-powered email conversation overviews and suggested responses

Connect Customer provides agents with generative AI-powered email conversation overviews, suggested actions, and responses. This enables agents to handle emails more efficiently, so customers receive faster, more consistent support.

For example, a customer emails about a refund request. Connect Customer Connect automatically provides key details about the customer's purchase history on the agent workspace, recommends a refund resolution step-by-step guide, and generates an email response to help resolve the contact quickly.

For more information, see Use AI-powered email conversation overviews and suggested responses. Also see the CreateSession API for updates to support this feature, updates to data types such as DataDetails, and new data types such as EmailGenerativeAnswerAIAgentConfiguration.

Connect Customer makes it easier to get customer input on outbound calls

Connect Customer supports Get customer input and Store customer input flow blocks for outbound voice whisper flows. The **Get customer input block** allows a prompt to be played to a customer on an outbound call after they answer the call but before they are connected with an agent, and the customer's response can be collected through either DTMF input or by using an Amazon Lex V2 bot.

This capability allows you to capture interactive and dynamic customer input on outbound calls before these are connected to an agent. For example, you can use the **Get customer input** block to obtain customer consent for call recording as part of outbound calls placed by agents, and use it to trigger Connect Customer conversational analytics recording and analytics.

Agent time-off balance data in the Connect Customer analytics data lake

Agent time-off balance data is available in the Connect Customer data lake, making it easier for you to generate reports and insights from this data. You access the latest and historical agent time-off balances across different time-off categories (paid time-off, sick leave, leave of absence) in the data lake. You can also view a chronological list of all transactions that impacted the balance. For example, if an agent starts with 80 hours of paid time-off on January 1, submits a 20-hour request on January 3, and later cancels it, you can see each transaction's impact on the final 80-hour balance. This makes time-off management easier by eliminating the need for managers to manually reconcile balances and time-off transactions.

For more information, see Staff timeoff balance changes.

Agent screen recording for ChromeOS devices

You can use screen recording for agents using ChromeOS devices. With screen recording, you can identify areas for agent coaching (for example, long contact handle duration or non-compliance with business processes) by not only listening to customer calls or reviewing chat transcripts, but also watching agent actions while handling a voice, chat, or task contact. Email is not supported.

For more information, see Connect Customer Client Application.

Scheduling of individual agents

Connect Customer now supports scheduling of individual agents, giving you more flexibility in scheduling your workforce. For example, when onboarding 100 new agents to a business unit with schedules already published for next two months, you can create schedules for only those new agents and automatically merge them with existing schedules. This eliminates the need for workarounds such as manually copying schedules from existing agents to new agents or regenerating schedules for entire business unit, thus improving manager productivity and operational efficiency.

For more information, see Forecasting & agent scheduling in Connect Customer.

Email supports threaded views and includes conversation history in replies

Connect Customer now includes the conversation history in agent replies and introduces threaded views of email exchanges, making it easier for both agents and customers to maintain context and continuity across interactions. This enhancement provides a more natural and familiar email experience for both agents and customers.

For more information, see Set up email in Connect Customer.

Automate follow-up evaluations triggered by initial evaluation results

Connect Customer can now automatically initiate follow-up evaluations to analyze specific situations identified during initial evaluations. For example, when an initial customer service evaluation detects customer interest in a product, Amazon Connect can automatically trigger a follow-up evaluation focused on the agent's sales performance. This enables managers to maintain consistent evaluation standards across agent cohorts and over time, while capturing deeper insights on specific scenarios such as sales opportunities, escalations, and other critical interaction moments.

For more information, see Enable persistent connection for Connect Customer agents.

Copy and bulk edit of agent scheduling configuration

Connect Customer now supports copy and bulk edit of agent scheduling configuration, making it easier to set up and maintain agent schedules. You can create new scheduling configurations by copying existing ones — for example, copy a weekday shift profile to create a weekend variant,

or, copy scheduling configuration (time-zone, weekly working hours, days off) from an existing agent to multiple new hires. When bulk editing, you can select specific fields to update, such as update time-zone and start date for new hires without changing their weekly working hours. These updates reduce time spent by managers on configuration management, thus improving productivity and operational efficiency.

For more information, see Forecasting & agent scheduling in Connect Customer.

Customize service level calculations

Connect Customer now enables you to customize service level calculations to your specific needs. Supervisors and managers can define time thresholds for when a contact is considered to meet service level standards and select which contact outcomes to include in the calculation. For example, managers can choose to count callback contacts, exclude contacts transferred out while waiting in queue, and exclude short abandons using a configurable time threshold. Customization of service level calculation is available from the metric configuration section on the analytics dashboards.With this feature supervisors and managers can now create a service level metric calculation that better aligns with their business operations. With a customized view of service level performance, operations managers can assess how effectively they have met their service standards.

For more information, see Metrics, dashboards, and insights in Connect Customer.

September 2025 Updates

Dashboards support filtering and comparing metrics by any time range

Connect Customer dashboards support selecting and comparing any time ranges. This enables you to focus on specific, relevant data and perform in-depth analysis up to a maximum of 35 days in the last 3 months. Additionally, you can select Week to Date and Month to Date time ranges.

For example, if a new sales campaign launches at the start of the current week, a contact center manager can compare the current week's handle time or contact volume with the same time range last week using Week to Date, to decide if additional agents are required to handle the increasing contact volume and maintain service levels.

For more information, see Dashboards in Connect Customer for getting contact center performance data.

Added two APIs: AssociateContactWithUser and ListRoutingProfileManualAssignmentQueues

Use these APIs to programmatically assign queued contacts to available users and list the manual assignment queues associated with a routing profile: AssociateContactWithUser and ListRoutingProfileManualAssignmentQueues.

These APIs support the functionality described in Access the Worklist app in the agent workspace.

Customize service level calculations

You can customize service level calculations to your specific needs by selecting if callbacks, abandons, or transfers are included in service level calculations. You can define time thresholds for when a contact is considered to meet service level standards and select which contact outcomes to include in the calculation.

For example, managers can choose to count callback contacts, exclude contacts transferred out while waiting in queue, and exclude short abandons using a configurable time threshold. This enables them to create a service level metric calculation that better aligns with their business operations.

For more information, see Create custom calculations of service level metrics.

Connect Customer conversational analytics sensitive data redaction in 7 additional languages

Connect Customer conversational analytics provides sensitive data redaction from voice and chat conversational analytics in French (France, Canada), Portuguese (Portugal, Brazil), Italian, German, and Spanish (Spain).

For more information, see AI features.

Flow designer analytics mode

You can use analytics in the drag-and-drop flows designer. This enables you to make data-driven decisions when optimizing your flows. You can view aggregate traffic through each completed and in-progress step in the flow, allowing you to identify behavioral patterns of your customers or pinpoint where errors are being encountered. For more information, see Monitor flow performance.

New callback metrics

Added the following metric definitions:

- Average queue abandon time - customer first callback
- Average queue answer time - customer first callback
- Average speed of answer - customer first callback dialed
- Average wait time after customer connection - customer first callback
- Callback attempts - customer first callback
- Contact volume - agent first callback
- Contact volume - customer first callback
- Contacts abandoned - customer first callback
- Contacts handled - customer first callback

Use contact segment attributes

For scenarios where information for a contact varies between transfers or multi-party conferences —such as business unit name, account type, or contact reason—you can use contact segment attributes. Contact segment attributes enable you to centrally manage the information with predetermined values and apply it to a unique contact record. This approach preserves accurate business context throughout customer journeys. It helps minimize data inconsistencies by enforcing standardized attribute values, and ensures reporting and analytics always reflect the true customer journey. For more information, see Contacts, contact chains, and contact attributes and Use contact segment attributes.

New detailed disconnect reasons for improved call troubleshooting

Connect Customer offers expanded disconnect reasons to help you better understand why outbound calls failed to connect in your contact center. These enhanced reasons are based on standard telecom error codes that provide deeper call insights and enable faster troubleshooting. For more information, see DisconnectReason under ContactTraceRecord.

Use agent hierarchy filters to search for contacts

You can search for contacts by using agent hierarchy filters on the **Contact search** page in the Connect Customer admin website. You can drill-down into your hierarchy to review contacts

handled by specific contact center sites, departments or teams, for assessing contact quality or agent performance.

This functionality enables centralized teams within contact centers, such as quality management and regulatory compliance, to efficiently locate and review contacts handled by specific teams or departments. This streamlines their workflow for performance evaluation and compliance auditing. For more information see Search for completed and in-progress contacts in Connect Customer.

Manual work item assignment for agents

Agents can manually prioritize the next important task, email, or chat in a queue. For example, when a customer calls in to enquire about their previously submitted refund request, an agent can search for any pending tickets related to the case, assign it to themselves, and resolve it immediately.

Supervisors and managers can enable manual assignment by updating agent configuration in routing and security profiles. Agents can then use the new worklist application in their agent workspace to manually assign themselves the next important chat, task, or email. For more information, see Access the Worklist app in the agent workspace.

August 2025 Updates

conversational analytics with external voice expanded to additional AWS Regions

conversational analytics with external voice is now supported in Asia Pacific (Tokyo), Asia Pacific (Sydney), Canada (Central), Europe (Frankfurt), and Europe (London). For more information, see Integrate Connect Customer conversational analytics with external voice systems and Conversational analytics availability by Region.

Multi-user web, in-app, and video calling

Connect Customer supports multi-user web, in-app, and video calling, allowing multiple users to join the same session with an agent through a web browser or mobile application. Contact center customers and agents can dynamically add participants during a live call or multiple participants can join a scheduled session with the same agent. Participants can engage in audio, video, and screen sharing for a fully collaborative experience. For more information, see Enable multi-user in-app, web, and video calling.

Recurring activities in agent schedules

Connect Customer supports recurring activities in agent schedules, allowing you to add repeating events in a few clicks. You can schedule activities such as daily stand-up at 8 a.m. or team meeting every Monday at 9 a.m. as a series that automatically gets added to agent schedules. These can be scheduled as individual recurring series for each agent or a shared recurring series across multiple agents. For more information, see Forecasting & agent scheduling in Connect Customer.

Connect Customer communications widget supports task and email forms for websites and applications

Connect Customer provides out-of-the-box embedding of tasks and emails into your websites and applications using the contact form option in the communications widget. You can add the communications widget to your website to enable customers to submit callback requests outside business hours or send emails through webforms.

The feature includes these capabilities:

- Configure customer-facing forms using the drag and drop editor
- Generate code snippets for seamless website integration
- Provide customers with flexible engagement options
- Manage all engagements through existing Connect Customer workflows

For more information, see the section called “Add the Connect Customer widget to your website”.

Connect Customer Outbound Campaigns supports multi-profile campaigns and enhanced phone number retry sequencing

Connect Customer Outbound Campaigns supports account-based campaigns, enabling you to reach multiple people associated with the same account. For example, when calling about a joint bank account, if the first person is unavailable, the system automatically tries to reach other authorized members of the account.

The feature includes these enhancements:

- Target multiple profiles within the same campaign for outreach to all associated contacts in an account

- Define prioritized contact sequences across multiple phone numbers (mobile, home, work)
- Configure fallback phone numbers within each profile
- Automatically progress to next preferred phone number after unsuccessful attempts
- Create more flexible engagement workflows to improve right-party contact rates

This feature is available in all AWS Regions where Connect Customer Outbound Campaigns is supported. For more information, see Outbound Campaigns.

Use the GetContactMetrics API to retrieve real-time position in queue

You can use the GetContactMetrics API and the Position in Queue metric to retrieve real-time position in queue data. (This functionality is not available in flows, only by using the API.) This enhancement provides contact centers with a way to manage customer wait times more effectively by:

- Retrieving accurate queue position for each contact
- Offering proactive callbacks during long wait periods
- Making data-driven decisions between primary and alternative queues
- Monitoring queues with routing criteria and agent proficiencies
- Optimizing agent resource allocation through improved queue visibility

For more information, see the GetContactMetrics API documentation and the Position in Queue metric definition.

July 2025 Updates

Enhancements to audio treatment while customers wait in queue

You can configure flows to execute logic such as routing priority changes while continuing to play audio to customers waiting in queue. For example, when a customer is in queue listening to music or instructions, you can periodically check metrics to determine whether to transfer them to a different queue or conditionally offer a callback, without having the check itself cause any interruption to the music. For more information, see the Loop prompts block.

Enhanced third-party application support in agent workspace

The agent workspace supports new actions and workflows powered by third-party applications running in the background. This enhancement allows agents to perform various tasks without leaving the agent workspace, such as:

- Completing new training prompts upon login
- Accessing company-specific phone directories during contact transfers
- Filling out forms in pop-up windows
- Downloading files

Agents can seamlessly resume their work exactly where they left off after helping a customer. This single-pane-of-glass experience improves agent productivity and enhances customer satisfaction.

Third-party applications are available in the following AWS Regions: US East (N. Virginia), US-West (Oregon), Africa (Cape town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London).

For more information, see Access third-party applications in the agent workspace in the Amazon Connect Administrator Guide and the Amazon Connect Agent Workspace Developer Guide.

Apply Automatic fail to a section or the entire evaluation form

You can configure an evaluation form so answering 0 to a specific question assigns a score of 0 to the section, the subsection, or the entire evaluation form. Previously this option assigned a score of 0 to the entire form. For more information, see Step 5: Assign scores and ranges to answers in Create an evaluation form in Connect Customer.

Direct signing of calls from US numbers to North American Numbering Plan (NANP) destinations

All calls from US numbers (toll-free or direct-inward-dial) are marked and signed with STIR/SHAKEN attestation headers and attestation levels provided by Connect Customer through AMCS LLC. Previously, these calls were marked and signed with headers and attestation levels determined by our carrier partners. For more information, see Stir/Shaken attestation in Connect Customer.

Forecast editing user interface

You can select a forecast and then make edits—such as increasing contact volume by a percentage or setting exact values—across specific date ranges, queues, and channels. You can preview and apply changes within the forecasting user interface. For example, if a there's an upcoming marketing campaign expected to drive higher traffic, you can increase the short-term forecast by 15% for Tuesdays and Wednesdays between 12 PM and 2 PM for the next two weeks. With this feature, you can simplify the process of managing forecast changes, improve planning accuracy, and respond faster to demand fluctuations. For more information, see Edit a forecast in Connect Customer.

New disconnect reason: CUSTOMER_NEVER_ARRIVED

Added the disconnect reason `CUSTOMER_NEVER_ARRIVED` to the contact record. For more information, see ContactTraceRecord.

Analytics dashboard in agent workspace

The agent workspace includes an out-of-box analytics dashboard that provides agents with insights into their individual performance metrics and queue status. Agents can view their performance metrics, such as contacts handled and average handle time. They can also view metrics about their assigned queue, such as contacts in queue and longest wait time.

These insights help agents improve their performance and make data-driven decisions to enhance customer experience. For example, agents can better time their breaks by monitoring queue volumes.

For more information, see Access the performance dashboard directly in the agent workspace.

In addition, there's a new widget on the **Queue and agent performance** dashboard: Agent status drill down. And there's a new metric: Agents on contact.

Parallel AWS Lambda execution in flows

You can set up the parallel execution of AWS Lambda functions in flows, enabling faster and more seamless customer experiences. You can integrate with third-party or homegrown systems such as CRMs by using Lambda to automate tasks like reading or updating customer records. You can now execute multiple Lambda functions concurrently or continue progressing the flow and run additional actions while a Lambda runs. For example, in an automated customer interaction, you

can now look up a customer's past purchases while simultaneously checking for active promotions and playing a message about a new offer.

You can configure these capabilities directly in the drag-and-drop flow designer using the AWS Lambda function and Wait flow blocks, or through public APIs.

> **Note**
>
> The name of the **Invoke Lambda function** block has been changed to **AWS Lambda function** to indicate this increased functionality.

June 2025 Updates

Flow designer: new features

The following new features have been added to the flow designer to help you navigate, edit, and troubleshoot flows more efficiently.

Connections tab

Use the **Connections** tab on the block configuration panel to quickly navigate and edit between blocks by using their incoming and outgoing branches. The following sections explain the features on the **Connections** tab.

Topics

- Navigation
- Change connection
- Create a new block

Navigation

- Choose **Center this block in the view** to center the selected block in the viewport.
- Choose an **outgoing branch's name** to visualize its path.
- Choose the **edit icon** to immediately modify the connected block.
- Choose an **incoming block's name** to open the connected block for editing.

- Choose the **active branch** to visualize the connection. If a branch appears greyed out, it indicates the block is not currently linked to that branch.

The following GIF shows how to navigate through the flow designer canvas using these options.

Change connection

For **outgoing branches**, use the dropdown menu to select a block and update the connection.

Use **free-text search** to quickly locate and connect to a specific block.

To remove a connection, use the **Disconnect** option. The following GIF shows how to use **Disconnect**.

Create a new block

You can create a new block directly from the **Connections** tab without leaving the current view.

- Select **Add New Block**, choose the desired block type, and optionally provide a name.
- The block will be created instantly. No need to drag and drop from the block library

The following GIF shows how to add a new block (in this case a **Disconnect** block) from the **Connections** tab.

Notes tab

Use the **Notes** tab to view all notes attached to a block. You can create and edit notes directly within this tab.

The following GIF shows the **Notes** tab for the **Set disconnect flow** block.

Block error navigation

The flow designer includes shortcuts and buttons to help locate blocks with issues more efficiently.

When publishing, if a block contains errors, you can choose the associated error message button to navigate directly to the problematic block.

- Additionally, use **Ctrl + ;** and **Ctrl + '** to cycle between blocks with errors.
- Each block's issue is also clearly displayed in the block configuration panel

The following GIF shows how to navigate to the problematic blocks.

Flow designer keyboard shortcuts and accessibility improvements

The flow designer includes a **Keyboard shortcuts** panel, which includes an expanded set of shortcuts for navigating through and editing flows. For more information, see Keyboard shortcuts for the Connect Customer flow designer.

The flow designer includes the following accessibility improvements: screen reader support, Reflow Mode, button-based movement, and high-contract lines. These are described below.

Screen reader support

Changes made on the canvas are announced if the users have enabled screen reader, allowing users to better follow updates as they happen. On Windows the shortcut is **Win+Ctrl+Enter** and on Mac **Cmd+F5**.

Reflow Mode

Reflow Mode makes sure that panels and interface elements automatically rearrange when zoomed in. So even at high zoom levels, everything remains visible and can be navigated to.

The following GIF shows how to use Reflow Mode.

Button-based movement

You can use the directional buttons on the flow designer canvas for precise block movement. You can reposition selected blocks using the arrow buttons for greater control and navigation.

The following GIF shows how to use the directional buttons.

High contrast lines

High contrast lines enhance the visual distinction between the three connector line types, making it easier for users with visual impairments to differentiate connections.

The following GIF shows how to enable high contrast lines in the flow designer.

The following image shows two flow designer canvases. The first one shows the default contrast. The second one shows high contrast lines.

Enhanced audio treatment for customers in queue

The Loop prompts block allows you to run flow logic while continuing to play audio to customers waiting in queue. You can check metrics and modify routing priorities without interrupting the customer's audio experience. For more information, see How the interrupt option works.

Improved UI for No-code builder

The Connect Customer UI builder, used to create Views that power Step-by-Step Guides, has an updated user interface. The improved UI is designed to reduce the complexity of building Views used in guided workflows. It makes the process of passing dynamic data onto Views and storing data entered on a view by a user more initiative and consistent with Connect Customer workflow orchestration.

In addition, the UI builder contains a consistent look and feel with the rest of Connect Customer by using Cloudscape Design System components.

For more information, see Build views with the UI builder in Connect Customer, especially the subtopic Configure dynamic fields.

Segment creation from imported files in Customer Profiles

Connect Customer Customer Profiles allows you to create customer segments from imported CSV files. This feature enables you to upload predefined customer lists, streamline targeted segment creation, and use them for multichannel outbound campaigns.

- Map CSV data to standard profile attributes using AI-powered analysis
- Create custom attributes as needed
- Configure profile expiry settings up to 90 days
- Use unique identifiers to match and update existing profiles

For more information, see Create segments from imported files in Connect Customer.

Additional chat metrics

Added the following chat metrics to Connect Customer. Each metric is available in the Connect Customer admin website and by using the GetMetricDataV2 API.

- Average messages
- Agent average contact first response wait time
- Average conversation close time
- Conversations abandoned
- Average customer messages
- Average customer response time
- Average agent messages
- Average agent message length
- Average agent first response time
- Average agent response time
- Average bot messages

Also added fields to the Contact record in the Connect Customer data lake.

Create instance replication between Asia Pacific (Tokyo) and Asia Pacific (Osaka)

You can maintain a synchronized instance in Asia Pacific (Osaka) that mirrors the channel configurations and service quotas of your Asia Pacific (Tokyo) environment. With a resiliency instance in Asia Pacific (Osaka), you can replicate your Connect Customer configurations, such as users, routing profiles, and flows, and configure traffic distribution settings to pre-define groups of users and phone numbers to shift between Asia Pacific (Tokyo) and Asia Pacific (Osaka). This enables your resiliency instance to handle new incoming traffic after switching Regions. To get started, you first need to set up an Connect Customer instance in Asia Pacific (Tokyo) as your primary Region. You can then create a replica instance for Amazon Connect in the Asia Pacific (Osaka) Region. For more information, see Set up Connect Customer Global Resiliency.

Use customizable work labels for agent scheduling

You can use customizable work labels for agent scheduling. Customizable work labels make it easier for you to identify the type of work an agent is scheduled for. You can create work activities with custom labels and assign them to agent schedules by day of the week. For example, you can assign "Order processing" as the work activity for Monday, "Returns management" for Tuesday, and "Work" (existing default activity) for rest of the week. This simplifies the experience for managers

because they can now easily identify who is scheduled for which type of work. This capability also improves the experience for agents as they now have visibility into how their time is allocated. For more information, see Create shift activities.

Ingest agent activities from third-party applications to evaluate agent performance

You can integrate agent activities from third-party applications as Connect Customer tasks. Managers can then evaluate these activities alongside work completed in Connect Customer. This provides managers with a unified application for quality management. For more information, see Ingest agent activities from third-party applications to evaluate agent performance.

Amazon Connect Customer Profiles Profile Explorer

Connect Customer Customer Profiles Profile Explorer is a feature that provides a unified, customizable view of customer information. Key features include:

- Real-time search using multiple identifiers (for example, email, phone number, booking references)
- Customizable views highlighting relevant customer information
- AI-generated customer summaries with personalized behavioral insights

Profile Explorer is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Tokyo), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), Europe (Frankfurt), and Europe (London). Note that AI summary is currently not available in Africa (Cape Town).

For more information, see the Set up Profile Explorer in Customer Profiles.

New quota: Maximum contacts in an agent queue per instance

A new quota has been introduced for the maximum number of contacts that can be queued at once in a single agent queue. The quota is set to 10 contacts per queue and applies to every agent queue in your instance. (The default was already 10 contacts; we're surfacing the quota so it's easier for you to change.) This is a resource-level quota and can be increased upon request. For more information, see Connect Customer service quotas.

Connect Customer Customer Profiles enhanced calculated attributes

Connect Customer Customer Profiles provides enhanced calculated attributes with the following improvements:

- Timestamp controls: Specify timestamps on data, including future-dated events
- Historical data backfill: Automatically include previously ingested data when creating new attributes
- Improved limits: Process historical data information with increased limits

These enhancements enable more accurate and relevant calculated attributes, supporting sophisticated use cases such as:

- Tracking upcoming appointments
- Analyzing long-term customer behavior patterns
- Evaluating customer lifetime value
- Providing agents with relevant context before customer interactions

These features are available in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Asia Pacific (Seoul), Canada (Central), Europe (Frankfurt), and Europe (London).

For more information, see the Create calculated attributes in Connect Customer.

Enhanced hold duration tracking for multiparty calls

You can track durations of holds initiated by individual agents in multiparty calling scenarios by using the new Agent Initiated Hold Duration field on the contact record. Use this field to gain insights into hold patterns at the individual agent level during customer interactions. For more information, see AgentInitiatedHoldDuration in the Data model for Connect Customer contact records topic.

Updates to email quotas

The following updates have been released for email quotas and feature specifications:

New

- **Email addresses per inbound email message** quota is 50 email addresses total across To and CC. It is not adjustable.
- **File attachments per email** = 10 attachments. This is a feature specification and cannot be adjusted.

Updates

- **Active email contact expiry** quota is customizable up to 90 days.
- **Email domains per instance** quota has been increased from 5 custom email domains to 100.
- **Email addresses per instance** is an adjustable quota; it was incorrectly documented as a feature specification. The default is 100.

For more information, see Connect Customer service quotas.

May 2025 Updates

End of support notice for Connect Customer Voice ID

End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more information, visit Amazon Connect Customer Voice ID end of support.

Audio optimization for Omnissa cloud desktops

You can deliver high-quality voice experiences in Omnissa Virtual Desktop Infrastructure (VDI) environments. Connect Customer automatically optimizes audio by redirecting media from your agent's local desktop to Connect Customer, simplifying the agent experience and improving audio quality by reducing network hops. Agents can simply log into their Omnissa remote desktop application (that is, Omnissa Horizon) and start accepting calls using your custom agent user interface. For more information, see Optimize Connect Customer audio for Omnissa cloud desktops.

Agent hierarchy groups datatype in Analytics Data Lake

You can use an agent hierarchy groups table to incorporate organizational structure data into your custom analytics and reporting workflows. You can join this with existing tables such as Users to retrieve complete hierarchical information about your agents and their team assignments. For more information, see Agent Hierarchy Groups.

Additional AWS Regions for WhatsApp Business messaging and SMS

Connect Customer supports WhatsApp Business messaging and SMS in additional Regions. For more information, see Availability of Connect Customer features by Region.

Access conversational analytics real-time dashboards in AWS GovCloud (US) Region

You can access Connect Customer conversational analytics real-time queue and agent performance dashboards, and flows performance dashboards in AWS GovCloud (US) Region, a secure cloud environment designed for government and public sector customers. For more information, see Conversational analytics features by Region.

Administrator access for agent schedules

You can grant administrator access to agent schedules, making it easier to address key operational needs with minimal configuration. You can give certain users access to all published agent schedules without being added as a supervisor to every staff group. See the **Access to all published schedules** option on the **Staff rules** tab of the **Scheduling** page. For more information, see Create staff rules.

April 2025 Updates

Enhanced contact information in DescribeContact API

The DescribeContact API provides richer contact information, enabling more efficient contact center operations. The enhanced API response includes detailed insights such as disconnect reasons, recording status, after-contact work time, and custom contact attributes in a single call. This allows programmatic handling of contact scenarios, such as automatically re-queuing disconnected chats based on specific disconnect reasons, helping maintain conversation continuity. For more information, see the DescribeContact API documentation.

New metrics and dashboard drill downs for outbound campaigns

Outbound campaigns provides enhanced reporting capabilities for outbound campaigns, including five new metrics and detailed dashboard drill downs. conversational analytics dashboards show campaign engagement metrics, execution-level performance data, and delivery issue details. Admins can monitor campaign progress in real-time and troubleshoot delivery issues with granular insights. These metrics are accessible through the GetMetricDataV2 API and Zero-ETL data lake for custom reporting. For more information, see Outbound campaign metrics in Connect Customer.

View real-time adherence on the Queue and agent performance dashboard

You can view real-time agent adherence displayed in the **Agent adherence** widget on the **Queue and agent performance** dashboard. Use the widget to apply filters on adherence status, duration, and percentage; sort by duration or percentage; and apply conditional formatting within the agent adherence widget on the queue and agent performance dashboard. For example, a supervisor can highlight agents who have been falling behind schedule for more than 5 minutes, quickly identify breaches, and notify the agents accordingly. For more information, see Schedule Adherence for agent productivity in Connect Customer.

Remove agent schedules in bulk

You can remove agent schedules in bulk, making day-to-day management of agent schedules more efficient. With this launch, you can now remove schedules for up to 400 agents for a single day, or up to 30 days for a single agent. For example, remove all schedules for next Monday as the contact center is going to be closed, or remove future shifts for an agent who is no longer with the organization. For more information, see Remove agent shifts.

Enforce granular access control by using agent hierarchies

You can enforce granular access control based on a specific agent hierarchy. Assigning hierarchies to a user allows you to define organizational groups that a user belongs to and you can enable granular access controls by allowing users to only view metrics for agents within their hierarchy or a specific assigned hierarchy. For example, you can configure hierarchy groups and levels for a team, and only users assigned to a hierarchy group within that team will be able to see metrics for those agents. For more information, see Apply hierarchy-based access control to dashboards and reports in Connect Customer.

Track and meet service level agreements (SLAs) on cases

Connect Customer Cases provides capabilities to help contact centers track and meet service level agreements (SLAs) on cases. Using the Connect Customer admin website, admins can set up SLA rules based on case attributes and configure target statuses and resolution times without having to write code. Agents and managers can view the real-time SLA status directly in their case list view to prioritize urgent work, while admins can create rules to automatically escalate cases when SLAs are not met. For more information, see How SLAs work in Connect Customer Cases.

March 2025 Updates

Enable or disable conversational analytics sentiment analysis

In Connect Customer conversational analytics, when you choose a language that is supported by sentiment analysis, and choose **Enable speech analytics** or **Enable chat analytics**, sentiment analysis is enabled by default for all agents and customers. For a list of languages supported by sentiment analysis, see AI features. For information about disabling sentiment analysis, see Disable sentiment analysis.

Customize the wait time for DTMF input

You can customize the number of seconds that Connect Customer waits between a caller's keypad button presses so you can optimize user inputs in your IVR systems. You can adjust the waiting period from 1 to 20 seconds; previously it was fixed at 5 seconds. For more information, see the Store customer input block.

This update applies to keypad button presses. To configure wait times for voice input for Amazon Lex, you use the Get customer input block. See *Configurable time-outs for voice input* in the Get customer input topic.

Added 34 languages to Connect Customer conversational analytics conversational analytics

Connect Customer conversational analytics added support for conversational analytics in 34 new languages including Afrikaans, Arabic (Modern Standard), Bengali, Bosnian, Bulgarian, Chinese (Cantonese), Croatian, Czech, Estonian, Farsi, Galician, Greek, Hebrew, Hungarian, Kannada, Latvian, Lithuanian, Macedonian, Malayalam, Marathi, Romanian, Russian, Serbian, Sinhala, Slovak, Slovenian, Somali, Sundanese, Telugu, Thai, Turkish, Ukrainian, Vietnamese, and Zulu.

For more information, see the Connect Customer conversational analytics language table.

View agents' adherence to their work schedules in a calendar view

You can view adherence breaches by agent and day, for up to 90 days in the past, alongside their shifts. You can filter out minimal adherence breaches. This visualization allows you to immediately spot adherence breaches across your team, prioritize the most critical incidents, compare with past agent behavior, and take steps to address concerns with the agent.

For more information, see How supervisors view published schedules using the Connect Customer admin website.

Process to enable outbound campaigns for the purpose of event-driven mass notifications

Connect Customer outbound campaigns supports event-driven mass notifications, such as severe weather warnings, evacuation notices, disaster response communications, or utility disruptions impacting many thousands of customers with prior authorization and approval. Additional charges might apply based on your location and anticipated notification volumes.

For more information, see Set up Connect Customer outbound campaigns.

Track agent acknowledgements of performance evaluations

You can capture and review agent acknowledgements of performance evaluations within conversational analytics. This helps you make sure that agents have reviewed evaluation feedback and understand performance expectations. Agents can acknowledge their review of performance evaluations within the Connect Customer admin website, and add optional notes (for example, "reviewed and accepted feedback on being more empathetic towards angry customers"). Managers can then track agent acknowledgements, to confirm that agents are regularly reviewing the feedback on performance evaluations for improving their performance.

For more information, see Acknowledge performance evaluations in Connect Customer.

Configure agent assist directly from the Connect Customer admin website

You can customize your agent assist experience directly from the Connect Customer admin website. With this no-code approach, contact center administrators can configure AI agent behaviors, create

or edit custom prompts and set appropriate guardrails. For example, users can update AI prompts when launching new products, adjust AI guardrails to filter inappropriate content, or refine AI agents.

For more information, see Customize AI agents.

Increased limit on number of routing criteria updates per queued contact

Previously, routing criteria could be updated only up to three times while a contact was in queue. You can now update the routing criteria on a queued contact an unlimited number of times. However, if you update the routing criteria more than 3 times on a queued contact, only the latest 3 updates will be stored on the contact record and used to calculate metrics such as Step Expired % and Step Contacts Queued. To learn more, see RoutingCriteria in the contact record documentation.

Dynamically update questions on an evaluation form

You can create dynamic evaluation forms that automatically show or hide questions based on responses to previous questions, tailoring each evaluation to specific customer interaction scenarios. For example, when a manager answers "Yes" to the form question *Did the customer try to make a purchase on the call?*, the form automatically presents a follow-up question: *Did the agent read the sales disclosure?*

You can consolidate evaluation forms that are applicable to different interaction scenarios into a single dynamic evaluation form which automatically hides irrelevant questions. This reduces manager effort in selecting the relevant evaluation form and determining which evaluation questions are applicable to the interaction, helping managers perform evaluations faster and more accurately.

For more information, see Step 4: Conditionally enable questions in Create an evaluation form.

February 2025 Updates

Updates to Connect Customer Analytics data lake

Connect Customer Analytics Data Lake provides a unified source for contact center data, including contact records, agent performance metrics, Contact Lens insights, and more. This eliminates the

need to build and maintain complex data pipelines. You can create custom reports using Connect Customer data or seamlessly combine it with third-party data using zero-ETL integration.

The data lake enables contact center managers to use BI tools of their choice, such as QuickSight, to analyze the information that matters most to improving customer experience and operational efficiency.

For more information, see Connect Customer data lake.

There are updated tables for Contact records, Contact Evaluation records, Lex, and Outbound Campaigns. For tables of the latest fields, see Data type definitions for the Connect Customer data lake.

Allow agents to exchange shifts with each other

Agents can initiate shift trades directly with each other, allowing them to manage unexpected life events without using time off. Managers can automate some approvals while ensuring others are approved manually. This option reduces their work without sacrificing controls when needed. For example, supervisors can automate approvals for agents handling non-critical tasks, such as routine customer inquiries, while manually approving requests from agents who handle sensitive customer segments, like healthcare or high-value enterprise accounts.

For more information, see Create shift trade groups and Set up shift exchange in Connect Customer.

Released ListAnalyticsDataLakeDataSets API and update to preview APIs

Released the ListAnalyticsDataLakeDataSets API. Use this API to list the data lake datasets available to associate with for a given Connect Customer instance.

In addition, updated the following preview APIs with `ClientToken`, a unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

- AssociateApprovedOrigin
- AssociateBot
- AssociateInstanceStorageConfig
- AssociateLambdaFunction

- AssociateSecurityKey
- DeleteInstance
- DisassociateApprovedOrigin
- DisassociateBot
- DisassociateInstanceStorageConfig
- DisassociateLambdaFunction
- DisassociateLexBot
- DisassociateSecurityKey
- UpdateInstanceAttribute
- UpdateInstanceStorageConfig

Agent performance evaluations dashboard

You can use the agent performance evaluation dashboard to view aggregations of agent performance, and insights across cohorts of agents over time. You can access a unified dashboard on agent performance across evaluation scores, productivity (for example, contacts handled, average handle time, and more) and operational metrics.

Through detailed performance scorecards at both team and individual levels, you can dive deep into specific performance criteria, and compare performance with similar cohorts and over time, to identify agent strengths and improvement opportunities. The dashboard also provides you with insights into agent time allocation and contact handling efficiency, so you can drive improvements in agent productivity.

For more information, see Agent performance evaluations dashboard.

Evaluations metrics

There are now four evaluations metrics. For more information, see Evaluation metrics.

Target multiple agent proficiencies in a single routing step

You can target up to four different combinations of agent proficiencies per routing step. By using up to three OR conditions, routing tries to match a contact with four different types of agents which increases the possibility of finding a suitable match. For example, if the backup for a niche of banking skills consists of agents trained on account management, registration, and tax, then

after an initial search for balance transfer agents, you can attempt a match across all four types of agents at the same time.

For more information, see How routing criteria works.

Configure which states an agent can be in when adhering to their schedule

You can choose which states an agent can be in when adhering to their schedule, making it easier for you to customize adherence tracking to match your unique operational needs. You can define custom mappings between agent statuses and schedule activities.

For example, you can map schedule activity "Work" to multiple agent statuses such as "Available" and "Back-office work." An agent scheduled for "Work" from 8 AM to 10 AM will be considered adherent if they are either in "Available" or "Back-office work" status.

You can also view the actual name of the scheduled activity in the real-time adherence dashboard (as opposed to only Productive/Non-productive).

For more information, see Create shift activities.

Create conditionally required fields in Connect Customer Cases

You can create conditionally required fields to streamline case field population for agents and reduce data entry errors. You can configure case templates that prompt agents to enter relevant information in specific situations. For example:

- Provide a Close Reason when a case moves to Closed status.
- Provide a Product Serial Number when the Issue Type is Hardware Problem.
- Provide a Disposition Code when handling a system-generated case.

Conditionally required fields help agents follow processes for capturing necessary information, improving data quality for reporting, resolution tracking, and compliance. For more information, see Add case field conditions to a case template.

Also see the following APIs that are part of these release:

- CreateCaseRule
- BatchGetCaseRule

- DeleteCaseRule
- ListCaseRules
- UpdateCaseRule

Automatically email agents about completed performance evaluations

You can send automatic email notifications to agents when their contacts are evaluated, so they can review the evaluations and improve their performance. Managers can create rules to send emails based on specific evaluation criteria. For example, you can set up automatic notifications for agents who receive evaluation scores below 50%, ensuring prompt attention to performance opportunities. Managers can also personalize email content based on performance levels — whether recognizing top performers or providing constructive guidance for improvement areas. For more information, see Create rules that send email notifications.

January 2025 Updates

Use Agent Workspace audio optimization for Citrix and Amazon WorkSpaces virtual desktops

You can use Connect Customer Agent Workspace to redirect audio from Citrix and Amazon WorkSpaces Virtual Desktop Infrastructure (VDI) environments to an agent's local device. Audio redirection improves voice quality and reduces latency for voice calls handled on virtual desktops. It provides a better experience for both end customers and agents. For more information, see Use the agent workspace to optimize audio for Amazon WorkSpaces, Citrix, Omnissa, Azure Virtual Desktop, and Windows 365 cloud desktops.

Screen recording available in AWS GovCloud (US-West)

Government and public sector customer can use the screen recording capabilities in the AWS GovCloud (US-West) Region. For more information about screen recording, see Set up and review agent screen recordings.

Public preview of persistent agent connections for faster call handling

You can maintain an open communication channel between your agents and Connect Customer to help reduce the time it takes to establish a connection with a customer. Contact center

administrators can configure an agent's user profile to maintain a persistent connection after a conversation ends. This allows for subsequent calls to connect faster.

Connect Customer persistent agent connection makes it easier to support compliance requirements with telemarketing laws such as the U.S. Telephone Consumer Protection Act (TCPA) for outbound campaigns' calling by reducing the time it takes for a customer to connect with your agents.

For more information, see Enable persistent connection.

Evaluate agent performance for email contacts

You can evaluate agent performance for email contacts. Managers can assess agent performance across contact channels (voice, chat, email, and tasks) in a single easy-to-use web interface, and get aggregated insights across cohorts of agents over time. Managers can evaluate agent performance by reviewing email threads and additional details of the email interaction (for example, handle time) in the Connect Customer admin website.

You can also use public APIs to incorporate data from third-party systems (such as CSAT, sales volumes, customer retention, and more) into performance evaluations of email contacts, providing managers with comprehensive insights on agent performance. For more information, see Evaluate performance.

Dashboards provide configurable groupings and filters

You can define widget level filters and groupings, re-order and re-size columns, and delete or add new metrics. With these dashboards, you can view and compare real-time and historical aggregated performance, trends, and insights using custom-defined time periods (for example, week over week), summary charts, time-series chart. For example, you can create a single line chart that combines contacts queued, average queue answer time, and abandoned contacts, filtered for your most important queues, so you can quickly see how increasing contact volumes impact both wait time and customer abandonment rates. For more information, see Customize your Connect Customer dashboard.

Real-time dashboard for agent activity

You can monitor real-time agent activity and take immediate actions such as listen-in to a contact, barge (take over) a contact, or change an agent state in a few clicks from a single interface. You can track how long an agent has been on after contact work, color code time in specific statuses,

and listen into live contacts that need immediate attention. For example, you can automatically highlight in red if an agent is an error state to give a quick visual indicator of where agents might need additional help to change their status back to available. For more information, see Queue and agent performance dashboard.

Earlier Updates

December 2024 Updates

Route to a specific range of agent proficiencies

Connect Customer allows you to target a range of agent proficiency levels, such as from levels 1 to 3 for French. You can ensure each contact is matched to an agent with the right skill level to handle it, resulting in reduced contact transfers and lower handle times. You can assign simpler contacts to new hires while reserving your tenured agents for the difficult contacts that require their knowledge and expertise. . For more information, see Frequently asked questions.

Exclude certain proficiencies during routing

Connect Customer allows you to exclude certain proficiencies from consideration when using routing criteria for routing. You can use this to exclude or reserve niche skills. For example, you can exclude dual-skilled Spanish and English speaking agents from English language contacts to reserve them for contacts in Spanish. You can include the dual-skilled agents when required by removing the exclusion condition.. For more information, see How routing criteria works.

Delete queues and routing profiles by using the Connect Customer admin website

You can use the Connect Customer admin website to permanently delete queues and routing profiles. For example, if your team set up sample queues to test a use case that is no longer needed, or you're consolidating your routing profiles because you have reorganized agents, you can easily remove the unwanted resources by using the Connect Customer admin website. For more information, see Delete a queue and Delete a routing profile.

agent assist supports 64 languages for agent assistance capabilities

Customer service agents can chat with Q for assistance in their native language and Q will provide answers, knowledge article links, and recommended step-by-step guides in that language. New languages supported include: Chinese, French, French (Canadian), Italian, Japanese, Korean,

Malay, Portuguese, Spanish, Swedish, and Tagalog. For the full list of supported languages, see AI features.

For more information, see Set languages.

Multi-party chat

You can enable multiparty chat for your contact center, allowing up to 4 additional agents to join an ongoing chat conversation with a customer. This makes it easier to collaborate and resolve customer issues quickly. For example, agents can add a supervisor or subject matter expert to the chat, ensuring customers receive accurate and timely support.

For more information, see Host multi-party chats.

Authenticate customers during a chat

You can use built-in capabilities for customer authentication within chat, making it easier to verify customer identity and deliver personalized experiences. The Authenticate Customer flow block provides the flexibility to prompt your customers to sign in after they start a chat, making it simple to authenticate. For example, unauthenticated customers engaged with a chat bot can be prompted to sign in before being routed to an agent.

For more information, see Set up customer authentication.

Agent schedule data in Analytics data lake

The Analytics data lake now includes published schedules data, which allows you to generate reports and insights. From agent schedules data in the Analytics data lake, you can automate key operational use cases such as generating reports for paid and unpaid hours for payroll, generating summarized views of how many agents are scheduled to work and how many have time-off in a given time period.

For more information, see Scheduling data in the Connect Customer analytics data lake.

Configure holidays and other overrides to hours of operation

You can set up variations to standard day-of-the-week operating hours in advance. You can configure overrides by using the Connect Customer admin website or APIs. During daily contact handling, Connect Customer automatically checks for overrides and provides your customers with an appropriate flow path, such as offering a callback when the call center is closed. After an override period passes, your call center automatically reverts to standard hours of operation.

For more information, see Set overrides for extended, reduced, and holiday hours. For a list of new APIs associated with this release, see Hours of operation actions in the *Connect Customer API Reference*.

Connect Customer supports push notifications for mobile chat on iOS and Android devices

Connect Customer supports push notifications for mobile chat on iOS and Android devices, improving the customer experience and enabling faster issue resolution. For more information, see Enable push notifications for mobile chat.

Configure tasks to expire up to 30 days from creation

You can set task durations to expire up to 30 days from creation, with a default of 7 days. For example, you can specify one issue to expire at 2 hours from creation for urgent escalations, and specify another issue for mandatory training to stay active for 30 days. For more information, see Task templates in Connect Customer.

Track the originating agent when they create a task manually

You can track the originating agent when they create a task manually from the agent workspace or Contact Control Panel (CCP). This capability allows supervisors to run analytics on how many tasks are created by an individual agent. For more information, see Track who created a task.

Provide callbacks for customers who use chat, tasks, and email

You can enable customers to request callbacks from chats, tasks, and email, in addition to voice calls. For example, if a customer reaches out after hours when no agent is available, they can request a callback by sending a chat message or completing a webform request that uses tasks. Callbacks allow your customers to get a call from an available agent during normal business hours, without requiring them to stay on the line. For more information, see Set up queued callback.

Collect sensitive customer data within chats without requiring the customer to switch channels

Connect Customer makes it easier for you to collect sensitive customer data and deliver seamless transactional experiences within chats. You can support inline chat interactions such as processing payments, updating customer information like address changes, or collecting customer data like account details, without requiring the customer to switch channels or navigate to another page on your website. For more information, see the Flow block in Connect Customer: Show view block.

Proactive outbound engagement in the Connect Customer admin website

You can proactively engage your customers in a personalized manner. Connect Customer includes features that help non-technical business users create customer segments using prompts and drive trigger-based campaigns to deliver timely, relevant communications to the right audiences.

- Use the segment AI assistant in Connect Customer Customer Profiles to build audiences using natural language queries and receive recommendations based on trends in the customer data.
- Identify segments such as customers with an increase in support cases over the last quarter, or whose have reduced purchases in the last month, using easy-to-use prompts.
- Use trigger-based campaigns based on real-time customer events on Connect Customer outbound campaigns to proactively drive outbound communications in just a few clicks.

Engage customers with timely, relevant communications by using their preferred channels, responding instantly to behaviors such as abandoned shopping carts or frequent visits to specific help pages.

For more information, see Use the segment AI assistant in Connect Customer and Create an outbound campaign using event triggers.

Generative AI-powered self-service with agent assist

agent assist, a generative-AI powered assistant for customer service, supports end-customer self-service interactions across Interactive Voice Response (IVR) and digital channels. With this launch, businesses can augment their existing self-service experiences with generative AI capabilities to create more personalized and dynamic experiences to improve customer satisfaction and first contact resolution. For more information, see (legacy) Use generative AI-powered self-service with AI agents.

AI guardrails for agent assist

agent assist, a generative AI powered assistant for customer service, enables you to natively configure AI guardrails to implement safeguards based on their use cases and responsible AI policies. Contact center administrators can configure company-specific guardrails for agent assist to filter harmful and inappropriate responses, redact sensitive personal information, and limit incorrect information in the responses due to potential large language model (LLM) hallucination. For more information, see Create AI guardrails for AI agents.

Built-in dashboards to analyze conversational AI bot performance

You can use built-in dashboards to monitor the performance of your conversational AI bots. This makes it easy for you to analyze and continuously improve your self-service and automated experiences. From the conversational analytics flows performance dashboard, you can view Amazon Lex and Q in Connect bot analytics including how your customers communicate their issues, the most common contact reasons, and the outcomes of the interaction. From the dashboard, you can navigate to the bot management page and make updates in a couple clicks to improve bot accuracy. These new capabilities make it easy for you analyze the performance of your conversational AI experiences, all within the Connect Customer admin website.

For more information, see Flows and conversational bot performance dashboard.

Create conversational AI bots by using the Connect Customer admin website

In just a few clicks you can create, edit, and continuously improve conversational AI bots for interactive voice response (IVR) and chatbot self-service experiences by using the Connect Customer admin website (powered by Amazon Lex). By using the Connect Customer drag-and-drop workflow designer, you can enhance your bots with Connect Customer Customer Profiles, making it easy to deliver personalized experiences with no code. For example, you can upgrade your touch-tone menu (for example, Press 1 for Account Support) with a bot to greet your customer by name, proactively offer to help them pay an upcoming bill, and offer them additional support options. These new bot building capabilities in Connect Customer make it easy for you create and launch bot-powered self-service experiences by reducing the need for you to manage multiple applications or custom integrations.

For more information, see Create conversational AI bots in Connect Customer.

For a list of new metrics included in this release, see Connect Customer bot metrics and analytics.

Record audio during IVR and other automated interactions

You can record audio when your customer engages with self-service interactive voice response (IVR) and other automated interactions. On the **Contact details** page, you can listen to the recording or review logs which includes information such as the bot transcription or touch-tone menu selection. You can configure recording settings using the **Set recording and analytics behavior** block on the Connect Customer drag-and-drop workflow designer. This allows you to easily specify portions of the experience to record. For example, pausing and resuming recordings before and after sensitive exchanges, such as when a customer shares their credit card or social security number. These new

capabilities make it easy for you to monitor and audit the quality of your self-service experiences or to record interactions for compliance or policy purposes.

For more information, see Monitor automated interactions (IVR) in Connect Customer.

Intraday forecast dashboards

With the Intraday forecast dashboards you can compare intraday forecasts against previously published forecasts, review projected daily performance, and receive predictions for effective staffing, all available within the Connect Customer conversational analytics dashboards. With intraday forecasts, you receive updates every 15 minutes with predictions for rest-of-day contact volumes, average queue answer time, average handle time, and, now, effective staffing. These forecasts allow you to take proactive actions to improve customer wait time and service level. For example, contact center managers can now track agent use at the queue level, enabling them to identify potential imbalances or staffing shortages and take action before wait times are impacted.

This release includes a new metric: Effective staffing.

For more information, see Intraday forecast performance dashboard.

Automatically categorize your contacts using generative AI

Connect Customer conversational analytics allows you to automatically categorize your contacts using generative AI, making it easy to identify top drivers, customer experience, and agent behavior for your contacts. You can provide criteria to categorize contacts in natural language, such as *Did the customer try to make a payment on their balance?*. conversational analytics then automatically labels contacts that meet the match criteria, and provides relevant points from the conversation. For more information, see Use Generative AI to semantically match contacts with natural language statements and Automatically categorize contacts by matching conversations with natural language statements, or specific words and phrases.

Connect Customer conversational analytics automates agent performance evaluations using generative AI

Connect Customer conversational analytics provides you with the ability to use generative AI to automatically fill and submit agent performance evaluations. Managers can specify their evaluation criteria in natural language, and use generative AI for automating evaluations of any or all of agents' customer interactions, and get aggregated agent performance insights across cohorts of agents over time.. For more information, see Create an evaluation form in Connect Customer.

Integrate WhatsApp with Connect Customer

You can integrate WhatsApp with Connect Customer and enable customers to use WhatsApp to message your call centers. For more information, see Set up WhatsApp Business messaging.

Integrate Connect Customer conversational analytics with on-premise voice systems

You can integrate Connect Customer conversational analytics with other voice systems for real-time and post-call analytics. Using conversational analytics with your existing voice system can help you improve customer experience and agent performance. In addition, this can be a first step to migrating to a cloud contact center. You can start with conversational analytics analytics and performance insights and then at a later date migrate your agents to Connect Customer.

For more information, see Integrate Connect Customer conversational analytics with external voice systems.

November 2024 Updates

Connect Customer Email is generally available

Connect Customer Email provides built-in capabilities that make it easy for you to prioritize, assign, and automate the resolution of customer service emails, improving customer satisfaction and agent productivity. With Amazon Connect Email, you can receive and respond to emails sent by customers to business addresses or submitted through web forms on your website or mobile app.

You can configure auto-responses, prioritize emails, create or update cases, and route emails to the best available agent when agent assistance is required. Additionally, these capabilities work seamlessly with Amazon Connect outbound campaigns enabling you to deliver proactive and personalized email communications. For more information, see Set up email in Connect Customer.

This release includes additional APIs. For more information, see Email actions in the *Connect Customer API Reference Guide*.

Connect Customer conversational analytics launches calibrations for agent performance evaluations

You can conduct calibration sessions to drive consistency and accuracy in how managers evaluate agent performance. Through calibrations, you can review differences in evaluations filled by

different managers to align managers on evaluation best practices and identify opportunities to improve the evaluation form. For more information, see Calibration sessions for performance evaluations.

Connect Customer offers personalized and proactive engagement capabilities

Connect Customer offers a set of capabilities to help you proactively address customer needs before they become potential issues, enabling better customer outcomes. You can initiate proactive outbound communications for real-time service updates, promotional offers, product usage tips, and appointment reminders at just the right moments throughout your customer's experience from the right channel. For more information, see Set up customer segments in Connect Customer Customer Profiles and Set up Connect Customer outbound campaigns.

Create custom dashboards

You can create custom dashboards, as well as add and remove widgets from existing dashboards. This functionality enables you to change widgets to create the view that best fits your specific business need. For example, if you want to monitor performance covering self-service, queue, and agent, you can add all three types of widgets to your dashboard to have a single end-to-end view of contact center performance. For more information, see Add or remove widgets on a dashboard and Create custom dashboards.

October 2024 Updates

Callbacks for a chat or task contact

Your customers can request voice callbacks by sending you a chat and task, in addition to when they make voice calls. For example, if a customer reaches out after hours when no agent is available, they can request a voice callback by sending a chat message or completing a webform request (which uses tasks). Callbacks allow your customers to get a voice call from an available agent during normal business hours, without requiring them to stay on the line. For more information, see Callbacks from a chat, task, or email contact.

Monitor agent assist by using CloudWatch Logs

To gain visibility into the real-time recommendations that agent assist provides to your agents, and the customer intents it detects through natural language understanding, you can query CloudWatch Logs. For more information, see Monitor AI agents using CloudWatch.

Forecasting data in Connect Customer Analytics data lake

You can use published forecast (short-term and long-term) data in the data lake. This makes it easier for you to generate reports and insights from this data. For example, you can build dashboards that compare forecasts against actuals or view this data in conjunction with other data sets such as sales forecasts. You can also automate ingestion of this data in business intelligence tools. To generate these reports and insights, you can use Amazon Athena with AWS Quick or another business intelligence tool of your choice.

For more information about the content of the forecasting tables in the data lake, see Forecasting data in the Connect Customer analytics data lake.

Use screen sharing with web and video calls

You can use screen sharing with Connect Customer web and video calls, and pass contextual information to Connect Customer. Screen sharing enables agents to quickly gain an understanding of issues and help guide the customer. For more information, see Set up in-app, web, video calling, and screen sharing capabilities. In addition, see the StartScreenSharing API.

Connect Customer Chat provides SDKs for iOS and Android

Connect Customer Chat provides SDKs for iOS and Android, allowing you to deliver native in-app chat experiences that improve customer satisfaction and reduce operational costs. These SDKs provide pre-built components for network and session management. For more information, see Integrate Connect Customer chat into a mobile application.

agent assist adds personalized guidance for agents

agent assist can recommend personalized guidance to agents using customer data from Connect Customer and other third-party CRM systems. agent assist detects the customer's intent from the real-time voice or chat conversation and understands customer data to recommend what an agent should say or what action they should take.

For more information, see Use AI agents for real-time assistance.

Added new configuration capabilities to metrics dashboards

Three configuration capabilities have been added to the Connect Customer metrics dashboards:

- Changing Metrics

- Color coded performance thresholds
- Customizing Service Level and other metrics

For more information, see Dashboards in Connect Customer for getting contact center performance data.

September 2024 Updates

Send message flow block to initiate outbound SMS contacts

Connect Customer supports the ability to initiate outbound SMS contacts, enabling businesses to help increase customer satisfaction by engaging customers on their preferred communication channel. For more information, see the Flow block in Connect Customer: Send message flow block and the StartOutboundChatContact API.

Enhancements for automated evaluations

Released the following enhancements for automated evaluations:

- You can automatically mark a performance evaluation question as not applicable based on conversational insights (for example, detected call reason). This enables you to automatically fill and submit evaluation forms that contain situation-specific questions, for example, if the customer called to open an account, did the agent explain the account benefits and pricing?
- Automatically fill answers to evaluation form questions using additional contact metrics such as longest hold duration, number of holds, agent interaction, and hold time.

For more information, see Create a rule in conversational analytics that submits an automated evaluation.

August 2024 Updates

conversational analytics supports additional languages

conversational analytics can generate transcriptions in 10 more languages: Catalan (Spain), Danish (Denmark), Dutch (Netherlands), Finnish (Finland), Indonesian (Indonesia), Malay (Malaysia), Norwegian Bokmål (Norway), Polish (Poland), Swedish (Sweden), and Tagalog/Filipino (Philippines). These languages are not available in Connect Customer instances created in the Africa (Cape Town) AWS Region.

With this launch, conversational analytics conversational analytics provides transcription support for 33 languages. For the complete list, see AI features.

View the Intraday forecast performance dashboard

Use the Intraday forecast performance dashboard to view forecasts that are updated every 15 minutes for queues that have a minimum of 2000 unique contacts per week, per queue-channel for last 5 weeks. For more information, see Intraday forecast performance dashboard.

View an audit trail for changes to an agent performance evaluation

You can review the changes made to an agent performance evaluation when it is re-submitted. Previously the audit trail was available in an S3 bucket. Now it's available in the Connect Customer admin website.

When an evaluator submits changes to an existing evaluation, managers can view an audit trail of who submitted the original evaluation, who re-submitted the evaluation, and what changes they made. You can this information to perform internal audits and improve consistency across evaluators. For more information, see View an evaluation audit trail in Connect Customer.

Specify a flow that runs when a callback is created

You can specify a flow that runs when a callback is created for customers who want to maintain their position in queue. For example, you can specify a flow that sends an advance SMS to notify the customer, updates contact attributes with the latest customer data for reference on the call, or terminate the callback if the issue has already been resolved. For more information, see the **Set creation flow** parameter on the Flow block in Connect Customer: Transfer to queue block.

Updates to filter comparison operator and metric results dimension for the GetMetricDataV2 API

You can now use metric threshold comparison operator such as `LTE` (less than equal) and `LT` (less than) to explicitly include the threshold boundary value.

The metric results empty dimension values were also updated to be consistent in returning `null`. Previously `empty String` was returned in some scenarios when the request contained groupings attributes that were not defined in the filters. For more information, see the GetMetricDataV2 API documentation.

Programmatically set routing criteria on a contact through the UpdateContactRoutingData API

You can now use the `UpdateContactRoutingData` API to programmatically update the routing criteria on a contact. Previously, you could only set the routing criteria on a contact using the Set routing criteria flow block in the Connect Customer admin website. For more information, see the UpdateContactRoutingData API documentation.

Connect Customer supports audio optimization for Amazon WorkSpaces cloud desktops

You can deliver high-quality voice experiences in Amazon WorkSpaces Virtual Desktop Infrastructure (VDI) environments. Connect Customer automatically optimizes audio by redirecting media from your agent's local desktop to Connect Customer, simplifying the agent experience and improving audio quality by reducing network hops. For more information, see Optimize Connect Customer audio for Amazon WorkSpaces cloud desktops.

July 2024 Updates

Configure when whisper flows are used

You can configure when whisper flows are used during a contact. For example, you can choose to turn off whisper flows during an outbound or callback scenario to save time when the agent and customer are expecting the contact. This helps you optimize the performance of your flows and reduce the duration of a contact. For more information, see Flow block in Connect Customer: Set whisper flow.

Download screen recordings from the Contact details page

You can download screen recordings from the **Contact details** page in the Connect Customer admin website. This enables you to evaluate contact quality and agent performance by using offline reviews, as well as review downloaded screen recordings with agents for coaching. This release also provides a new security profile permission—**Screen recording - Enable download button**—to manage who can download screen recordings. For more information, see Review agent screen recordings in the Connect Customer Client Application.

Updated `AmazonConnectSynchronizationServiceRolePolicy` service-linked role managed policy

Updated the service-linked role managed policy with additional permissions for Managed Synchronization. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

Dashboard and metrics for outbound campaigns

You use the outbound campaigns performance dashboard to understand the performance of your outbound campaigns across voice contacts. You can easily visualize and monitor campaign performance, track efficiency, measure compliance, and understand campaign outcomes for your voice workloads. You can view real-time and historical reports using custom time periods and benchmarks, track campaign progress and delivery status, and drill down into call classification outcomes (for example, human answered, voicemail).

Following are new historical metrics for outbound campaigns:

- Average dials per minute
- Average wait time after customer connection
- Campaign contacts abandoned after X
- Campaign contacts abandoned after X rate
- Delivery attempts
- Delivery attempt disposition rate
- Human answered

Connect Customer Client Application v2.0.1 is available

Released Connect Customer Client Application v2.0.1. This version includes bug fixes and enhancements to improve the stability and monitoring of the application. To download the latest version, see Connect Customer Client Application.

Faster generative AI-powered post-contact summaries for agents ACW

Enhancements to generative AI-powered post-contact summaries enable your users to access them within seconds after a voice contact ends. For example, agents can access post-contact summaries

on the CCP and use them to quickly complete after contact work (ACW). This feature supports only voice contacts on the CCP.

These faster summaries are available by using APIs and Amazon Kinesis Data Streams, enabling you to integration with third-party agent workspace or CRM systems. For more information, see View generative AI-powered post-contact summaries in Connect Customer.

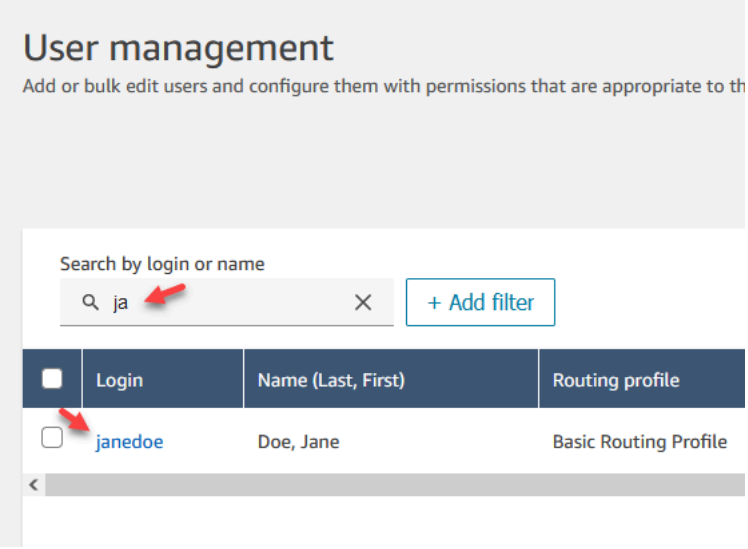
More options for searching for resources on the Connect Customer admin website

You have more options for searching resources on the Connect Customer admin website. The search options are available on pages that you use for managing (adding, editing) the following resources: users, queues, hours of operation, routing profiles, and prompts.

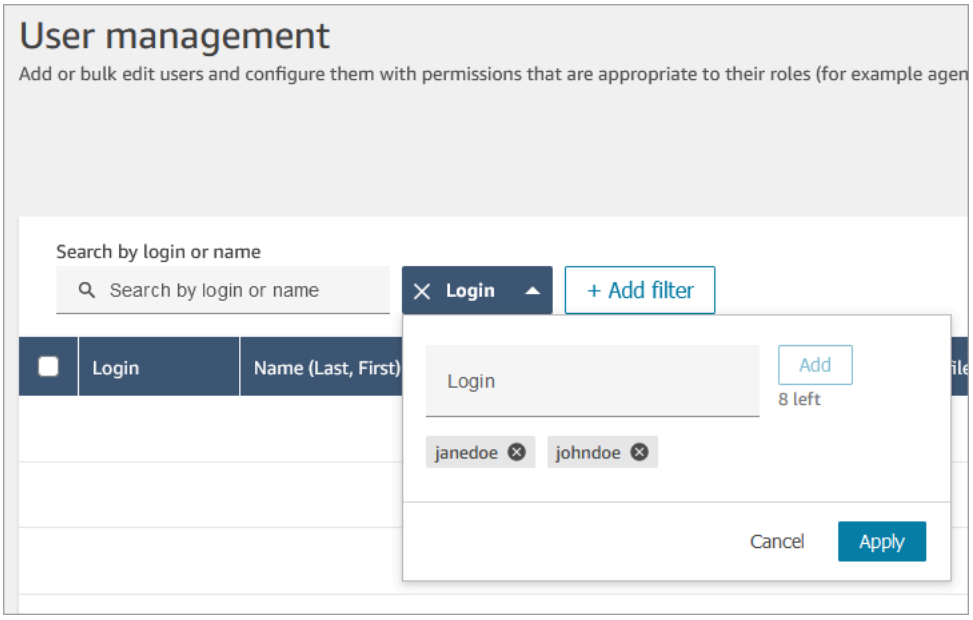
There are two ways you can search resources on the Connect Customer admin website resource management pages:

- **Search box**: This option helps you find matches fast with minimal effort. It provides free-text type-ahead search, and supports searching with "contains" logic.

  For example, as you start typing the name of the resource, any results that match are returned. The following image shows the first part of the login name was typed in search. Connect Customer automatically returned users that matched the first two characters typed - "ja".



- **Add filter**: This option enables you to perform more targeted searches using more advanced criteria. For example, you can specify multiple routing profiles, tags, or logins. The following image shows a Login filter. The search will return results for two logins: janedoe and johndoe.



Automated rotation of agent shifts

You can create a pattern of shifts that agents will repeatedly rotate through (for example, morning shift, afternoon shift, night shift). You can define how many weeks each shift should be scheduled before moving to the next one in the rotation. This feature makes it easier to administrate schedules and make sure that agents receive a business-defined sequence of shifts. For more information, see Set up shift rotation patterns in Connect Customer.

June 2024 Updates

Updates to Routing Profiles and Queues Search APIs

You can search for routing profiles by associated queues, and search for queues based on the routing profile they are assigned to by using the `SearchRoutingProfile` and `SearchQueues` APIs. These search APIs allow you to query by both name and ID, and support granular access controls (using tags) over the associated resources. For more information, see the SearchRoutingProfile and SearchQueues API documentation.

New definitions for NextContactId and PreviousContactId

`NextContactId` and `PreviousContactID` have new definitions. For more information, see ContactTraceRecord.

Connect Customer outbound campaigns performance dashboard

You can use the outbound campaigns performance dashboard to understand the performance of your outbound campaigns across voice contacts. For more information, see Outbound campaigns performance dashboard.

Route contact within a queue to a specific agent

You can now offer a contact in a queue to a specific agent or set of agents based on user ID; if the agent is not available within a given period of time, you can expire off the routing criteria to instead offer the contact to any available agent in queue. For more information, see Set up routing in Connect Customer based on agent proficiencies.

agent assist recommends step-by-step guides

agent assist, a generative-AI powered assistant for contact center agents, recommends step-by-step guides in real-time. Agents use step-by-step guides to quickly take action to resolve customer issues. For more information, see Integrate agent assist with step-by-step guides.

In addition, see the following new APIs that are part of this release:

- CreateContentAssociation
- DeleteContentAssociation
- GetContentAssociation
- ListContentAssociations

Updated look and feel for the Connect Customer agent workspace

The Connect Customer agent workspace features an updated user interface to improve the productivity and focus for your agents. The updated user interface is designed to be more intuitive and highly responsive, and it increases the visual consistency across capabilities. It provides your agents with a more streamlined user experience.

With this launch, you can also easily build and embed third-party applications that have a consistent look and feel with the agent workspace by using Cloudscape Design System components. For more information, see Access third-party applications in the agent workspace.

May 2024 Updates

Multi-party calls

Agents in a multi-party call can add participants to the call after the customer has disconnected. Agents can use quick connects or the number pad on the Contact Control Panel to add participants.

Some examples:

- After a customer disconnects from a multi-party call, the agent can add another agent or supervisor to the call to continue the discussion.
- If a customer is accidentally dropped from a multi-party call, the agent can reinstate the customer without restarting the multi-party call by manually adding all the participants.

> **Note**
>
> You must enable multi-party calling to use this feature. For more information about enabling multi-party calling, see Update telephony and chat options.

Connect Customer supports multiple features in Apple Messages for Business

As part of the Apple Messages for Business integration, Connect Customer supports the ability to send Attachments, use Apple Forms, use Apple Pay, access iMessage Apps, and provide authentication support. For more information on how to enable Apple Messages for Business, see Enable Apple Messages for Business with Connect Customer.

Set the forecast time zone

You can generate, view, and download forecasts in the time zone where your business operates. Connect Customer automatically adjusts forecasts to account for daylight saving changes. For example, if your contact center receives contacts from 8AM-8PM US Eastern time, then forecasts will automatically switch from 8AM-8PM Eastern Daylight Time (EDT) to 8AM-8PM Eastern Standard Time (EST) on November 3, 2024.

Time zone support in forecasts simplifies the day-to-day experience for managers. For more information, see Set the forecast time zone.

Updated `AmazonConnectServiceLinkedRolePolicy` service-linked role managed policy

Updated the service-linked role managed policy with the agent assist API action `wisdom:ListContentAssociations`. For a description of the additional action, see Connect Customer updates to AWS managed policies.

New flow and flow module analytics

You can use the following historical metrics for flows and flow modules to identify emergent issues, monitor usage patterns, and measure the impact of configuration changes across your customer or internal facing experiences:

- Average flow time
- Flows started
- Flows outcome
- Flows outcome percentage
- Maximum flow time
- Minimum flow time

These metrics are available in the Connect Customer admin website. You can also access them programmatically by using the GetMetricDataV2 API.

You can use the flows dashboard to view and compare real-time and historical aggregated performance, trends, and insights using custom-defined time periods (for example, week over week), charts, and tables. The flows dashboard can help you answer questions such as "how many contacts dropped out of my contact center before reaching a queue?" or "how long does it take for contacts to navigate through my self-service voice flow?"

Create rules for monitoring flow metrics

You can configure rules to automatically create a task, send an email, or generate an Amazon EventBridge event whenever a flow or flow module metric breaches the threshold you define. For example, you can create a rule to assign a task to a contact center administrator whenever the dropped rate (that is, a percentage of contacts that dropped from a flow) for your inbound welcome flow exceeds 10% over a trailing 4 hour window. For more information, see Create alerts on real-time metrics in Connect Customer.

New Connect Customer Cases APIs

Connect Customer Cases provides attached file APIs that make it easy to upload attachments, check attachments details, and delete attachments from cases. For more information on enabling and working with attachments, see Enable attachments and Uploading Attached Files. To view the attached file APIs, see Files actions.

Connect Customer conversational analytics provides generative AI-powered agent performance evaluations (Preview)

Connect Customer conversational analytics provides managers with generative AI-powered recommendations for answers to questions in agent evaluation forms, enabling them to perform evaluations faster and more accurately. For more information, see Evaluate agent performance in Connect Customer using generative AI.

New metrics available on the Historical metrics page

The following metrics are available on the **Historical metrics** page in the Connect Customer admin website. For a description of each metric, see Metric definitions in Connect Customer.

- Abandonment rate
- Agent non-response without customer abandons
- Average contact duration
- Average conversation duration
- Average customer hold time all contacts
- Average agent greeting time
- Average agent interruptions
- Average holds
- Average agent interruption time
- Average non-talk time
- Average resolution time
- Average talk time
- Average agent talk time
- Average customer talk time

- Agent talk time percent
- Customer talk time percent
- Talk time percent
- Non-talk time percent
- Contacts handled (connected to agent timestamp)
- Contacts queued (enqueue timestamp)
- Callback attempts
- Contacts abandoned in X
- Contacts answered in X
- Contacts resolved in X

April 2024 Updates

New definitions for NextContactId and PreviousContactId

`NextContactId` and `PreviousContactID` have new definitions. For more information, see ContactTraceRecord.

Use screen recording with multiple agents connecting to the same desktop in your environment

You can enable agent screen recording when your VDI environment is configured to allow multiple agents to connect concurrently to the same Windows instance (multi-session VDI). This makes it even easier and more cost effective for you to help agents improve their performance when using Connect Customer in a multi-session VDI environment.

To use this update, download the latest version of the screen recording client application. For the download location, see Connect Customer Client Application.

Voice contacts rejected by an agent have a state of `REJECTED`

Voice contacts rejected by an agent used to have a state of `ERROR` for Contact State in the Agent Event Stream. Now they have a state of `REJECTED`, which is the same as chat and task contacts. This is also reflected on Real-time metrics for the agent.

March 2024 Updates

conversational analytics enables you to automatically fill and submit evaluations

conversational analytics enables you to automatically fill and submit evaluations, using insights and metrics from conversational analytics. For more information on creating a rule that submits an automated evaluation, see Create a rule in conversational analytics that submits an automated evaluation.

Connect Customer allows you to create rich, interactive chat experiences for customers using step-by-step guides

Connect Customer allows you to create rich, interactive chat experiences for customers using step-by-step guides, that help resolve issues faster and improve the customer experience. For more information, see Use step-by-step guides in chats.

Connect Customer agent workspace supports third-party applications in general availability

The Connect Customer agent workspace now supports third-party applications in general availability. Agents can use the native agent applications of Connect Customer (Q in Connect, Cases, Customer Profiles, and Step-by-step Guides) alongside internal or custom-built agent applications, all within a unified agent workspace. For more information, see Integrate third-party applications in the agent workspace, Use screen pop functionality of third-party applications in the Connect Customer agent workspace, the Agent Workspace developer guide, the Connect Customer API reference guide, and the Amazon AppIntegrations API reference.

GA for generative AI-powered post-contact summaries

Released generative AI-powered post-contact summaries for general availability. This feature summarizes long customer conversations into succinct, coherent, and context rich contact summaries. For example, a summary might say "The customer didn't receive a reimbursement for a last minute flight cancellation and the agent didn't offer a partial reimbursement as per the SOP." Use these summaries to help supervisors improve the customer experience by getting faster insights when reviewing contacts, saving time on quality and compliance reviews, and more quickly identifying opportunities to improve agent performance.

For more information, see View generative AI-powered post-contact summaries in Connect Customer.

Hierarchy-based access control (Preview)

In addition to tags, you can enable granular access controls for users by configuring agent hierarchies within the Connect Customer admin website. Assigning hierarchies to a user allows you to define organizational groups that a user belongs to, and you can restrict users from accessing others outside their hierarchy by configure granular permissions. For example, you can configure hierarchy groups and levels for a BPO, such as Acme Corp, and only users assigned to hierarchy groups under Acme Corp will be able to see or edit these users. To learn more about using agent hierarchies to enforce granular access controls for users, see the Apply hierarchy-based access control in Connect Customer.

February 2024 Updates

Connect Customer provides case management metrics

Connect Customer Cases provides the following metrics for case management:

- Average case resolution time
- Average contacts per case
- Cases created
- Cases reopened
- Cases resolved
- Cases resolved on first contact
- Current cases

These metrics give you insights into case volumes and performance. You can view new reports using the historical metrics dashboard in the Connect Customer admin website to analyze case resolution performance based on point in time snapshots or specific time intervals.

Connect Customer Cases provides audit history on cases

Connect Customer Cases provides audit history on cases, allowing you to see which users worked on a case, what changes they made, and the order in which those changes occurred. This launch makes it easier for contact center agents and managers to understand what happened on a case for improved collaboration, quality assurance, and compliance. For information on how to enable the feature for your users, see Assign permissions. Also, see GetCaseAuditEvents in the *Connect Customer API Reference*.

January 2024 Updates

GA for Connect Customer outbound campaigns voice dialing API

Released the PutDialRequestBatch for general availability. This API enables you to use your own list management capability to set up the contact strategy (for example, campaign start and end times, do-not-call times, maximum contact attempts) while programmatically using Connect Customer predictive dialer with machine learning (ML)–powered answering machine detection. This helps increase live-party connections.

Barge for chat: Managers can join ongoing chats between agents and customers

Managers can join and participate in ongoing chats between agents and customers, ensuring that even the most complex customer issues are resolved quickly and accurately. For more information, see Barge into live voice and chat conversations between contact center agents and customers. Also see updates to the MonitorContact and SendEvent APIs.

GetRecommendations and QueryAssistant APIs will be discontinued starting June 1, 2024

Two Amazon Q in Connect APIs—GetRecommendations and QueryAssistant—will be discontinued starting June 1, 2024. To receive generative responses after March 1, 2024, you will need to create a new Assistant in the Connect Customer console and integrate the Amazon Q in Connect JavaScript library (amazon-q-connectjs) into your applications.

High-quality voice experiences for agents using Citrix Virtual Desktop Infrastructure (VDI) environments.

Connect Customer allows you to deliver high-quality voice experiences when your agents use Citrix Virtual Desktop Infrastructure (VDI) environments. Your agents can use the Citrix remote desktop application to offload audio processing to the agent's local device and to automatically redirect audio to Connect Customer, resulting in a simpler agent experience and improved audio quality over challenging networks. For more information, see Citrix VDI with Connect Customer audio optimization.

Granular access controls using resource tags for historical metrics reports

You can apply granular permissions to resource metrics that are included in historical metrics reports. For more information, see Apply granular access control to historical metrics reports in Connect Customer.

December 2023 Updates

Update to third-party applications preview

Added support for third-party applications (preview) to listen to Connect Customer contact and agent events.

Expanded AWS Regions to support: US East (N. Virginia), US-West (Oregon), Africa (Capetown), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London).

Connect Customer provides granular access controls using resource tags configured for hours of operation and prompts in the Connect Customer admin website

Provide granular access controls using resource tags configured for hours of operation and prompts in the Connect Customer admin website. For example, you can tag hours of operation with `Division:HumanResources`, and then only let HR administrators see and edit those work hours.

Prompts are audio files, such as on-hold music, that can be customized and configured to play within call flows. For example, you can tag celebrity prompts with `Department:Insurance`, and then only let administrators from your insurance line of business access those prompts.

Connect Customer provides an API to programmatically update the priority of contacts

Programmatically update the priority of contacts, such as voice calls, callbacks, chats, and tasks, in addition to the existing Change routing priority/age flow block. With this API, you can update a contact's or customer's position in a queue directly from your custom monitoring dashboards. For more information, see the UpdateContactRoutingData API.

Route contacts according to the proficiency of agents

You create and use agent proficiencies for routing a contact to the best available agent in a queue. Each proficiency indicates an agent's level of expertise in an predefined attribute such as language fluency, skillset, or customer issue types they support. For more information, see Set up routing in Connect Customer based on agent proficiencies.

Added Connect Customer Cloudformation resources

Added AWS::Connect::PredefinedAttribute and AWS::Connect::User UserProficiency Cloudformation resources.

Connect Customer conversational analytics provides an API to programmatically search for contacts

Programmatically search for contacts using filters such as contact attributes (time range, agent, channel, queue) and keywords within a conversation. Using this API, you can build custom user interfaces that enable managers and agents to search for completed or in progress contacts. For more information, see the SearchContacts API.

Pause and resume tasks

You can pause and resume all tasks that aren't expired, disconnected, or scheduled for a later time. This enables agents to free up an active slot so they can receive more critical tasks when their current task is stalled, for example, because of a missing approval or waiting on an external input. For more information, see Concepts: Pause and resume tasks. Also see the PauseContact and ResumeContact APIs.

Manage your cases and set up escalation workflows using the rules designer in the Connect Customer UI

you can create rules to automatically create a task, update a case, or send email alerts to a manager whenever a case is created or updated. In addition, you can create rules using Connect Customer conversational analytics to automatically create a case for post-conversation follow-up, such as when negative customer sentiment or specific key words are detected in a conversation.

For more information, see Automatically monitor and update cases in Connect Customer Cases, Allow Connect Customer Cases to send updates to conversational analytics rules, Create a rule in conversational analytics that creates a case, Create a rule in conversational analytics that ends associated tasks from a case, and Create a rule in conversational analytics that updates a case.

Get a more granular view of your Connect Customer bill and usage

You can get detailed billing reports in AWS Cost Explorer and AWS Cost & Usage Reports by using cost allocation tags (key:value pairs) to aggregate the data. You can gain more insights into your

Connect Customer bill and better organize your bill by lines of business/departments (for example, support, banking, sales, claims), types of issues, phone numbers, environments, and more.

For more information, see Set up granular billing for a detailed view of your Connect Customer usage. Also see TagContact and UntagContact in the *Connect Customer API Reference*.

Customer Profiles calculated attributes that turn customer data into actionable insights

Connect Customer Customer Profiles enables contact center managers to create calculated attributes that turn customer behavior data (contacts, orders, web visits) into actionable customer insights such as a customer's preferred channel to drive dynamic routing, personalize IVRs, and provide agents with more relevant customer context. For more information, see the Getting started with calculated attributes in Connect Customer Customer Profiles documentation.

Contacts Answered/Abandoned in X

On the **Real-time metrics** page, you can define custom thresholds for Contacts abandoned and Contacts answered in X seconds, where X is a time range that you specify.

November 2023 Updates

Customer Profiles provides a generative AI powered customer data mapping capability

Customer Profiles provides a generative AI powered customer data mapping capability that significantly reduces the time needed to create unified profiles, which allows you to create more personalized customer experiences more efficiently. For more information, see Generate a mapping with generative AI in Customer Profiles.

UI builder for step-by-step guides

This feature allows you to create and manage the UI pages shown to agents in step-by-step guides. Using a drag-and-drop interface you are able to define static and dynamic content for the agent's UI. This includes layouts, styles, and dynamic data, which enables you to control the look and feel of your agent's experience. With this capability, you are able define what gets displayed in your agent's UI during the step-by-step guided experience. For more information, see the Build views with the UI builder in Connect Customer documentation.

Added agent assist

Connect Customer agent assist is a generative AI customer service assistant. It is an LLM-enhanced evolution of Connect Customer Wisdom that delivers real-time recommendations to help contact center agents resolve customer issues quickly and accurately.

Connect Customer agent assist automatically detects customer intent during calls and chats using conversational analytics and natural language understanding (NLU). It then provides agents with immediate, real-time generative responses and suggested actions. It also provides links to relevant documents and articles.

For more information, see Use AI agents for real-time assistance and the agent assist API Reference.

Connect Customer conversational analytics provides real-time conversational analytics for chat

conversational analytics provides real-time conversational analytics for chat, extending the machine learning-powered post-contact analytics (for example, sentiment analysis, automated contact categorization, and more) to real-time contact scenarios. These capabilities enable contact center managers to help detect customer issues during in-progress chat contacts, and help them resolve customer issues faster. For example, managers can get a real-time email alert when customer sentiment for a chat contact turns negative, allowing them to join the in-progress contact and help resolve the customer issue.

For more information, see Analyze conversations using conversational analytics in Connect Customer conversational analytics. In addition, see the ListRealtimeContactAnalysisSegmentsV2 action in the *Connect Customer API Reference*.

Connect Customer conversational analytics provides generative AI-powered post-contact summaries (Preview)

conversational analyticsprovides generative AI-powered post-contact summaries, enabling contact center managers to more efficiently monitor and help improve contact quality and agent performance.

conversational analytics already labels parts of contact transcripts as issue, outcome, and action item. With this launch, conversational analytics condenses a long customer conversation into

a concise and coherent summary (for example, customer didn't receive reimbursement for last minute flight cancellation, and the agent didn't offer partial reimbursement as per the SOP). This enables managers to help reduce the overall time spent on evaluating contact quality and agent performance, as they no longer have to read long contact transcripts or listen to call recordings.

For more information, see View generative AI-powered post-contact summaries in Connect Customer.

Connect Customer supports in-app, web, and video calling

The Connect Customer in-app, web, and video calling capabilities enable your customers to contact you without ever leaving your web or mobile application. You can use these capabilities to pass contextual information to Connect Customer. This enables you to personalize the customer experience based on attributes such as the customer's profile or other information, like actions previously taken within the app.

For more information, see Set up in-app, web, video calling, and screen sharing capabilities. In addition, see the StartWebRTCContact action in the *Connect Customer API Reference*.

Connect Customer supports two-way SMS

Connect Customer supports two-way Short Messaging Service (SMS) capabilities, making it easy for you to resolve customer issues by text messaging. SMS offers a ubiquitous and convenient channel for customers to get help, while enabling you to deliver personalized experiences at a lower cost.

To get started, claim your two-way SMS number from AWS End User Messaging SMS and associate the number with your Connect Customer instance. Connect Customer SMS uses the same automation, routing, configuration, analytics, and agent experience as calls and chats, making it easy to deliver seamless omnichannel customer experiences.

For more information, see Set up SMS messaging in Connect Customer. In addition, see the following new actions in the Connect Customer API Reference Guide.

- `AssociateFlow`
- `DisassociateFlow`
- `GetFlowAssociation`
- `ImportPhoneNumber`
- `ListFlowAssociations`

- `SendChatIntegrationEvent`

Analytics data lake (Preview)

You can use Analytics data lake as a central location to query various types of data from Connect Customer. This data includes contact records and conversational analytics conversational analytics. Data is refreshed around every 24 hours. You can use the Analytics data lake to create custom reports or run SQL queries.

For more information, see Access Connect Customer data lake. In addition, see new actions in the Analytics data lake actions topic in the *Connect Customer API Reference*.

Added metrics to the `GetMetricDataV2` action

Added the following agent and contact performance metrics to the GetMetricDataV2 action:

- After contact work time
- Agent interaction and hold time
- Agent interaction time
- Contact flow time
- Contact handle time
- Contacts hold agent disconnect
- Contacts hold customer disconnect
- Contacts put on hold
- Customer hold time
- Contacts transferred out external
- Contacts transferred out internal
- Agent answer rate
- Agent idle time
- Error status time
- Agent non-productive
- Online time
- Agent outbound connecting time

- Agent contact time
- Non-adherent time: This metric is available in AWS Regions where Forecasting, capacity planning, and scheduling is available.

Customer Profiles block enhancements

You can access more customer information, including orders, cases, assets, custom attributes, and calculated attributes through the Customer Profiles Flow block. For more information, see Flow block in Connect Customer: Customer profiles.

View and manage applied service quotas for Connect Customer using AWS Service Quotas

Service Quotas allows you to view both default and applied quota values for resources used by each of your Connect Customer instances. When requesting a quota increase, Service Quotas allows you to indicate both the Connect Customer quota and desired value. For quotas that support resource level adjustability you can also specify your Connect Customer instance. For more information, see Connect Customer service quotas.

Added an action to `AmazonConnectServiceLinkedRolePolicy`

Updated `AmazonConnectServiceLinkedRolePolicy` with an action for Connect Customer agent assist. For a description of the additional action, see Connect Customer updates to AWS managed policies.

Connect Customer provides a conversational analytics conversational analytics dashboard

Connect Customer provides a pre-built conversational analytics conversational analytics dashboard that enables customers to understand why customers are contacting, the trends of contact drivers over time, and the performance of each of those call drivers (for example, average handle time for call driver "where's my stuff?"). For more information, see conversational analytics conversational analytics dashboard.

Connect Customer provides a pre-built queue performance dashboard

Connect Customer provides a pre-built queue performance dashboard that helps contact center managers analyze, track, and improve contact center performance. This dashboard enables

managers to view and compare real-time and historical aggregated queue performance using custom-defined time periods (for example, week over week), a summary chart, and a time series graph. For more information, see Queue performance dashboard.

Connect Customer prompts configuration page provides CloudTrail coverage

The prompts configuration user interface has been updated to make it more efficient for you to manage prompts. In addition, when you add, update or delete a prompt from the Connect Customer admin website, a record of that activity is available in AWS CloudTrail for visibility, reporting, and compliance. For example, you might notice a discrepancy in the IVR prompt that customers hear when they call your support line. To investigate, you can use AWS CloudTrail to answer questions such as, "who saved this recording?" and "when was this prompt changed?" For more information about the new prompts page, see Create prompts in Connect Customer.

Connect Customer enables integration with your preferred file scanning application to detect malware

You can integrate Connect Customer with your preferred file scanning application to detect malware or other unwanted content in attachments before they can be shared in a chat or uploaded to a case. This capability provides an additional layer of protection for your customers and organization by preventing malicious files from being shared and downloaded. For more information, see Set up attachment scanning in Connect Customer.

Connect Customer outbound campaigns voice dialing API

You can create contacts for all high-volume voice outreach by using the BatchPutContact API. This API makes it easier for you to track outcomes of all campaign calls by using the Connect Customer contact record.

Connect Customer Cases supports author name on comments

You can programmatically add and view author comments by using the CreateRelatedItem and SearchRelatedItems APIs.

Updated `AmazonConnectCampaignsServiceLinkedRolePolicy` service-linked role managed policy

Updated the service-linked role managed policy for outbound campaigns. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

Added Create persistent chat association flow block and CreatePersistentContactAssociation API

You can set up a chat to be persistent either when the chat session is initially created or at any time during the lifetime of the chat. To set up persistent chat after the chat session has started, use the new CreatePersistentContactAssociation API or include the new Create persistent contact association block in your flow.

Optimization to how the CCP detects and handles stale WebSocket connections

When an agent initializes the CCP, a WebSocket connection is opened and it is used during subsequent contact handling. If that agent experiences poor network conditions, this might result in the agent becoming unreachable without the backend detecting it. With this release the WebSocket connections for these agents are detected as stale and cleaned in 1-2 minutes.

Connect Customer can identify, within about 2 minutes, a situation where a chat customer and an agent are on a chat contact, and the agent becomes unreachable (for example, as a result of losing wifi or losing power to their local machine), allowing the backend to run the chat disconnect flow. Before this optimization, it could take up to 10 minutes to run any chat disconnect flows.

Added new service-linked role policy and service-linked role

Added `AmazonConnectSynchronizationServiceRolePolicy` service-linked role policy and `AWSServiceRoleForAmazonConnectSynchronization` service-linked role for managed synchronization. The policy and role provide access to read, create, update, and delete Connect Customer resources and is used to automatically synchronize AWS resources across AWS regions. For more information, see AWS managed policy: AmazonConnectSynchronizationServiceRolePolicy and Using service-linked roles for Connect Customer Managed Synchronization.

Added conversational analytics conversational analytics metrics to the GetMetricDataV2 API

You can analyze aggregate agent and contact performance using conversational analytics conversational analytics metrics in the GetMetricDataV2. The following new metrics were added: **non-talk time percent**, **talk time percent**, **talk time agent percent**, and **talk time customer percent**. For descriptions of these metrics, see Metric definitions in Connect Customer.

Added configuration management across AWS Regions for Connect Customer Global Resiliency customers

Connect Customer Global Resiliency customers can use the ReplicateInstance API to copy configuration information for resources such as users, routing profiles, queues, and flows across AWS Regions. The API also automatically matches the service quotas for these resources across AWS Regions as part of the replication process. For more information, see Create a replica of your existing Connect Customer instance.

Added the BatchGetFlowAssociation API. Use this API to obtain a list of flow-associations for the resource identifiers provided in the API request. For example, you can list which phone numbers are associated with which flows in an Connect Customer instance.

October 2023 Updates

Added actions to `AmazonConnectServiceLinkedRolePolicy`

Updated `AmazonConnectServiceLinkedRolePolicy` with actions for Connect Customer Customer Profiles. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

Third-party applications preview

You can integrate third-party applications into the agent workspace. For more information, see Integrate third-party applications in the agent workspace and the Amazon Connect agent workspace third-party developer guide.

Added actions to `AmazonConnectServiceLinkedRolePolicy`

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

Updated `AmazonConnectServiceLinkedRolePolicy` with actions for Connect Customer Wisdom. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

Added the UpdatePhoneNumberMetadata API

Use the UpdatePhoneNumberMetadata to update the metadata for a phone number, such as the phone number description.

Add as many as four access control tags to a single security profile

Adding additional access control tags will make a given security profile more restrictive. For example, if you add four access control tags like `BPO:AcmeCorp`, `Specialty:Claims`, `Department:Billing`, and `City:NewYork`, the user would only be able to see resources containing all four of these tags. For more information, see Apply tag-based access control in Connect Customer.

Added actions to `AmazonConnectServiceLinkedRolePolicy`

Updated `AmazonConnectServiceLinkedRolePolicy` with actions for Connect Customer Customer Profiles. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

CTI Adapter upgrade for third-party cookies

This upgrade prevents the blocking of third-party cookies from impacting Connect Customer across Chrome and all supported browsers. For more information, see Connect Customer CTI Adapter for Salesforce release notes and Using Connect Customer with third-party cookies.

Create and customize up to 15 communications widgets

You can create and customize up to 15 communications widgets per Connect Customer instance. For more information, see Add a chat user interface to your website hosted by Connect Customer.

Access the trailing 90 days of historical agent and contact metrics

You can access the trailing 90 days of historical agent and contact metrics (for example, Service level *X*, Average handle time) by using the GetMetricDataV2 API. You can also make requests spanning up to 35 days with data categorized by customizable time intervals such as 15 minutes, hourly, or weekly.

In addition, added the following metrics to the `GetMetricDataV2` API. These metrics are not available in Connect Customer admin website.

- Abandonment rate

- Agent non-response without customer abandons
- Average customer hold time all contacts
- Average resolution time
- Contacts resolved in X seconds

Added actions to `AmazonConnectServiceLinkedRolePolicy`

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

Updated `AmazonConnectServiceLinkedRolePolicy` with actions for Connect Customer Wisdom. For a description of the additional actions, see Connect Customer updates to AWS managed policies.

September 2023 Updates

Released Connect Customer Client Application v1.0.2.38

Released Connect Customer Client Application v1.0.2.38. This version contains minor fixes and improvements. For more information, see Connect Customer Client Application.

Added "View my contacts" permission

Added a new security profile permission: View my contacts. On the **Contact search** page, agents who have this permission can access the contacts that they've handled. If you're using conversational analytics, agents can also review the analyzed recording and transcripts of the contact. For more information, see Assign permissions to use conversational analytics in Connect Customer.

Streams API upgrade for third-party cookies

This upgrade prevents the blocking of third-party cookies from impacting Connect Customer across Chrome and all supported browsers. For more information, see Using Connect Customer with third-party cookies.

Create alerts on real-time metrics

You can create rules that automatically send emails or tasks to managers based on the values of real-time metrics. This enables you to alert managers on contact center operations that could potentially impact the end-customer experience.

For more information, see Create alerts on real-time metrics in Connect Customer.

"Maximum contacts in queue" includes all channels

If you have a queue that combines more than one channel, and you set a custom value for **Maximum contacts in queue**, the queue stops accepting new contacts after that number is reached, regardless of the distribution of contacts. For example, if you set the value to 50, and the first 50 contacts are chats, then voice calls are not routed to this queue.

For more information, see Set the limit of maximum contacts in a queue using Connect Customer.

Manage contacts from the Contact details page

On the **Contact details** page of an in-progress contact, you can manage a contact by transferring, rescheduling, or ending the contact. For more information, see Manage contacts from the Contact details page in Connect Customer.

Upload file attachments to cases

Agents can upload file attachments to cases. For more information, see Enable attachments in your CCP so customers and agents can share and upload files. For a list of supported file types, see Connect Customer feature specifications.

In addition, when agents leave comments on cases, their name is included.

Search for in-progress contacts

You can search for in-progress contacts on the **Contact search** page. For more information, see Search for in-progress contacts in Connect Customer.

Subscribe to the Contact Data Updated event in the contact event stream

You can subscribe to an event type called `CONTACT_DATA_UPDATED`. The `Contact` object includes an `UpdatedProperties` field. This enables you to monitor for changes to scheduled

timestamp for tasks, and changes to user-defined attributes on the contact record. In addition, hierarchy groups information in the `AgentInfo` object is included for `CONTACT_DATA_UPDATED`, `CONNECTED_TO_AGENT`, and `DISCONNECTED` event types. For more information, see Contact events data model.

APIs to programmatically configure views in step-by-step guides

Connect Customer provides APIs to programmatically create and manage view resources used in step-by-step guides. View resources define what gets displayed in your agent's UI during a step-by-step guide. For more information, see the Use views to customize the user interface for agents, customers, and other user personas in Connect Customer documentation.

Support for UIFN in more than 60 countries

Connect Customer supports Universal International Freephone number (UIFN) in more than 60 countries that are registered with the International Telecommunications Union, an organization that supports the administration of the UIFN service. Connect Customer allows you to enable UIFNs in as many countries as you need, with a requirement of at least 5 countries. For more information, see Connect Customer support of the inbound only UIFN service.

August 2023 Updates

Voice dialing for outbound campaigns, no agents required

You can use Connect Customer outbound campaigns for high-volume outreach with no agents required. A new dialer type called "Agentless" makes it easier to proactively communicate with your customers for use cases such as personalized voice notifications and appointment reminders. For more information, see Create an outbound campaign and the CreateCampaign API.

Connect Customer Cases supports nine additional languages

Connect Customer Cases supports nine additional languages. You can view the Connect Customer Cases user interface in any language supported by Connect Customer regardless of your AWS Region. For more information, see Connect Customer Cases.

Granular access controls using resource tags for the agent activity audit report

You can apply granular permissions to the agent activity audit report in the Connect Customer historical metrics UI using resource tagging and tag-based access controls. For more information,

see Agent activity audit tag-based access control in Connect Customer and Apply tag-based access control in Connect Customer.

Enhanced user bulk edit

You can update up to 100 user records on the Connect Customer admin website in less than half the time it used to take to make bulk updates. This enhancement is especially useful during contact surges when you might need to change the routing profile for many agents. For more information, see Edit users in bulk in Amazon Connect Customer.

Connect Customer scheduling supports agent group activities

Connect Customer scheduling allows contact center managers to more efficiently create and manage activities for groups of agents. For more information, see Add shift activities in draft or published schedules in Connect Customer.

GA for global sign-in and agent distribution capabilities

Released the following Connect Customer Global Resiliency capabilities for general availability: global sign-in and agent distribution across Connect Customer Regions. This release includes:

- A global sign-in endpoint that enables agents to sign in once and be logged into multiple AWS Regions. This eliminates the need to log off / log back into either region separately
- An API action to provision agents that are "global" and available in both Regions.
- An API action to distribute agents across these AWS Regions by percentage in 10% increments (for example, 100% in US East (N. Virginia) and 0% in US West (Oregon), or 50% in each Region). This provides you with the flexibility to slowly shift agents across Regions or all at the same time.
- Custom and embedded Contact Control Panel enhancements that enable agents to process contacts from their current active Region without needing to know which Region is active at any given time.

For more information, see Set up your agent's experience with Connect Customer Global Resiliency. Also see the following new APIs:

- AssociateTrafficDistributionGroupUser
- DisassociateTrafficDistributionGroupUser
- ListTrafficDistributionGroupUsers

Updated UpdateTrafficDistribution with `SignInConfig` and `AgentConfig` parameters.

To create a CloudFormation template for traffic distribution groups, see the following topic:

- AWS::Connect::TrafficDistributionGroup

100 rows on real-time metrics tables

You can now view up to 100 rows in the real-time metrics tables on the **Real-time metrics** page. Previously, the maximum was 50 rows. For more information about real-time metrics, see Real-time metrics reports in Connect Customer.

Sorting on column header names

You now have the ability to sort by choosing a column header, rather than choosing the smaller arrow next to the header text. For more information about real-time metrics, see Real-time metrics reports in Connect Customer.

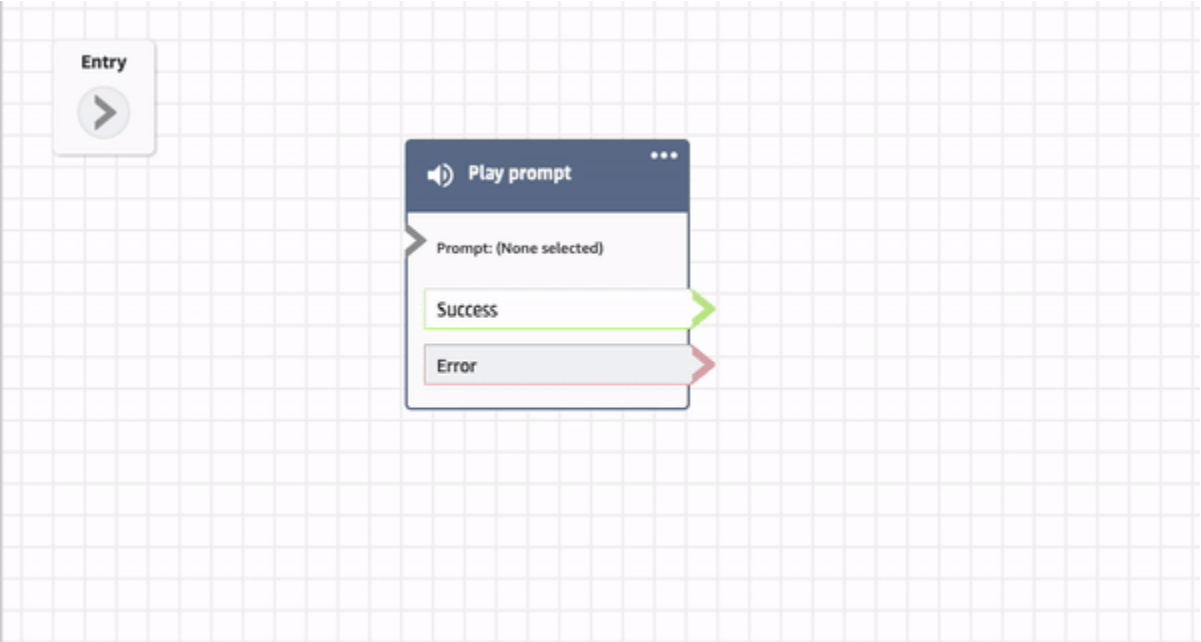
Route based on time since last inbound contact

Added an option to specify that selected agents with this routing profile will not have their routing order impacted by outbound contacts. For more information, see Create a routing profile in Connect Customer to link queues to agents.

July 2023 Updates

Customize the names of flow blocks

To help you distinguish blocks in a flow, you can customize the names of blocks. For example, you might rename a *Play Prompt* flow block to *Welcome message* or a *Get customer input* flow block to *Hotel booking Lex bot*. The following GIF shows how to customize the name of a flow block.



For more information, see Customize the name of a flow block in Connect Customer.

Archive, restore, and delete flows and modules

You can archive, restore, and delete flows and modules by using the Connect Customer admin website. This makes it easier to manage flows and modules that are not in use or no longer needed. For example, flows used only during certain times of the year can be archived when not in use and then unarchived when needed. When a flow or module has been archived, you can then permanently delete it so it is no longer available within your list of flows and modules. For more information, see Archive, delete, and restore flows in Connect Customer.

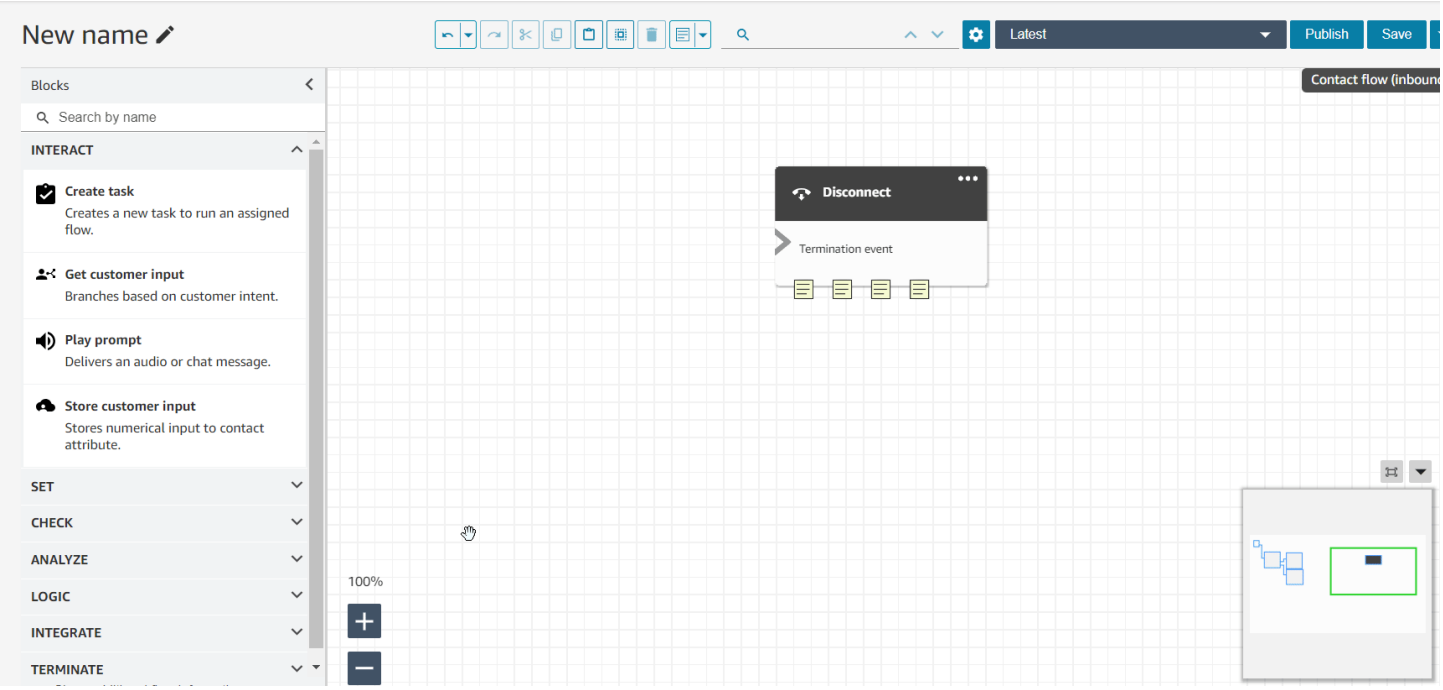
Undo and redo actions in the flow designer

You can undo and redo actions in the flow designer. Choose the undo and redo items on the toolbar. Or, with your cursor on the flow designer canvas, use the shortcut keys: Ctrl+Z to undo, Ctrl+Y to redo. For more information, see Undo and redo actions in the flow designer in Connect Customer.

Add notes to a flow block

To add notes to a block, on the toolbar choose Annotation. Or, with your cursor on the flow designer canvas, use the shortcut keys: Ctrl + Alt +N. A yellow box opens for you to type up to 1000 characters. This enables you to leave comments that others can view. For more information, see Add comments to a flow block in the flow designer in Connect Customer.

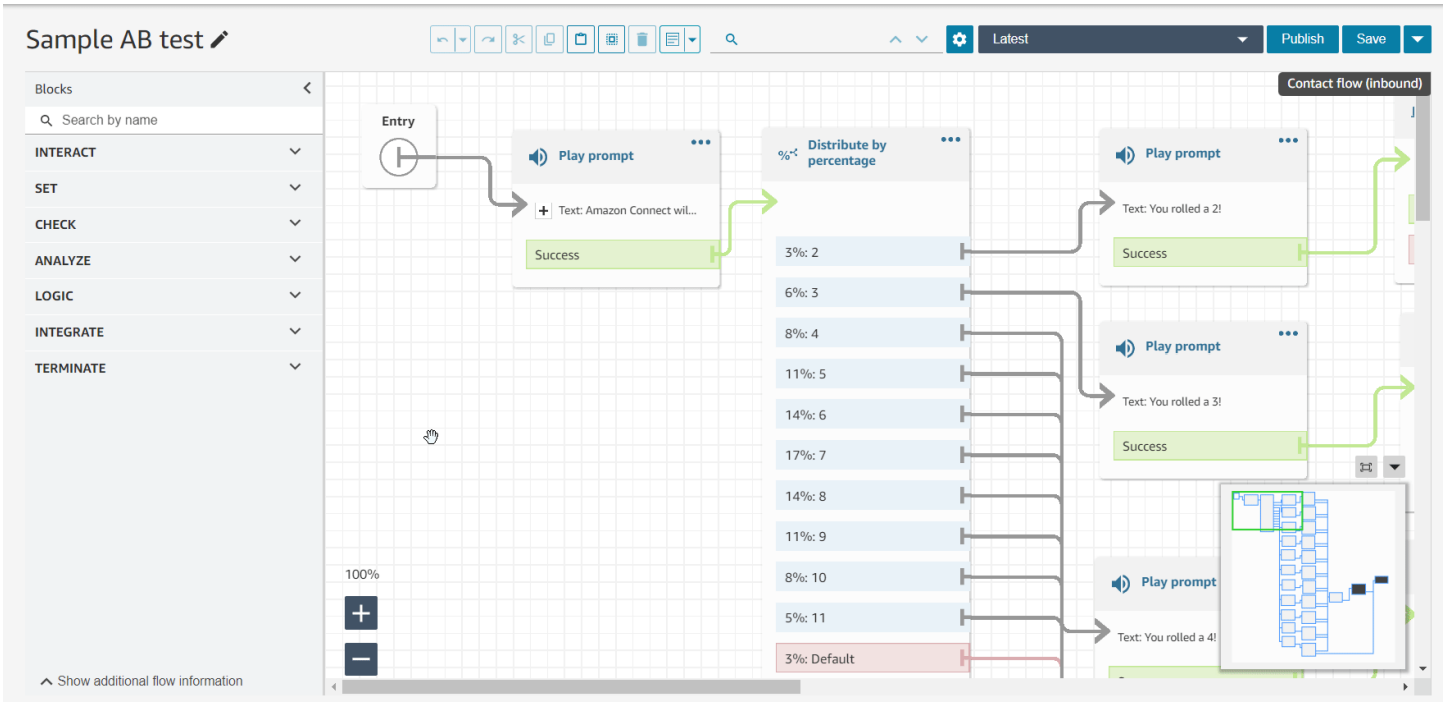
The following GIF shows how to move notes around the flow designer and attach them to a block.



Use the mini-map to navigate a flow

On the flow designer, the mini-map view to helps you easily navigate the flow. The drag-to-move mini-map has visual highlights that enable you to quickly move to any point in the flow. For more information, see Use the mini-map in Connect Customer to navigate a flow.

The following GIF shows an example of how you can use the mini-map to navigate a large flow.



Restrict attributes to specific flows

Released a new type of attributes called a flow attribute. Flow attributes are restricted to the flow in which they are configured. They are useful in situations where you don't want to persist the data throughout the contact, such as when you need to use sensitive information like the customer's credit card number to do a Lambda data dip. For more information, see Flow attributes.

Import time off balances

You can import time off balances for your users. You can also set the group allowance for time off by hour, for each calendar day, for specific time off activities. Connect Customer uses the time off balance to automatically approve or decline time off requests based on the agent's available net balance and the group allowance for time off. For more information, see Import an agent's time off balance to Connect Customer and Set group allowance for time off in Connect Customer.

Schedule flexible days and shift activities based on shift length

The following scheduling functionality has been released:

- You can generate agent schedules that have the appropriate number of activities, such as breaks or meals, depending on the duration of the shift. The required number of breaks and meals are automatically placed in schedules that are compliant to various regional labor laws.

- You can generate agent schedules that include flexible days, that is, days that will be optionally scheduled if there's a need. Connect Customer can automatically generate flexible schedules that are compliant to agent's contracts and regional labor laws, thereby saving time for schedulers.

For more information, see Create a template for an agent's weekly shift in Connect Customer.

Connect Customer Customer Profiles supports rule-based matching and merging

Connect Customer Customer Profiles supports rule-based resolution to match and merge similar profiles into unified ones. This enables you to enhance customer service by granting agents and automated systems access to relevant customer information. As a result, interactions become faster and more personalized for customers. For more information, see Use Identity Resolution to consolidate similar profiles in Connect Customer.

Released Connect Customer Client Application v1.0.1.33

The Connect Customer Client Application is used to record agent screens. With this newer version you no longer need to restart your desktop after installing the client application. For the download location, see the Connect Customer Client Application topic.

Connect Customer Cases provides case assignment

Case assignment helps organizations reduce the time to resolve customer issues by clearly tracking case activities and resolution ownership. Agents can associate a case with a queue or an individual agent for resolution. Agents can view and filter cases assigned to their queue, and managers can directly assign cases to individual agents. For more information, see Set up a case assignment in Connect Customer Cases.

conversational analytics Conversational Analytics metrics in the API

You can analyze aggregate agent and contact performance using conversational analytics Conversational Analytics metrics in the GetMetricDataV2 API. The list of metrics include Average contact duration, Average conversation duration, Average greeting time agent, Average holds, Average interruptions agent, Average interruption time agent, Average non-talk time, Average talk time, Average talk time agent, and Average talk time customer. For more information, see Metric definitions in Connect Customer and GetMetricDataV2.

Connect Customer Wisdom supports real-time recommendations for chat conversations

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

Connect Customer Wisdom delivers ML-powered, real-time recommended information to help chat agents quickly solve customer needs.

Delete queues and routing profiles programmatically

You can delete queues and routing profiles programmatically. For more information, see the following topics:

- DeleteQueue action
- delete-queue AWS CLI
- DeleteRoutingProfile action
- delete-routing-profile AWS CLI

To create an CloudFormation template for queues and routing profiles, see the following topics:

- AWS::Connect::Queue
- AWS::Connect::RoutingProfile

June 2023 Updates

Agents can change their audio device settings in the CCP and agent workspace

You can configure the Contact Control Panel (CCP) or agent workspace to enable agents to select their preferred device for microphone input and audio output, such as voice media and new contact notifications. For more information, see How to use the CCP to change your audio device settings.

Connect Customer Chat: New interactive message types

Connect Customer Chat supports new interactive message types: quick replies and carousels. With quick replies, customers are presented with a list of response options (for example, **Yes**, **No**) that they can easily choose to reply. Carousels present a set of interactive messages in a horizontally-scrolling format. Your customers can scroll through them and select the best option. For more information, see Add Amazon Lex interactive messages for customers in chat.

GetMetricDataV2 API: Region availability and new functionality

The GetMetricDataV2 API is available in the AWS GovCloud (US-West) Region. GetMetricDataV2 is now released in all AWS Regions where Connect Customer is offered. This API enables you to access the trailing 35 days of historical agent and contact metrics (for example, service level, average handle time) with customizable filters and groupings.

You can use GetMetricDataV2 to build custom dashboards to measure queue and agent performance over time. For example, you can identify the number of contacts that were disconnected by an agent versus disconnected by a customer hanging up. For more information, see GetMetricDataV2.

Search for existing tags within an Connect Customer instance

Connect Customer provides the ability to search for existing tags within an instance, both programmatically through API and within the UI. When tagging resources, you can search from pre-existing key:value pairs before creating new ones. For more information, see the SearchResourceTags API.

Added screen recording capabilities to conversational analytics

Connect Customer conversational analytics provides screen recording capabilities, making it easy for you to help agents improve their performance. With screen recording, you can identify areas for agent coaching (for example, long contact handle duration or non-compliance with business processes) by not only listening to customer calls or reviewing chat transcripts, but also watching the agent's actions while they are handling a contact. For more information, see Set up and review agent screen recordings in Connect Customer.

Connect Customer scheduling allows agents to manage time off requests

Connect Customer scheduling allows contact center agents to manage their time off requests in a self-serve manner. For more information, see Create a time off request in Connect Customer.

Real-time data export of unified customer profiles to an Amazon Kinesis Data Stream

Connect Customer Customer Profiles supports real-time data export of unified customer profiles to an Amazon Kinesis Data Stream. Companies can enable data streaming and automatically receive data for new profiles and updates to existing profiles into their Amazon Kinesis Data Stream. For more information, see Export your unified customer profile data.

May 2023 Updates

Added theme detection to conversational analytics

conversational analytics provides a machine learning powered capability for businesses to help identify top contact drivers by grouping customer conversations into themes. For more information, see Use theme detection in Connect Customer conversational analytics to discover issues with contacts.

New APIs for managing prompts

You can programmatically create and manage prompts using APIs, for example, to extract prompts stored in Connect Customer and add them to your Amazon S3 bucket. AWS CloudTrail, CloudFormation, and tagging are supported. For more information, see Prompt actions in the *Connect Customer API Reference Guide*. Also see AWS::Connect::Prompt in the *CloudFormation User Guide*.

Added supervisor alerts on agent performance

Connect Customer conversational analytics provides supervisor alerts on agent performance. This enables you to identify which contacts (for example, those with an evaluation score less < 50%) that require supervisors follow-up with agents on their team. For more information, see Notify supervisors and agents about performance evaluations.

Interactive messages: Rich formatting in chat titles and subtitles

You can add rich formatting to the titles and subtitles of your chat messages. For example, you can add links, italics, bold, numbered lists, and bulleted lists. You use markdown to format your text. For more information, see Rich formatting in titles and subtitles in the *Add interactive messages to chat* topic.

April 2023 Updates

GA for Connect Customer evaluation capabilities

Released Connect Customer evaluation capabilities for general availability. Use these capabilities to:

- Create evaluation forms
- Evaluate agent performance
- Create rules that trigger an action (such as send email or tasks) based on evaluation results
- Search evaluation forms and evaluations

To manage evaluation forms programmatically, see the Evaluation actions in the *Connect Customer API Reference*. To create a shared template for evaluation forms, see the AWS::Connect::EvaluationForm resource in the *CloudFormation User Guide*.

New API: Use `CreateParticipant` to customize chat flow experiences

Added the CreateParticipant API which you can use to customize chat flow experiences. You use it to integrate custom participants. For more information, see Customize chat flow experiences in Connect Customer by integrating custom participants.

Customer Profiles displays case information in the agent workspace

Using Connect Customer Customer Profiles inside the agent workspace, agents can see cases from third-party case management solutions and Connect Customer Cases inside a particular customer profile. For more information, see Customer Profiles in Connect Customer and Access Customer Profiles in the agent workspace.

Added Cross-channel concurrency

You can configure an agent's routing profile to receive contacts from multiple channels at the same time. For example, while an agent is on a voice contact, they can be offered contacts from any other channels enabled in the routing profile, such as chats and tasks.

For more information, see Create a routing profile in Connect Customer to link queues to agents. Also see the CrossChannelBehavior API.

Set Voice ID block supports fraud watchlist ID

Updated the Set Voice ID block so it supports fraud watchlist ID for fraud detection.

Search, sort, and filter published agent schedules

Schedulers can quickly search, sort, and filter agent schedules from within the published schedule calendar. For more information, see How supervisors view published schedules using the Connect Customer admin website.

March 2023 Updates

Added Wisdom support for Microsoft SharePoint Online

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

You can choose Microsoft SharePoint Online as knowledge base for Wisdom articles. For more information, see Initial set-up for AI agents. Also see the AppIntegrationsConfiguration API in the *Connect Customer agent assist API Reference*.

Create step-by-step guides for your agents

Inside the out-of-the-box Connect Customer agent workspace, you can create workflows that walk agents through custom UI pages that suggest what to do at a given moment during a customer interaction. You can create guides that help agents identify customer issues and recommend subsequent actions, as well as surface screen-pops and forms for submitting transactions and disposition codes. For more information, see Set up step-by-step guides in Connect Customer.

Added support for nested JSON in Invoke AWS Lambda function flow block

The Invoke AWS Lambda function flow block supports JSON responses. For more information, see Flow block in Connect Customer: AWS Lambda function.

Added Show View flow block

This block is used to configure UI based workflows that you can surface to users in front end applications. For more information, see Flow block in Connect Customer: Show view.

Added staff level shift profile

You can assign a shift profile to individual agents. This is useful to do when, for example, you have part-time agents who are in the same staffing group as your full-time agents, but they require their own shift profile. For more information, see the **Associate to shift profile** option described in Create staff rules for scheduling in Connect Customer.

Added support for multiple fraudster watchlists

Every domain has a default watchlist where all existing fraudsters are placed by default. You can create and manage custom watchlists to be evaluated against for known fraudster detection. For more information, see Known fraudster detection, and see new actions in the Connect Customer Voice ID API Reference.

Search and sort schedules in the Schedule Manager

Schedulers can quickly search for schedule names using partial keywords or sort the schedule list based on start date, end date, creation date, or updated date. For more information, see Search and sort a schedule.

Added the ability to configure multiple IAM roles that can be assigned to a single user when using SAML 2.0

You can configure multiple IAM roles that can be assigned to a single user when using SAML 2.0 which enables you to support user access from multiple identity providers simultaneously. For example, if you are migrating identity providers, you can configure multiple IAM roles associated to a single user and that user will be able to access Connect Customer from either provider. To learn more about configuring IAM roles for SAML 2.0 in Connect Customer, see the Configure SAML with IAM for Connect Customer documentation.

Added panel template for interactive chat messages

With a panel template, you can present customers with up to 10 choices under one question in a chat message. For more information, see Add Amazon Lex interactive messages for customers in chat.

Added `GetMetricDataV2` API

Added the GetMetricDataV2 API to the *Connect Customer API Reference Guide*. This API enables you to programmatically access trailing 14 days of historical agent and contact metrics data. It extends the capabilities of the GetMetricData API, provides new historical metrics (for example, the number of contacts disconnected, and the number of callback attempts), and provides the ability to filter metrics with more granularity.

February 2023 Updates

Added new attribute type `ENHANCED_CONTACT_MONITORING` to the Describe, List, and Update Instance Attribute APIs

This release updates the APIs: `DescribeInstanceAttribute`, `ListInstanceAttributes`, and `UpdateInstanceAttribute`. You can use it to programmatically enable/disable enhanced contact monitoring using attribute type `ENHANCED_CONTACT_MONITORING` on the specified Amazon Connect instance. For more information, see DescribeInstanceAttribute, ListInstanceAttributes, and UpdateInstanceAttribute.

Added the `DeleteDomain` API for Cases

For more information, see the DeleteDomain API in the *Connect Customer Cases API Reference Guide*.

Added `RelatedContactId` to `StartTaskContact` API

You can link together an unlimited number of task contacts using the `RelatedContactID` parameter supported in the `StartTaskContact` API. For more information, see Linked tasks and the StartTaskContact API in the *Connect Customer API Reference Guide*.

Connect Customer Cases integrates with AWS PrivateLink

For more information, see Creating an interface VPC endpoint for Connect Customer.

Added support for more granular access controls (using resource tags) to view real-time metrics for agents, queues, and routing profiles

You can enable more granular access controls for real-time metrics by configuring resource tags and access control tags within security profiles in the Connect Customer admin website. For more

information, see Real-time tag-based access control and Tag based access control in Connect Customer.

Added support to provide more granular permissions to metrics reports, including new permissions for real-time metrics, historical metrics, and agent activity audit

You can configure more granular permissions to metrics and reports from within security profiles in the Connect Customer admin website. For more information, see Permissions required to view real-time metrics reports and Agent activity audit permissions.

Added support to provide visibility into an agent's next activity

You can view an agent's next activity in the real-time metrics agent table in the Connect Customer real-time metrics UI and by using the public API. For more information, see the NextStatus API reference.

Apply S3 Object Lock for the call recordings bucket

You can use Amazon S3 Object Lock in combination with your call recording bucket to help prevent call recordings from being deleted or overwritten for a fixed amount of time, or indefinitely. For more information, see How to set up S3 Object Lock for immutable call recordings.

CloudFormation templates for instance management

You can use CloudFormation templates to manage Connect Customer instances for associating Amazon Lex and Lex V2 bots, Lambda functions, security keys, and approved origins—along with the rest of your AWS infrastructure—in a secure, efficient, and repeatable way. For more information, see Connect Customer resource type reference in the *CloudFormation User Guide*.

January 2023 Updates

Added long lasting, persistent chat experiences

Connect Customer makes it easier for you to deliver long lasting, persistent chat experiences for your customers. Persistent chats enable customers to resume previous conversations with the context, metadata, and transcripts carried over, eliminating the need for customers to repeat themselves and allowing agents to provide personalized service with access to the entire

conversation history. To set up persistent chat experiences, provide a previous contact ID when calling the StartChatContact API to create a new chat contact.

For more information, see Enable persistent chat. Also see changes to StartChatContact in the *Connect Customer API Reference Guide*, and see the new `RelatedContactId` parameter in the GetTranscript API in the *Connect Customer Participant Service API Reference Guide*.

December 2022 Updates

Added message receipts feature for chat messages

The message receipts feature allows customers to receive *Message delivered* and *Read* receipts after they send a chat message. For more information, see Enable message Delivered and Read receipts in your chat user interface. Also see the SendEvent action, and the Item, MessageMetadata, and Receipt data types in the *Connect Customer Participant Service API Reference Guide*.

Updates to GetCurrentMetricData and GetCurrentUserData

For the GetCurrentMetricData API, added support for routing profile filter, sort criteria, and grouping by routing profiles. For the GetCurrentUserData API, added support for routing profiles, user hierarchy groups, and agents as filters, and next status and agent status name. For both APIs, added ApproximateTotalCount.

Added chat timeouts for chat participants

When a chat conversation between an agent and a customer has been inactive (no messages sent) for a certain amount of time, you might want to consider a chat participant to be idle, and you might even want to automatically disconnect an agent from the chat. To set up chat timeout timers, see Set up chat timeouts for chat participants.

Microsoft Edge Chromium support

Connect Customer now supports Microsoft Edge Chromium. For more information about supported browsers, see Browsers supported by Connect Customer.

Connect Customer supports JSON as a content type for chat messages

By supporting JSON as a content type, Connect Customer provides you with a way to pass additional information over chat to provide rich personalized experiences. For example, rendering updates to a custom UI, customer-built interactive messages, language translation capabilities, and

passing customer metadata to a third party bot. For more information, see StartChatContact in the *Connect Customer API Reference Guide*, and SendMessage in the *Connect Customer Participant Service API Reference Guide*.

Added topic on Connect Customer availability by Region

For more information, see Availability of Connect Customer services by Region.

conversational analytics granular data redaction

When you set up conversational analytics sensitive data redaction, you can choose which entities you want to redact, and how you want the redaction to appear in the transcript. For more information, see Enable redaction of sensitive data.

Additional conversational analytics language support and Region availability

conversational analytics now supports the following languages: English - New Zealand, English - South Africa. It is also available in the following Regions: Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore).

Released Barge to allow contact center managers to join ongoing calls

Barge allows managers to join and participate in an ongoing customer service call between a contact center agent and customer. After joining the call, a manager can speak with the customer, add participants, and even choose to remove an agent if needed. For more information, see Barge live conversations.

Added user hierarchy to bulk user upload

You can assign the user hierarchy in the .csv file when you add users in bulk. For more information, see Add users in bulk.

Granular access controls using resource tags for users, security profiles, routing profiles, and queues

You can now enable more granular access controls for security profiles, users, routing profiles, and queues by configuring resource tags within the Connect Customer console. You can add resource tags to filter and organize these resources logically, and configure access control tags within security profiles to enforce granular permissions. For more information, see Tagging resources in Connect Customer and Tag based access controls in Connect Customer.

Bulk user import now includes agent hierarchy and tags

Connect Customer now allows you to configure hierarchies and resource tags for users in bulk. You can now assign agent hierarchies and resource tags to each agent using the CSV bulk upload template which is available on the user management page. For more information, see Tagging resources in Connect Customer.

Released Rules Function language

The Rules Function language is a JSON-based representation of a series of rule conditions. Use it to programmatically add conditions to rules. For more information, see Connect Customer Rules Function language in the *Connect Customer API Reference Guide*.

GA for Rules APIs

Released a set of Rules APIs that enable you to programmatically create and manage rules. For more information, see Rules actions in the *Connect Customer API Reference*.

Search contacts by agent's first or last name is available in AWS GovCloud

November 2022 Updates

Create step-by-step guides for your agents

Inside the out-of-the-box Connect agent workspace, you can now create workflows that walk agents through custom UI pages that suggest what to do at a given moment during a customer interaction. You can create guides that help agents identify customer issues and recommend subsequent actions, as well as surface screen-pops and forms for submitting transactions and disposition codes. For more information, see Agent Workspace guided experience.

GA for Forecasting, capacity planning, and scheduling

Connect Customer provides a set of services powered by machine learning that help you optimize your contact center by offering the following:

- Forecasting. Analyze and predict contact volume based on historical data.
- Scheduling. Generate agent schedules for day-to-day workloads that are flexible, and meet business and compliance requirements.
- Capacity planning. Predict how many agents your contact center will require.

For more information, see Forecasting, capacity planning, and scheduling.

Released conversational analytics evaluation forms for preview

You can create evaluation forms, and then make them available to managers to review conversations alongside contact details, recordings, transcripts, and summaries, without the need to switch applications. Conversational analytics automatically pre-populates evaluation scores for criteria like script adherence, sensitive data collection, and customer greetings. For more information, see Evaluate performance (Preview).

Released conversational analytics conversational analytics capabilities for Connect Customer chat

Connect Customer conversational analytics provides conversational analytics capabilities for Connect Customer chat, extending the machine learning powered analytics to better assess chat contacts. For more information, see Analyze conversations using Connect Customer conversational analytics.

Added configurable Lex timeouts in chat

You can configure how long to wait for a response from a customer in a chatbot conversation before the session expires. For more information, see *Configurable time-outs for chat input* in the Get customer input topic.

Create rules that send email notifications

You can create conversational analytics rules that send email notifications to people in your organization. For more information, see Create conversational analytics rules that send email notifications.

Added MonitorContact API

Added a new API for programmatically initiating monitoring of ongoing contacts. For more information, see MonitorContact API.

Manage saved reports (admin)

You can view and delete all saved reports in your instance, including reports that were not created by you or that are not currently published. For more information, see Manage saved reports (admin).

Search for profiles using multiple search keys

In addition to searching for profiles with a single search key (that is, a key-values(s) pair), the SearchProfiles API has been enhanced to support searching for profiles using multiple keys and logical operators. This new functionality allows you to use between 1 and 5 search keys with AND or OR logic to find profiles with attributes that match the search criteria. For more information, see the SearchProfiles API reference topic.

Delete quick connects using the Connect Customer console

In addition to deleting quick connects programmatically, you can now delete them using the Connect Customer console. For more information, see Delete quick connects.

Added DismissUserContact API

Added a new API for programmatically clearing the notifications agents receive after they have missed or rejected a contact, making them eligible to be routed new contacts. This API can also be used to clear similar notifications when an agent encounters an error with accepting the contact or is handling After Contact Work. For more information, see the DismissUserContact API reference topic.

October 2022 Updates

Add secondary email address and mobile number to user accounts

For more information, see Add users to Connect Customer.

Emojis for chat messages

Added support for emojis for your customer's chat experience. Agents and customers can now send emojis when composing a chat message, enabling them to visually convey sentiment or emphasis during a chat conversation. For more information, see Enable text formatting for your customer's chat experience.

Released support for Enhanced 911 (E911)

Enhanced 911 (E911) enables location information to be sent to 911 dispatch when a 911 call is placed. In addition to connecting a user with 911 emergency services, customers in the United States can build E911 capabilities to automatically provide the caller's address information to 911 dispatchers. For more information, see Set up US emergency calling in Connect Customer.

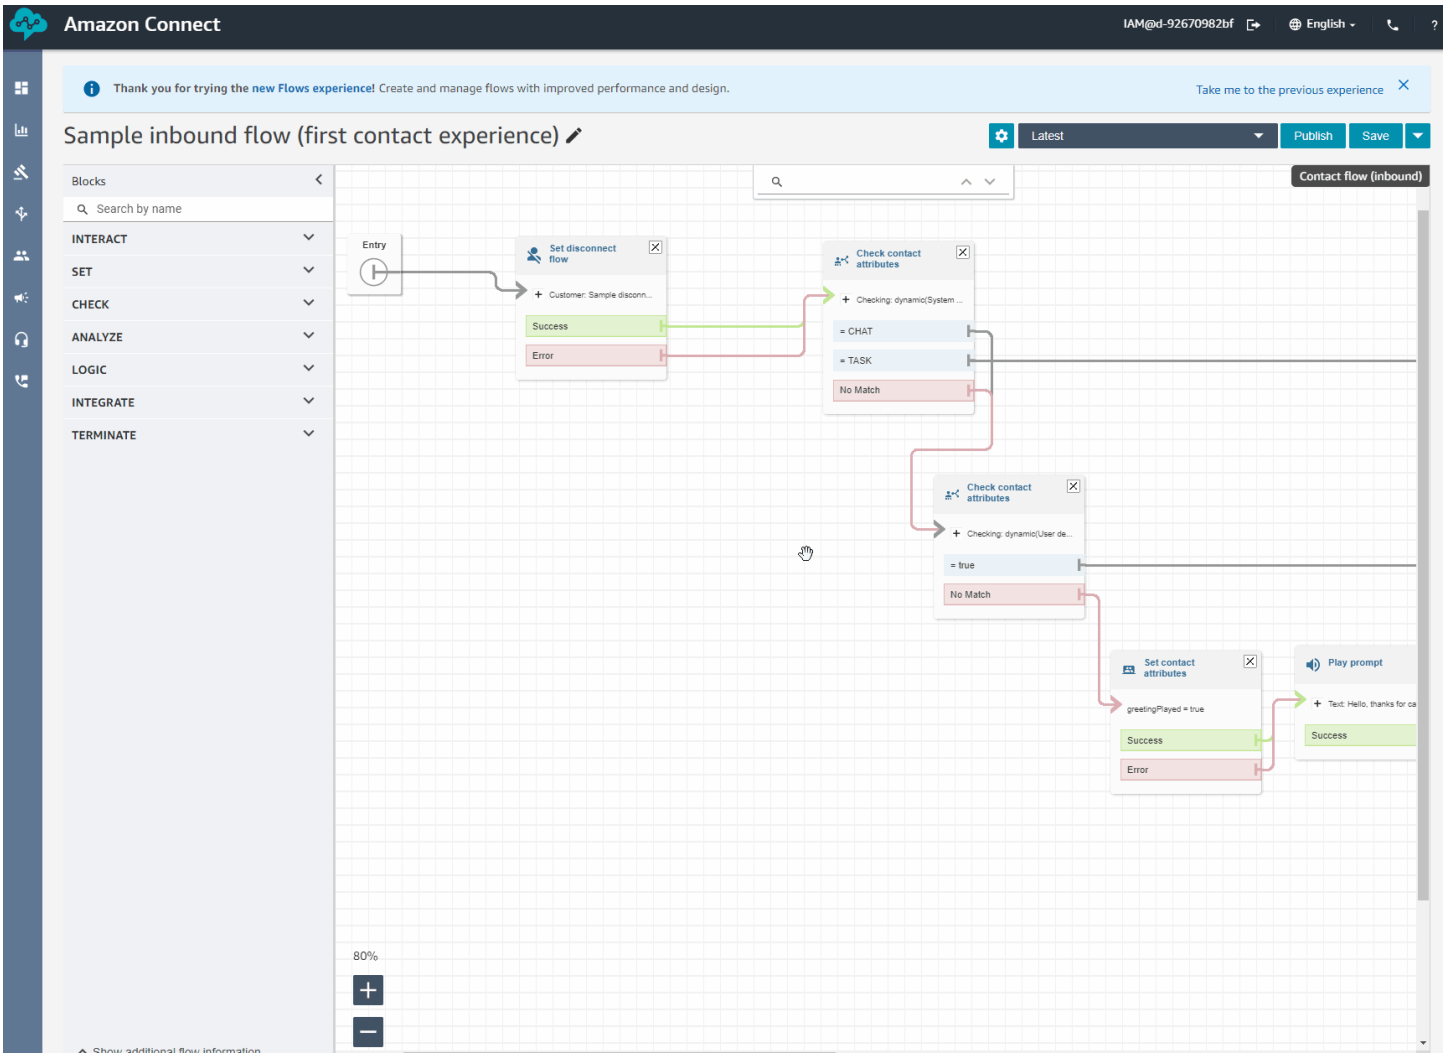
GA for Connect Customer Global Resiliency

Released Connect Customer Global Resiliency for General Availability. Global Resiliency enables you to provide customer service anywhere in the world with the highest reliability, performance, and efficiency, while meeting international regulatory requirements. For more information, see Set up Connect Customer Global Resiliency.

Added Ctrl+Shift+F to search flow block titles and metadata

Press **Ctrl+Shift+F** to display a search box in the flow designer, and then search the block titles and metadata. To hide the search box, go to **Settings**, **Toolbar**, and set the toggle.

The following GIF shows how to use the search box to find flow blocks that have **attributes** in their title. It also shows how to display or hide the search box using the toggle.



Released Connect Customer Cases for General Availability

Connect Customer Cases allows your agents to quickly track and manage customer issues that require multiple interactions, follow-up tasks, and teams in your contact center. For more information, see Connect Customer Cases and Connect Customer Cases API Reference.

September 2022 Updates

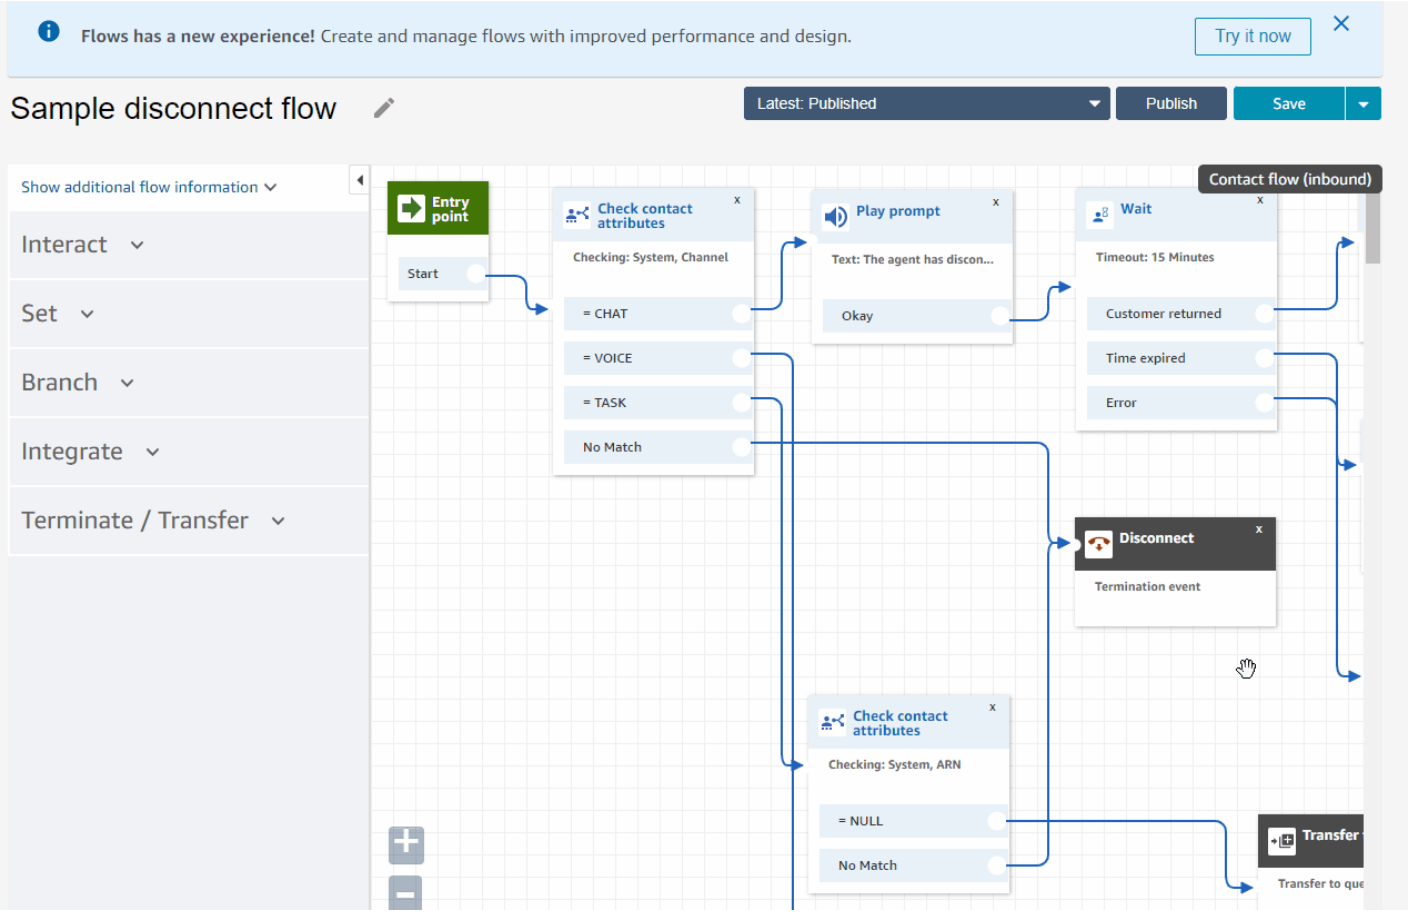
Searching for a contact? Choose from a list of categories

When you search a contact and filter results by conversational analytics categories, you can pick from a list of categories, rather than manually typing the name of a category.

Updated flow designer

We've released a number of improvements to the flow designer experience to make building and editing flows easier.

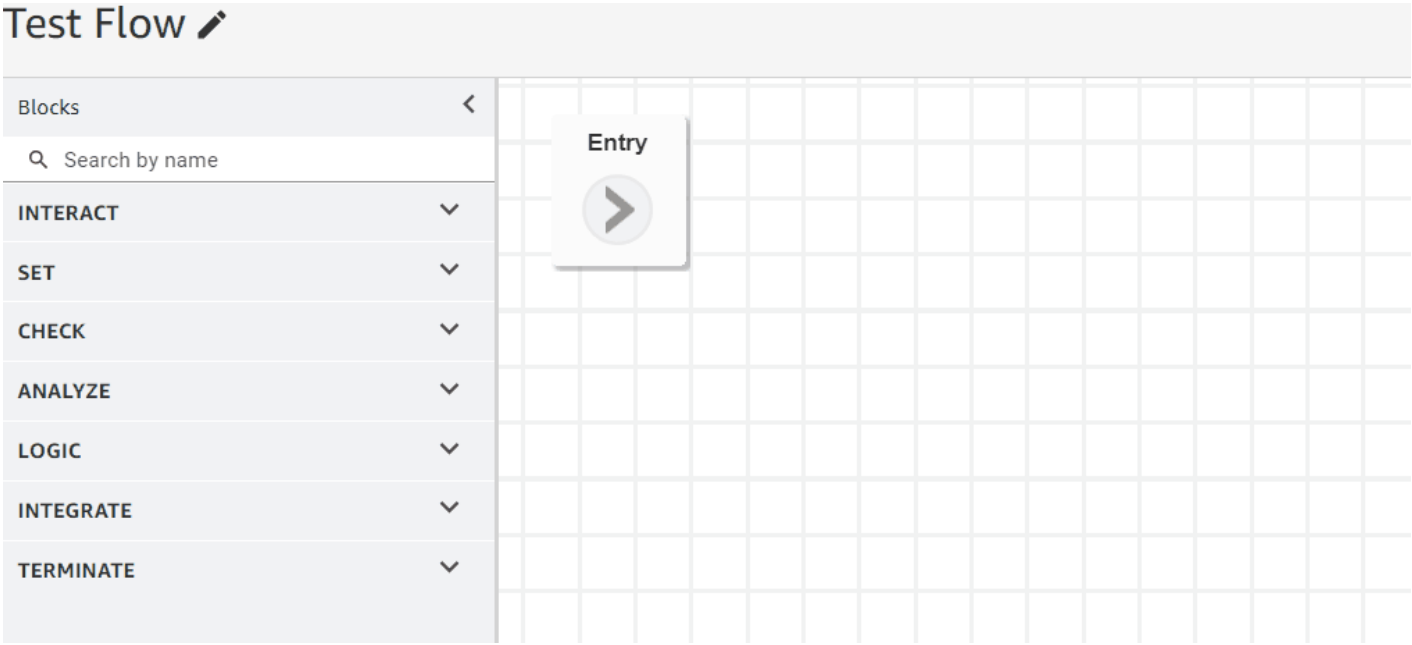
- Updated look and feel of block dock, blocks, and flow designer canvas.



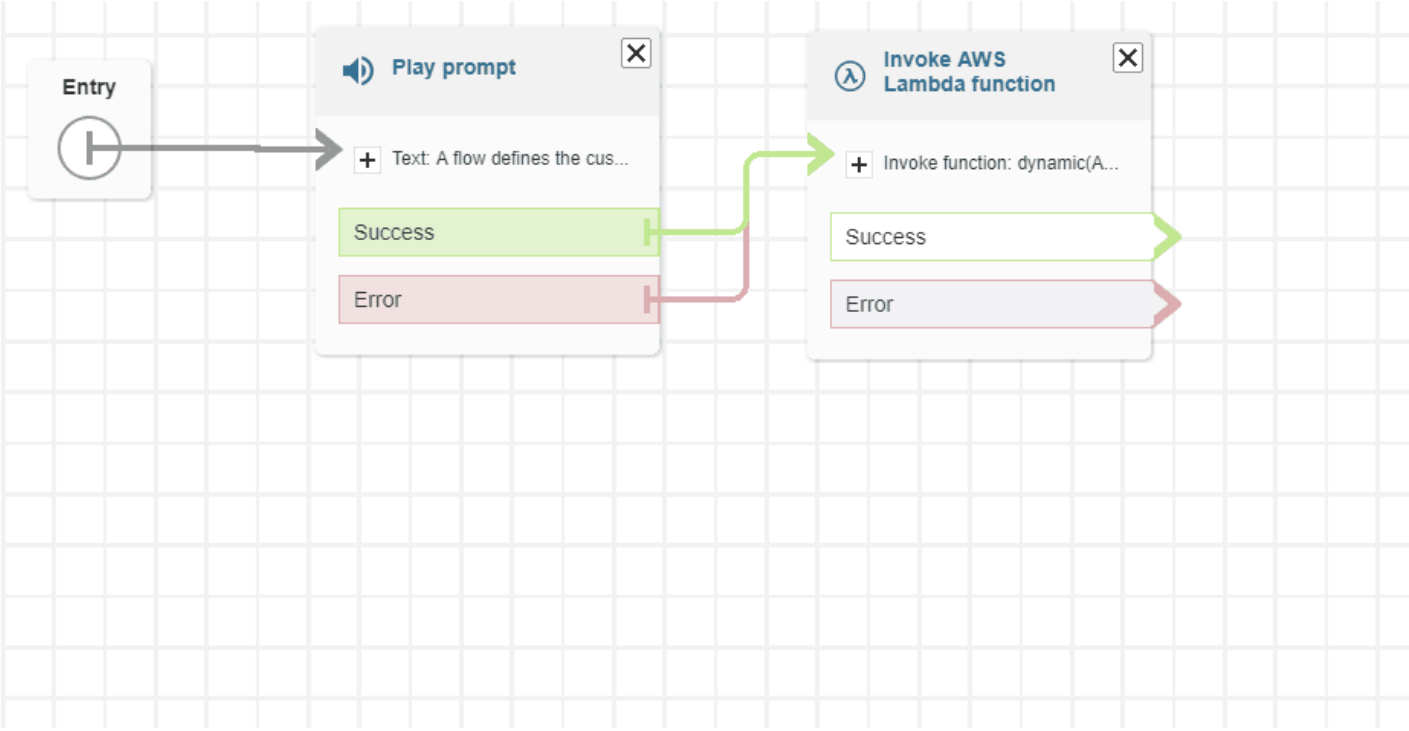
- Import / Export uses a standard flow language so you can interchangeably build flows in APIs or in the UI.

> **Important**
>
> To copy and paste flows and blocks in the updated flow designer, the flow must be in the new flow language. To convert a legacy flow into the new format, you have two options:
>
> - Option 1: In the flow designer user interface, opt in to the updated flow designer. Your legacy flows are automatically converted.
> - Option 2: Manually import a legacy flow using the updated flow designer.
>
> This option is most useful for scenarios where you have stored your flows in JSON offline. For example, for configuration control, you might have flow configurations in an offline data store. To copy a part of that flow and paste it into the updated flow designer, you need to import it into the updated flow designer. The importing process converts it to the new flow language. After that, you can copy and paste within the updated flow designer. If you want to keep using your offline data store as a source of truth, update the flow with the new format.

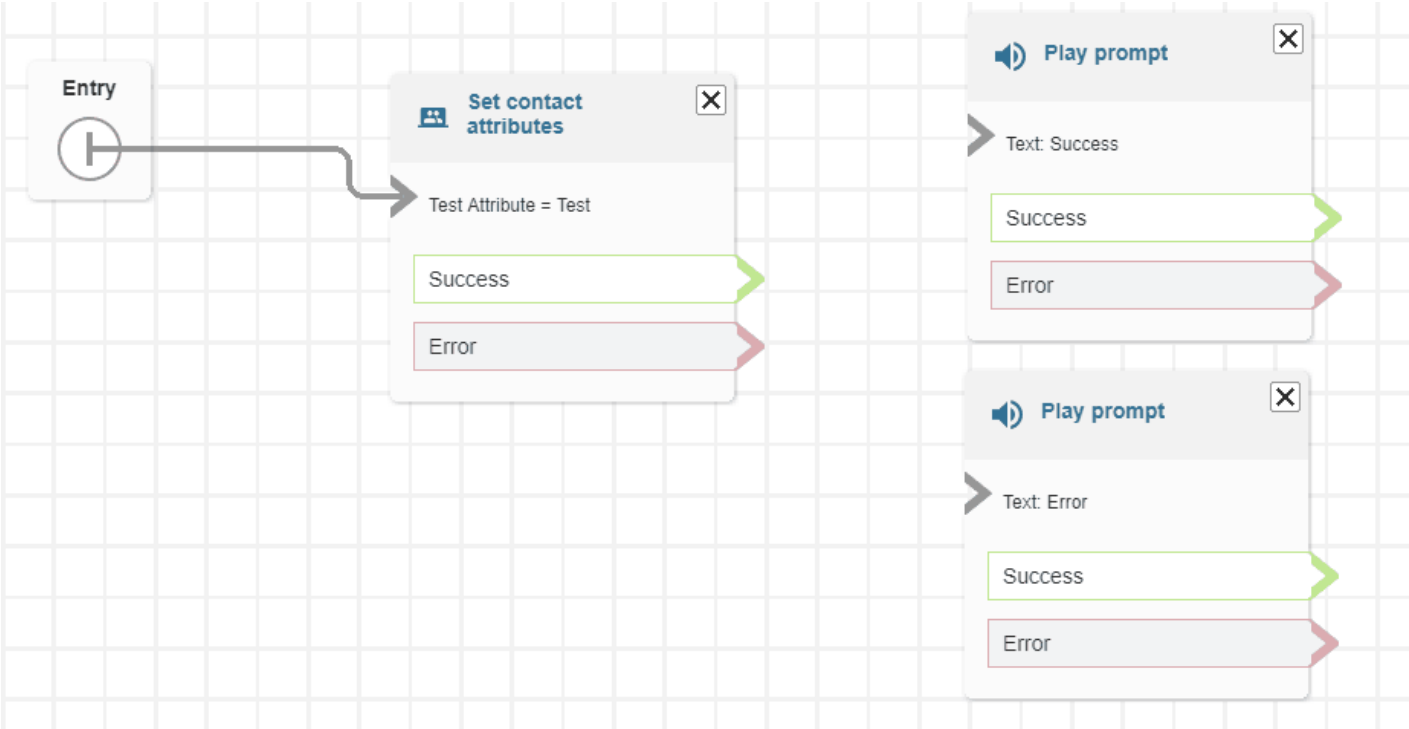
- You can use **Search** to filter blocks in the block dock.



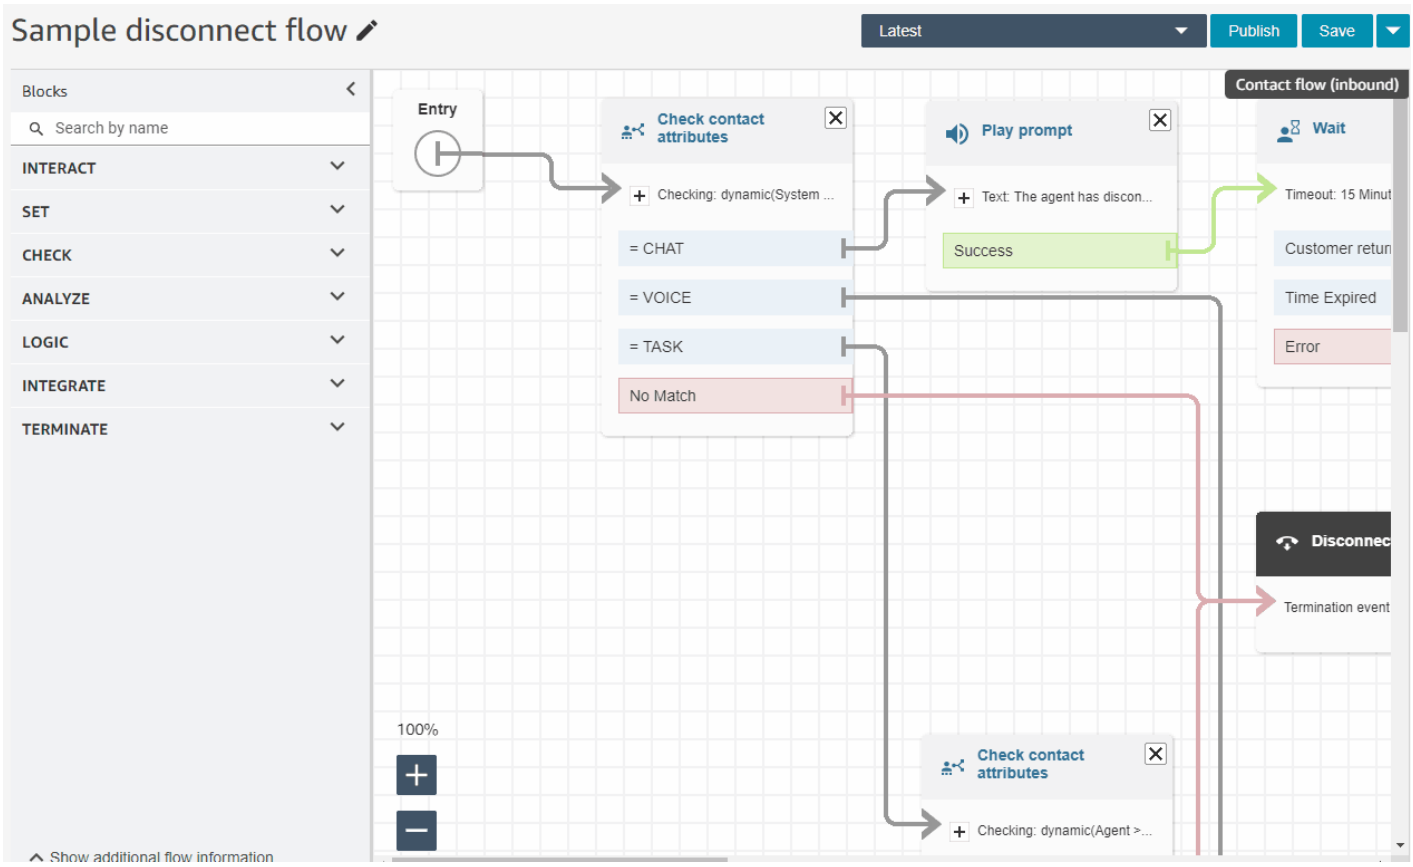
- Multi-line block metadata allows you to choose and expand to see block configurations.



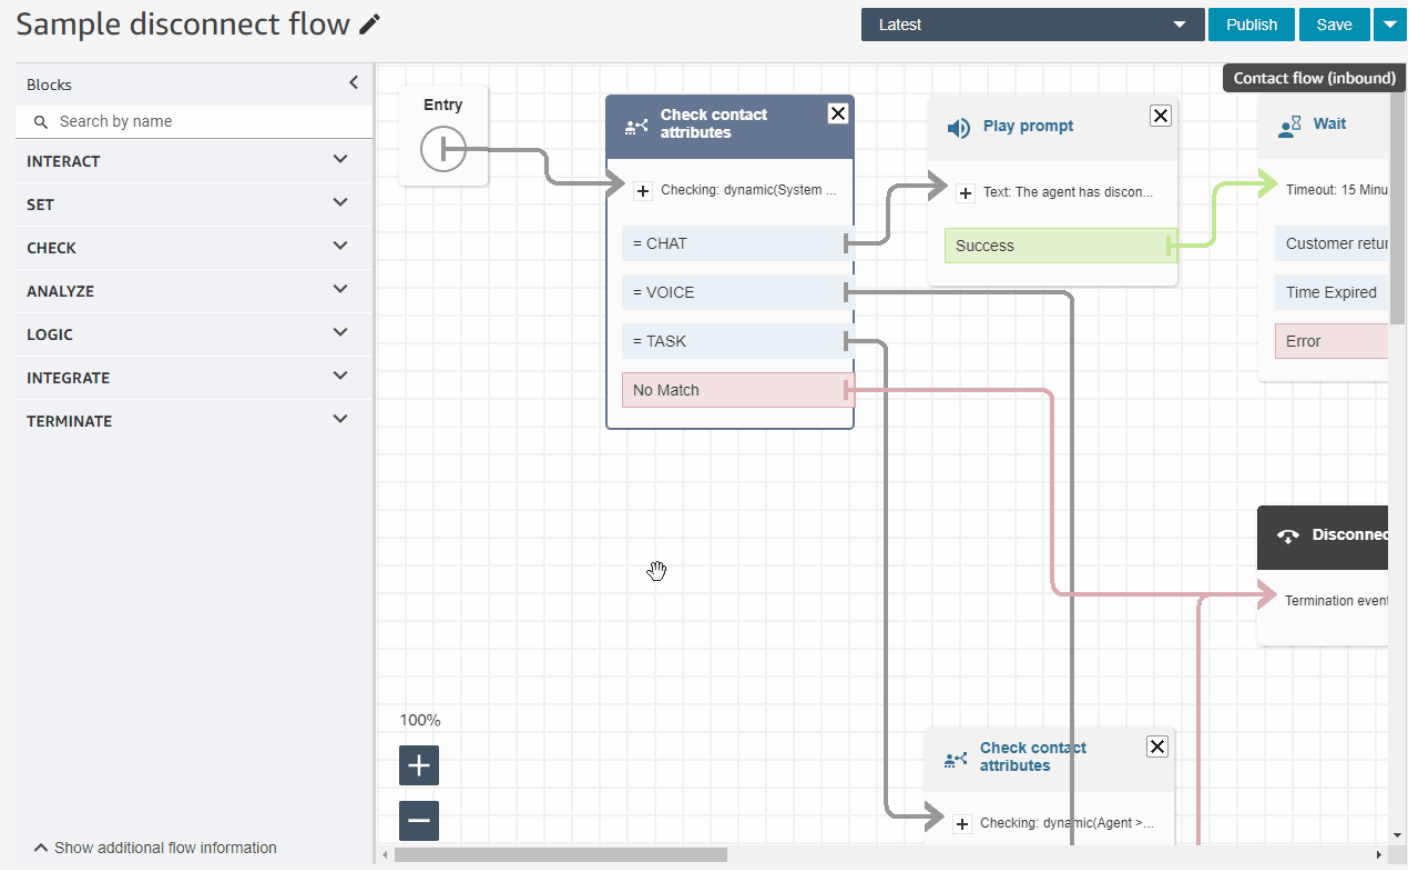
- Color-coded branches and connectors help you distinguish paths.



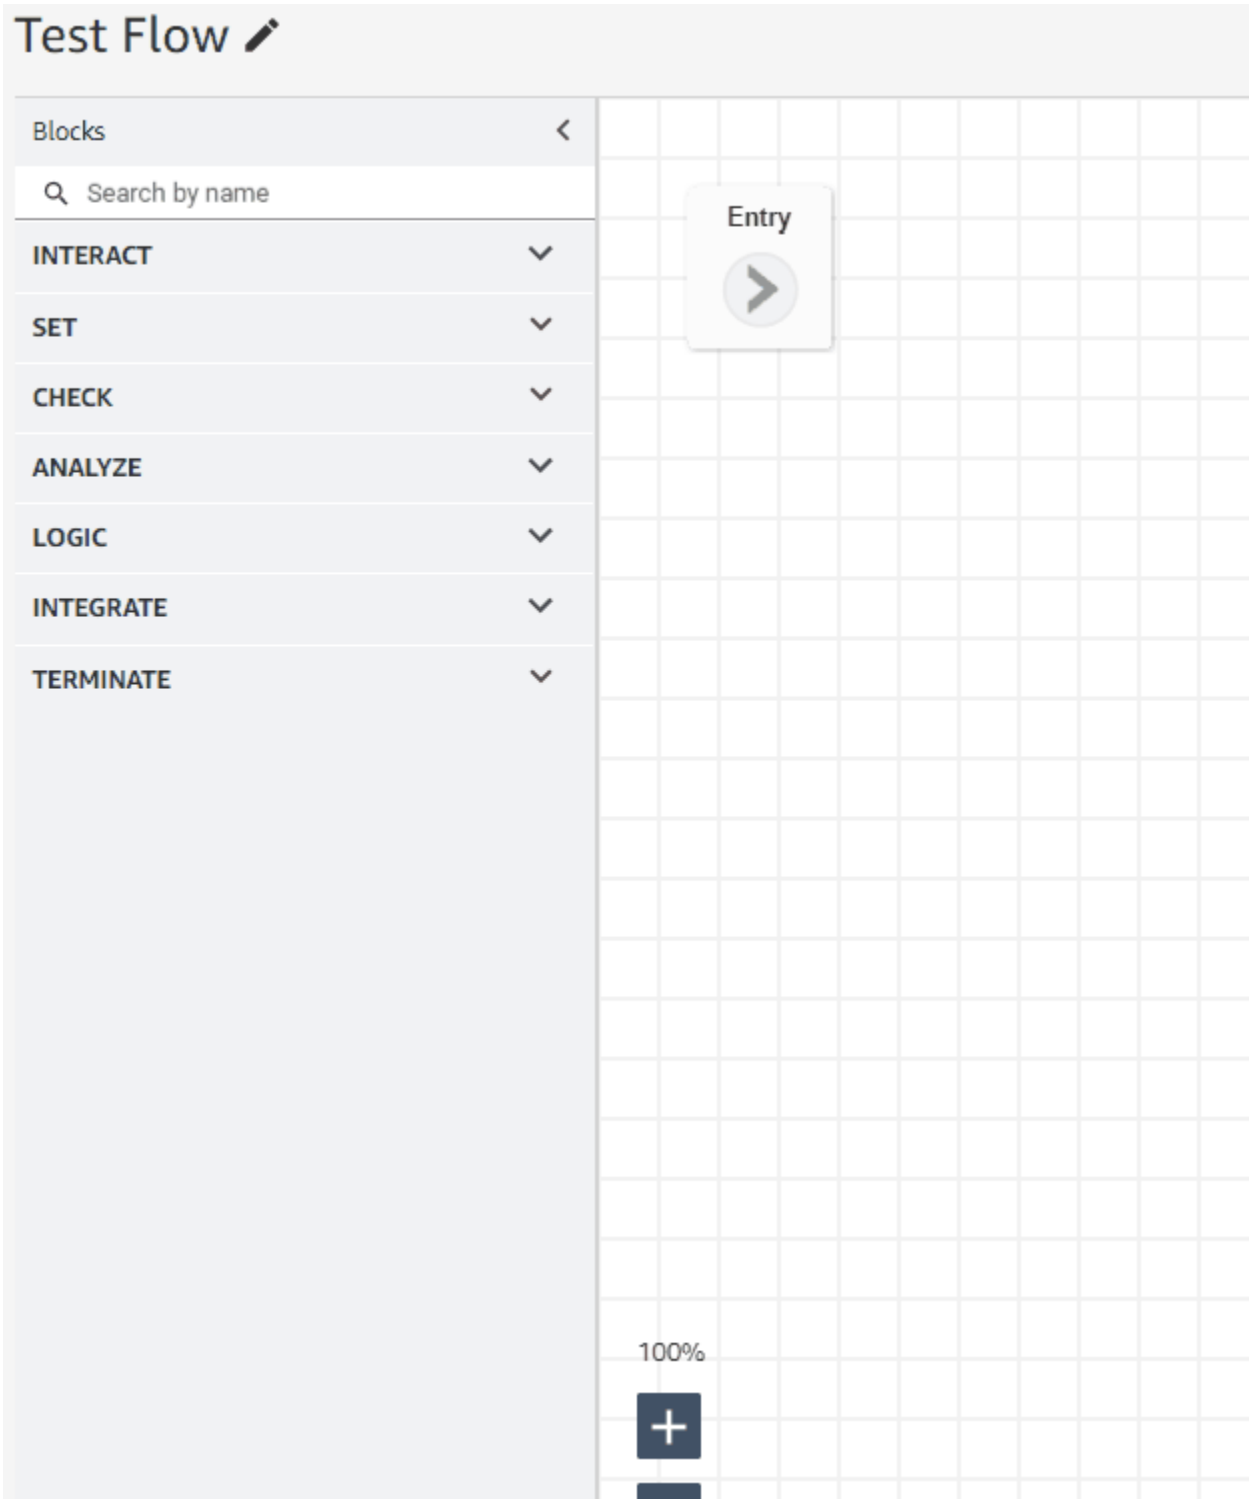
- Improved zooming.



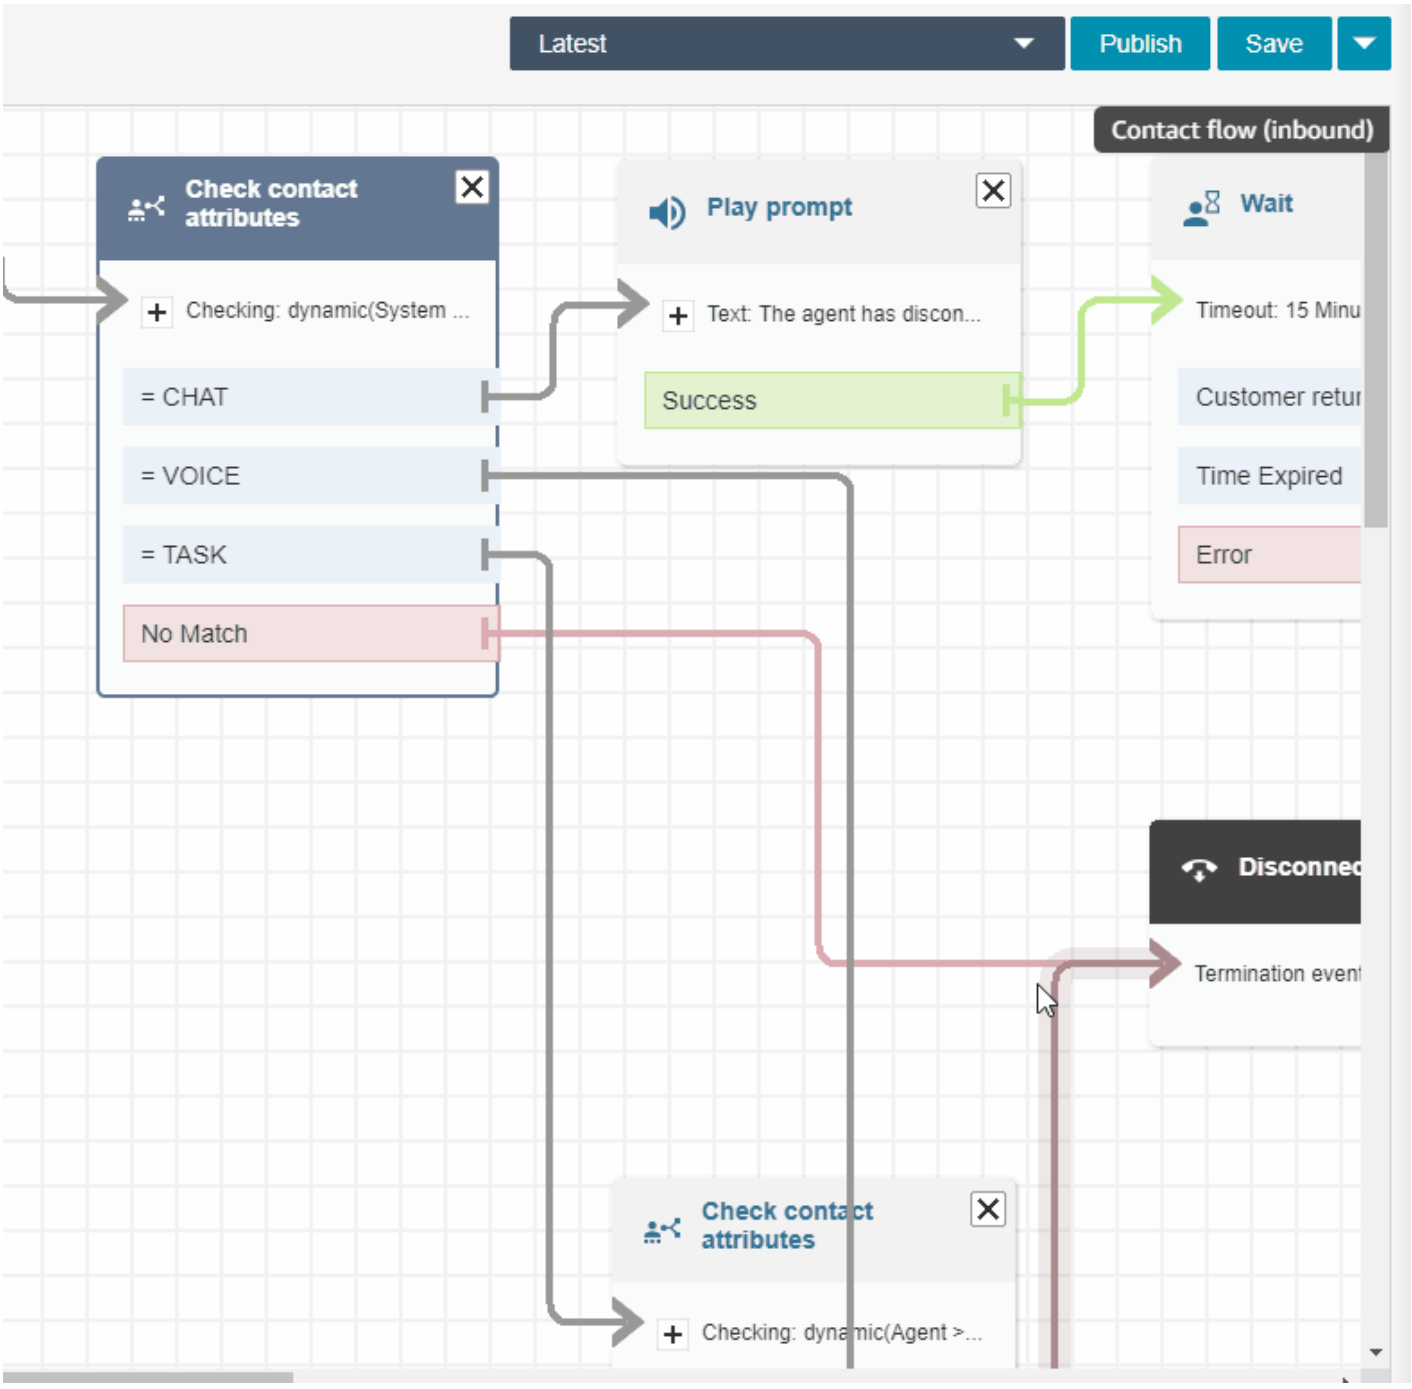
- Flow/module metadata appears at the bottom of the block dock.



- New, more intuitive categories (**Check**, **Analyze**, and **Logic**) to make it easier to find the blocks you are looking for.



- Updated user interface in the block **Property** pages.



Search for Connect Customer users by first name, last name, login, and more

You can search for Connect Customer users by first name, last name, user login, agent hierarchy, security profile, and routing profile. For example, you can search for all Connect Customer users who have the first name "Jane."

Queue dashboard

You can visualize historical queue data by using time series graphs to help identify patterns, trends, and outliers specifically for **Service Level**, **Contacts Queued**, and **Average Handle Time**. For more information, see Visualize: Queue dashboard.

August 2022 Updates

Contact search: Apply "Match any" or "Match all" to conversational analytics category searches

When you search for contacts, and filter by conversational analytics categories, you can apply **Match any** or **Match all** to the search. For example, you can search contacts with both "category A" and "category B," or with either one of the two categories.

Evaluate calls for voice spoofing

Use Voice ID to evaluate calls for voice spoofing. For more information, see Voice spoofing detection and the Connect Customer Voice ID API Reference.

Added SearchSecurityProfiles API

Added a new API for programmatically searching security profiles. For more information, see SearchSecurityProfiles.

Released Schedule Adherence (Preview)

Contact center supervisors or managers track schedule adherence to understand when agents are following the schedule that you have created. This helps make sure you achieve your service level targets, while improving agent productivity and customer satisfaction. For more information, see Schedule Adherence.

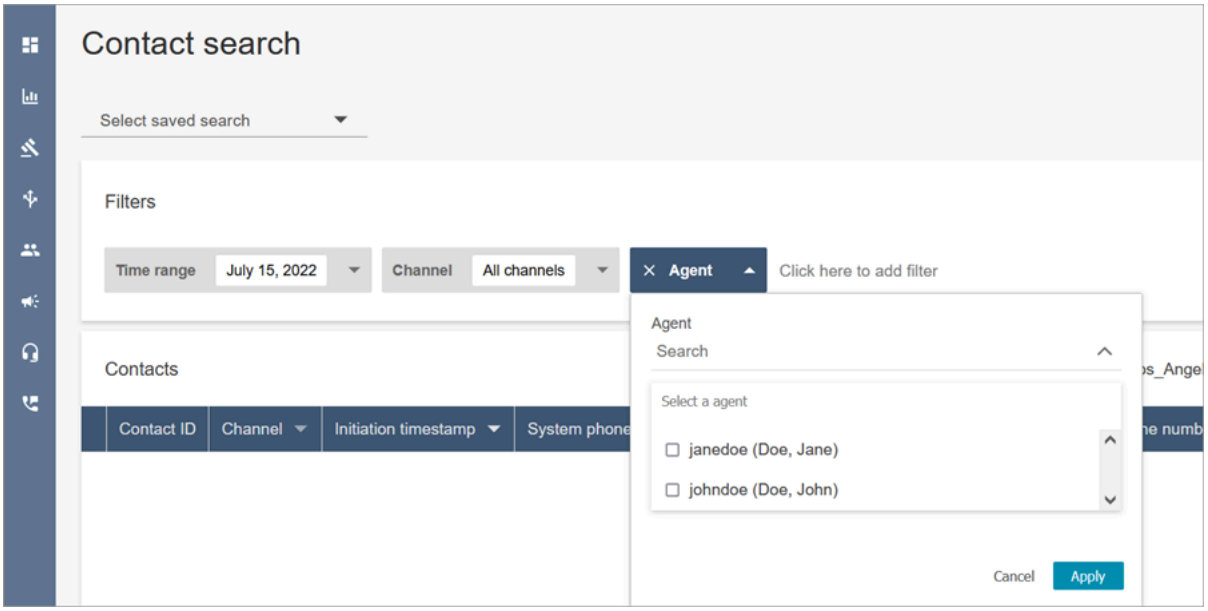
July 2022 Updates

Search for contacts by using the agent's first or last name

You can search for contacts using the agent's first or last name. The filter name is **Agent**.

Search contacts by agent's first or last name

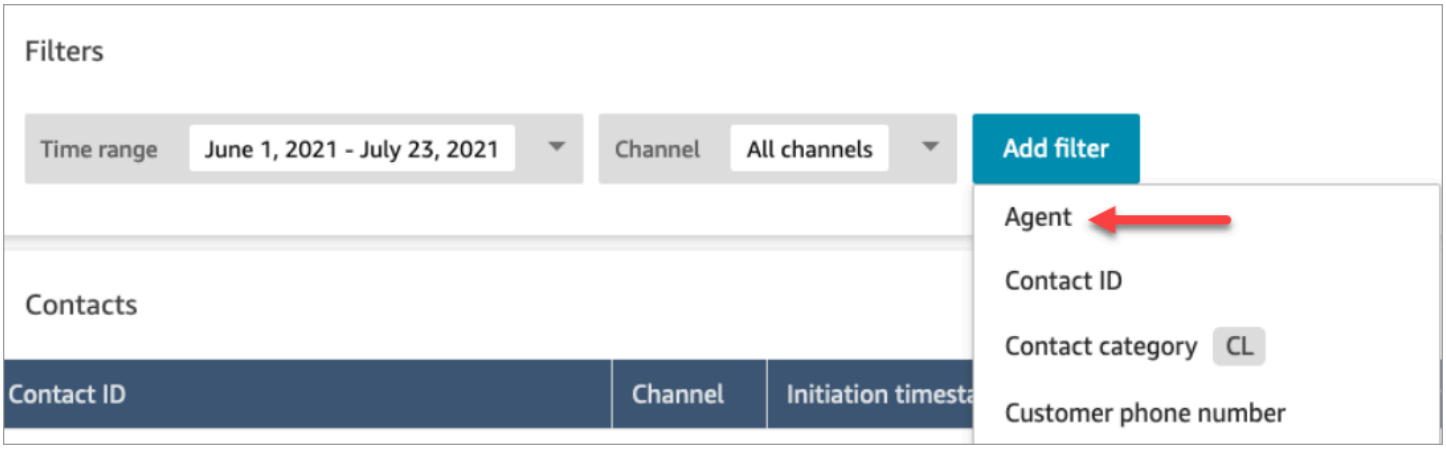
The following image shows the Agent filter, and the option to choose agents by name.



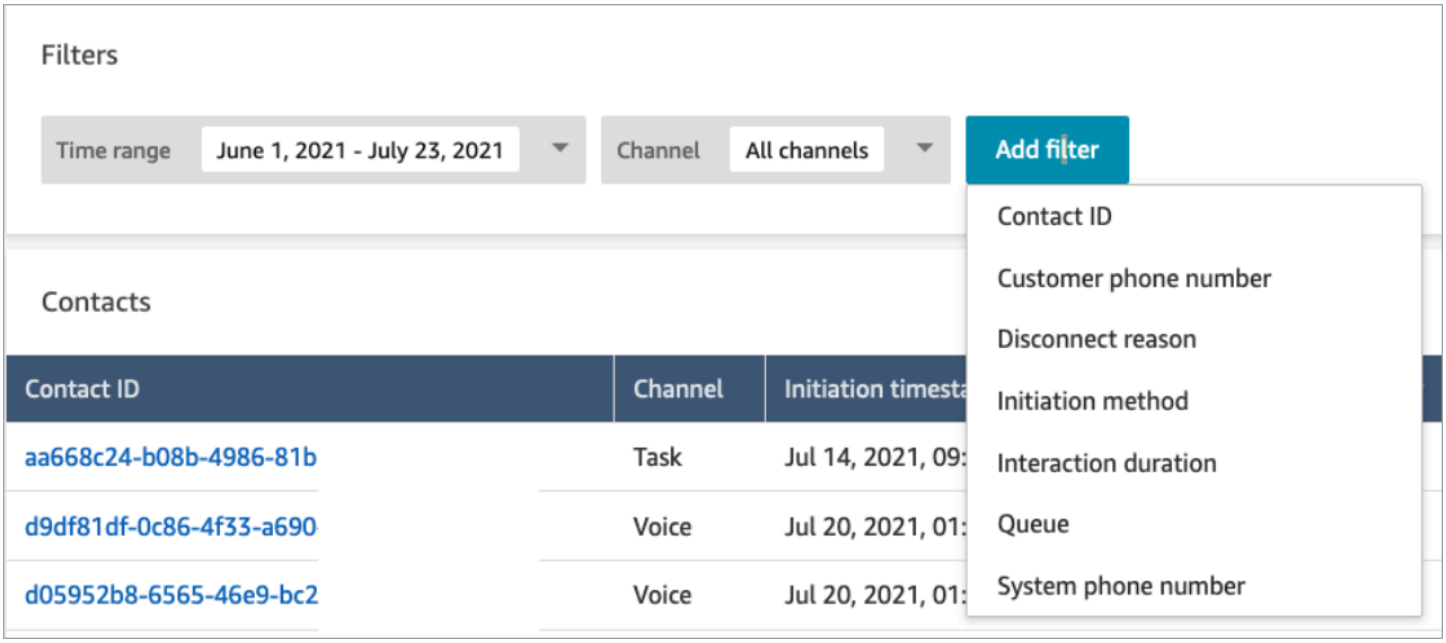
Required permissions to "Agent" search filter

To use the **Agent** filter on the **Contact search** page, in your Connect Customer security profile you must have **Users - View** permissions, as shown in the following image:

When you have **Users - View** permissions, on the **Contact search** page the **Agent** filter appears, as shown in the following image:



Without **User - View** permissions, the **Agent** filter is not visible, and searching contacts by Agent login is not supported, as shown in the following image:



Released updates for rich text format rendering

On the **Contact Search** and **Contact Detail** pages, you can now view chat transcripts that have rich text formatting, such as bold or italic font, bullet points, numbered lists, and hyperlinks. For more information about getting started with Connect Customer Chat, see Set up your customer's chat experience.

View call transcript using the CCP or agent application

Agents can view call unredacted transcripts in the CCP and agent application. For more information, see View a call transcript during ACW.

June 2022 Updates

Support for Lex intent confidence scores and sentiment analysis

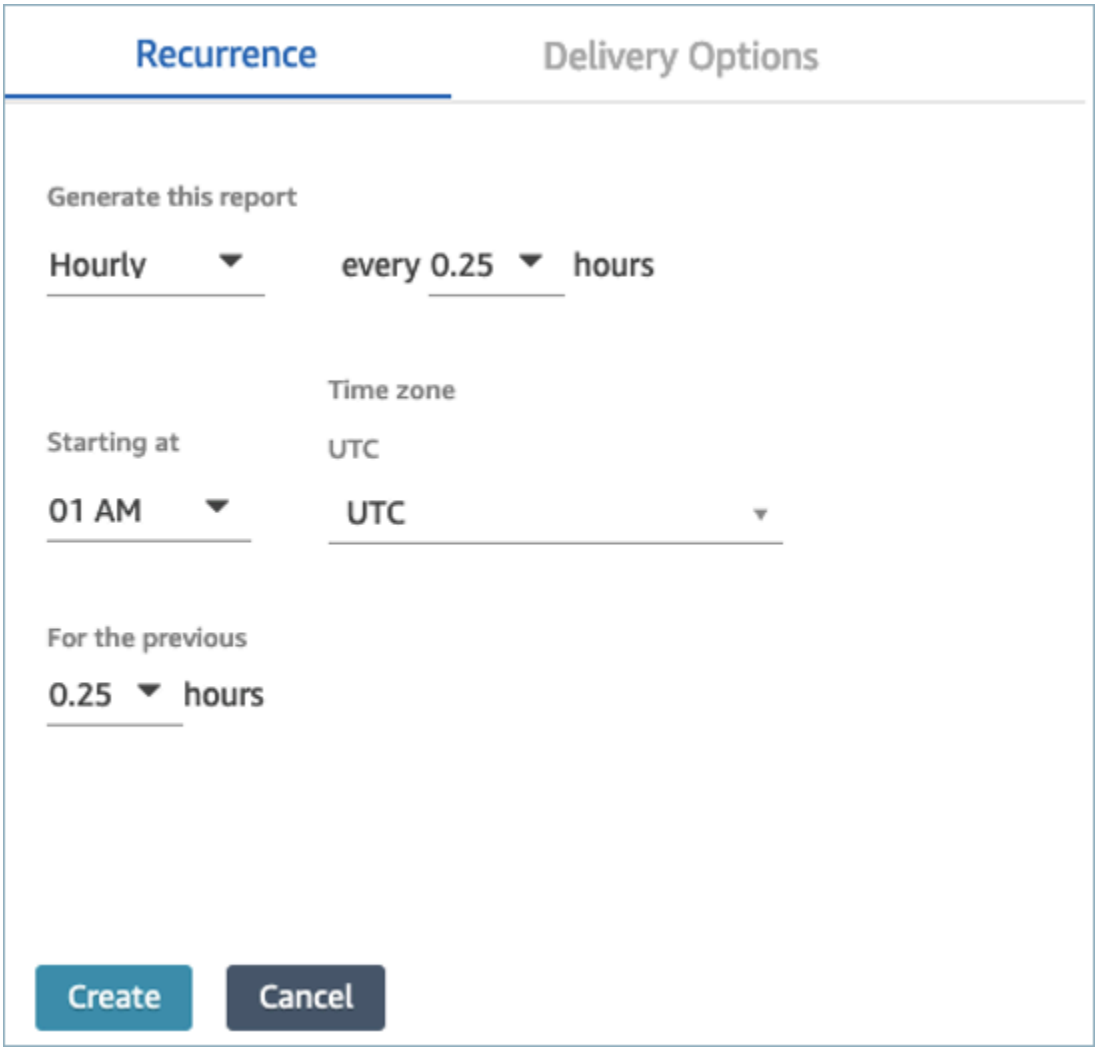
You can further personalize the automated self-service customer experience using Amazon Lex V2 intent confidence scores and sentiment analysis as a branch within your flows. For more information, see the Get customer input block. For a list of new contact attributes, see Amazon Lex V2 contact attributes.

Metrics Updates

The following updates were released in June 2022.

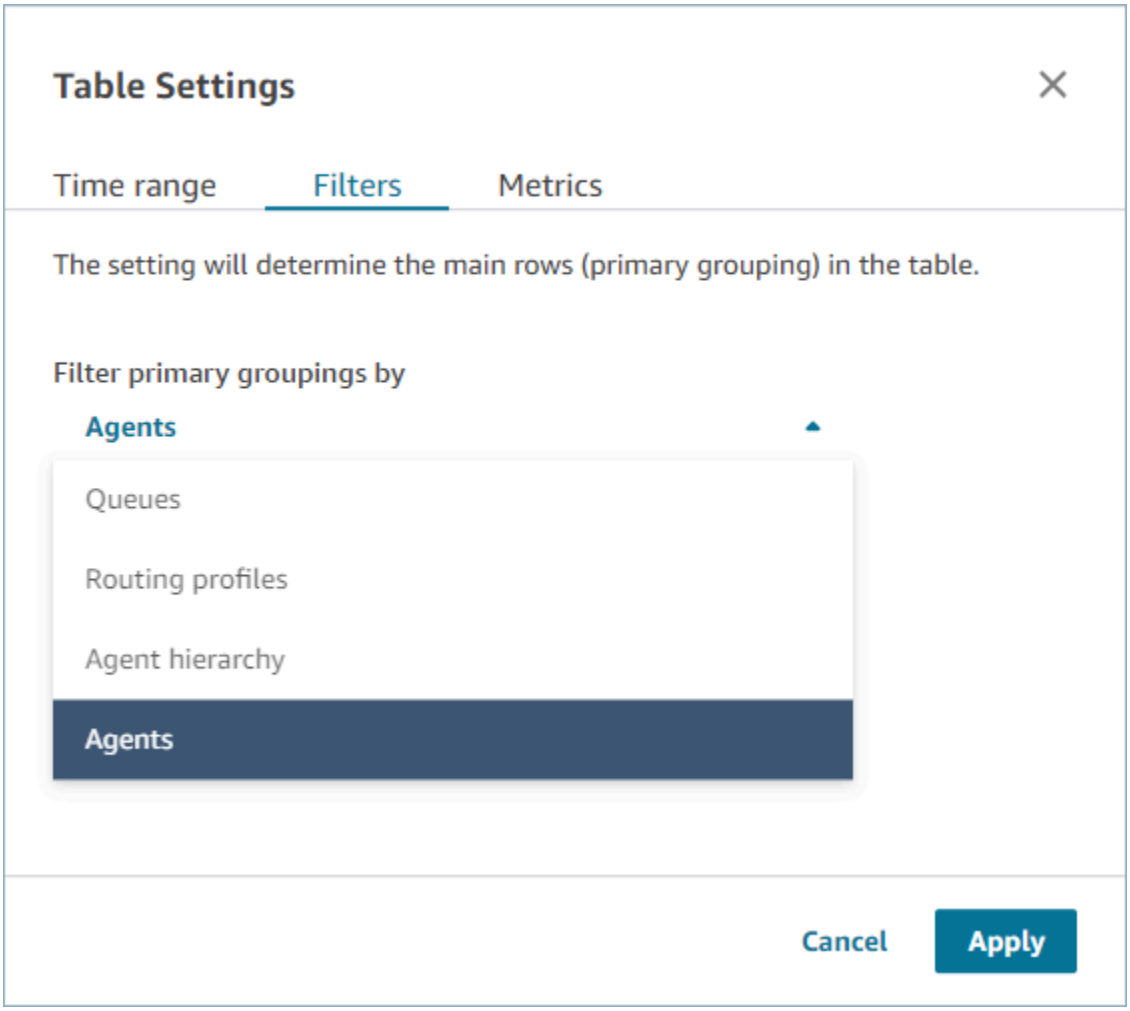
15 minute scheduled reports

You can now schedule historical metrics to refresh every 15 minutes. To select 15-minute schedules, select generate this report **Hourly** every .25 hours (this is the top most option in the second dropdown), for the previous .25 hours. The following image shows the values that you need to select.



Filter Real-Time Metrics Agent Table by Agent

You can now filter the agent table on the Real-Time Metrics page by agent. This filter functions the same as the existing queues, routing profiles, and agent hierarchy filters.



New contact transferred related metrics

We upgraded the existing Contacts transferred in and Contacts transferred out metrics to have consistent definitions. We added Contacts transferred in by agent and Contacts transferred out by agent for more granular contact transferred related metrics.

Changes to real-time metrics agent tables

We are rolling out a new service to maintain the high availability from metrics that you expect from Connect Customer. Due to this change, the agent tables are sorted by agent status instead of by agent login.

Additionally, the queues and routing profiles table are sorted by agents online instead of by queue or routing profile name.

Faster reload times for the Real-time metrics page

We are upgrading the performance of the **Real-time metrics** page so reload times are faster. The page will have the same functionality and user experience as the existing **Real-time metrics** page.

Released Connect Customer Cases (Preview)

Connect Customer Cases (Preview) allows your agents to quickly track and manage customer issues that require multiple interactions, follow-up tasks, and teams in your contact center. For more information, see Connect Customer Cases (Preview) and Connect Customer Cases API Reference (Preview).

GA for Connect Customer outbound campaigns

Released Connect Customer outbound campaigns, formerly known as High-volume outbound communications. This release includes a set of APIs for creating and managing outbound campaigns. For more information, see Enable Connect Customer outbound campaigns and Connect Customer Outbound Campaigns API Reference.

Released GetCurrentUserData API

Released the GetCurrentUserData API. It enables you to return the real-time active user data from the specified Connect Customer instance.

Released task templates

You can now create custom task templates, making it easy for agents to consistently capture the relevant and required information to create or complete tasks. For more information, see Create task templates. For information about using the API to programmatically create and manage task templates, see the Connect Customer API Reference and the Connect Customer Resource Type Reference in the *AWS CloudFormation User Guide*.

New API to transfer contacts

Added a new API that you can use to transfer contacts from one agent or queue to another agent or queue at any point after a contact is created. You can transfer a contact to another queue by providing the flow which orchestrates the contact to the destination queue. This gives you more control over contact handling and helps you adhere to the service level agreement (SLA) guaranteed to your customers.

For information, see TransferContact in the *Connect Customer API Reference*.

May 2022 Updates

Updated workflow for outbound campaigns

Updated the workflow for onboarding to outbound campaigns using the Connect Customer and Amazon Pinpoint user interface. For more information, see Enable outbound campaigns.

Voice ID expires speakers

For BIPA Compliance, Connect Customer Voice ID automatically expires speakers that have not been accessed for enrollment, re-enrollment, or successful authentication for three years. You can see a speaker's last access time by looking at the `lastAccessedAt` attribute returned by the DescribeSpeaker and ListSpeakers APIs.

For more information, see What data is stored? in the Use real-time caller authentication with Voice ID topic.

April 2022 Updates

New API to change an agent's current status

Connect Customer provides an API to programmatically change the current status of an agent. Agent statuses are used to determine when an agent is **Available** to be routed contacts in Connect Customer, versus when they are set to **Offline** or a custom status such as **Lunch** or **Break** and should not be routed contacts. For more information, see PutUserStatus in the Connect Customer API Reference.

New API to search for users by name, agent hierarchies, and tags

Added API to search for user records in your Connect Customer instance. This new API provides a programmatic and flexible way to search for users by first name, last name, username, routing profile, security profile, agent hierarchies or tags. For example, you can now use this API to search for all users tagged with a Department:key value pair. You can also quickly find a list of all users assigned to a specific security profile, routing profile, or agent hierarchy. For more information, see the Connect Customer API Reference.

New APIs to claim and configure phone numbers

Added new APIs to claim new phone numbers and configure them programmatically. Using these APIs, you can programmatically search for and claim available phone numbers, associate

phone numbers to flows, or release phone numbers that are no longer needed. Additionally, the phone number APIs come with support for AWS CloudFormation. For more information, see the Connect Customer API Reference and the Connect Customer Resource Type Reference in the *AWS CloudFormation User Guide*.

Telephony: Multi-party calls

You can enable Connect Customer to allow up to six parties on a call: the agent, the caller, and four more participants. (By default, Connect Customer allows agents to have up to three parties on a call: the agent, and caller, and another participant.)

For more information, see the following topics:

- Comparison of enhanced contact monitoring (multi-party) and three-party functionality in Connect Customer
- Enable enhanced multi-party contact monitoring in Connect Customer

For information about new functionality on the existing Connection and Contact API in Connect Customer Streams, see the Connect Customer Streams Readme.

The following sections describes how managing multi-party calls differs from managing three-party calls.

Play prompts from an Amazon S3 bucket

Added the ability to source prompts from an Amazon S3 bucket. You can store as many voice prompts as needed in Amazon S3 and access them in real time by using contact attributes in the following contact blocks that play prompts: Get customer input, Loop prompts, Play prompt, and Store customer input.

For more information, see the Play prompt block. For information about the policy required for Connect Customer to access the Amazon S3 bucket, see Set up prompts to play from an S3 bucket in Connect Customer.

CloudTrail support for queues and routing profiles

Connect Customer records all changes made to users, routing profiles, and queues as events in AWS CloudTrail. For example, you can identify who took which action, what resources were acted upon, and when an event occurred. For more information, see the section called “Logging service API calls”.

March 2022 Updates

Rich messaging for chat

Added support for rich messaging for your customer's chat experience. Agents and customers can use bold, italics, bulleted lists, numbered lists, hyperlinks, and attachments. For more information, see Enable text formatting for your customer's chat experience.

Customer Profiles: Object type mapping user interface

Added a user interface for creating object type mapping by using the Connect Customer admin console. For more information, see Create an object type mapping.

February 2022 Updates

Added bulk ingestion of data for Customer Profiles

Added support for the bulk ingestion of data for Customer Profiles. For more information, see *Bulk ingestion of data* in the Set up integration for Salesforce, ServiceNow, Marketo, or Zendesk topic.

New CloudWatch metrics for chat

Added the following Amazon CloudWatch metrics for chat: **ConcurrentActiveChats**, **ConcurrentActiveChatsPercentage**, **ChatBreachingActiveChatQuota**, and **SuccessfulChatsPerInterval**. For more information, see Monitoring your Connect Customer instance using CloudWatch.

January 2022 Updates

Configure maximum chat duration up to 7 days

You can configure the maximum chat duration to last up to 7 days. For more information, see the `ChatDurationInMinutes` parameter in the StartChatContact API.

Add custom vocabularies to conversational analytics

Improve the accuracy of speech recognition for product names, brand names, and domain-specific terminology, by expanding and tailoring the vocabulary of the speech-to-text engine in conversational analytics. For more information, see Add custom vocabularies to conversational analytics using the Connect Customer admin website.

December 2021 Updates

Communications widgets support browser notifications

The communications widget supports browser notifications for desktop devices. For more information, see Send browser notifications to customers when chat messages arrive.

Ingest data into Customer Profiles from Segment and Shopify

For more information, see Set up integration for Segment and Set up integration for Shopify.

November 2021 Updates

Released unified agent application

Connect Customer released the unified agent application to improve the agent experience and customer interactions. For more information, see Agent training guide.

Released key highlights

Connect Customer conversational analytics provides the option for you to view key highlights. The highlights show only those lines where conversational analytics has identified an issue, outcome, or action item in the transcript. For more information, see View key highlights of customer conversations in Connect Customer.

Released Identity Resolution to consolidate similar profiles

Connect Customer Customer Profiles offers Identity Resolution, a feature that is designed to automatically detect similar customer profiles by comparing name, email address, phone number, date of birth, and address. For example, two or more profiles with spelling mistakes, such as "John Doe" and "Jhn Doe," can be detected as belonging to the same customer "John Doe" using clustering and matching machine learning (ML) algorithms. Once a group of profiles are detected to be similar, admins can configure how profiles should be merged together by setting up consolidation rules by using the Connect Customer admin console or Connect Customer Customer Profiles APIs.

Connect Customer Customer Profiles stores contact history at no charge

Connect Customer Customer Profiles now provides contact history and customer information together in unified customer profiles at no charge, helping contact center managers personalize

the contact center experience. In new instances, Customer Profiles is enabled by default. For more information, see Step 4: Data Storage in the *Create an Connect Customer instance* topic.

Added modular flows to help you create common functions

Flow modules are reusable sections of a flow. You can create them to extract repeatable logic across your flows, and create common functions. For more information, see Flow modules for reusable functions.

New APIs to archive/unarchive and delete contact flows

Added new APIs that provide a programmatic and flexible way to manage your library of flows at scale. For example, flows used only during certain times of the year can be archived when not in use and then unarchived when needed. You can now also delete a flow so it is no longer available for use. For more information, see the Connect Customer API Reference.

Search contacts by custom contact attributes

Added support for searching contacts by custom contact attributes (also called user-defined attributes). For more information, see Search by custom contact attributes.

Added Customer profiles block

Added the Customer profiles block. It enables you to retrieve, create, and update a customer profile.

Released Contact APIs

Added APIs so you can get and update contact details programmatically. For example, you can describe contact details such as queue information, chat attachments, task references, and update contact information such as task name. For more information, see DescribeContact, UpdateContact, and ListReferences in the *Connect Customer API Reference*.

Released scheduled tasks

Added the ability to schedule tasks up to six days in the future to follow-up on customer issues when promised. You can also update the scheduled date and time using the UpdateContactSchedule API. For more information, see the Create task block and the Create a task topic in the *Agent training guide*.

Released security profiles APIs

Added APIs so you can create and manage security profiles programmatically. Security profiles help you manage who can access the Connect Customer dashboard and Contact Control Panel (CCP), and who can perform specific tasks. For more information, see the Connect Customer API Reference.

Changes to real-time metrics agent tables

We are rolling out a new service to maintain the high availability from metrics that you expect from Connect Customer. Due to this change, the agent tables are sorted by agent status instead of by agent login.

Additionally, the queues and routing profiles table are sorted by agents online instead of by queue or routing profile name.

Added new metrics

Added following new historical metrics: **Contacts transferred in by agent** and **Contacts transferred out by agent**. Added new real-time metrics: **Transferred in by agent** and **Transferred out by agent**. For more information, see Metrics definitions.

October 2021 Updates

Released real-time chat message streaming

You can subscribe to a real-time stream of chat messages. For more information, see Enable real-time chat message streaming.

Released `HoursOfOperation` APIs for General Availability

Released the Connect Customer `HoursOfOperation` APIs for general availability (GA). Also launched CloudFormation support for Users, User Hierarchies, and Hours of Operation. For more information, see the Connect Customer API Reference and the AWS CloudFormation User Guide.

September 2021 Updates

Released Connect Customer Wisdom General Availability

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

For more information, see Use AI agents for real-time assistance and the Connect Customer agent assist API Reference.

Connect Customer Voice ID - General Availability

For more information, see Use real-time caller authentication with Voice ID and the Connect Customer Voice ID API Reference.

Preview release of Connect Customer outbound campaigns

Added content for the preview release of outbound campaigns. By using Amazon Pinpoint Journeys and Connect Customer, you can now create outbound campaigns for voice, SMS, and email. For more information, see Enable outbound campaigns.

New Amazon AppIntegrations Service APIs

New DataIntegration APIs for the Amazon AppIntegrations Service: `CreateDataIntegration`, `DeleteDataIntegration`, `GetDataIntegration`, `ListDataIntegrationAssociations`, `ListDataIntegrations`, `UpdateDataIntegration`.

For more information, see Amazon AppIntegrations Service API Reference.

Display name and contact attributes in chat

You can now personalize the chat experience, as you can specify the name of your customer that interacts using the chat user interface. You can also securely pass the contact attributes to capture information about the contact which can be used in the flow to further personalize the experience.

For more information, see Pass the customer display name when a chat initializes and Pass contact attributes when a chat initializes.

Preview of agent application

Launched an updated UI for the agent application preview that combines Customer Profiles and the Contact Control Panel (CCP). For more information, see Access Customer Profiles in the agent application.

Added Create task block

Added the **Create task** block. It creates a new task, sets the tasks attributes, and initiates a flow to start the task. For more information, see Flow block: Create task.

August 2021 Updates

Improved user interface for Connect Customer console

Released a redesigned and improved user interface for the Connect Customer console, making it easier and faster to manage Connect Customer instances. For more information, see Create a Connect Customer instance.

APIs for Hours of Operation and Agent Status (Preview)

Released for ungated preview new APIs for managing hours of operation and agent status. For more information, see Connect Customer Service API Reference.

conversational analytics: Build rules that generate tasks and EventBridge events

conversational analytics rules now allow you to automatically generate tasks and EventBridge events based on uttered keywords, sentiment scores, customer attributes, and other criteria. For more information, see Create conversational analytics rules using the Connect Customer admin website.

Networking: Allow AWS Global Accelerator

When using SAML Sign-In to your Amazon Connect instance, you now need to add the AWS Global Accelerator domain, ***. awsglobalaccelerator.com**, to your allow list. For more information, see Set up your network to use the Connect Customer Contact Control Panel (CCP).

July 2021 Updates

"Next status" feature for the CCP

In busy contact centers, it can be difficult for agents to take a break or go offline when contacts are being quickly routed to them. To help agents manage their time, we have released a feature that lets agents pause new contacts being routed to them while they finish their current contacts. When all their slots are cleared, Connect Customer automatically sets agents to the next status, such as **Lunch**.

For details about how agents use this feature, see Set your "Next status" in the Contact Control Panel (CCP).

Metrics: No changes due to "Next status"

When an agent is in **Next status**, their metrics are the same as when their status is **Available**.

For example, an agent is handling one contact and chooses **Next status**. Here's what you'll see in the real-time metrics report:

- Agent Activity state = On Contact
- Agent - Staffed = 1

Non-productive time (NPT) is not incremented when an agent is in **Next status** because the agent is still **Available**. NPT increments only when the agent actually enters the non-productive status, such as **Lunch**.

Agent event stream has new NextAgentStatus field

When an agent sets their status to **Next status**, Connect Customer populates a new `NextAgentStatus` field with the next status selected by the agent.

At the same time, the `AgentStatus` field continues to display `Available`.

The following code snippet shows what the agent event stream looks like when an agent has set their CCP to **Next status: Lunch**.

```
"CurrentAgentSnapshot":
{
    "AgentStatus": {
            "ARN": "example-ARN",
```

```
            "Name": "Available",
            "StartTimestamp": "2019-08-13T20:52:30.704Z"
        },
     "NextAgentStatus": {
            "Name": "Lunch",
            "ARN": "example-ARN2",
            "EnqueueTimestamp": "2019-08-13T20:58:00.004Z",
        }
}
```

When an agent has not selected a **Next status**, the field is `null`, as shown in the following snippet:

```
"CurrentAgentSnapshot": {
    "AgentStatus": {
            "ARN": "example-ARN",
            "Name": "Available",
            "StartTimestamp": "2019-08-13T20:52:30.704Z"
        },
     "NextAgentStatus": null
}
```

Connect Customer Streams API and "Next status"

The feature has the following effect:

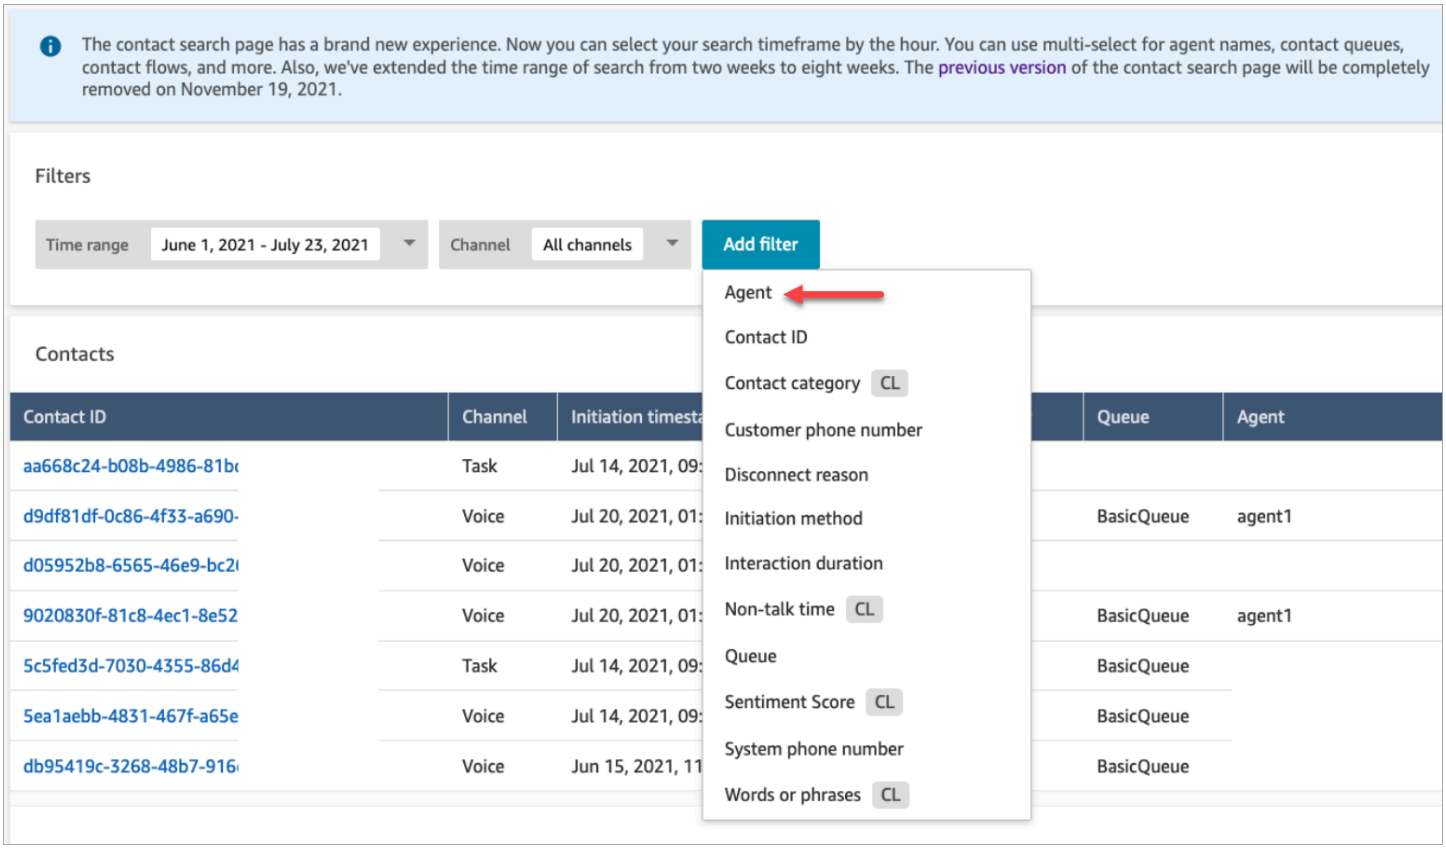
- If you integrate with Connect Customer Streams API and your agents interact directly with the native CCP user interface, your agents will start using this new feature immediately.
- If you integrate with Connect Customer Streams API but your agents don't interact directly with the native CCP user interface, your contact center will continue to have the previous behavior when agent.setState() is called: an agent will not be able to select an NPT or Offline status while connected to at least one contact.

  If you are handling state change logic yourself from Connect Customer Streams, you will need to make additional changes explained in the Connect Customer Streams README.

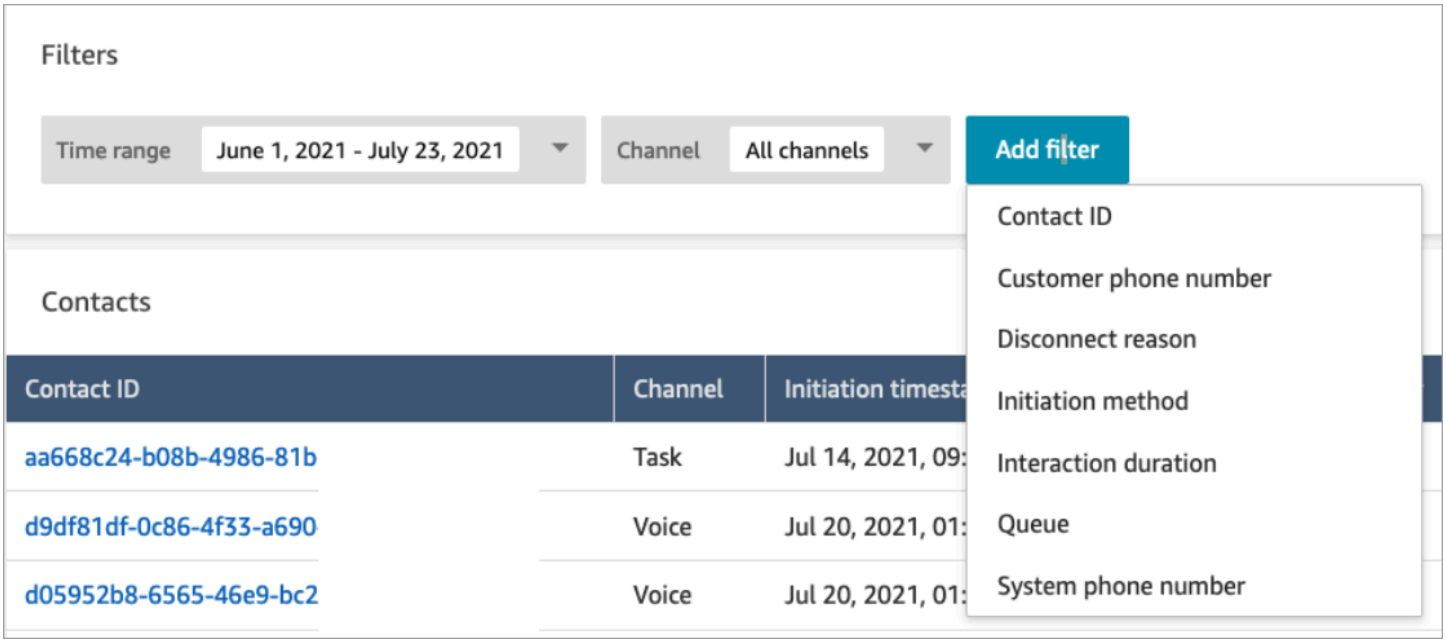
Contact search: To search contacts by Agent login requires Users - View permissions in your security profile

To use the **Agent** filter on the **Contact search** page, in your Connect Customer security profile you must have **Users - View** permissions, as shown in the following image:

When you have **Users - View** permissions, on the **Contact search** page the **Agent** filter appears, as shown in the following image:



Without **User - View** permissions, the **Agent** filter is not visible, and searching contacts by Agent login is not supported, as shown in the following image:



June 2021 Updates

Apple Messages for Business GA

Released Apple Messages for Business for general availability (GA). For more information, see Enable Apple Messages for Business with Connect Customer.

Quick connects management API GA

Released Connect Customer quick connects management API for general availability (GA). For more information, see Connect Customer Service API Reference. The quick connects API also supports AWS CloudFormation. For more information, see Connect Customer Resource Type Reference in the AWS CloudFormation User Guide.

Support for Amazon Lex V2 V2 console and APIs

For more information on using the Amazon Lex V2 V2 console with Connect Customer, see Add an Amazon Lex V2 bot. Added these three APIs: AssociateLexBot, DisassociateLexBot, and ListLexBots. See the Connect Customer Service API Reference.

Chat: Increase to chat agent concurrency

Chat agents can now handle up to 10 concurrent chat contacts. For more information, see Create a routing profile.

May 2021 Updates

Added contact events

Subscribe to a near real-time stream of contact events (for example, call is queued) in your Connect Customer contact center. For more information, see Connect Customer contact events.

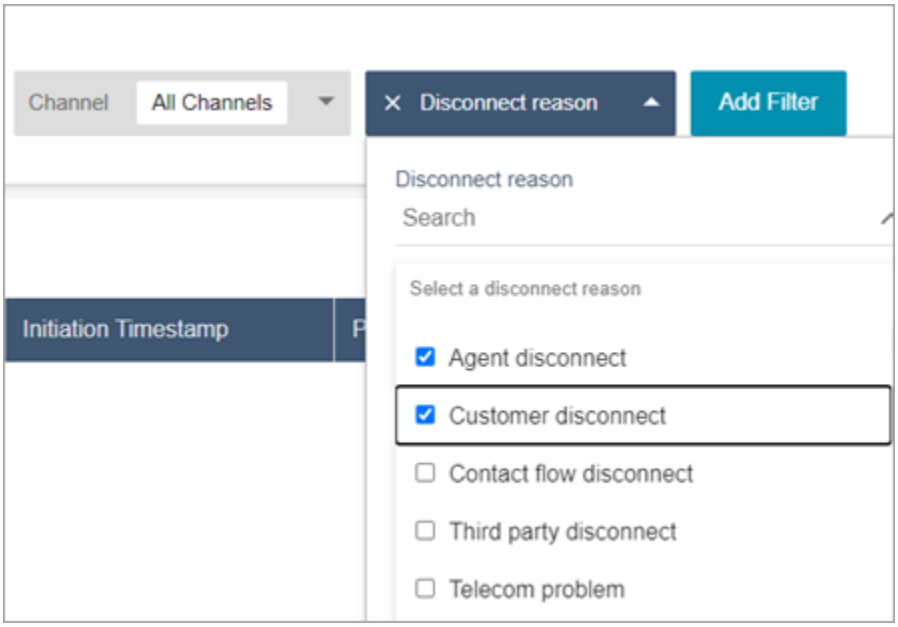
Contact search

The following changes were release for Contact search:

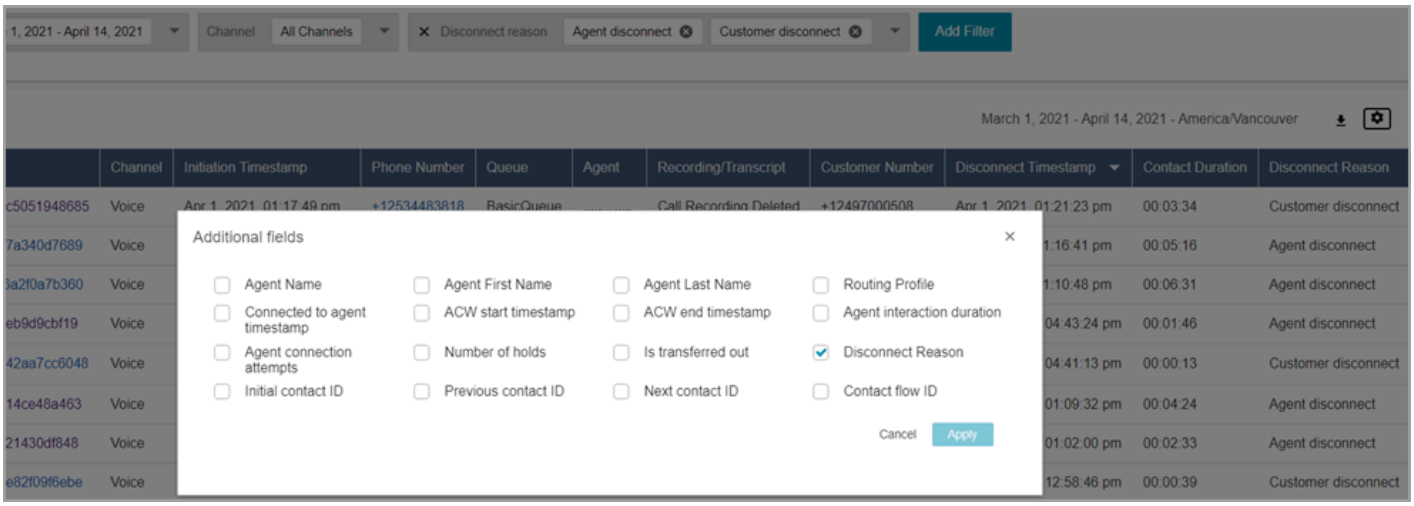
- Download increase: You are able to download 3,000 rows of search results to a CSV file, instead of 1,000 rows. This increase applies to contacts that occurred after Dec 01, 2020.
- Contact search supports Disconnect Reason as a new filter on the **Contact search** page.

  The following image shows how **Disconnect reason** appears in the user interface as a filter.

  The following image shows how you can filter by type of disconnect reason. For a definition of each disconnect reason, see the ContactTraceRecord section of the *Contact records data model* topic.



The following image shows how you add **Disconnect reason** as a column to your search results.



April 2021 Updates

Customer Profiles: Identity resolution

Added identity resolution APIs to Customer Profiles. For more information, see the GetMatches and MergeProfiles APIs in the Connect Customer Customer Profiles API reference.

conversational analytics: Use category tags to navigate transcript

For more information, see Choose category tags to navigate through transcript.

Fixes for chat metrics

We released fixes for the following issues identified in chat metrics:

- Connect Customer incorrectly reported that chat contacts that were created from disconnect flows were created from transfer flows.
- When these fixes, Connect Customer correctly reflects in the contact records and agent event stream that these chat contacts were created from disconnect flows.

There is no impact to voice or task contacts.

Chat contacts created through disconnect flows no longer increment the following metrics:

- Contact flow time
- Contacts incoming
- Contacts handled incoming
- Contacts transferred in

In addition, note the following fixes for contact records and the agent event stream for chat contacts:

- Contact records: There was an issue in the Attributes section of a chat contact record where the initiation method is **API** for both disconnect and transfer contacts. With this fix, the initiation method correctly reflects **Disconnect** and **Transfer**, respectively.
- Agent event stream: Chat contacts created from disconnect flows now have **Disconnect** as the initiation method.

March 2021 Updates

Connect Customer is now available in the Canada (Central) Region

Connect Customer is now available in the Canada (Central) Region. You can claim toll-free and local telephone numbers from Canadian telephony suppliers. For a list of countries were the Canada (Central) Region is supported, see Region requirements for phone numbers. For a list of conversational analytics features available in the Canada (Central) Region, see Availability of conversational analytics features by Region.

Domain for new Connect Customer instances is "my.connect.aws"

The domain for the Connect Customer access URL has changed to **my.connect.aws**.

For example:

- Current: https://[*instance name*].**awsapps.com**/connect/
- New: https://[*instance name*].**my.connect.aws**/

How does this change impact logging in to Connect Customer?

The current access URL continues to work for Connect Customer instances created before the release of the **my.connect.aws** domain. Any Connect Customer instances created after the release automatically use the new domain.

Also, if you create new Connect Customer instances after the release of the new domain, you must add new domains to your allowlist. These domains are **in addition** to the ones that are currently required.

Currently required domains added to your allow list:

- {myInstanceName}.awsapps.com/connect/ccp-v2
- {myInstanceName}.awsapps.com/connect/api
- *.cloudfront.net

New additional domains to add to your allowlist:

- {myInstanceName}.my.connect.aws/ccp-v2
- {myInstanceName}.my.connect.aws/api
- *.static.connect.aws

For more information, see Set up your network to use the Connect Customer Contact Control Panel (CCP).

Schedule for domain change

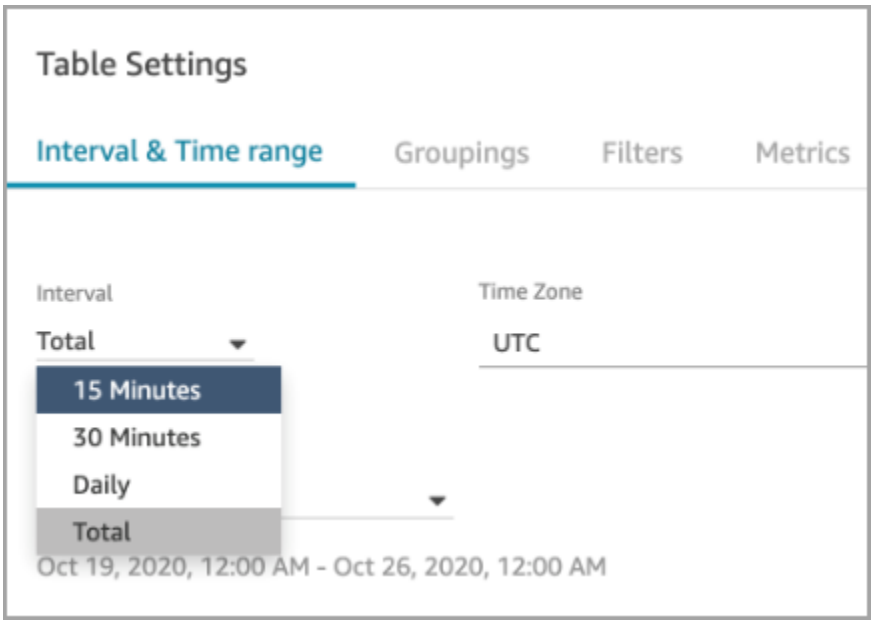
The change has been rolled out to all Regions.

March 2021

The following updates were released in March 2021.

When customizing a historical metrics report, you have the option to select a 15 minutes interval, in addition to the current option of a 30 minutes interval.

The 15 minutes interval works the same as the 30 minutes interval. For example, you can query up to three days of data at a time, for the past 35 days.



Chat: Add a chat user interface your website

Added a communications widget that you can customize and secure so it can only be launched from your widget. For more information, see Set up your customer's chat experience in Connect Customer.

Provided an open source example. For more information, see Customize chat with the Connect Customer open source example.

Connect Customer Endpoint Test Utility

To help you validate connectivity to Connect Customer, or troubleshoot when your agents are experiencing problems with the Contact Control Panel (CCP), we've added the Connect Customer Endpoint Test Utility. For more information, see Validate connectivity to Connect Customer with the Endpoint Test Utility.

February 2021 Updates

conversational analytics: Availability of real-time analytics

conversational analytics real-time analytics is available in Europe (London), Europe (Frankfurt), and Asia (Tokyo). For more information, see Conversational analytics features by Region.

Ingest data into Customer Profiles using Amazon S3

Added the ability to create and ingest data from Amazon S3. For more information, see Create and ingest customer data into Customer Profiles.

Disconnect reason in contact record stream

The Connect Customer contact records stream now includes **DisconnectReason** for voice calls and tasks. **DisconnectReason** indicates whether an agent or customer disconnected the call, or whether a telecom or network issue caused a call to disconnect. You can also determine whether a task was completed by an agent or an automatic flow, or it expired. For more information, see ContactTraceRecord.

Custom service levels

Added the ability to create custom service levels. For details, see New metric groupings and categories.

Metrics updates

The following updates were released in February 2021.

New metric groupings and categories

With the release of custom service level metrics, we also made the following changes:

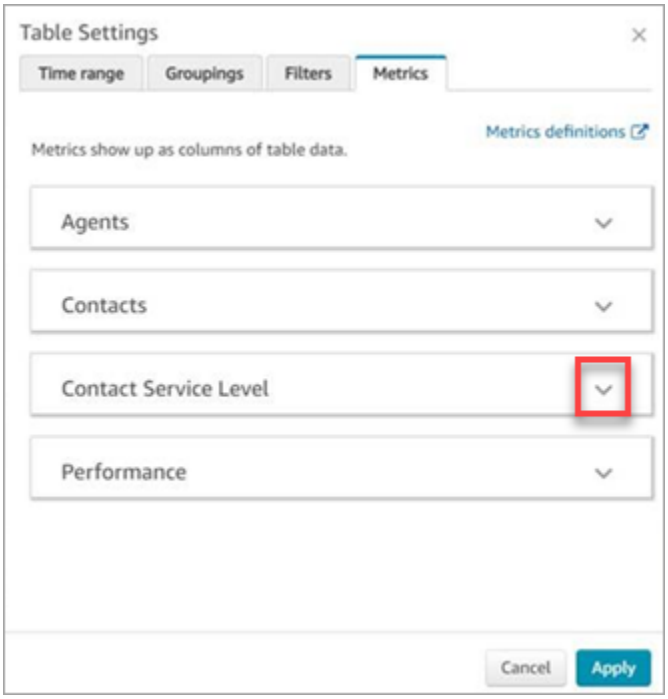
- On the **Table settings** pages, pre-set and custom service level metrics are in a new group called **Contact Service Levels**.
- Historical metrics on the **Table settings** page are grouped into categories.
- The order of metric columns on historical metrics reports changed to match the order of the metrics on the **Table settings** page.

Following is more information about these changes.

Real-time metrics: New Contact Service Level category

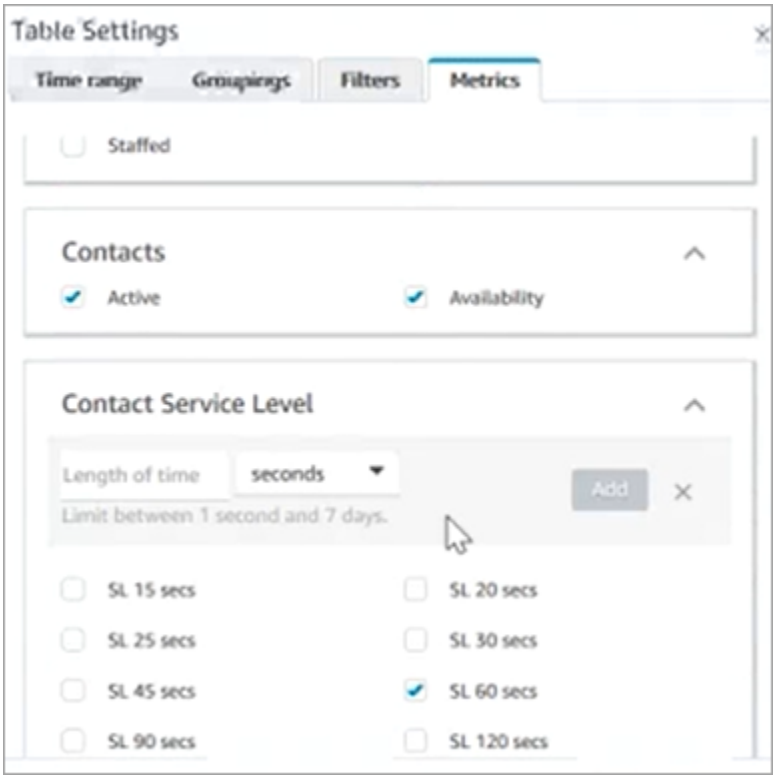
A new category of metrics appears on the **Table settings** page: **Contact Service Level**.

The following image shows this new category on the **Table settings** page, in an expandable group. Choose the arrow next to the group to view and select the metrics you want to add to your report.



Use the **Contact Service Level** category to choose pre-set service level metrics, and to create custom service level metrics.

The following image shows the user interface for creating custom service level metrics.

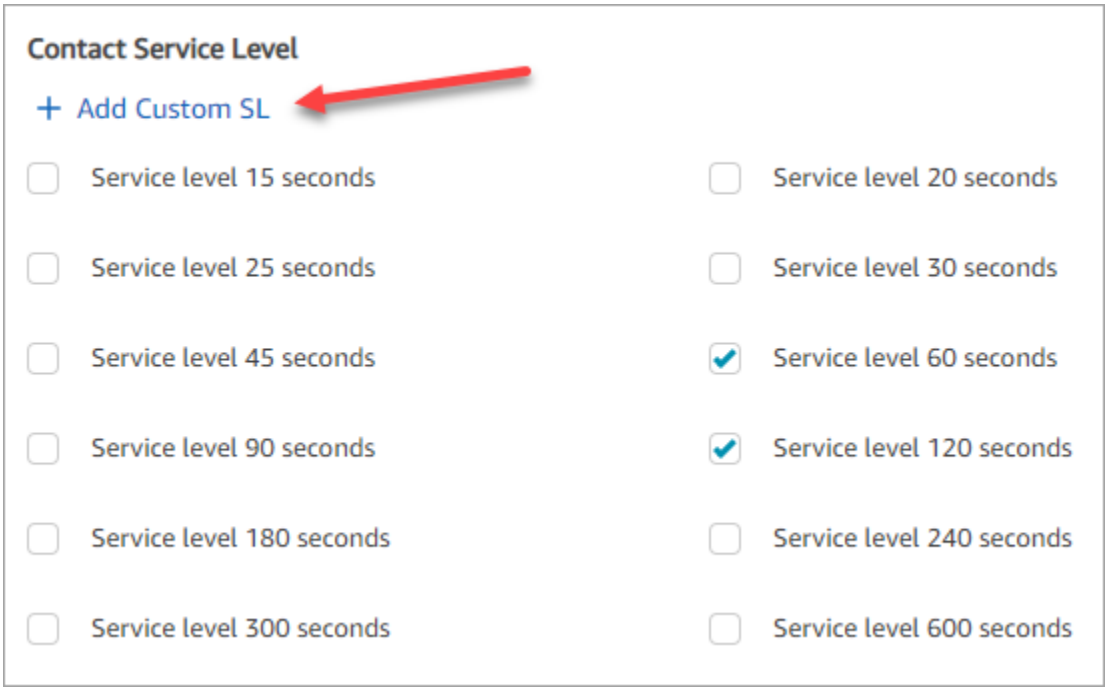


Historical metrics: New categories for metrics

To make it easier to find the historical metrics you want to add to a report, metrics on the **Table settings** page are grouped into the following categories:

- Agents
- Contacts Abandoned
- Contact Service Level: This group contains preset and custom service levels.
- Contacts Answered
- Performance

Choose **Add Custom SL** to add custom service levels to your historical metrics report, as shown in the following image.



The order of the metric columns on the historical metrics reports has changed

The order of the metric columns on the historical metrics reports matches the updated grouping scheme and order of the metrics on the **Table settings** page.

This change supports the addition of custom service level metrics. It also allows us to make future improvements for where, for example, control of how a report looks resides on the **Real-time metrics** page and the **Historical metrics** page, not the **Table settings** page.

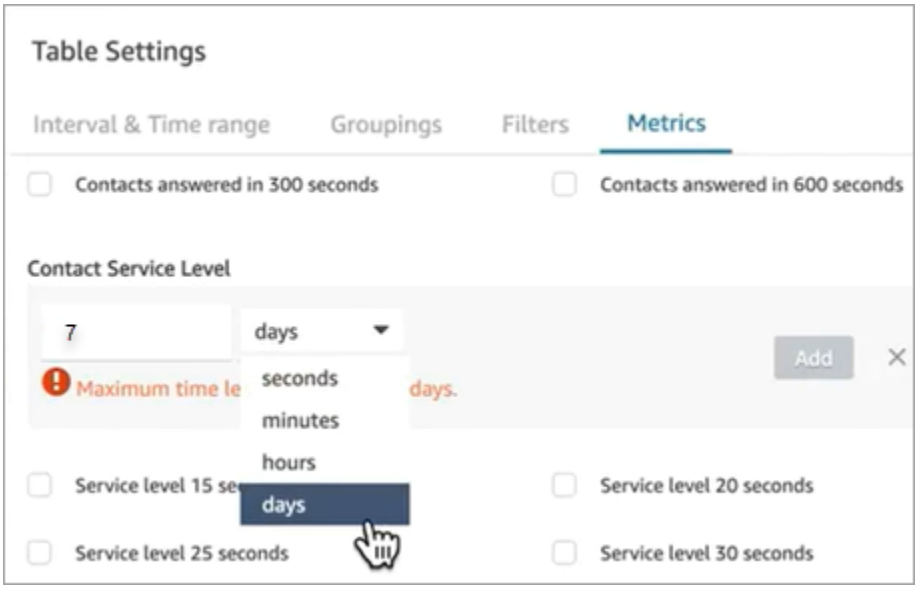
Note how metric columns now appear on reports:

- When you open the **Real-time metrics** page, custom service levels appear at the end of the **Performance** group.
- Metrics on existing **Scheduled reports** (the processed documents that arrive in your Amazon S3 buckets) are not re-ordered automatically. However, if you update an existing report, the metrics are re-ordered to match the order on the **Table settings** page.
- **Service level metrics**:
  - Real-time metrics reports: Service level metrics are always added to the end of the **Performance** group, in ascending order.
  - Historical metrics reports: When you add custom service level metrics, they are added to the end of the report in the order they were created.

Custom service level metrics

You have the ability to add custom service level metrics. You can also choose from additional durations, such as minutes, hours, or days.

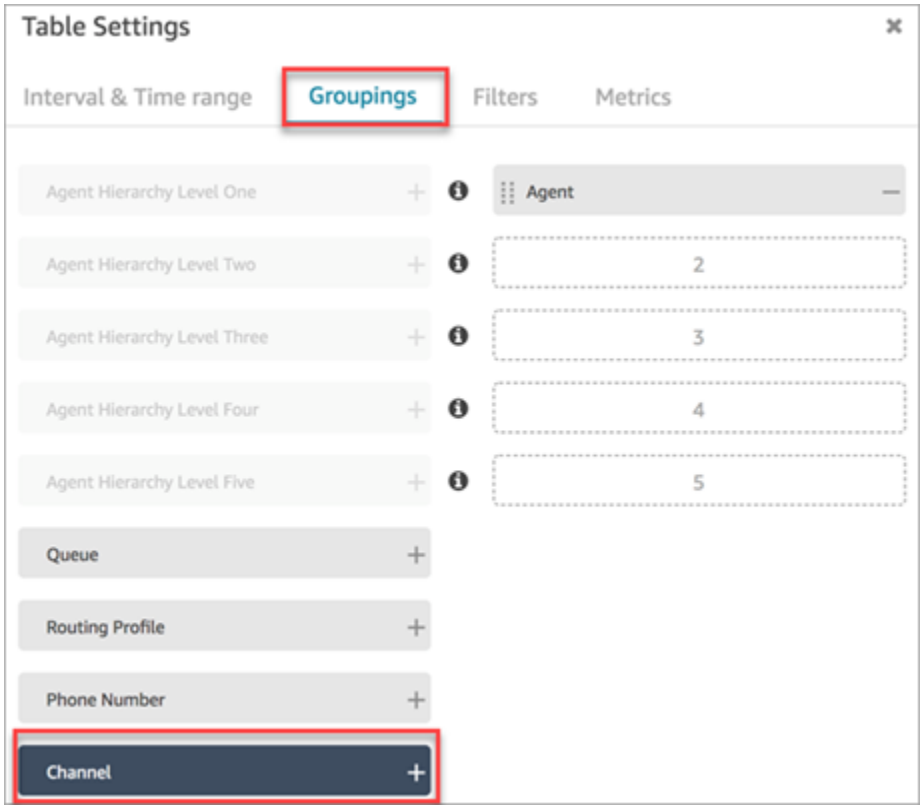
The maximum duration for a custom service level is 7 days. That's because in Connect Customer you can't have a contact that goes longer than 7 days.



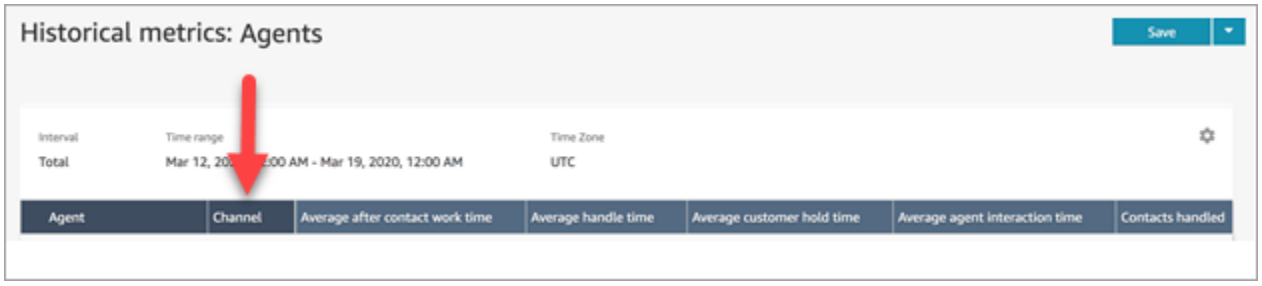
Group by channel in a historical metrics report

To group by channel on historical metrics reports

1. On the navigation menu, choose **Analytics and optimization**, **Historical metrics**, and then choose a report.
2. Choose **Settings**.
3. On the **Table Settings** page, choose the **Groupings** tab. Add **Channel**, and choose **Apply**.



4. The table shows a column for **Channel**, as shown in the following image.



January 2021 Updates

CCP: Change your audio settings

Added the ability to change audio settings from the Contact Control Panel (CCP). This applies to organizations using a customized CCP. For more information, see Change your audio device settings in the CCP or agent workspace.

Queue APIs (Preview)

Added APIs so you can programmatically create and manage queues. For more information, see Connect Customer Service API Reference.

Amazon AppIntegrations APIs - GA

Released Amazon AppIntegrations APIs for general availability (GA). For more information, see Amazon AppIntegrations Service API Reference.

December 2020 Updates

Quick Connect APIs (Preview)

Added APIs so you can programmatically create and manage quick connects. For more information, see Connect Customer Service API Reference.

Chat: Support for attachments

Added support for chat attachments. For more information, see Enable attachments in your CCP so customers and agents can share and upload files.

Added the following APIs:

- CompleteAttachmentUpload
- GetAttachment
- StartAttachmentUpload

Configurable DTMF timeouts for Lex bots

For more information, see Configurable fields for DTMF input.

Tasks

Added support for tasks, allowing you to prioritize, assign, track, and even automate tasks across the disparate tools agents use to support customers. For more information, see The task channel in Connect Customer.

Connect Customer APIs

Added an Connect Customer API that provides the ability to create tasks (`StartTaskContact`), and a set of preview APIs.

Preview APIs:

- `CreateIntegrationAssociation`

- `DeleteIntegrationAssociation`
- `ListIntegrationAssociations`
- `CreateUseCase`
- `DeleteUseCase`
- `ListUseCases`

Amazon AppIntegrations APIs (Preview)

Added the Amazon AppIntegrations APIs (Preview), which enables you to configure and reuse connections to external applications. For more information, see Amazon AppIntegrations Service API Reference (Preview).

Customer Profiles

Added Connect Customer Customer Profiles, enabling agents to create a customer profile for every new contact that comes in. You can also integrate with external applications that provide customer profile data. For more information, see Customer Profiles in Connect Customer and the Connect Customer Customer Profiles API Reference.

Real-time analytics using conversational analytics

Added real-time analytics for conversational analytics so you can detect and resolve customer issues more proactively while the call is in progress. For more information, see Analyze conversations using conversational analytics in Connect Customer conversational analytics and the Connect Customer conversational analytics API Reference.

Connect Customer Voice ID (Preview)

Added Connect Customer Voice ID (Preview), which provides for real-time caller authentication. For more information, see Use real-time caller authentication with Voice ID in Connect Customer.

Connect Customer Wisdom (Preview)

> **Note**
>
> In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.

Added Connect Customer Wisdom (Preview), which enables agents to search and find content across multiple repositories, such as frequently asked questions (FAQs), wikis, articles, and step-by-step instructions for handling different customer issues.

Connect Customer with Apple Messages for Business (Preview)

Added support for using Connect Customer with Apple Messages for Business. For more information, see Enable Apple Messages for Business with Connect Customer.

November 2020 Updates

Telephony call metadata attributes

- Added call attributes to improve fraud detection and routing. For more information, see Telephony call metadata attributes (call attributes).

View historical changes

- The ability to **View historical changes** on the resource configuration pages is now available for the London Region. The following differences appear as the changes are rolled out to other Regions.
  - Total results: The number feature in the **View historical changes** search page, and page numbers, are replaced with **Previous** and **Next** icons.
  - The Username filter requires the entire login name.

Chat

- Added interactive message templates. For more information, see Add Amazon Lex interactive messages for customers in chat.

APIs

- Added APIs so you can programmatically manage your agent hierarchies and agent groups. For more information, see Connect Customer Service API Reference.
- Added the following APIs (in an ungated preview release):
  - CreateInstance

- DescribeInstance
- ListInstances
- DeleteInstance
- UpdateInstanceAttribute
- UpdateInstanceStorageConfig

October 2020 Updates

The following updates were released in October 2020:

Flows

- Added chat support for whisper flows. For more information, see Flow block in Connect Customer: Set whisper flow.

Metrics

- Released the following real-time metrics:
  - Average agent callback connecting time
  - Average agent incoming connecting time
  - Average agent outbound connecting time

  Released the following historical metrics:
  - Agent API connecting time
  - Agent callback connecting time
  - Agent incoming connecting time
  - Agent outbound connecting time
  - Average agent API connecting time
  - Average agent callback connecting time
  - Average agent incoming connecting time
  - Average agent outbound connecting time
- In real-time metrics reports, added one-choose drill-downs. These allow you to drill down into queue and routing profile data in one choose. For more information, see Use pre-filtered tables for Routing profiles and Queues tables in Connect Customer.

- Added the **Restrict contact access** permission which enables you to manage a user's access to results on the **Contact search** page based on their agent hierarchy group. For more information, see Search for completed and in-progress contacts in Connect Customer.
- Added **ContactDetails** and **References** to the contact record. For more information, see Data model for Connect Customer contact records.

September 2020 Updates

The following updates were released in September 2020:

Service quotas

- Updated the service quotas for the following Connect Customer Participant Service APIs:
  - CreateParticipantConnection
  - DisconnectParticipant
  - GetTranscript

Flows

- Added the Connect Customer Flow language, a JSON-based representation of a series of flow actions, and the criteria for moving between them. For more information, see Flow language.

APIs

Added the following APIs for flows:

- CreateContactFlowf
- DescribeContactFlow
- UpdateContactFlowContent
- UpdateContactFlowName

Added the following API to list prompts:

- ListPrompts

Added the following APIs for routing profiles:

- AssociateRoutingProfileQueues
- CreateRoutingProfile
- DescribeRoutingProfile
- DisassociateRoutingProfileQueues
- ListRoutingProfileQueues
- UpdateRoutingProfileConcurrency
- UpdateRoutingProfileName
- UpdateRoutingProfileQueues

August 2020 Updates

The following updates were released in August 2020:

Flows

- Added the ability to automatically use the best sounding voice available from Amazon Polly for text-to-speech. For more information, see Amazon Polly best sounding voice.
- Added the ability to select, cut, copy, and paste flows. For more information, see Copy and paste flows in Connect Customer.

Telephony

- Added the ability for all customers to enable/disable media support for outbound phone calls. For more information, see Step 3: Set telephony in the Create a Connect Customer instance topic.

Monitoring

- Added logging of Connect Customer Participant Service calls with AWS CloudTrail. For more information, see Log Connect Customer API calls with AWS CloudTrail.

Connect Customer conversational analytics

- Updated the security profile permissions for the redaction feature. For more information, see Assign permissions to use conversational analytics in Connect Customer.

July 2020 Updates

The following updates were released in July 2020:

Flows

- The **Set voice** block supports speaking styles with neural text-to-speech (TTS) voices. For more information, see Flow block in Connect Customer: Set voice.

APIs

- Added StartContactRecording, StopContactRecording, SuspendContactRecording, ResumeContactRecording to the Connect Customer Service API.

Connect Customer conversational analytics

- Updated conversational analytics for general availability. This feature lets you analyze customer-agent conversations, by using speech transcription, natural language processing, and intelligent search capabilities. For more information, see Analyze conversations using conversational analytics in Connect Customer conversational analytics.

Metrics

- Fixed content that was added in June 2020 that said **Agent idle time**, **Agent on contact time**, and **Occupancy** had been deprecated. That was incorrect. Rather, they are no longer available for queue groupings only.
- Corrected how **Occupancy** is calculated. The correct calculation is:

  (Agent on contact (wall clock time) / (Agent on contact (wall clock time) + Agent idle time))

June 2020 Updates

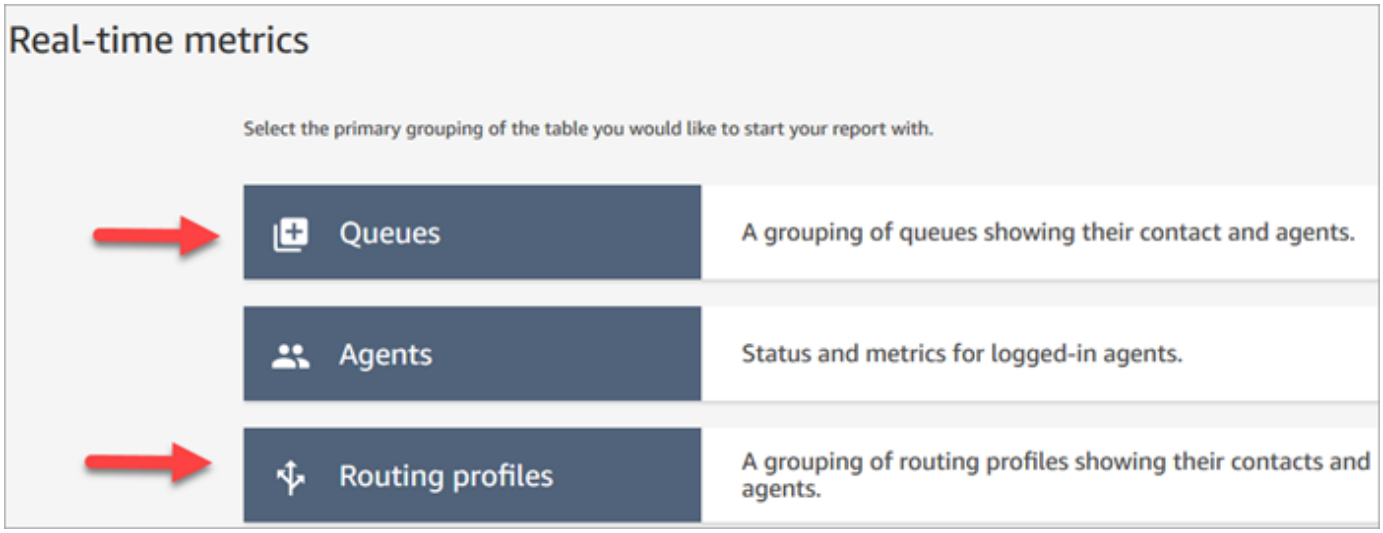
The following updates were released in June 2020:

June 2020: Changes for omnichannel support

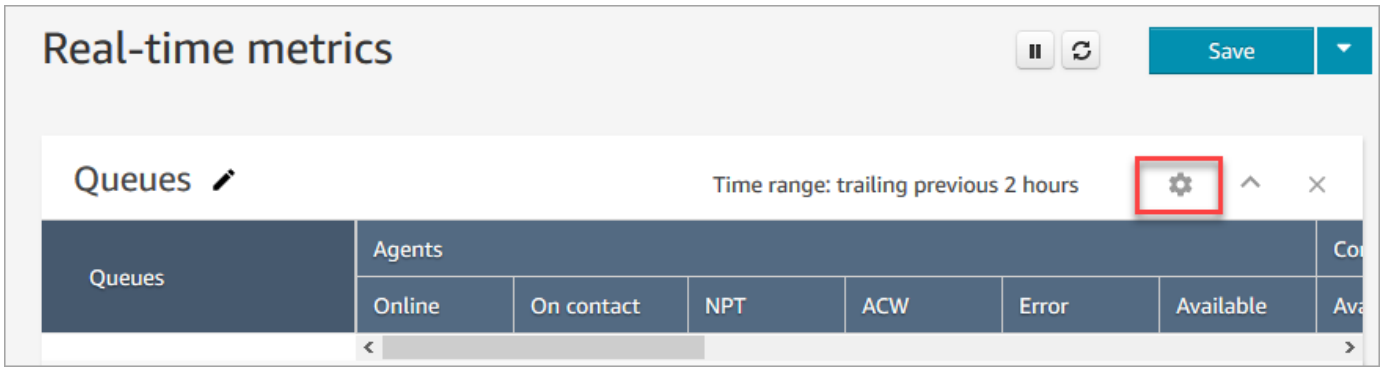
Group by channel

To group queues or routing profiles by channel on real-time metrics reports

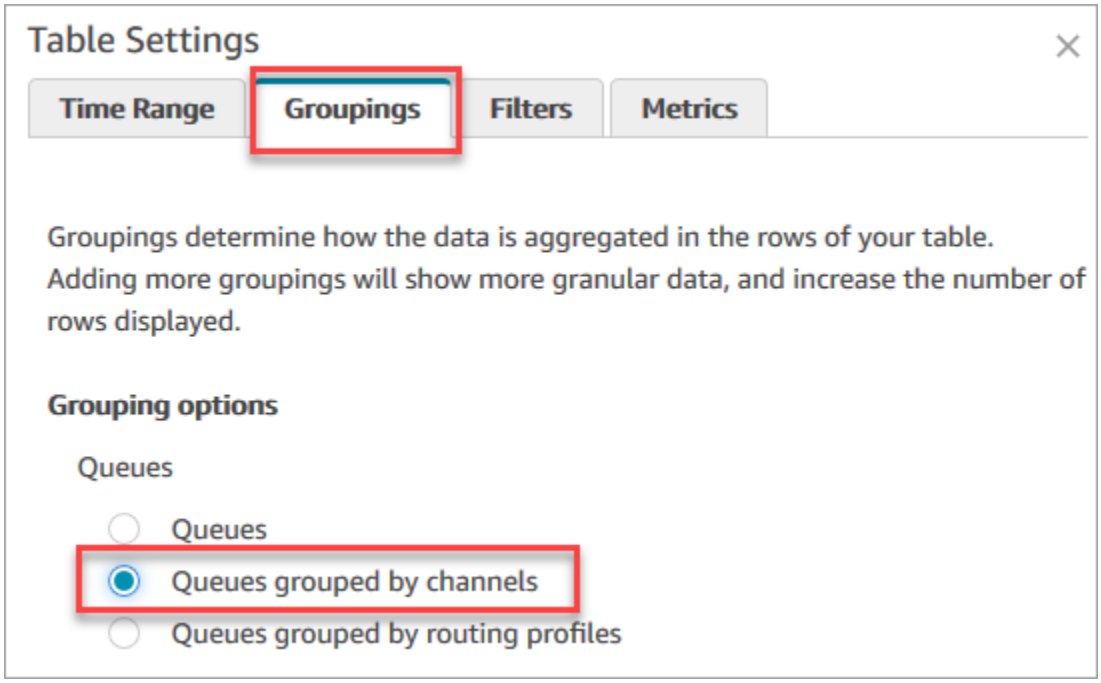
1. On the navigation menu, choose **Analytics and optimization**, **Real-time metrics**, and then select either **Queues** or **Routing profiles**.



2. Choose **Settings**.



3. On the **Table Settings** page, choose the **Groupings** tab and then select **Queues grouped by channels**. Or, if you're setting up a **Routing profiles** report, choose **Routing profiles grouped by channels**.



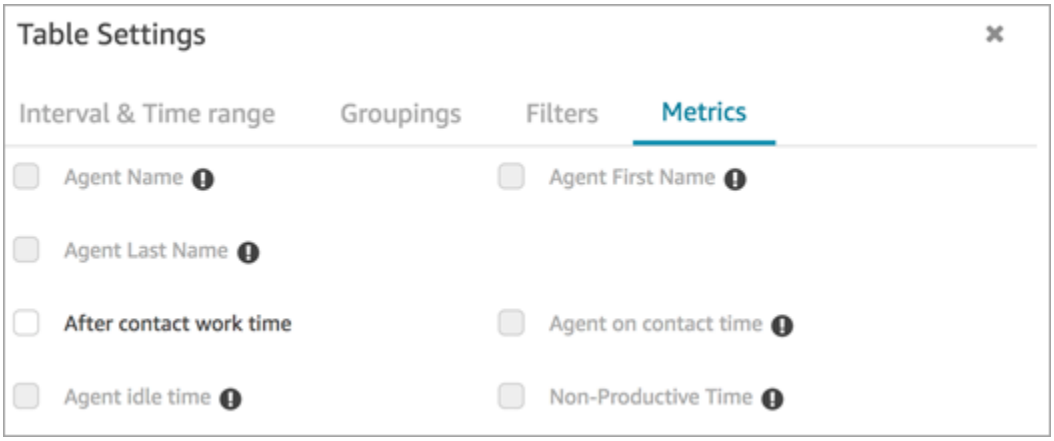
4. Choose **Apply**.
5. The table shows a column for **Channel**.

Group by queue in historical metrics reports

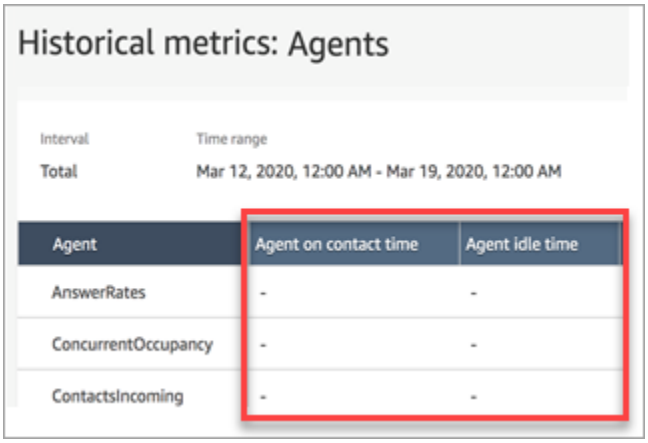
In the historical metrics report, when you group or filter metrics by **Queue**, the results for the following metrics aren't accurate:

- Agent idle time (not supported in queue grouping as of June, 2020)
- Agent on contact time (not supported in queue grouping as of June, 2020)
- Occupancy (not supported in queue grouping as of June, 2020)

Because of this, on the **Table Settings** page, **Metrics** tab, these metrics are inactive, as shown in the following image:



In addition, in the historical metrics report, Connect Customer displays a hyphen (-) in place of results for these metrics, and the cells are inactive (gray).



Effect of queue grouping on saved and scheduled reports

If the **Queue** grouping or filter is used on the following reports, note these effects:

- **Dashboards and reports**. The columns for these metrics don't appear in the saved reports when *grouped* by Queue. When the saved report is *filtered* by Queue, however, it shows "-".
- **Scheduled reports**. These reports continue to run successfully, but no results are returned for these metrics.

Agent on contact time (not supported in queue grouping as of June, 2020)

On historical metrics reports when an agent handles multiple chats concurrently, **Agent on contact time** shows wall clock time: the amount of time spent chatting. However, there isn't a metric that shows the time an agent spends chatting with each contact.

In addition, no results are returned when you use the **Queue** grouping or filter with **Agent on contact time**.

Agent idle time (not supported in queue grouping as of June, 2020

The **Agent idle time** metric divides the idle time into each queue associated with the agent. When contacts are grouped or filtered by **Queue**, however, Connect Customer doesn't provide an accurate view into the how the agent is working. Because of this, Connect Customer doesn't show **Agent idle time** when you apply the **Queue** grouping or filter to your report.

Occupancy (not supported in queue grouping as of June, 2020)

With the addition of chat, the **Occupancy** metric is now defined as the percentage of time that an agent was active on contacts. This percentage is calculated as follows:

- (Agent on contact (wall clock time) / (Agent on contact (wall clock time) + Agent idle time))

Because **Agent idle time** is now inaccurate when contacts are grouped or filtered by **Queues**, the **Occupancy** metric is also inaccurate. As a result, when contacts are grouped or filtered by Queues, **Occupancy** doesn't appear on the report.

Occupancy no longer appears on the **Dashboard** page.

Contact Control Panel (CCP)

- Released the following improvements:
  - DTMF input is passed to all lines in a three-way call. Any party can enter DTMF input.
  - Resolved an issue where the DTMF tone degraded when agents interacted with Quick connect or Number pad during a session.
  - Resolved an issue where quick connects sometimes did not appear on a page, even after an agent refreshed it.
  - Improved the experience when a manager "listens in" to multiple chat conversations. Updated the unread message count on the CCP to include messages sent by the customer and those sent by the agent. Previously, the unread message count only included messages sent by the customer.
- Published instructions for upgrading to the latest CCP. For more information, see Upgrade to the latest Connect Customer Contact Control Panel (CCP)..

- Published a training video that explains how to use the CCP. For more information, see Training video: How to use the Contact Center Panel (CCP) in Connect Customer.

Flows

- The **Set disconnect flow** block supports voice conversations. For more information, see Flow block in Connect Customer: Set disconnect flow.
- The **Set Voice** block supports Amazon Polly Neural Text-to-Speech (NTTS) voices. For more information, see Flow block in Connect Customer: Set voice.
- The **Get queue metrics** block can return metrics by channel, for example, by voice or chat. For more information, see Flow block in Connect Customer: Get metrics.

May 2020 Update

The following updates were released in May 2020:

Flows

- Added the ability to select multiple blocks at the same time and rearrange them as a group within a flow. For more information, see Create an inbound flow.

April 2020 Update

The following updates were released in April 2020:

Telephony

- Added early media support for outbound phone calls. Enabled by default, an agent hears tones and audio messages played by phone companies—such as busy signals, failure to connect errors, or other informational messages—through their headset or audio device. For more information, see Step 3: Set telephony in the Create a Connect Customer instance topic.
- Added the `barge-in-enabled` session attribute to the Get customer input block so customers can interrupt Amazon Lex bots with their voice.

March 2020 Update

The following updates were released in March 2020:

Flows

- Updated the Store customer input block to allow you to specify a custom terminating keypress.

Metrics

- Announced June 2020: Changes for omnichannel support.

Networking

- Updated softphone requirements in Set up your network to use the Connect Customer Contact Control Panel (CCP).

February 2020 Update

The following updates were released in February 2020:

Service Quotas

- Adjusted Connect Customer service quotas for new accounts.

Flows

Updated the following blocks so you can set contact attributes:

- Set customer queue flow
- Set hold flow
- Set whisper flow

January 2020 Update

The following updates were released in January 2020:

Contact Control Panel (CCP)

The following updates were made to the updated Contact Control Panel (ccp-v2):

- Agents can now transfer a contact by double-choosing a quick connect. For more information, see Transfer calls to a quick connect or external phone number using the Contact Control Panel (CCP).
- The number pad now retains the previously selected country flag so agents don't need to select it every time.
- All strings in the CCP user interface are now localized in available languages.
- Resolved an issue where the color of the call status bar incorrectly displayed as green during a conference call when the call was in the Joined state. It is now blue.
- Resolved an issue where the agent's name was displayed in error messages for missed chats, rather than the customer's name.

Networking

- Updated Set up your network to use the Connect Customer Contact Control Panel (CCP) to include requirements for the updated Contact Control Panel (ccp-v2).

December 2019 Update

The following update was released in December 2019:

Monitoring

- Added conversational analytics for preview. This feature enables you search conversations for keywords, sentiment scores, and non-talk time. For more information, see Analyze conversations using conversational analytics in Connect Customer conversational analytics.
- Added logging of Connect Customer API calls with AWS CloudTrail. For more information, see Log Connect Customer API calls with AWS CloudTrail.

November 2019 Update

The following updates were released in November 2019:

Omnichannel Support

- Added support for chat communications. For more information, see Feature overview.

November 2019

Name changes for "Missed" and "Agent status" and "On call"

The following real-time metrics were renamed:

Old name	New name
Missed	Agent non-response
Agent status	Agent activity
On call	On contact

For each metric, existing saved reports automatically start displaying the new name; you don't need to do anything for the new name to appear in your reports.

The column order for a saved report containing one of these metrics stays the same. For example, if you previously saved a report where **Agent status** was the third metric, now when you open that saved report, **Agent activity** is the name for the third metric.

For **Missed**, only the name of the metric changed; the underlying calculation stayed the same. We've changing the name of this metric to **Agent non-response** so it better reflects its definition:

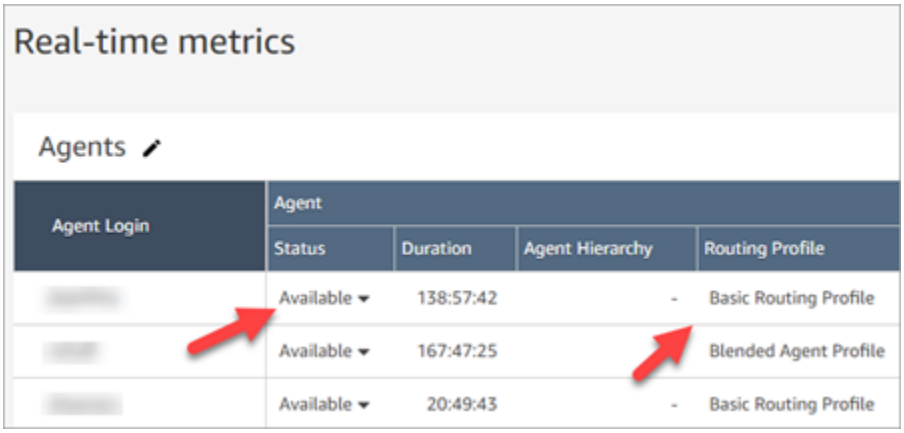
- **Agent non-response** increments whenever a contact is offered to an agent, and the agent doesn't respond to the contact for whatever reason.

  For example, the agent could have intentionally let the timer run out, or the agent could have forgotten to grant microphone access in the Contact Control Panel and never heard the ring. In these situations, Connect Customer doesn't drop the contact. Instead, the routing engine will offer it to another available agent, while the customer continues to wait in queue. This means a single contact could result in multiple **Agent non-responses** before an agent responds and handles the contact.

For **On call**, the name change to **On Contact** applies to the Real-time metrics UI only. You can continue using `AGENTS_ON_CALL` with the `GetCurrentMetricData` API to retrieve data for this metric.

Label updates for "Agent activity" and "Contact state"

Labels are the values returned in a report. For example, in the following image **Available** and **Basic Routing Profile** are labels.



For **Agent Activity** and **Contact State**, we renamed some of the labels that describe what the agent's current activity is and what's happening with the contact they are currently working on. This way, the labels in the Real-Time Metrics report are more consistent with the labels the agent sees in the Contact Control Panel. They also align with the data returned about these different states in other parts of Connect Customer.

When the name of **Agent Status** changed to **Agent Activity**, the following labels changed, too:

Scenario	Before: Agent Status Labels	After: Agent Activity Labels	Notes
Agent is logged in but offline	Not shown	Not shown	
Agent switches to **Available** in the CCP	Available	Available	
Agent has an incoming call	CallIncoming	Incoming	ContactState = Incoming contact

Scenario	Before: Agent Status Labels	After: Agent Activity Labels	Notes
Agent has an incoming callback	CallbackIncoming	Incoming	ContactState = Inbound callback
Agent accepted a callback, which is now making an outbound call to the customer	Calling	On Contact	ContactState = Outbound callback
Agent makes outbound call (regardless of what status the agent chose in their CCP)	Calling	On Contact	ContactState = Outbound contact
Agent missed a phone call due to timer expired	MissedCallAgent	Missed	
Agent is interacting with customer on phone call (regardless of what status the agent chose in their CCP)	On call	On Contact	
Agent puts customer on hold while on phone call (regardless of what status the agent chose in their CCP)	On call	On Contact	
After agent hangs up call	After call work	After contact work	

Scenario	Before: Agent Status Labels	After: Agent Activity Labels	Notes
Agent is on Lunch (a custom status)	Lunch	Lunch	
Supervisor's activity state if they are monitoring some agent	Monitoring	Monitoring	
Agent's activity state if they are connected to customer while being monitored by a supervisor	On call	On Contact	

The following table shows the how the labels changed for **Contact State**.

Scenario	Label Name Before	Label Name After
Agent is logged in but offline		
Agent switches to **Available** in the CCP	-	-
Agent has an incoming call	-	Incoming contact
Agent has an incoming callback	-	Inbound callback
Agent accepted a callback, which is now making an outbound call to the customer	Initial	Outbound callback

Scenario	Label Name Before	Label Name After
Agent makes outbound call (regardless of what status the agent chose in their CCP)	Initial	Outbound contact
Agent missed a phone call due to timer expired	Missed call	Missed contact
Agent is interacting with customer on phone call (regardless of what status the agent chose in their CCP)	Busy	Connected
Agent puts customer on hold while on phone call (regardle ss of what status the agent chose in their CCP)	OnHold	On hold
After agent hangs up call	After call work	After contact work
Agent is on Lunch (a custom status)	-	-
Supervisor's contact state if they are monitoring an agent	Monitoring	Monitoring

Flows

Added the following flow blocks:

- Wait
- Set disconnect flow

Updated the following flow blocks for chat:

- Play prompt
- Get customer input

- Store customer input
- Set recording and analytics behavior

User Management

- Added that you can use AWS Identity and Access Management (IAM) with Connect Customer. For more information, see Identity and access management for Connect Customer.

Live Media Streaming

- Added that you can capture customer audio for the entire interaction with your contact center. For more information, see Set up live media streaming of customer audio in Connect Customer.

API

- Added StartChatContact, ListTagsForResource, TagResource, UntagResource to the Connect Customer Service API.
- Added the Connect Customer Participant Service API. These APIs are used chat participants, such as agents and customers.

Contact Control Panel (CCP)

- Updated the CCP so it supports chat. For more information, see Agent training guide for the Contact Control Panel (CCP) and agent workspace in Connect Customer.

October 2019 Update

The following update was released in October 2019:

Metrics

- The real time metric **On call** is now incremented whenever an agent is handling a contact who is connected, on hold, in After Contact Work, or the agent is dialog out to a customer.

  This metric is available in the Queues tables and Routing Profile tables on the **Real time metrics** page. It's also returned by the `GetCurrentMetricData` API as `AGENTS_ON_CALL`.

June 2019 Update

The following update was released in June 2019:

Flows

- Added flow versioning so you can choose between a saved or published version when you roll back.

May 2019 Updates

The following updates were released in May 2019:

Metrics and Reporting

- Improved the error messages you might encounter when creating, editing, or deleting a scheduled report.
- In the Historical metrics report UI, changed **Contacts missed** to **Agent non-response**. This metric appears as **Contacts missed** in scheduled reports and exported CSV files.
- In the agent event stream, fixed the formatting of the timestamp millisecond so you can better order and analyze the data. To learn more, see Connect Customer agent event streams.

Contact Control Panel

- Resolved an issue where calling a destroy action (such as `connection.destroy`) using the Connect Customer Streams API resulted in different behavior depending on which leg of the conversation it was called from: the agent or the customer. Now calling a destroy action results in the same behavior for both: a busy conversation is moved to After Call Work (ACW) and a conversation in any other state is cleared. If you used the native Contact Control Panel instead of the Connect Customer Streams API, you weren't impacted by this issue.

April 2019 Updates

The following updates were released in April 2019:

Contact Control Panel

- Resolved an issue where the hold flow didn't run in this case:

- The agent missed a call and then set themselves back to Available.
- Then they were re-routed the same call.
- The agent put that customer on hold while handling the call.

  However, taking the customer off hold worked as expected and no other impact occurred.

- Resolved an issue where the Connect Customer Streams API returned `softphoneAutoAccept = FALSE` even though **Auto-Accept Call** was enabled for the agent.

March 2019 Update

The following updates were released in March 2019:

Metrics and Reporting

- Improved the error messages you might encounter when running real-time metrics reports. For example, if you manually configure a real-time metrics report to contain more than 100 queues, we'll display this message: "You've hit the maximum limit of 100 queues. Please reconfigure your report to contain no more than 100 queues." To learn more, see Troubleshoot no metrics or too few rows in a queues report in Connect Customer

Contact Control Panel

- Resolved an issue where, in rare cases, an agent already handling an outbound call could have been incorrectly presented with an additional queued callback, even though they are only allowed to handle one contact at a time. Since that agent would have been on contact and not idle, the agent wouldn't have been able to accept the queued callback.

  In these cases, the outbound call was not impacted; the agent wouldn't have noticed any differences in the CCP. The callback was presented to another agent instead of being dropped.

February 2019 Updates

The following updates were released in February 2019:

Updates by category

- Contact Routing

- Flows
- Metrics and Reporting
- Contact Control Panel (CCP)

Contact Routing

- Resolved an issue where in rare cases some contacts were not routed to the agent that was available for the longest time.
- Resolved an issue in the user interface where the value displayed for **No. of agents staffed** for the **Basic Routing Profile** on the **Routing Profiles** page was incorrect. The correct number of agents for the routing profile was displayed on the **User Management** page.

Flows

- Resolved an issue with the flow editor when adding intents in Chrome.
- Resolved an issue where routing priority and age for queued callbacks were not saved.
- Resolved an issue where contact attributes for an outbound whisper flow were not saved.

Metrics and Reporting

- Added **EnqueueTimestamp**, **Duration**, and **DequeueTimestamp** to the contact record for callback contacts.
- Resolved an issue where **InitiationTimestamp** for callback contacts did not match the time that the callback was created.
- Resolved an issue where users were given an incorrect message when they did not have permissions to edit a report.

Contact Control Panel (CCP)

- Resolved an issue where callbacks were not ringing in the CCP.

January 2019 Updates

The following updates were released in January 2019:

Updates by category

- Contact Routing
- Flows
- Metrics and Reporting

Contact Routing

- Resolved an issue where in rare cases agent transfers were failing.

Flows

- Resolved an issue where agent transfers were failing.
- Resolved an issue that resulted in periodic delays in publishing flow logs.

Metrics and Reporting

- Resolved an issue in real-time metrics reports where the page showed the wrong calculation for **Avg queue answer time**.
- Resolved an issue where some events were missing from an agent event stream.

December 2018 Updates

The following updates were released in December 2018:

Updates by category

- Metrics and Reporting
- Contact Control Panel (CCP)

Metrics and Reporting

- Resolved an issue where agent event streams were missing agent snapshots during login and logout events.
- Resolved an issue where the contact record detail page displayed timestamps using the timezone selected on the search page.

- Resolved an issue where the AfterContactWork status was overridden.
- Resolved an issue where the timestamps are incorrect if an agent accidentally disconnects while placing a customer on hold.

Contact Control Panel (CCP)

- Resolved an intermittent issue with initialization when an agent configuration is corrupted or null.
- Resolved an issue where pressing Enter to transfer a call did not work.

November 2018 Updates

The following updates were released in November 2018:

Updates by category

- General
- Flows
- Metrics and Reporting

General

- Resolved an issue with auditing.
- Resolved an issue that sometimes resulted in agents being placed in a default state when a contact disconnected when attempting to connect to an agent.
- Resolved an issue that sometimes resulted in newly created agents not being able to log in correctly if the log in attempt occurred immediately after user account was created.

Flows

- Added the new Loop block, which lets you loop through segments of a flow, such as requesting customer information additional times if valid data is not entered.

Metrics and Reporting

- Resolved an issue where callbacks handled were included in the count for incoming contacts in historical reports, but not counted in scheduled reports. Callbacks handled are no longer included in the count for Incoming contacts handled in historical reports.
- Improved performance of report generation for reports with a large number of queues and agents in an instance.
- Resolved an issue with how ACW was reported, and backfilled data in customer instances to correct the ACW data for September, October, and November.

October 2018 Updates

The following updates were released in October 2018:

Updates by category

- General
- Metrics and Reporting
- API

General

- Resolved an issue that sometimes resulted in stuck media sessions.

Metrics and Reporting

- Resolved an issue that sometimes resulted in agent names not being displayed correctly in historical reports.
- Resolved an issue that sometimes resulted in the data related to agent Auxiliary states were incorrectly overwritten.

API

- Resolved an issue where the `GetCurrentMetrics` operation returned the metric `OLDEST_CONTACT_AGE` in milliseconds instead of seconds.

September 2018 Updates

The following updates were released in September 2018:

Updates by category

- General
- API

General

- Improved page loading times for the **User management** page.
- Resolved an issue that sometimes caused issues loading the **Queues** page when there were a large number of quick connects associated with a queue.

API

- Released the UpdateContactAttributes operation for the Connect Customer API.

August 2018 Updates

The following updates were released in August 2018:

Updates by category

- General
- Contact Routing
- Metrics and Reporting

General

- Added a restriction of 64 characters for the password length for the administrator account created during instance creation.
- Resolved an issue where the **Hours of operation** page would not load when no days were selected for a saved Hours of operation configuration.

Contact Routing

- Increased the timeout for whispers to 2 minutes for outbound and queued callbacks so that agents have longer to prepare for the incoming call.

Metrics and Reporting

- Modified how the value for the Contacts abandoned metric so that calls that transfer to callbacks are not counted as abandoned contacts.

July 2018 Updates

The following updates were released in July 2018:

Updates by category

- New Features
- General
- Metrics and Reporting
- Flows

New Features

- Outbound caller ID number
- Add an Amazon Lex bot to Connect Customer
- User Management APIs
- Set up a flow to manage contacts in a queue in Connect Customer

General

- Added an error message when attempting to create an admin user during instance creation using "Administrator" as the user name. The user name Administrator is reserved for internal use, and cannot be used to create a user account in Connect Customer.
- Added support for directory user names that include consecutive dashes.

- Added pagination when displaying security profiles in your instance so that more than 25 security profiles can be displayed.
- Performance optimizations to reduce latency when using the `StartOutboundVoiceContact` API.

Metrics and Reporting

- Resolved an issue in real-time metrics reports where applied filters were not displayed in the settings page when an additional filter was applied. The settings page now displays the applied filters correctly.

Flows

- Added drop-down menus for contact attributes to make it easier to reference attributes in a flow.

June 2018 Updates

The following updates were released in June 2018:

Updates by category

- General
- Telephony and Voice
- Flows
- Metrics and Reporting
- Contact Control Panel (CCP)

General

- Changed the font in the UI to Amazon Ember for better readability.

Telephony and Voice

- Introduced support for using Amazon Lex bots with Connect Customer in the US West (Oregon) Region.

- Fixed a bug that in some cases caused a call to drop when a Loop prompt occurred at the same as a call connecting to an agent.

Flows

- Renamed the **Set queue** block to **Set working queue**.
- Added a **Copy to clipboard** button next to the ARN of a flow so you can easily copy the ARN. Choose **Show additional flow information** under the name of the flow in the designer to display the ARN.
- Added a new **Call phone number** block, which lets you choose the phone number from your instance to display as the caller ID in an outbound whisper flow. For more information, see Outbound caller ID number.
- Released contact attributes for system metrics, including a new **Get metrics** block in flows. For more information, see Use attributes in Connect Customer to route based on number of contacts in a queue.

Metrics and Reporting

- Fixed an issue that caused incorrect rendering of the search field in the filters settings for some historical metrics reports.
- Fixed an issue in downloaded reports where the phone number would be blank instead of listing the phone number for calls that were callbacks.
- Login/Logout reports now support 20,000 rows per report generation, up from 10,000.

Contact Control Panel (CCP)

- Added a mute button to the CCP and a mute function to the Streams API so agents can mute and unmute active calls.

April and May 2018 Updates

The following updates were released in April and May 2018:

Updates by category

- General

- Telephony and Voice
- Flows
- Metrics and Reporting
- Contact Control Panel (CCP)

General

- New Amazon Polly voices are now automatically made available in Connect Customer as soon as they are launched. You can use new voices, such as Matthew and Léa, in your flows.
- Updated password enforcement for Connect Customer user accounts to match requirements for the Connect Customer admin account created during instance creation.
- Resolved an issue that sometimes resulted in the email addresses not being saved when updating an existing user account.

Telephony and Voice

- Service optimizations to reduce latency and improve caller ID for Japanese telephony.
- Customers can now place calls to Jersey and Guernsey in the Channel Islands.
- Added support for keypad numeric input to an Amazon Lex bots when used in an Connect Customer contact flow. For more information, see Connect Customer Now Supports Keypad Input with an Amazon Lex Chatbot.
- Reduced latency for the contact control panel, improving the agent user experience.

Flows

- Resolved an issue with publishing a flow in the case where an **AWS Lambda function block** is used in a flow, and the input type for a parameter was changed from **Send attribute** with a **System** attribute is changed to **Send text**. These flows now publish successfully.
- Agent and customer whispers are now maintained with queued callbacks.
- Attributes now correctly persist with queue callbacks.
- Contact attributes are now maintained when using a **Loop prompt** block in a queue flow.

Metrics and Reporting

- Data for scheduled reports is now delayed by 15 minutes to allow for most recent data to be incorporated in to reports. Previously, in some cases, report data for the final 15 minute period during the scheduled report interval did not get included in scheduled reports. This applies to all report types.
- In metric calculations, the time that an incoming call rings is attributed to idle time if the agent is in idle state before an incoming call.
- The metric **Agent on contact time** now includes time that an agent spent in an auxiliary busy state.
- Published new documentation about metrics.

Contact Control Panel (CCP)

- Added a **Save** button to the settings menu for the CCP when an agent is using a desk phone. The **Save** button saves the deskphone configuration between sessions.
- Agent username is now available as part of agent configuration data in the Connect Customer Streams API.
- Contact attributes are now available when using the streams.js (Streams API) for screenpops after queued callbacks.
- Fixed issue where for some auto-accept calls, the agent continued to hear ringing after accepting and joining the call.

Connect Customer Document history

Change	Description	Date
Interactive responses for agent assist	Amazon Connect Customer agent assist now responds with interactive component s, such as cards and carousels , in the agent workspace. Also reorganized the section for agent assist. For more information, see agent assist.	November 13, 2026
Global Resiliency for quick responses	Quick responses now support replication with Connect Customer Global Resilienc y. You can mirror quick responses and the knowledge base that stores them across your linked Regions. Agents can then use the same quick responses in either Region. For more information, see Global Resiliency for quick responses.	November 13, 2026
Evaluation review data in the Connect Customer data lake	The Connect Customer analytics data lake now includes the `evaluatio n_review_record` table, which stores evaluatio n review requests, who reviewed them, and the review outcome, with sample queries. For more informati	October 28, 2026

	on, see Evaluation review record.	
Email draft auto-save in the agent workspace	Connect Customer now automatically saves an agent's in-progress email as they compose a reply or an outbound email, so agents don't lose their work and can return to the draft later. For more information, see Email draft auto-save in the agent workspace.	October 26, 2026
Show Profile Explorer in the agent workspace	Administrators can now show a Profile Explorer layout in the Customer Profiles app in the agent workspace, instead of the default fixed layout. For more information about showing Profile Explorer in the agent workspace, see Show Profile Explorer in the agent workspace.	October 22, 2026
Release notes updates	Added release notes for recent Connect Customer features, including segment membership events in Customer Profiles, shift bidding, importing evaluation form PDFs with AI, custom metrics APIs, agent-to-agent collaboration, and Live Sync and Touchpoint. For more information, see Release notes for Connect Customer.	October 22, 2026

New layouts for agent workspace	Amazon Connect Customer now offers two layouts for the agent workspace: Modern, which optimizes screen space for different channels, and Classic, which matches the original layout of the agent workspace . For more information about choosing a layout for the agent workspace, see Choose a layout for the agent workspace.	October 21, 2026
Global Resiliency for chat	Added a Global Resiliency for chat topic that groups the chat channel experienc e for Connect Customer Global Resiliency (ACGR). With ACGR and global routing, you can let users resume chat conversations across your linked Regions, carrying context, metadata, and transcripts forward through chat rehydration. For more information, see Global Resiliency for chat and Enable users to resume chat conversations across active Regions.	October 20, 2026

Reorganized step-by-step guides and added prefill for after contact work	Reorganized the section for step-by-step guides for clarity and readability. Also added a page on prefilling guides for after contact work with the contact summary and extracted information from conversational analytics. For more information, see Prefill guides for after contact work using conversational analytics .	October 12, 2026
Updated agent-to-agent collaboration documentation	Reorganized the agent-to-agent collaboration pages, with separate setup pages for Connect Customer AI agents and external AI agents and clearer guidance on collaboration modes, audio streaming , and tracing. Also added a page on how to build an external AI agent server. For more information, see Build an external AI agent server.	October 6, 2026
Preview attachments in the agent workspace	Agents can preview attachments on an email contact, a chat contact, or a case in the agent workspace , without downloading them to their device. For more information, see Preview attachments in the agent workspace.	September 30, 2026

Add contact attributes and reference the contact ID in outbound campaign voice dials	In an outbound campaign flow, you can now attach customer-defined contact attributes to a voice dial from the **Send communication** block, and reference the created contact's ID with `$.OutboundCommunication.Telephony.ContactId` . For more information, see Add contact attributes to voice dials and Reference the dialed contact ID in the campaign flow.	September 29, 2026
Connection information when starting a chat	Added guidance on requesting a chat participant's connection information in the same call that starts the chat, and on starting real-time message streaming from that same call. For more information, see Set up your customer's chat experience in Connect Customer.	September 24, 2026

Service level on the Intraday forecast performance dashboard	The Intraday forecast performance dashboard now includes a new metric, Service level, which appears on the Intraday trailing performan ce overview widget, the Daily projection widget, and a new Service level trend graph. The dashboard template uses a 60-second threshold , which you can change for each widget to match your service level target. For more information, see Intraday forecast performan ce dashboard.	September 23, 2026
Create and configure data tables	Expanded the data tables documentation, including data table expressions, default values, lock levels, CSV import and export, and record-based access control. For more information, see Create and configure data tables.	September 21, 2026

Manager assist is available in preview	Manager assist provides conversational access to your contact center performance data. You can ask operational questions in plain language, request investigations of metric changes, and generate charts and summaries. For more information, see Manager assist.	August 12, 2026
Handling email loops	Added guidance on preventing automated email loops caused by bounce notifications (Non-Delivery Reports) and out-of-office replies. For more information, see Handling email loops.	August 11, 2026

Feature name changes for Amazon Connect Customer	Updated feature names throughout the admin guide to align with the July 2026 naming guidance. The following feature names changed: • Contact Lens is now conversational analytics • Amazon Q in Connect is now agent assist • Forecasting, Capacity Planning, and Scheduling is now forecasting and agent scheduling • Voice+ is now Live Sync For more information, see What is Amazon Connect?.	August 4, 2026
Updated porting requirements for Thailand	Porting local telephone numbers in Thailand now requires a completed form with contact name, contact phone number, and contact email address. For more information, see Thailand in the *Region requirements for ordering and porting phone numbers* topic.	July 30, 2026
Updated porting hours for New Zealand	The window for porting New Zealand phone numbers is now 8 AM to 3 PM NZT. For more information, see New Zealand portability.	July 30, 2026

Connect Customer now supports Vietnamese phone numbers	Customers can now use Vietnamese phone numbers with Connect Customer through our telephony partner. For more informati on, see Vietnam phone number requirements.	July 30, 2026
Postal code time zone requirements	Clarified that when you configure a Journey or campaign to detect a recipient's local time zone using postal code, you must populate your customer profile's `Address.Country` together with `Address.P ostalCode` . This is the only time zone detection method that requires `Country`. For more informati on, see Time zone and Time zone.	July 27, 2026

Optimize Connect Customer audio for Azure Virtual Desktop and Windows 365	You can deliver high-quality voice experiences in Azure Virtual Desktop (AVD) and Windows 365 Virtual Desktop Infrastructure (VDI) environments. Using Microsoft Multimedia Redirection (MMR), Connect Customer redirects audio from the session host to the agent's local device, improving audio quality by reducing network hops. For more information, see Optimize Connect Customer audio for Azure Virtual Desktop and Windows 365.	July 24, 2026

Use the DeleteContactData API to delete PII from a contact	You can delete personally identifiable information (PII) — including customer endpoints, additional email recipients, and the email subject — from a terminated contact and its contact record using the DeleteContactData API reference. The DeleteContactData API sets redacted fields to `null` and updates the `connect:RedactedFields` segment attribute with the categories of PII that you redacted. For more information, see Data model for Connect Customer contact records and Segment attributes.	July 8, 2026
Updated scheduling troubleshooting documentation for shift profile time zones	Updated the scheduling troubleshooting guidance to clarify that shift profiles support any time zone. For more information, see Troubleshooting forecasting & agent scheduling in Connect Customer.	June 15, 2026

Updated outbound campaigns service-linked role policy	Added permissions for new outbound campaigns channels including web notifications, chat messages, WhatsApp through AWS End User Messaging Social, and SMS through Amazon Pinpoint SMS and Voice. Tightened resource scoping with `aws:ResourceAccount` conditions on most actions and removed legacy actions. For more information, see Service-linked role permissions for outbound campaigns.	May 26, 2026

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with `profile:*` permissions for Connect Customer Customer Profiles on resources with the `amazon-connect-` domain prefix, with an explicit deny for `profile:CreateDomain`, `profile:UpdateDomain`, `profile:DeleteDomain`, `profile:CreateEventStream`, `profile:DeleteEventStream`, `profile:DeleteWorkflow`, `profile:DeleteProfileKey`, `profile:UntagResource`, `profile:TagResource`, and `profile:CreateIntegrationWorkflow`. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	May 20, 2026

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with `wisdom:*` permissions for agent assist, with an explicit deny for `wisdom:DeleteAssistant` and `wisdom:DeleteKnowledgeBase`. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	May 18, 2026

Outbound Campaigns now supports multi-contact time zone detection	Connect Customer Outbound Campaigns now detects customer time zones using all phone numbers and addresses on a customer profile, not just the primary contact fields. When a profile's contact information spans multiple time zones, the system delivers messages only during hours that fall within the configured window across every detected time zone, and skips profiles when no overlap exists. For example, if a customer has a mobile number in Eastern time and a business number in Pacific time with a 9 AM–5 PM delivery window, messages are sent only between 12–5 PM ET when both time zones overlap. This capability is available in all AWS Regions where Connect Customer Outbound Campaigns is offered at no additional cost.	May 18, 2026

Default Step-by-Step Guides now available for After Contact Work	Connect Customer now supports default Step-by-Step Guides for After Contact Work (ACW), enabling administrators to automatically launch a guide when an agent enters the ACW state. This eliminates the need for agents to manually navigate to the correct application during wrap-up, standardizing post-contact workflows such as logging disposition codes, updating cases, and completing follow-up actions. Organizations can improve consistency, reduce errors, and accelerate agent productivity across contact center operations. This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (London), and AWS GovCloud (US-West). For more information, see Enable smart default guides for ACW.	May 18, 2026

Cases now supports customer profile identity resolution	Connect Customer Cases now automatically reassociates cases when duplicate customer profiles are merged through Identity Resolution in Customer Profiles. When the same customer has multiple profiles—such as when they reach out through different channels or provide different contact details—Identity Resolution detects and merges those duplicates, and Cases brings all associated cases together under the unified profile. Agents see a complete case history for each customer without searching across profiles or piecing together history manually. This feature is available in the following AWS Regions: US East (N. Virginia), US West (Oregon), Canada (Central), Europe (Frankfurt), Europe (London), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), and Africa (Cape Town).	May 18, 2026

Provide agent coaching	Supervisors and managers can now provide coaching to agents directly within Connect Customer. For more information, see Provide agent coaching.	March 3, 2026
Single Instance or Multiple Instances	Added guidance on single vs. multiple Amazon Connect instance architecture decision-making, including pros/cons and use case recommendations, see Single Instance or Multiple Instances.	February 5, 2026
Amazon Connect now enables per-channel auto-accept and After Contact Work (ACW) timeouts	You can now configure agents with auto-accept and after contact work timeout settings for chat, tasks, emails, and callbacks to optimize how agents spend their time. Previously, these settings were available only for inbound voice contacts. To learn more, see Configure agent settings.	February 5, 2026
Audio Enhancement for agents	Connect Customer now offers Audio Enhancement to improve audio quality on the agent's side by reducing background noise and isolating the agent's voice during calls. For more information, see Enable Audio Enhancement.	February 4, 2026

Recurring events for operating hours	Connect Customer now makes it easier to manage contact center operating hours using recurring events with a visual calendar that provides at-a-glance visibility. For more information, see Set overrides for extended, reduced, and holiday hours.	January 12, 2026
WhatsApp channel for outbound campaigns	Connect Customer now supports WhatsApp as a channel for outbound campaigns, enabling businesses to reach customers through WhatsApp messaging with template-based communications. For more information, see Create outbound campaigns.	November 30, 2025
Using Views to create persona-based Workspace pages	Connect Customer Views and Guides UI changes to improve the View resource and power persona-based Workspace s. For more information, see Using Views to create persona-based Workspace pages	November 30, 2025
Use Connect Customer agentic assistance	Connect Customer provides AI agents that help customer service representatives solve live interactions with end customers. For more informati on, see Use Connect Customer agentic assistance.	November 30, 2025

Tag based access control for Connect Customer performance evaluations	Connect Customer now supports tag based access control for Connect Customer performance evaluations. For more information, see Set up tag-based-access controls on performance evaluations	November 30, 2025
Predictive Insights (Preview)	Added comprehensive documentation for the new Predictive Insights (Preview) feature, including detailed information about AI-powered recommendation capabilities, implementation steps, and integration with Connect flows and AI agents. Updated the object type mapping section with new schemas for Web Analytics, Item, and Device standard objects to support the Predictive Insights functionality. For more information, see Predictive Insights (Preview).	November 30, 2025
Performance evaluations of self-service interactions	You can now automatically evaluate the quality of self-service interactions using custom criteria, conversational analytics insights, and contact metrics. For more information, see Performance evaluations of self-service interactions.	November 30, 2025

Get stored content flow block	Introduces a new flow block called Get stored content. For more information, see Flow block in Connect Customer: Get stored content	November 30, 2025
Enable message streaming for AI-powered chat	Connect Customer supports message streaming for AI-powered chat interactions. For more information, see Enable message streaming for AI-powered chat.	November 30, 2025
Enable in-flight sensitive data redaction and message processing	Connect Customer supports message processing that intercepts and modifies chat messages before they reach any participant. For more information, see Enable in-flight sensitive data redaction and message processing.	November 30, 2025
Custom metrics	Added three new tables documenting metric level filters, grouping keys, and top-level filters used in Connect Customer contact center analytics, including detailed schemas for Contact and Agent metric categorie s. For more information, see Metric primitives definitions for Connect Customer.	November 30, 2025

Create a multi-step and multi-channel journey	Connect Customer supports creating a multi-step and multi-channel journey. For more information, see https://docs.aws.amazon.com/connect/latest/adminguide/create-a-multi-step-and-multi-channel-journey.html lCreate a multi-step and multi-channel journey	November 30, 2025
Connect Model Context Protocol support	Connect Customer now supports Model Context Protocol (MCP), enabling AI agents for both end-customer self-service and employee assistance to use standardized tools for retrieving information and completing actions. For more information, see Connect Model Context Protocol support.	November 30, 2025
Agent-initiated flows	Agents can now initiate flows during active chat sessions to collect data, process payments, update profiles, and initiate automated processes while maintaining direct customer interaction. For more information, see Enable agent-initiated flows during active chat sessions.	November 30, 2025

Added support for third-party speech providers	Connect Customer now supports third-party speech-to-text (STT) and text-to-speech (TTS) providers like Deepgram and ElevenLabs. This allows contact centers to use external speech services directly within Connect Customer through a simple console configuration—no coding required. For more information, see Configure third-party speech providers.	November 30, 2025
Added support for testing and simulation	Connect Customer supports testing and simulation call simulation capabilities to let customers to simulate their contact center experiences. For more information, see Connect Customer call simulation.	November 30, 2025
Added AI agent performance metrics	Added the **AI Agent performance dashboard** for viewing AI Agent performance, and get insights across AI Agents and over time. For more information, see AI Agent performance dashboard.	November 30, 2025

Updated AmazonConnectSynchronizationServiceRolePolicy service-linked role managed policy	Added batch and import actions for Managed Synchronization. For more details on the changes, see Connect Customer updates to AWS managed policies.	November 21, 2025
Customize service level calculations	You can customize service level calculations to your specific needs by selecting if callbacks, abandons, or transfers are included in service level calculations. You can define time threshold s for when a contact is considered to meet service level standards and select which contact outcomes to include in the calculation. For more information, see Create custom calculations of service level metrics.	November 18, 2025
Added new action to AmazonConnectServiceLinkedRolePolicy	Updated the service-linked role managed policy with an action for agent assist. For more information, see Connect Customer updates to AWS managed policies.	November 18, 2025

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	The Connect Customer service-linked role (SLR) now includes AWS End User Messaging Social permissions that allow listing WhatsApp business accounts. Additionally, the SLR enables listing WhatsApp message templates and retrieving details about specific templates from business accounts that are tagged `AmazonConnectEnabled : True` . For a description of the additional actions, see Connect Customer updates to AWS managed policies.	October 27, 2025
Configure thresholds for schedule adherence	You can configure thresholds for schedule adherence, giving you more flexibility in how you track agent performance. You can define thresholds for how early or late agents start or end their shifts, as well as for individual activities. For example, agents can start their shift 5 minutes early and end 10 minutes late, or end their breaks 3 minutes late, without negatively impacting their adherence scores. For more information, see Schedule Adherence for agent productivity.	October 24, 2025

Preview dialing mode for outbound campaigns	Outbound campaigns support preview dialing, allowing agents to review customer information before placing calls. Campaign managers can configure review time limits and enable contact removal. New analytics dashboards provide visibility into agent behavior and campaign performance. For more information, see Outbound campaigns.	October 22, 2025
Granular permissions for conversation recordings and transcripts	You can use granular permissions to manage access to conversation recordings and transcripts in the Connect Customer admin website. You can separately configure access to recordings and transcripts, allowing users to listen to calls while preventin g unauthorized copying of transcripts. Connect Customer provides flexible download controls, enabling users to download redacted recording s while restricting downloads of unredacted versions. For more information, see List of security profile permissions.	October 22, 2025

Set up agent schedule adherence notifications	You can set up agent schedule adherence notifications to make it easier for you to proactively identify when agents aren't adhering to their scheduled activitie s. You can define rules to automatically send email or text notifications (using EventBridge) to superviso rs when agents exceed adherence thresholds. For example, if agent adherence drops below 85% in a trailing 15-minute window, superviso rs can receive an email alert. For more information, see Set up schedule adherence notifications.	October 21, 2025
Search for related items across all cases within a domain	You can use the SearchAll RelatedItems API to search for related items across all cases within a domain. This is a global search operation that returns related items from multiple cases, unlike the case-specific SearchRel atedItems API.	October 3, 2025

Generative AI-powered email conversation overviews and suggested responses	Connect Customer provides agents with generative AI-powered email conversat ion overviews, suggested actions, and responses. This enables agents to handle emails more efficiently, so customers receive faster, more consistent support. For more information, see Use generative AI-powered email conversation overviews and suggested responses. Also see the CreateSession API for updates to support this feature, updates to data types such as DataDetails, and new data types such as EmailGene rativeAnswerAIAgentConfigur ation.	October 2, 2025
Connect Customer makes it easier to get customer input on outbound calls	Connect Customer supports Get customer input and Store customer input flow blocks for outbound voice whisper flows. The **Get customer input block** allows a prompt to be played to a customer on an outbound call after they answer the call but before they are connected with an agent, and the customer's response can be collected through either DTMF input or by using an Amazon Lex V2 bot.	October 2, 2025

Agent time-off balance data in the Connect Customer data lake	Agent time-off balance data is available in the Connect Customer data lake, making it easier for you to generate reports and insights from this data. You access the latest and historical agent time-off balances across different time-off categories (paid time-off, sick leave, leave of absence) in the data lake. You can also view a chronological list of all transactions that impacted the balance. For more information, see Staff timeoff balance changes.	October 1, 2025
Agent screen recording for ChromeOS devices	You can use screen recording for agents using ChromeOS devices. For more informati on, see Amazon Connect Client Application.	October 1, 2025
Added two APIs	Use these APIs for custom contact routing and manual contact assignment: AssociateContactWithUser and ListRoutingProfileManualAssignmentQueues.	September 25, 2025

Dashboards support filtering and comparing metrics by any time range	Connect Customer dashboards support selecting and comparing any time ranges. This enables you to focus on specific, relevant data and perform in-depth analysis up to a maximum of 35 days in the last 3 months. Additionally, you can select Week to Date and Month to Date time ranges. For more information, see Dashboards in Connect Customer for getting contact center performance data.	September 23, 2025
Customize service level calculations	You can customize service level calculations to your specific needs by selecting if callbacks, abandons, or transfers are included in service level calculations. You can define time thresholds for when a contact is considered to meet service level standards and select which contact outcomes to include in the calculation. For more information, see Create custom calculations of service level metrics.	September 22, 2025
Connect Customer conversational analytics sensitive data redaction in 7 additional languages	French (France, Canada), Portuguese (Portugal, Brazil), Italian, German, and Spanish (Spain). For more information, see AI features.	September 22, 2025

Flow designer analytics mode	You can use analytics in the drag-and-drop flows designer. This enables you to make data-driven decisions when optimizing your flows. You can view aggregate traffic through each completed and in-progress step in the flow, allowing you to identify behavioral patterns of your customers or pinpoint where errors are being encounter ed. For more information, see Monitor flow performance with metrics in flow designer analytics mode.	September 16, 2025
Use contact segment attributes	For scenarios where informati on for a contact varies between transfers or conferences, such as business unit names that might change as a contact moves between departments, you use contact segment attributes. This enables you to centrally manage the information with predetermined values. For more information, see Contacts, contact chains, and contact attributes and Use contact segment attributes.	September 9, 2025
New callback metrics	For a list of new metrics, see September 2025 Updates.	September 9, 2025

New detailed disconnect reasons for improved call troubleshooting	Connect Customer offers expanded disconnect reasons to help you better understand why outbound calls failed to connect in your contact center. These enhanced reasons are based on standard telecom error codes that provide deeper call insights and enable faster troubleshooting. For more information, see DisconnectReason under ContactTraceRecord.	September 8, 2025
Use agent hierarchy filters to search for contacts	You can search for contacts by using agent hierarchy filters on the **Contact search** page in the Connect Customer admin website You can drill-down into your hierarchy to review contacts handled by specific contact center sites, departments or teams, for assessing contact quality or agent performance. For more information, see Search for completed and in-progress contacts in Connect Customer.	September 4, 2025

Manual work item assignment for agents	Agents can manually prioritize the next important task, email, or chat in a queue. Supervisors and managers can enable manual assignment by updating agent configuration in routing and security profiles. For more information, see Access the Worklist app in the Amazon Connect agent workspace.	September 2, 2025
conversational analytics with external voice expanded to additional AWS Regions	conversational analytics with external voice is now supported in Asia Pacific (Tokyo), Asia Pacific (Sydney), Canada (Central), Europe (Frankfurt), and Europe (London). For more information, see Integrate Connect Customer conversational analytics with external voice systems and conversational analytics availability by Region.	August 25, 2025
Updated requirements for ordering and porting phone numbers in Chile	Updated the identification requirements for ordering and porting phone numbers in Chile. For more information, see Region requirements for ordering and porting phone numbers in Amazon Connect.	August 22, 2025

Multi-user web, in-app, and video calling	Connect Customer supports multi-user web, in-app, and video calling, allowing multiple users to join the same session with an agent through a web browser or mobile application. For more information, see the Enable multi-user in-app, web, and video calling.	August 18, 2025
Recurring activities in agent schedules	Connect Customer supports recurring activities in agent schedules, allowing you to add repeating events such as daily stand-ups or weekly team meetings as automatic series in agent schedules . For more information, see Forecasting, capacity planning, and scheduling in Connect Customer.	August 15, 2025

Connect Customer communications widget supports task and email forms for websites and applications	Connect Customer provides out-of-the-box embedding of tasks and emails into websites and applications using the contact form option in the communications widget. Supervisors can configure customer-facing forms using the drag and drop editor and generate code snippets for website integration. For more information, see Add the Connect widget to your website to accept chat, task, email, and web calling contacts.	August 15, 2025
Connect Customer Outbound Campaigns supports multi-profile campaigns and enhanced phone number retry sequencing	Connect Customer Outbound Campaigns supports account-based campaigns and enhanced phone number retry sequencing. You can target multiple profiles within the same campaign and define prioritized contact sequences across multiple phone numbers. For more information, see Outbound Campaigns.	August 11, 2025
Connect Customer launches GetContactMetrics API for real-time position in queue	You can retrieve real-time queue position data through the GetContactMetrics API. For more information, see the GetContactMetrics API and the Position in queue metric.	August 8, 2025

Removed Upcoming changes topic	The changes listed in the topic have been launched.	July 31, 2025
Enhancements to audio treatment while customers wait in queue	You can configure flows to execute logic such as routing priority changes while continuing to play audio to customers waiting in queue. For more information, see the Loop prompts block.	July 31, 2025
Added topic on troubleshooting AI agents self-service issues	For more information, see Troubleshoot AI agents self-service issues.	July 31, 2025
Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles permissions. Also, added support for profile UploadJobs on all amazon-connect-* resources, and not just "upload-jobs" resources . For a description of the additional actions, see Connect Customer updates to AWS managed policies.	July 25, 2025

Enhanced third-party application support in agent workspace	Connect Customer allows businesses to introduce new actions and workflows into the agent workspace , powered by third-party applications running in the background. This enhancement enables agents to complete more advanced workflows within a single-pane-of-glass experience, improving their productivity and customer satisfaction. For more information, see Third-party applications in agent workspace.	July 25, 2025
Apply Automatic fail to a section or entire evaluation form	You can configure an evaluation form so answering 0 to a specific question assigns a score of 0 to the section, the subsection, or the entire evaluation form. Previously this option assigned a score of 0 to the entire form. For more information, see Step 5: Assign scores and ranges to answers.	July 24, 2025

Forecast editing UI	You can select a forecast, make edits—such as increasing contact volume by a percentage or setting exact values—across specific date ranges, queues, and channels, and then preview and apply changes within the forecasting UI. For more information, see Edit a forecast.	July 23, 2025
New disconnect reason	Added CUSTOMER_NEVER_ARRIVED as a new DisconnectReason to the contact record. For more information, see ContactTraceRecord.	July 22, 2025
AmazonConnectServiceLinkedRolePolicy – Added actions for Amazon Polly	Updated the service-linked role managed policy with Amazon Polly permissions. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	July 15, 2025

Analytics dashboard in agent workspace	Connect Customer now provides agents with an out-of-box analytics dashboard in the agent workspace. The dashboard displays individual performance metrics and queue status information to help agents make data-driven decisions. For more information, see Performance dashboard in the agent workspace. A new widget, **Agent status drill down**, has been added to the **Queue and agent performance** dashboard. For more information, see Agent status drill down. A new metric, **Agents on contact**, is now available. For more information, see Agents on contact.	July 14, 2025

Parallel AWS Lambda execution in flows	You can set up the parallel execution of AWS Lambda functions in flows, enabling faster and more seamless customer experiences. You can integrate with third-party or homegrown systems such as CRMs by using Lambda to automate tasks like reading or updating customer records. You can now execute multiple Lambda functions concurrently or continue progressing the flow and run additional actions while a Lambda runs. For more information, see Flow block in Connect Customer: AWS Lambda function.	July 7, 2025
Enhanced flow designer UI editing features	Connect Customer provides new editing and accessibility enhancements for the drag-and-drop flow designer making it easier to build customer service experiences. These enhancements include keyboard navigation, auto arranging of blocks, screen reader support, and improved support for high zoom on browsers. For more information, see see Release notes.	July 3, 2025

Use customizable work labels for agent scheduling	You can use customizable work labels for agent scheduling. Customizable work labels make it easier for you to identify the type of work an agent is scheduled for. You can create work activities with custom labels and assign them to agent schedules by day of the week. For more information, see Release notes.	June 30, 2025
Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles permissions. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	June 30, 2025
Segment creation from imported files in Customer Profiles	Connect Customer Customer Profiles enables you to create customer segments from imported CSV files. This feature allows you to upload predefined customer lists and use them for targeted engagement strategies. For more information, see Create segments from imported files.	June 30, 2025

Ingest agent activities from third-party applications to evaluate agent performance	You can integrate agent activities from third-par ty applications as Connect Customer tasks. Managers can then evaluate these activitie s alongside work completed in Connect Customer. This provides managers with a unified application for quality management. For more information, see Ingest agent activities from third-party applications to evaluate agent performance.	June 30, 2025

Improved UI for No-code builder	The Connect Customer UI builder, used to create Views that power Step-by-Step Guides, has an updated user interface. The improved UI is designed to reduce the complexity of building Views used in guided workflows. It makes the process of passing dynamic data onto Views and storing data entered on a view by a user more intuitive and consistent with Connect Customer workflow orchestration. In addition, the UI builder contains a consistent look and feel with the rest of Connect Customer by using Cloudscape Design System components. For more information, see No-code UI builder, especially the subtopic Configure dynamic fields.	June 30, 2025

Enhanced audio treatment for customers in queue	Connect Customer enables you to run flow logic while maintaining continuous audio playback for customers in queue. This enhancement allows you to modify routing decisions without interrupting the customer's listening experience. For more information, see How the Loop prompts interrupt option works.	June 30, 2025
Create instance replication between Asia Pacific (Tokyo) and Asia Pacific (Osaka)	You can maintain a synchronized instance in Asia Pacific (Osaka) that mirrors the channel configurations and service quotas of your Asia Pacific (Tokyo) environment. For more information, see Release notes.	June 30, 2025
Added chat metrics, and new fields to the Contacts record in the Connect Customer data lake	For a list of new metrics, see Release notes.	June 30, 2025

New quota: Maximum contacts in an agent queue per instance	A new quota has been introduced for the maximum number of contacts that can be queued at once in a single agent queue. The quota is set to 10 contacts per queue and applies to every agent queue in your instance. (The default was already 10 contacts; we're surfacing the quota so it's easier for you to change.) This is a resource-level quota and can be increased upon request. For more informati on, see Connect Customer service quotas.	June 12, 2025
Updated AmazonCon nectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional Connect Customer Customer Profiles permissio ns. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	June 9, 2025
Updates to email quotas	The **Email domains per instance quota** has been increased from 5 custom email domains to 100. For a list of additional updates, see Updates to email quotas.	June 3, 2025

Enhanced hold duration tracking for multiparty calls	You can track durations of holds initiated by individual agents in multiparty calling scenarios by using the new Agent Initiated Hold Duration field on the contact record. Use this field to gain insights into hold patterns at the individual agent level during customer interactions. For more information, see AgentInitiatedHoldDuration in Data model for Connect Customer contact records	June 3, 2025
End of support notice for Connect Customer Voice ID	End of support notice: On May 20, 2026, AWS will end support for Amazon Connect Customer Voice ID. After May 20, 2026, you will no longer be able to access Voice ID on the Amazon Connect Customer console, access Voice ID features on the Connect Customer admin website or Contact Control Panel, or access Voice ID resources. For more informati on, visit Amazon Connect Customer Voice ID end of support.	May 20, 2025

Audio optimization for Omnissa cloud desktops	You can deliver high-quality voice experiences in Omnissa Virtual Desktop Infrastru cture (VDI) environments. Connect Customer automatic ally optimizes audio by redirecting media from your agent's local desktop to Connect Customer, simplifyi ng the agent experience and improving audio quality by reducing network hops. Agents can simply log into their Omnissa remote desktop application (that is, Omnissa Horizon) and start accepting calls using your custom agent user interface. For more information, see Optimize Connect Customer audio for Omnissa cloud desktops.	May 8, 2025
Agent hierarchy groups datatype in data lake	You can use an agent hierarchy groups table to incorporate organizat ional structure data into your custom analytics and reporting workflows. You can join this with existing tables such as Users to retrieve complete hierarchi cal information about your agents and their team assignments. For more information, see Agent Hierarchy Groups.	May 7, 2025

Additional AWS Regions for WhatsApp Business messaging and SMS	Connect Customer supports WhatsApp Business messaging and SMS in additional Regions. For more information, see Availability of Amazon Connect features by Region.	May 6, 2025
Access conversational analytics real-time dashboards in AWS GovCloud (US) Region	You can access Connect Customer conversational analytics real-time queue and agent performance dashboards, and flows performance dashboards in AWS GovCloud (US) Region, a secure cloud environment designed for government and public sector customers. For more information, see conversational analytics features by Region.	May 6, 2025

Enhanced contact information in DescribeContact API	The DescribeContact API provides richer contact information, enabling more efficient contact center operations. The enhanced API response includes detailed insights such as disconnec t reasons, recording status, after-contact work time, and custom contact attributes in a single call. This allows programmatic handling of contact scenarios, such as automatically re-queuing disconnected chats based on specific disconnect reasons, helping maintain conversation continuity. For more informati on, see the DescribeContact API documentation.	May 1, 2025
Administrator access for agent schedules	You can give certain users access to all published agent schedules without being added as a supervisor to every staff group. See the **Access to all published schedules** option on the **Staff rules** tab of the **Scheduling** page. For more information, see Create staff rules for scheduling.	May 1, 2025

View real-time adherence on the Queue and agent performance dashboard	You can view real-time agent adherence displayed in the **Agent adherence** widget on the **Queue and agent performance** dashboard . Use the widget to apply filters on adherence status, duration, and percentage; sort by duration or percentage; and apply conditional formatting within the agent adherence widget on the queue and agent performance dashboard. For more information, see Schedule Adherence.	April 30, 2025
Remove agent schedules in bulk	You can remove agent schedules in bulk, making day-to-day management of agent schedules more efficient. With this launch, you can now remove schedules for up to 400 agents for a single day, or up to 30 days for a single agent. For more information, see Remove agent shifts.	April 30, 2025

New metrics and dashboard drill downs for outbound campaigns	Outbound campaigns provides enhanced reporting capabilities for outbound campaigns, including five new metrics and detailed dashboard drill downs. conversational analytics dashboards show campaign engagement metrics, execution-level performan ce data, and delivery issue details. Admins can monitor campaign progress in real-time and troubleshoot delivery issues with granular insights. These metrics are accessible through the GetMetricDataV2 API and Zero-ETL data lake for custom reporting. For more informati on, see Outbound campaign metrics and reporting.	April 30, 2025
Combined historical and real-time metrics definitions into one topic	Combined two topics and applied a new format to the definitions. For more information, see Metrics definitions.	April 21, 2025

Enforce granular access control by using agent hierarchies	You can enforce granular access control based on a specific agent hierarchy. For example, you can configure hierarchy groups and levels for a team, and only users assigned to a hierarchy group within that team will be able to see metrics for those agents. For more informati on, see Apply hierarchy-based access control to dashboard s and reports in Connect Customer.	April 18, 2025
Track and meet service level agreements (SLAs) on cases	Connect Customer Cases provides capabilities to help contact centers track and meet service level agreement s (SLAs) on cases. Using the Connect Customer admin website, admins can set up SLA rules based on case attributes and configure target statuses and resolution times without having to write code. Agents and managers can view the real-time SLA status directly in their case list view to prioritize urgent work, while admins can create rules to automatically escalate cases when SLAs are not met. For more information, see How SLAs work in Connect Customer Cases.	April 17, 2025

Enable or disable conversational analytics sentiment analysis	You can enable or disable conversational analytics sentiment analysis. This provides organizations with control over sentiment analysis, particularly for those needing to meet compliance obligations, while maintaining access to other conversational analytics conversational analytics capabilities including transcripts, generative AI summaries, and other conversational insights. For more information, see the Disable sentiment analysis.	March 31, 2025
Customize the wait time for DTMF input	You can customize the number of seconds that Connect Customer waits between a caller's keypad button presses so you can optimize user inputs in your IVR systems. You can adjust the waiting period from 1 to 20 seconds; previously it was fixed at 5 seconds. For more information, see the Store customer input block.	March 31, 2025

Added 34 languages to Connect Customer conversational analytics conversational analytics	Connect Customer conversational analytics added support for conversational analytics in 34 new languages including Afrikaans, Arabic (Modern Standard), Bengali, Bosnian, Bulgarian, Chinese (Cantonese), Croatian, Czech, Estonian, Farsi, Galician, Greek, Hebrew, Hungarian, Kannada, Latvian, Lithuanian, Macedonian, Malayalam, Marathi, Romanian, Russian, Serbian, Sinhala, Slovak, Slovenian, Somali, Sundanese, Telugu, Thai, Turkish, Ukrainian, Vietnamese, and Zulu. For more information, see the Connect Customer conversational analytics language table.	March 31, 2025

View agents' adherence to their work schedules in a calendar view	You can view adherence breaches by agent and day, for up to 90 days in the past, alongside their shifts. You can filter out minimal adherence breaches. This visualization allows you to immediately spot adherence breaches across your team, prioritiz e the most critical incidents , compare with past agent behavior, and take steps to address concerns with the agent. For more informati on, see How supervisors view published schedules using the Connect Customer admin website.	March 28, 2025
Process to enable outbound campaigns for the purpose of event-driven mass notificat ions	Connect Customer outbound campaigns supports event-dri ven mass notifications, such as severe weather warnings, evacuation notices, disaster response communications, or utility disruptions impacting many thousands of customers with prior authorization and approval. Additional charges might apply based on your location and anticipated notification volumes. For more information, see Set up Connect Customer outbound campaigns.	March 26, 2025

Track agent acknowledgements of performance evaluations	You can capture and review agent acknowledgements of performance evaluations within conversational analytics. This helps you make sure that agents have reviewed evaluation feedback and understand performance expectations. For more information, see Acknowledge performance evaluations.	March 21, 2025
Increased limit on number of routing criteria updates per queued contact	Previously, routing criteria could be updated only up to three times while a contact was in queue. You can now update the routing criteria on a queued contact an unlimited number of times. However, if you update the routing criteria more than 3 times on a queued contact, only the latest 3 updates will be stored on the contact record and used to calculate metrics such as Step Expired % and Step Contacts Queued. To learn more, see RoutingCriteria in the contact record documentation.	March 17, 2025

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional permissions to send messages in agent assist. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	March 14, 2025
Dynamically update questions on an evaluation form	You can create dynamic evaluation forms that automatically show or hide questions based on responses to previous questions, tailoring each evaluation to specific customer interaction scenarios. For example, when a manager answers "Yes" to the form question *Did the customer try to make a purchase on the call?*, the form automatically presents a follow-up question: *Did the agent read the sales disclosure?* For more information, see Step 4: Conditionally enable questions in Create an evaluation form.	March 6, 2025
Updates to Connect Customer Analytics data lake	Updated tables for Contact records, Contact Evaluation records, Lex, and Outbound Campaigns. For tables of the latest fields, see Data type definitions for Connect Customer Analytics data lake.	February 28, 2025

Allow agents to exchange shifts with each other	Agents can initiate shift trades directly with each other, allowing them to manage unexpected life events without using time off. Managers can automate some approvals while ensuring others are approved manually. For more information, see Create shift trade groups and Set up shift exchange in Connect Customer.	February 25, 2025
Agent performance evaluations dashboard	You can use the agent performance evaluation dashboard to view aggregations of agent performance, and insights across cohorts of agents over time. For more information, see Agent performance evaluations dashboard.	February 10, 2025
Agent evaluation metrics	For more information, see Evaluation metrics.	February 10, 2025
Target multiple agent proficiencies in a single routing step	You can target up to four different combinations of agent proficiencies per routing step. By using up to three OR conditions, routing tries to match a contact with four different types of agents which increases the possibility of finding a suitable match. For more information, see How routing criteria works.	February 7, 2025

Configure which states an agent can be in when adhering to their schedule	You can choose which states an agent can be in when adhering to their schedule, making it easier for you to customize adherence tracking to match your unique operational needs. You can define custom mappings between agent statuses and schedule activities. For more information, see Create daily activities for an agent's shift in your contact center.	February 5, 2025
Create conditionally required fields in Connect Customer Cases	You can create conditionally required fields to streamlin e case field population for agents and reduce data entry errors. You can configure case templates that prompt agents to enter relevant informati on in specific situations. For more information, see Add case field conditions to a case template in Amazon Connect.	February 4, 2025

Automatically email agents about completed performance evaluations	You can send automatic email notifications to agents when their contacts are evaluated, so they can review the evaluations and improve their performance. Managers can create rules to send emails based on specific evaluation criteria. For more information, see Create conversational analytics rules that send email notifications.	February 3, 2025
Use Agent Workspace audio optimization for Citrix and Amazon WorkSpaces virtual desktops	You can use Connect Customer Agent Workspace to redirect audio from Citrix and Amazon WorkSpaces Virtual Desktop Infrastructure (VDI) environments to an agent's local device. Audio redirection improves voice quality and reduces latency for voice calls handled on virtual desktops. It provides a better experience for both end customers and agents. For more information, see Use Agent Workspace to optimize audio for Citrix and Amazon WorkSpaces cloud desktops.	January 21, 2025

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer agent assist permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	January 17, 2025
Screen recording available in AWS GovCloud (US-West)	Government and public sector customer can use the screen recording capabilities in the AWS GovCloud (US-West) Region. For more information about screen recording, see Set up and review agent screen recordings.	January 17, 2025
Public preview of persistent agent connections for faster call handling	You can maintain an open communication channel between your agents and Connect Customer to help reduce the time it takes to establish a connection with a customer. Contact center administrators can configure an agent's user profile to maintain a persistent connection after a conversation ends. This allows for subsequent calls to connect faster. For more information, see, see Enable persistent connection for Connect Customer agents.	January 17, 2025

Real-time dashboard for agent activity	You can monitor real-time agent activity and take immediate actions such as listen-in to a contact, barge (take over) a contact, or change an agent state in a few clicks from a single interface. For more informati on, see Queue and agent performance dashboard.	January 14, 2025
Dashboards provide configura ble groupings and filters	You can define widget level filters and groupings, re-order and re-size columns, and delete or add new metrics. With these dashboards, you can view and compare real-time and historical aggregate d performance, trends, and insights using custom-defined time periods (for example, week over week), summary charts, time-series chart. For more information, see Customize your dashboard.	January 14, 2025

Evaluate agent performance for email contacts	You can evaluate agent performance for email contacts. Managers can assess agent performance across contact channels (voice, chat, email, and tasks) in a single easy-to-use web interface, and get aggregated insights across cohorts of agents over time. Managers can evaluate agent performance by reviewing email threads and additional details of the email interaction (for example, handle time) in the Connect Customer admin website. For more informati on, see Evaluate contact center agent performance in Connect Customer.	January 10, 2025
Route to a specific range of agent proficiencies	Connect Customer allows you to target a range of agent proficiency levels, such as from levels 1 to 3 for French. You can ensure each contact is matched to an agent with the right skill level to handle it, resulting in reduced contact transfers and lower handle times. For more information, see Frequently asked questions on routing proficiencies.	December 20, 2024

Exclude certain proficiencies during routing	Connect Customer allows you to exclude certain proficiencies from consideration when using routing criteria for routing. You can use this to exclude or reserve niche skills. For more information, see How routing criteria works.	December 20, 2024
Delete queues and routing profiles by using the Connect Customer admin website	You can use the Connect Customer admin website to permanently delete queues and routing profiles. For more information, see Delete a queue and Delete a routing profile.	December 20, 2024
agent assist supports 64 languages for agent assistance capabilities	Customer service agents can chat with Q for assistance in their native language and Q will provide answers, knowledge article links, and recommended step-by-step guides in said language. New languages supported include: Chinese, French, French (Canadian), Italian, Japanese, Korean, Malay, Portuguese, Spanish, Swedish, and Tagalog. For the full list of supported languages, see AI features.	December 19, 2024

Multi-party chat	You can enable multiparty chat for your contact center, allowing up to 4 additiona l agents to join an ongoing chat conversation with a customer. This makes it easier to collaborate and resolve customer issues quickly. For example, agents can add a supervisor or subject matter expert to the chat, ensuring customers receive accurate and timely support. For more information, see Host multi-party chats.	December 18, 2024
Authenticate customers during a chat	You can use built-in capabilit ies for customer authentic ation within chat, making it easier to verify customer identity and deliver personali zed experiences. The Authenticate Customer flow block provides the flexibili ty to prompt your customers to sign in after they start a chat, making it simple to authenticate. For example, unauthenticated customers engaged with a chat bot can be prompted to sign in before being routed to an agent. For more information, see Set up customer authentication.	December 18, 2024

Agent schedule data in Analytics data lake	The Analytics data lake now includes published schedules data, which allows you to generate reports and insights. From agent schedules data in the Analytics data lake, you can automate key operation al use cases such as generatin g reports for paid and unpaid hours for payroll, generatin g summarized views of how many agents are scheduled to work and how many have time-off in a given time period. For more informati on, see Scheduling data in Analytics data lake in Connect Customer.	December 17, 2024

Configure holidays and other overrides to hours of operation	You can set up variations to standard day-of-the-week operating hours in advance. You can configure overrides by using the Connect Customer admin website or APIs. During daily contact handling, Connect Customer automatically checks for overrides and provides your customers with an appropriate flow path, such as offering a callback when the call center is closed. After an override period passes, your call center automatically reverts to standard hours of operation. For more information, see Set overrides for extended, reduced, and holiday hours. For a list of new APIs associated with this release, see Hours of operation actions in the *Connect Customer API Reference*.	December 12, 2024

Connect Customer supports push notifications for mobile chat on iOS and Android devices	Connect Customer supports push notifications for mobile chat on iOS and Android devices, improving the customer experience and enabling faster issue resolution. For more information, see Enable push notifications for mobile chat.	December 11, 2024
Updated `AmazonConnectServiceLinkedRolePolicy` service-linked role managed policy	Updated the service-linked role managed policy with an additional permission to support push notifications. The Amazon Pinpoint `mobiletargeting:SendMessages` action allows Connect Customer to send push notifications. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	December 10, 2024
Track the originating agent when they create a task manually	You can track the originating agent when they create a task manually from the agent workspace or Contact Control Panel (CCP). This capability allows supervisors to run analytics on how many tasks are created by an individual agent. For more information, see Track who created a task.	December 6, 2024

Provide callbacks for customers who use chat, tasks, and email	You can enable customers to request callbacks from chats, tasks, and email, in addition to voice calls. For example, if a customer reaches out after hours when no agent is available, they can request a callback by sending a chat message or completing a webform request that uses tasks. Callbacks allow your customers to get a call from an available agent during normal business hours, without requiring them to stay on the line. For more information, see Set up queued callbacks.	December 6, 2024
Configure tasks to expire up to 30 days from creation	You can set task durations to expire up to 30 days from creation, with a default of 7 days. For example, you can specify one issue to expire at 2 hours from creation for urgent escalations, and specify another issue for mandatory training to stay active for 30 days. For more information, see Create task templates.	December 6, 2024

Added important note about video and screen sharing behavior when on hold	During a video call or screen sharing session, agents are able to see the customer's video or screen share even when the customer is on hold. It is the customer's responsib ility to handle personally identifiable information (PII) accordingly. If you want to change this behavior, you can build a custom Contact Control Panel (CCP) and communication widget. For more information, see Set up in-app, web, video calling, and screen sharing capabilit ies.	December 6, 2024
WhatsApp integration	You can integrate WhatsApp messaging with Connect Customer and enable customers to contact you by using WhatsApp. You can use inbound contact flows to route customers to specific queues. You can also use Amazon Lex to automate responses, and Amazon Lex templates to provide list and reply controls. For more information, see Set up WhatsApp business messaging and Add Amazon Lex interactive messages for customers in chat.	December 1, 2024

Updated CustomerProfilesServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles and Outbound campaigns permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	December 1, 2024
Updated ConnectCustomerServiceLinkedRolePolicy managed policy	Updated the service-linked role managed policy with AWS End User Messaging Social permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	December 1, 2024
Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	December 1, 2024
Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional permissions to support Connect Customer integration with AWS End User Messaging Social. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	December 1, 2024

Record audio during IVR and other automated interactions	You can record audio when your customer engages with self-service interactive voice response (IVR) and other automated interactions. On the **Contact details** page, you can listen to the recording or review logs which includes information such as the bot transcription or touch-ton e menu selection. You can configure recording settings using the **Set recording and analytics behavior** block on the Connect Customer drag-and-drop workflow designer. For more informati on, see Monitor automated interactions (IVR) in Connect Customer.	December 1, 2024

Proactive outbound engagement in the Connect Customer admin website	Connect Customer has capabilities to proactive ly engage your customers in a personalized manner. These features help non-technical business users create customer segments using prompts and drive trigger-based campaigns to deliver timely, relevant communications to the right audiences. Use the segment AI assistant in Connect Customer Customer Profiles to build audiences using natural language queries and receive recommend ations based on trends in the customer data. Identify segments such as customers with an increase in support cases over the last quarter, or whose have reduced purchases in the last month, using easy-to-use prompts. Use new trigger-based campaigns based on real-time customer events on Connect Customer outbound campaigns to proactively drive outbound communica tions in just a few clicks. Engage customers with timely, relevant communica tions by using their preferred channels, responding	December 1, 2024

	instantly to behaviors such as abandoned shopping carts or frequent visits to specific help pages. For more information, see Segment AI assistant and Create an outbound campaigns using event triggers.	
Intraday forecast dashboards	With the Intraday forecast dashboards you can compare intraday forecasts against previously published forecasts , review projected daily performance, and receive predictions for effective staffing, all available within the Connect Customer conversational analytics dashboards. With intraday forecasts, you receive updates every 15 minutes with predictions for rest-of-day contact volumes, average queue answer time, average handle time, and, now, effective staffing. For more information, see Intraday forecast performance dashboard.	December 1, 2024

Integrate Connect Customer conversational analytics with on-premise voice systems	You can integrate Connect Customer conversational analytics with other voice systems for real-time and post-call analytics. Using conversational analytics with your existing voice system can help you improve customer experience and agent performance. In addition, this can be a first step to migrating to a cloud contact center. You can start with Contact Lens analytics and performance insights and then at a later date migrate your agents to Connect Customer. For more information, see Set up Connect Customer external voice transfer to an on-premise voice system.	December 1, 2024

Generative AI-powered self-service with agent assist	agent assist, a generativ e-AI powered assistant for customer service, now supports end-customer self-service interactions across Interactive Voice Response (IVR) and digital channels. With this launch, businesse s can augment their existing self-service experiences with generative AI capabilities to create more personalized and dynamic experiences to improve customer satisfact ion and first contact resolutio n. For more information, see Generative AI-powered self-service with agent assist.	December 1, 2024

Create conversational AI bots by using the Connect Customer admin website	In just a few clicks you can create, edit, and continuou sly improve conversational AI bots for interactive voice response (IVR) and chatbot self-service experiences by using the Connect Customer admin website (powered by Amazon Lex). By using the Connect Customer drag-and-drop workflow designer, you can enhance your bots with Connect Customer Customer Profiles, making it easy to deliver personali zed experiences with no code. For more information, see Create conversational AI bots in Connect Customer. For a list of new metrics included in this release, see Connect Customer bot metrics and analytics.	December 1, 2024

Connect Customer conversational analytics automates agent performance evaluations using generative AI	Connect Customer conversational analytics provides you with the ability to use generative AI to automatically fill and submit agent performance evaluations. Managers can now specify their evaluation criteria in natural language, and use generative AI for automating evaluations of any or all of agents' customer interactions, and get aggregated agent performance insights across cohorts of agents over time. For more information, see Create an evaluation form with a title in Connect Customer.	December 1, 2024

Collect sensitive customer data within chats without requiring the customer to switch channels	Connect Customer makes it easier for you to collect sensitive customer data and deliver seamless transacti onal experiences within chats, enhancing the overall customer experience. You can now support inline chat interactions such as processin g payments, updating customer information like address changes, or collectin g customer data like account details, without requiring the customer to switch channels or navigate to another page on your website. For more information, see Flow block in Connect Customer: Show view.	December 1, 2024

Built-in dashboards to analyze conversational AI bot performance	You can use built-in dashboards to monitor the performance of your conversational AI bots. This makes it easy for you to analyze and continuously improve your self-service and automated experiences. From the Contact Lens flows performance dashboard, you can view Amazon Lex and Q in Connect bot analytics including how your customers communicate their issues, the most common contact reasons, and the outcomes of the interaction. For more information, see Flows and conversational bot performance dashboard.	December 1, 2024

Automatically categorize your contacts using generative AI	Connect Customer conversational analytics allows you to automatically categorize your contacts using generative AI, making it easy to identify top drivers, customer experience, and agent behavior for your contacts. You can provide criteria to categorize contacts in natural language, such as *Did the customer try to make a payment on their balance?* conversational analytics then automatically labels contacts that meet the match criteria, and provides relevant points from the conversation. For more information, see Automatically categorize contacts by matching conversations with natural language statements, or specific words and phrases and Use Generative AI to semantically match contacts with natural language statements.	December 1, 2024

AI guardrails for agent assist	agent assist, a generativ e AI powered assistant for customer service, now enables customers to natively configure AI guardrails to implement safeguard s based on their use cases and responsible AI policies. Contact center administrators can configure company-s pecific guardrails for agent assist to filter harmful and inappropriate responses, redact sensitive personal information, and limit incorrect information in the responses due to potential large language model (LLM) hallucination. For more information, see Create AI guardrails for agent assist.	December 1, 2024
Updated AmazonCon nectServiceLinkedR olePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional permissions to support the email channel. The Amazon SES actions allow Connect Customer send, receive, and manage emails by using the Amazon SES APIs. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	November 22, 2024

Connect Customer email is generally available	Connect Customer email provides built-in capabilities that make it easy for you to prioritize, assign, and automate the resolution of customer service emails, improving customer satisfaction and agent productivity. For more information, see Set up email. This release includes additional APIs. For more information, see Email actions in the *Connect Customer API Reference Guide*.	November 22, 2024
Connect Customer conversational analytics launches calibrations for agent performance evaluations	You can conduct calibration sessions to drive consistency and accuracy in how managers evaluate agent performance. Through calibrations, you can review differences in evaluations filled by different managers to align managers on evaluation best practices and identify opportunities to improve the evaluation form. For more information, see Calibration sessions for performance evaluations.	November 22, 2024

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles and Connect Customer agent assist permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	November 18, 2024
Updated AmazonConnectCampaignsServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer, EventBridge, and Connect Customer agent assist permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	November 18, 2024

Connect Customer offers personalized and proactive engagement capabilities	Connect Customer offers a set of capabilities to help you proactively address customer needs before they become potential issues, enabling better customer outcomes. You can initiate proactive outbound communications for real-time service updates, promotional offers, product usage tips, and appointme nt reminders at just the right moments throughout your customer's experience from the right channel. For more information, see Set up customer segments in Connect Customer Customer Profiles and Set up Amazon Connect outbound campaigns .	November 18, 2024

Create custom dashboards	You can create custom dashboards, as well as add and remove widgets from existing dashboards. This functionality enables you to change widgets to create the view that best fits your specific business need. For example, if you want to monitor performance covering self-service, queue, and agent, you can add all three types of widgets to your dashboard to have a single end-to-end view of contact center performan ce. For more information, see Dashboards in Connect Customer for getting contact center performance data.	November 14, 2024
Updated `AmazonConnectSynchronizationServiceRolePolicy` service-linked role managed policy	Consolidated allowed actions and added a deny-list of actions for Managed Synchronization. For more details on the changes, see Connect Customer updates to AWS managed policies.	November 12, 2024

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional permissions to get and list Amazon Chime SDK Voice Connectors that are associated with Connect Customer. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	October 25, 2024
Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with Connect Customer Customer Profiles and Connect Customer agent assist permissions. For a list of the additional actions, see Connect Customer updates to AWS managed policies.	October 25, 2024
Monitor agent assist by using CloudWatch Logs	To gain visibility into the real-time recommendations that agent assist provides to your agents, and the customer intents it detects through natural language understanding, you can query CloudWatch Logs. For more information, see Monitor Amazon Q in Connect by using CloudWatch Logs.	October 25, 2024

Forecasting data in Connect Customer Analytics data lake	You can use published forecast (short-term and long-term) data in the data lake. This makes it easier for you to generate reports and insights from this data. For example, you can build dashboards that compare forecasts against actuals or view this data in conjuncti on with other data sets such as sales forecasts. For more information about the content of the forecasting tables in the data lake, see Forecasting data in Connect Customer Analytics data lake.	October 25, 2024
Use screen sharing with web and video calls	You can use screen sharing with Connect Customer web and video calls, and pass contextual information to Connect Customer. Screen sharing enables agents to quickly gain an understan ding of issues and help guide the customer. For more information, see Set up in-app, web, video calling, and screen sharing capabilities. In addition, see the StartScre enSharing API.	October 23, 2024

Connect Customer Chat provides SDKs for iOS and Android	Connect Customer Chat provides SDKs for iOS and Android, allowing you to deliver native in-app chat experiences that improve customer satisfaction and reduce operational costs. These SDKs provide pre-built components for network and session management. For more information, see Integrate Connect Customer chat into a mobile application.	October 21, 2024
agent assist adds personalized guidance for agents	agent assist can recommend personalized guidance to agents using customer data from Connect Customer and other third-party CRM systems. agent assist detects the customer's intent from the real-time voice or chat conversation and understands customer data to recommend what an agent should say or what action they should take. For more information, see Use agent assist for generative AI–powered agent assistance in real-time.	October 7, 2024

Added new configuration capabilities to metrics dashboards	Three configuration capabilities have been added to the Connect Customer metrics dashboards: • Changing Metrics • Color coded performance thresholds • Customizing Service Level and other metrics For more information, see Dashboards for getting contact center performance data.	October 4, 2024
Send message flow block to initiate outbound SMS contacts	Connect Customer supports the ability to initiate outbound SMS contacts, enabling businesses to help increase customer satisfaction by engaging customers on their preferred communication channel. For more information, see the Send message flow block and the StartOutboundChatContact API.	September 30, 2024

Updated AmazonConnectSynchronizationServiceRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with additional permissions to support the launch of the HoursOfOperationOverride attribute. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	September 25, 2024
Enhancements for automated evaluations	You can use automated evaluations with optional questions. In addition, you can use automated evaluations with additional contact metrics. For more information, see Create a rule that submits an automated evaluation.	September 4, 2024
View the Intraday forecast performance dashboard	Use the Intraday forecast performance dashboard to view forecasts that are updated every 15 minutes for queues that have a minimum of 2000 unique contacts per week, per queue-channel for last 5 weeks. For more information, see Intraday forecast performance dashboard.	August 30, 2024

View the Intraday forecast performance dashboard	Use the Intraday forecast performance dashboard to view forecasts that are updated every 15 minutes for queues that have a minimum of 2000 unique contacts per week, per queue-channel for last 5 weeks. For more information, see Intraday forecast performance dashboard.	August 29, 2024
View an audit trail for changes to an agent performance evaluation	You can review the changes made to an agent performance evaluation when it is re-submitted. Previously the audit trail was available in an S3 bucket. Now it's available in the Connect Customer admin website. For more information, see View an evaluation audit trail.	August 22, 2024

Specify a flow that runs when a callback is created	You can specify a flow that runs when a callback is created for customers who want to maintain their position in queue. For example, you can specify a flow that sends an advance SMS to notify the customer, updates contact attributes with the latest customer data for reference on the call, or terminate the callback if the issue has already been resolved. For more information, see the **Set creation flow** parameter on the Transfer to queue block.	August 16, 2024
Updates to filter comparison operator and metric results dimension for the GetMetricDataV2 API	You can now use metric threshold comparison operator such as `LTE` (less than equal) and `LT` (less than) to explicitly include the threshold boundary value. The metric results empty dimension values were also updated to be consistent in returning `null`. Previously `empty String` was returned in some scenarios when the request contained groupings attributes that were not defined in the filters. For more information, see the GetMetricDataV2 API documentation.	August 12, 2024

Programmatically set routing criteria on a contact through the UpdateContactRoutingData API	You can now use the `UpdateContactRoutingData` API to programmatically update the routing criteria on a contact. Previously, you could only set the routing criteria on a contact using the Set routing criteria flow block in the Connect Customer admin website. For more information, see the UpdateContactRoutingData API documentation.	August 9, 2024
Guidance on troubleshooting audio quality issues	Published a topic on how to troubleshoot audio quality issues. For more information, see Troubleshoot audio quality issues by using QualityMetrics in the contact record.	August 5, 2024

Connect Customer supports audio optimization for Amazon WorkSpaces cloud desktops	You can deliver high-quality voice experiences in Amazon WorkSpaces Virtual Desktop Infrastructure (VDI) environments. Connect Customer automatically optimizes audio by redirecting media from your agent's local desktop to Connect Customer, simplifying the agent experience and improving audio quality by reducing network hops. For more information, see Optimize Connect Customer audio for Amazon WorkSpaces cloud desktops.	August 5, 2024
Configure when whisper flows are used	You can configure when whisper flows are used during a contact. For example, you can choose to turn off whisper flows during an outbound or callback scenario to save time when the agent and customer are expecting the contact. This helps you optimize the performance of your flows and reduce the duration of a contact. For more information, see Flow block: Set whisper flow.	July 31, 2024

Download screen recordings from the Contact details page	You can download screen recordings from the **Contact details** page in the Connect Customer admin website. This enables you to evaluate contact quality and agent performance by using offline reviews, as well as review downloaded screen recordings with agents for coaching. This release also provides a new security profile permission—**Screen recording - Enable download button**—to manage who can download screen recordings. For more information, see Review agent screen recordings.	July 26, 2024
Updated `AmazonConnectSynchronizationServiceRolePolicy` service-linked role managed policy	Updated the service-linked role managed policy with additional permissions for Managed Synchronization. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	July 24, 2024

Dashboard and metrics for outbound campaigns	You use the outbound campaigns performance dashboard to understand the performance of your outbound campaigns across voice contacts. For a list of new outbound campaigns historical metrics, see the Release notes for Connect Customer.	July 24, 2024
Faster generative AI-powered post-contact summaries for agents ACW	Enhancements to generative AI-powered post-contact summaries enable your users to access them within seconds after a contact ends. For example, agents can access post-contact summaries on the CCP and use them to quickly complete after contact work (ACW). These faster summaries are available by using APIs and Amazon Kinesis Data Streams, enabling you to integration with third-party agent workspace or CRM systems. For more information, see View generative AI-powered post-contact summaries.	July 22, 2024

Connect Customer Client Application v2.0.1 is available	Released Connect Customer Client Application v2.0.1. This version includes bug fixes and enhancements to improve the stability and monitorin g of the application. To download the latest version, see Connect Customer Client Application.	July 22, 2024
Automated rotation of agent shifts	You can create a pattern of shifts that agents will repeatedly rotate through (for example, morning shift, afternoon shift, night shift). You can define how many weeks each shift should be scheduled before moving to the next one in the rotation. This feature makes it easier to administrate schedules and make sure that agents receive a business-defined sequence of shifts. For more informati on, see Set up shift rotation patterns.	July 10, 2024

Updates to Routing Profiles and Queues Search APIs	You can search for routing profiles by associated queues, and search for queues based on the routing profile they are assigned to by using the `SearchRoutingProfile` and `SearchQueues` APIs. These search APIs allow you to query by both name and ID, and support granular access controls (using tags) over the associated resources. For more information, see the SearchRoutingProfile and SearchQueues API documentation.	June 30, 2024
Route contact within a queue to a specific agent	You can now offer a contact in a queue to a specific agent or set of agents based on user ID; if the agent is not available within a given period of time, you can expire off the routing criteria to instead offer the contact to any available agent in queue. For more information, see Routing using agent proficiencies.	June 28, 2024

Connect Customer outbound campaigns performance dashboard	You can use the outbound campaigns performance dashboard to understand the performance of your outbound campaigns across voice contacts. For more information, see Outbound campaigns performance dashboard.	June 28, 2024
agent assist recommends step-by-step guides	agent assist, a generative-AI powered assistant for contact center agents, recommends step-by-step guides in real-time. Agents use step-by-s tep guides to quickly take action to resolve customer issues. For more informati on, see Integrate AI agents with step-by-step guides. In addition, see the following new APIs that are part of this release: CreateContentAssoc iation, DeleteContentAssoc iation, GetContentAssociation, ListContentAssociations	June 27, 2024

Updated AmazonConnectReadOnlyAccess managed policy	Updated the managed policy due to the renaming of the Connect Customer action connect:GetFederationTokens to connect:AdminGetEmergencyAccessToken. This change is backwards compatible and the use of either action name will continue to work in your policies. For more information, see Connect Customer updates to AWS managed policies.	June 15, 2024
Updated look and feel for the Connect Customer agent workspace	you can also easily build and embed third-party applications that have a consistent look and feel with the agent workspace by using Cloudscape Design System components. For more information, see Access third-party applications in the agent workspace.	June 3, 2024

Set the forecast time zone	You can generate, view, and download forecasts in the time zone where your business operates. Connect Customer automatically adjusts forecasts to account for daylight saving changes. For example, if your contact center receives contacts from 8AM-8PM US Eastern time, then forecasts will automatically switch from 8AM-8PM Eastern Daylight Time (EDT) to 8AM-8PM Eastern Standard Time (EST) on November 3, 2024. Time zone support in forecasts simplifies the day-to-day experience for managers. For more information, see Set the forecast time zone.	May 29, 2024
Updated `AmazonConnectServiceLinkedRolePolicy` service-linked role managed policy	Updated the service-linked role managed policy with Amazon Cognito user pools permissions to use select read operations and Connect Customer Customer Profiles permissions to put data into Customer Profiles . For a description of the additional actions, see Connect Customer updates to AWS managed policies.	May 23, 2024

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy with the agent assist API action wisdom:ListContentAssociations . For a description of the additional action, see Connect Customer updates to AWS managed policies.	May 20, 2024
New flow and flow module analytics	Added the following historical metrics for flows and flow modules: Average flow time, Flows started, Flows outcome, Flows outcome percentage, Maximum flow time, and Minimum flow time. For a description of each metric, see Historical metrics definitions. Added the flows dashboard. Added the ability to create a rule when a flow or flow module breaches a rule you define.	May 15, 2024

New metrics available on the Historical metrics page	The following metrics are available on the **Historical metrics** page in the Connect Customer admin website: Abandonment rate, Agent non-response without customer abandons, Average contact duration, Average conversation duration, Average customer hold time all contacts, Average agent greeting time, Average agent interruptions, Average holds, Average agent interrupt ion time, Average non-talk time, Average resolution time, Average talk time, Average agent talk time, Average customer talk time, Agent talk time percent, Customer talk time percent, Talk time percent, Non-talk time percent, Contacts handled (connected to agent timestamp), Contacts queued (enqueue timestamp), Callback attempts, Contacts abandoned in X, Contacts answered in X, Contacts resolved in X. For a descripti on of each metric, see Historical metrics definitions.	May 2, 2024

Voice contacts rejected by an agent have a state of REJECTED	Voice contacts rejected by an agent used to have a state of ERROR for Contact State in the Agent Event Stream. Now they have a state of REJECTED, which is the same as chat and task contacts. This is also reflected on Real-time metrics for the agent.	April 2, 2024
Combined Connect Customer API reference guides	Combined all the API reference guides for Connect Customer services (for example, Amazon Q in Connect, Cases, Outbound Campaigns, Voice ID) into the main Connect Customer API reference guide. Published redirects so existing bookmarks continue to work. See the Connect Customer API Reference.	March 27, 2024

GA for generative AI-powered post-contact summaries	Released generative AI-powered post-contact summaries for general availability. This feature summarizes long customer conversations into succinct, coherent, and context rich contact summaries. For example, a summary might say "The customer didn't receive a reimbursement for a last minute flight cancellat ion and the agent didn't offer a partial reimburse ment as per the SOP." For more information, see View generative AI-powered post-contact summaries.	March 25, 2024
Historical metrics for case management	Connect Customer Cases provides the following metrics for case managemen t: Average case resolution time, Average contacts per case, Cases created, Cases reopened, Cases resolved, Cases resolved on first contact, Current cases.	February 29, 2024
Added topic on best practices for outbound campaigns	For more information, see Best practices for Connect Customer outbound campaigns.	February 19, 2024

Connect Customer Cases provides audit history on cases	For information on how to enable the feature for your users, see Assign permissions. Also, see GetCaseAuditEvents in the *Connect Customer API Reference*.	February 2, 2024
Added topic on managing chat across Regions	For more information, see Manage chat across Regions.	February 2, 2024
Added topic on opt out of using your data for service improvement	Learn which Connect Customer services use your customer's content that you provide to train models and continuously improve your experience, and how to opt out if desired. For more information, see Opt out of using your data for service improvement.	January 19, 2024
Added topic on best practices for using PutDialRequestBatch for outbound campaign calling	For more information, see Best practices for using PutDialRequestBatch for outbound campaign calling.	January 19, 2024

GA for Connect Customer outbound campaigns voice dialing API	Released the PutDialRequestBatch for general availability. This API enables you to use your own list management capability to set up the contact strategy (for example, campaign start and end times, do-not-call times, maximum contact attempts) while programmatically using Connect Customer predictive dialer with machine learning (ML)–powered answering machine detection. This helps increase live-party connections.	January 12, 2024
Barge for chat: Managers can join ongoing chats between agents and customers	Managers can join and participate in ongoing chats between agents and customers, making sure that even the most complex customer issues are resolved quickly and accurately. For more information, see Barge live voice and chat conversations . Also see updates to the MonitorContact and SendEvent APIs.	January 12, 2024

High-quality voice experiences for agents using Citrix Virtual Desktop Infrastructure (VDI) environments.	Your agents can use the Citrix remote desktop application to offload audio processing to their local device and to automatically redirect audio to Connect Customer. For more information, see Citrix VDI with Connect Customer audio optimization.	January 10, 2024
GetRecommendations and QueryAssistant APIs will be discontinued starting June 1, 2024	Two Amazon Q in Connect APIs—GetRecommendations and QueryAssistant—will be discontinued starting June 1, 2024. To receive generative responses after March 1, 2024, you will need to create a new Assistant in the Connect Customer console and integrate the Amazon Q in Connect JavaScript library (amazon-q-connectjs) into your applications.	January 10, 2024
Granular access controls using resource tags for historical metrics reports	You can apply granular permissions to resource metrics that are included in historical metrics reports. For more information, see Apply tag-based access control to historical metrics reports.	January 3, 2024

Pause and resume tasks	You can pause and resume all tasks that aren't expired, disconnected, or scheduled for a later time. This enables agents to free up an active slot so they can receive more critical tasks when their current task is stalled, for example, because of a missing approval or waiting on an external input. For more information, see Concepts: Pause and resume tasks. Also see the PauseContact and ResumeContact APIs.	December 15, 2023
More granular billing reports	Apply contact tags to obtain more detailed billing reports in AWS Cost Explorer and AWS Cost & Usage Reports. For more information, see Set up granular billing for a detailed view of your Connect Customer usage. Also see TagContact and UntagContact in the *Connect Customer API Reference*.	December 15, 2023
New metrics: Contacts Answered/Abandoned in X	On the **Real-time metrics** page, you can define custom thresholds for Contacts abandoned in X and Contacts answered in X, where X is a time range that you specify.	December 4, 2023

Updated AmazonConnectServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy to use Amazon Pinpoint phone numbers to allow Connect Customer to send SMS. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	November 28, 2023
UI builder for step-by-step guides	This feature allows you to create and manage the UI pages shown to agents in step-by-step guides. Using a drag-and-drop interface you are able to define static and dynamic content for the agent's UI. This includes layouts, styles, and dynamic data, which enables you to control the look and feel of your agent's experience. With this capability, you are able define what gets displayed in your agent's UI during the step-by-step guided experience. For more information, see the No-code UI builder documentation.	November 28, 2023

Customer Profiles provides a generative AI powered customer data mapping capability	Customer Profiles provides a generative AI powered customer data mapping capability that significantly reduces the time needed to create unified profiles, which allows you to create more personalized customer experiences more efficient ly. For more information, see Generative AI powered data mapping.	November 28, 2023
Connect Customer supports two-way SMS	Connect Customer supports two-way Short Messaging Service (SMS) capabilities, making it easy for you to resolve customer issues by text messaging. SMS offers a ubiquitous and convenient channel for customers to get help, while enabling you to deliver personalized experienc es at a lower cost. For more information, see Set up SMS messaging. For a list of new actions, see the Release notes.	November 28, 2023

Connect Customer provides in-app, web, and video calling	The Connect Customer in-app, web, and video calling capabilities enable your customers to contact you without ever leaving your web or mobile application. You can use these capabilities to pass contextual informati on to Connect Customer. This enables you to personali ze the customer experienc e based on attributes such as the customer's profile or other information, like actions previously taken within the app. For more information, see Set up in-app, web, and video calling capabilities and the StartWebRTCContact action in the *Connect Customer API Reference*.	November 28, 2023

Connect Customer conversational analytics provides real-time conversational analytics for chat	conversational analytics provides real-time conversational analytics for chat, extending the machine learning-powered post-contact analytics (for example, sentiment analysis, automated contact categorization, and more) to real-time contact scenarios. For more information, see Analyze conversations using conversational analytics and the ListRealtimeContactAnalysisSegmentsV2 action in the *Connect Customer API Reference*.	November 28, 2023
Connect Customer conversational analytics provides generative AI-powered post-contact summaries (Preview)	conversational analytics provides generative AI-powered post-contact summaries, enabling contact center managers to more efficiently monitor and help improve contact quality and agent performance. For more information, see View generative AI-powered post-contact summaries (Preview).	November 28, 2023

Analytics data lake (Preview)	You can use Analytics data lake as a central location to query various types of data from Connect Customer. This data includes contact records and conversational analytics conversational analytics. Data is refreshed around every 24 hours. You can use the Analytics data lake to create custom reports or run SQL queries. For more informati on, see Access Analytics data lake. For a list of new actions, see the Analytics data lake actions topic in the *Connect Customer API Reference*.	November 28, 2023
Added agent assist	Connect Customer agent assist is a generative AI– customer service assistant. It is an LLM-enhanced evolution of Connect Customer Wisdom that delivers real-time recommendations to help contact center agents resolve customer issues quickly and accurately. For more informati on, see Use agent assist for generative AI– powered agent assistance in real-time and the agent assist API Reference .	November 28, 2023

Create quick responses	Quick responses provide pre-written answers to common customer inquiries during a chat conversation. The responses can save time and reduce customer frustration. For more information, see Create quick responses for use with chat contacts and Search for quick responses in CCP.	November 17, 2023
View and manage applied service quotas for Connect Customer using AWS Service Quotas	Service Quotas allows you to view both default and applied quota values for resources used by each of your Connect Customer instances. When requesting a quota increase, Service Quotas allows you to indicate both the Connect Customer quota and desired value. For quotas that support resource level adjustability you can also specify your Connect Customer instance. For more information, see Connect Customer service quotas	November 16, 2023
Added an action to AmazonConnectServiceLinkedRolePolicy	Updated AmazonConnectServiceLinkedRolePolicy with an action for Connect Customer agent assist. For a description of the additional action, see Connect Customer updates to AWS managed policies.	November 15, 2023

Connect Customer prompts configuration page provides CloudTrail coverage	The prompts configuration user interface has been updated to make it more efficient for you to manage prompts. In addition, when you add, update or delete a prompt from the Connect Customer admin website, a record of that activity is available in AWS CloudTrai l for visibility, reporting, and compliance. For more information about the new prompts page, see Create prompts.	November 10, 2023
Connect Customer enables integration with your preferred file scanning application to detect malware	You can integrate Connect Customer with your preferred file scanning applicati on to detect malware or other unwanted content in attachments before they can be shared in a chat or uploaded to a case. This capability provides an additional layer of protectio n for your customers and organization by preventin g malicious files from being shared and downloaded. For more information, see Set up attachment scanning.	November 9, 2023

Updated AmazonConnectCampaignsServiceLinkedRolePolicy service-linked role managed policy	Updated the service-linked role managed policy for outbound campaigns. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	November 8, 2023
Connect CustomerConnect Customer outbound campaigns voice dialing API	Connect Customer outbound campaigns supports high-volume voice outreach by using the BatchPutContact API. You can use your own list management capability to set up the contact strategy (for example, campaign start and end times, do-not-call times, maximum contact attempts), while programmatically using the Connect Customer predictive dialer with machine learning (ML)–powered answering machine detection. This increases live-party connections and reduces the amount of time agents waste with unanswered calls. You can also track outcomes of all campaign calls using the Connect Customer contact record.	November 8, 2023

Connect Customer Cases supports author name on comments	You can programmatically add and view author comments by using the CreateRelatedItem and SearchRelatedItems APIs.	November 8, 2023
Added new service-linked role policy and service-linked role	Added `AmazonConnectSynchronizationServiceRolePolicy` service-linked role policy and `AWSServiceRoleForAmazonConnectSynchronization` service-linked role for managed synchronization. The policy and role provide access to read, create, update, and delete Connect Customer resources and is used to automatically synchronize AWS resources across AWS regions. For more information, see AWS managed policy: AmazonConnectSynchronizationServiceLinkedRolePolicy and Using service-linked roles for Connect Customer Managed Synchronization.	November 3, 2023

Added Create persistent chat association flow block and new API	You can set up a chat to be persistent either when the chat session is initially created or at any time during the lifetime of the chat. To set up persistent chat after the chat session has started, use the new CreatePersistentContactAssociation API or include the new Create persistent contact association block in your flow.	November 3, 2023
Added conversational analytics conversational analytics metrics in the API	You can analyze aggregate agent and contact performance using conversational analytics conversational analytics metrics in the GetMetricDataV2. The following new metrics were added: **non-talk time percent**, **talk time percent**, **talk time agent percent**, and **talk time customer percent**. For descriptions of these metrics, see Historical metrics definitions.	November 2, 2023

Added configuration management across AWS Regions for Connect Customer Global Resiliency customers	Connect Customer Global Resiliency customers can use the ReplicateInstance API to copy configuration information for resources such as users, routing profiles, queues, and flows across AWS Regions. The API also automatically matches the service quotas for these resources across AWS Regions as part of the replication process. For more informati on, see Create a replica of your existing Connect Customer instance. Added the BatchGetFlowAssociation API. Use this API to obtain a list of flow-associations for the resource identifiers provided in the API request. For example, you can list which phone numbers are associated with which flows in an Connect Customer instance.	November 2, 2023
Added actions to AmazonCon nectServiceLinkedR olePolicy	Updated AmazonCon nectServiceLinkedR olePolicy with actions for Connect Customer Customer Profiles. For a description of the additiona l actions, see Connect Customer updates to AWS managed policies.	October 30, 2023

Increased quota for GetProfileObjectType	Changed default limit for GetProfileObjectType from 5 to 10.	October 28, 2023
Third-party applications preview	You can integrate third-party applications into the agent workspace. For more information, see Third-party applications (3p apps) in the agent workspace (Preview) and the Amazon Connect agent workspace third-party developer guide.	October 27, 2023
Added actions to AmazonConnectServiceLinkedRolePolicy	Updated AmazonConnectServiceLinkedRolePolicy with actions for Connect Customer Wisdom. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	October 25, 2023
Updated the definition of Contact handle time	Contact handle time includes the time agents spend in an **Offline** status making outbound calls.	October 23, 2023
Added UpdatePhoneNumberMetadata API	Use the UpdatePhoneNumberMetadata to update the metadata for a phone number, such as the phone number description.	October 23, 2023

Outbound calling restrictions	Added a new topic that explains restrictions that are in place for outbound calling with Connect Customer: Outbound calling restrictions.	October 16, 2023
Add as many as four access control tags to a single security profile	Adding additional access control tags will make a given security profile more restrictive. For example, if you add four access control tags like `BPO:AcmeCorp` , `Specialty:Claims` , `Department:Billing` , and `City:NewYork` , the user would only be able to see resources containing all four of these tags. For more information, see Tag-based access control configuration limitations.	October 16, 2023
Updated default rate limit for GetContactAttribute and UpdateContactAttribute	For new Connect Customer instances, the default rate limit for GetContactAttribute and UpdateContactAttribute has been updated. For more information, see API throttling quotas.	October 6, 2023

Added actions to AmazonConnectServiceLinkedRolePolicy	Updated AmazonConnectServiceLinkedRolePolicy with actions for Connect Customer Customer Profiles. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	October 6, 2023
Create and customize up to 15 communications widgets	You can create and customize up to 15 communications widgets per Connect Customer instance. For more information, see Add a chat user interface to your website.	October 5, 2023
Access trailing 90 days of historical agent and contact metrics	You can access the trailing 90 days of historical agent and contact metrics (for example, Service level, Average handle time by using the GetMetricDataV2 API. You can also make requests spanning up to 35 days with data categorized by customizable time intervals such as 15 minutes, hourly, or weekly. Also added five new metrics to the GetMetricDataV2 API. They are not available in the Connect Customer admin website. For a list, see the Release notes.	October 3, 2023

Connect Customer Client Application v1.0.2.38 is available	Released Connect Customer Client Application v1.0.2.38 . This version contains minor fixes and improvements. For more information, see Connect Customer Client Application.	September 29, 2023
Added actions to AmazonConnectServiceLinkedRolePolicy	Updated AmazonConnectServiceLinkedRolePolicy with actions for Connect Customer Wisdom. For a description of the additional actions, see Connect Customer updates to AWS managed policies.	September 29, 2023
Added "View my contacts" permission	Added a new security profile permission: View my contacts. On the **Contact search** page, agents who have this permission can access the contacts that they've handled. If you're using conversational analytics, agents can also review the analyzed recording and transcripts of the contact. For more information, see Security profile permissions for conversational analytics.	September 25, 2023

Streams API upgrade for third-party cookies	This upgrade prevents the blocking of third-party cookies from impacting Connect Customer across Chrome and all supported browsers. For more informati on, see Use Connect Customer Streams API for third-party cookies.	September 22, 2023
Create alerts on real-time metrics	You can create rules that automatically send emails or tasks to managers based on the values of real-time metrics. This enables you to alert managers on contact center operations that could potentially impact the end-customer experience. For more information, see Create alerts on real-time metrics.	September 20, 2023

"Maximum contacts in queue" includes all channels	If you have a queue that combines more than one channel, and you set a custom value for **Maximum contacts in queue**, the queue stops accepting new contacts after that number is reached, regardless of the distribut ion of contacts. For example, if you set the value to 50, and the first 50 contacts are chats, then voice calls are not routed to this queue. For more information, see Set the Maximum contacts in queue limit.	September 15, 2023
Manage contacts from the Contact details page	On the **Contact details** page of an in-progress contact, you can manage a contact by transferring, rescheduling, or ending the contact. For more information, see Manage contacts from the Contact details page.	September 14, 2023
Upload file attachments to cases	Agents can upload file attachments to cases. For more information, see Enable attachments. For a list of supported file types, see Feature specifications.	September 11, 2023

Subscribe to the CONTACT_DATA_UPDATED event type in the contact event stream	You can subscribe to an event type called `CONTACT_DATA_UPDATED`. The `Contact` object includes an `UpdatedProperties` field. This enables you to monitor for changes to scheduled timestamp for tasks, and changes to user-defined attributes on the contact record. In addition, hierarchy groups information in the `AgentInfo` object is included for `CONTACT_DATA_UPDATED`, `CONNECTED_TO_AGENT`, and `DISCONNECTED` event types. For more information, see Contact events data model.	September 11, 2023
Search for in-progress contacts	You can search for in-progress contacts on the **Contact search** page. For more information, see Search for in-progress contacts.	September 11, 2023

APIs to programmatically configure views in step-by-step guides	Connect Customer provides APIs to programmatically create and manage view resources used in step-by-step guides. View resources define what gets displayed in your agent's UI during a step-by-step guide. For more information, see the View resource documentation.	September 7, 2023
Support for UIFN in more than 60 countries	Connect Customer supports Universal International Freephone number (UIFN) in more than 60 countries that are registered with the International Telecommunications Union, an organization that supports the administration of the UIFN service. Connect Customer allows you to enable UIFNs in as many countries as you need, with a requirement of at least 5 countries. For more information, see UIFN service.	September 1, 2023

Voice dialing for outbound campaigns, no agents required	You can use Connect Customer outbound campaigns for high-volume outreach with no agents required. A new dialer type called "Agentless" makes it easier to proactively communicate with your customers for use cases such as personalized voice notifications and appointment reminders. For more information, see Create an outbound campaign and the CreateCampaign API.	August 31, 2023
Connect Customer Cases supports nine additional languages	For more information, see Connect Customer Cases in the *Languages supported by Connect Customer* topic.	August 28, 2023
Granular access controls using resource tags for the agent activity audit report	You can apply granular permissions to the agent activity audit report in the Connect Customer historical metrics UI using resource tagging and tag-based access controls. For more information, see tag-based access controls for agent activity audit and tag-based access controls in Connect Customer.	August 25, 2023

Enhanced user bulk edit	You can now update up to 100 user records on the Connect Customer admin website in less than half the time it used to take to make bulk updates. This enhancement is especially useful during contact surges when you might need to change the routing profile for many agents. For more information, see Edit users in bulk.	August 24, 2023
Connect Customer scheduling supports agent group activities	Connect Customer scheduling allows contact center managers to more efficiently create and manage activities for groups of agents. For more information, see Add shift activities in draft or published schedules.	August 24, 2023
GA for global sign-in and agent distribution capabilities	Released the following Connect Customer Global Resiliency capabilities for general availability: global sign-in and agent distribution across Connect Customer Regions. For more information, see Set up your agent's experience with Connect Customer Global Resiliency. For a list of new APIs associated with this release, see the Release notes for Connect Customer.	August 10, 2023

Sorting on column header names	You now have the ability to sort by choosing a column header, rather than choosing the smaller arrow next to the header text. For more information about real-time metrics, see Real-time metrics reports.	August 8, 2023
100 rows on real-time metrics tables	You can now view up to 100 rows in the real-time metrics tables on the **Real-time metrics** page. Previously, the maximum was 50 rows. For more information about real-time metrics, see Real-time metrics reports.	August 8, 2023
Route based on time since last inbound contact	Added an option to specify that selected agents with this routing profile will not have their routing order impacted by outbound contacts. For more information, see Create a routing profile.	August 4, 2023
Use the mini-map to navigate a flow	On the flow designer, the mini-map view to helps you easily navigate the flow. The drag-to-move mini-map has visual highlights that enable you to quickly move to any point in the flow. For more information, see Use the mini-map to navigate a flow.	July 31, 2023

Undo and redo actions in the flow designer	For more information, see Undo and redo actions in the flow designer.	July 31, 2023
Restrict attributes to specific flows	Released a new type of attributes called a flow attribute. Flow attributes are restricted to the flow in which they are configured. They are useful in situations where you don't want to persist the data throughout the contact, such as when you need to use sensitive information like the customer's credit card number to do a Lambda data dip. For more information, see Flow attributes.	July 31, 2023
Customize the names of flow blocks	To help you distinguish blocks in a flow, you can customize the names of blocks. For example, you might rename a *Play Prompt* flow block to *Welcome message* or a *Get customer input* flow block to *Hotel booking Lex bot*. For more information, see Set custom flow block name.	July 31, 2023

Archive, restore, and delete flows and modules	You can archive, restore, and delete flows and modules by using the Connect Customer admin website. This makes it easier to manage flows and modules that are not in use or no longer needed. For example, flows used only during certain times of the year can be archived when not in use and then unarchive d when needed. When a flow has been archived, you can then permanently delete the flow so it is no longer available within your list of flows. For more informati on, see Archive, restore, and delete flows and modules.	July 31, 2023
Add notes to a block	For more information, see Add notes to a block.	July 31, 2023
Added permissions for using Wisdom page in console	For more information, see Required permissions for using custom IAM policies to manage access to the Connect Customer console.	July 28, 2023
Streamlined the left nav in the documentation	Streamlined the left navigatio n menu in the Connect Customer Administrator Guide to make it easier to navigate.	July 27, 2023

Schedule flexible days and shift activities based on shift length	You can generate agent schedules that have the appropriate number of activities, such as breaks or meals, depending on the duration of the shift. The required number of breaks and meals are automatically placed in schedules that are compliant to various regional labor laws. You can generate agent schedules that include flexible days, that is, days that will be optionally scheduled if there's a need. Connect Customer can automatically generate flexible schedules that are compliant to agent's contracts and regional labor laws, thereby saving time for schedulers. For more information, see Create shift profiles.	July 27, 2023

Import time off balances	You can import time off balances for your users. You can also set the group allowance for time off by hour, for each calendar day, for specific time off activities. Connect Customer uses the time off balance to automatically approve or decline time off requests based on the agent's available net balance and the group allowance for time off. For more information, see Import an agent's time off balance in a .csv file and Set group allowance for time off.	July 27, 2023
Connect Customer Customer Profiles supports rule-based matching and merging	Connect Customer Customer Profiles supports rule-based resolution to match and merge similar profiles into unified ones. This enables you to enhance customer service by granting agents and automated systems access to relevant customer information. As a result, interactions become faster and more personalized for customers. For more information, see Use Identity Resolution to consolidate similar profiles.	July 27, 2023

Connect Customer Client Application v1.0.1.33 is available	Released Connect Customer Client Application v1.0.1.33 . With this newer version you no longer need to restart your desktop after installin g the client application. For the download location, see the Amazon Connect Client Application topic.	July 21, 2023
Connect Customer Cases provides case assignment	Case assignment helps organizations reduce the time to resolve customer issues by clearly tracking case activitie s and resolution ownership. Agents can associate a case with a queue or an individua l agent for resolution. Agents can view and filter cases assigned to their queue, and managers can directly assign cases to individual agents. For more information, see Set up case assignment.	July 20, 2023
Updated ordering and porting numbers in Brazil	Process and ID requireme nts have changed. For more information, see Brazil in the *Region requirements for ordering and porting phone numbers* topic.	July 19, 2023

conversational analytics Conversational Analytics metrics in the API	You can analyze aggregate agent and contact performance using conversational analytics Conversational Analytics metrics in the GetMetricDataV2 API. The list of metrics include Average contact duration, Average conversation duration, Average greeting time agent, Average holds, Average interruptions agent, Average interruption time agent, Average non-talk time, Average talk time, Average talk time agent, and Average talk time customer. For more information, see Historical metrics definitions and GetMetricDataV2.	July 18, 2023
Connect Customer Wisdom supports real-time recommendations for chat conversations	Connect Customer Wisdom delivers ML-powered, real-time recommended information to help chat agents quickly solve customer needs.	July 17, 2023

Delete queues and routing profiles programmatically	You can delete queues and routing profiles programmatically. For more information, see the following topics in the Connect Customer API Reference: DeleteQueue and DeleteRoutingProfile. Or see the following CLI topics: delete-queue and delete-routing-profile. To create an CloudFormation template for queues and routing profiles, see the following topics: AWS::Connect::Queue and AWS::Connect::RoutingProfile.	July 13, 2023
Agents can change their audio device settings in the CCP and agent workspace	You can configure the Contact Control Panel (CCP) or agent workspace to enable agents to select their preferred device for microphone input and audio output, such as voice media and new contact notifications. For more information, see How to use the CCP to change your audio device settings.	June 30, 2023

New interactive message types	Connect Customer Chat supports new interacti ve message types: quick replies and carousels. With quick replies, customers are presented with a list of response options (for example, **Yes**, **No**) that they can easily choose to reply. Carousels present a set of interactive messages in a horizontally-scrolling format. Your customers can scroll through them and select the best option. For more information, see Add interacti ve messages to chat.	June 29, 2023
Search for existing tags within an Connect Customer instance	Connect Customer provides the ability to search for existing tags within an instance, both programma tically through API and within the UI. When tagging resources, you can search from pre-existing key:value pairs before creating new ones. For more information, see the SearchResourceTags API.	June 27, 2023

Added screen recording capabilities	Connect Customer conversational analytics provides screen recording capabilities, making it easy for you to help agents improve their performance. With screen recording, you can identify areas for agent coaching (for example, long contact handle duration or non-compliance with business processes) by not only listening to customer calls or reviewing chat transcripts, but also watching the agent's actions while they are handling a contact. For more information, see Set up and review agent screen recordings.	June 16, 2023
Connect Customer scheduling allows agents to manage time off requests	Connect Customer scheduling now allows contact center agents to manage their time off requests in a self-serve manner. For more information, see Create time off.	June 15, 2023

Real-time data export of unified customer profiles to an Amazon Kinesis Data Stream	Connect Customer Customer Profiles supports real-time data export of unified customer profiles to an Amazon Kinesis Data Stream. Companies can enable data streaming and automatically receive data for new profiles and updates to existing profiles into their Amazon Kinesis Data Stream. For more information, see Set up real-time export.	June 8, 2023

GetMetricDataV2 API: Region availability and new functionality	The GetMetricDataV2 API is available in the AWS GovCloud (US-West) Region. GetMetricDataV2 is now available in all AWS Regions where Connect Customer is offered. This API enables you to access the trailing 35 days of historical agent and contact metrics (for example, service level, average handle time) with customizable filters and groupings. You can use GetMetricDataV2 to build custom dashboards to measure queue and agent performance over time. For example, you can identify the number of contacts that were disconnected by an agent versus disconnected by a customer hanging up. For more information, see GetMetricDataV2.	June 6, 2023
conversational analytics theme detection	conversational analytics provides a machine learning powered capability for businesses to help identify top contact drivers by grouping customer conversations into themes. For more information, see Use theme detection to discover issues.	May 24, 2023

Troubleshoot monitoring agent conversations	Added feature specifications for monitoring agent conversations. Added when the multi-party calls and enhanced monitoring feature is and is not enabled on your instance, the number of people who can be on the same agent call at the same time. Added a new topic to help you troubleshoot problems that might occur when supervisors monitor live agent conversations. For more information, see Troubleshoot monitoring agent conversations with Connect Customer.	May 18, 2023
New APIs for managing prompts	You can programmatically create and manage prompts using APIs, for example, to extract prompts stored in Connect Customer and add them to your Amazon S3 bucket. AWS CloudTrail, CloudFormation, and tagging are supported. For more information, see Prompt actions in the *Connect Customer API Reference Guide*. Also see AWS::Connect::Prompt in the *CloudFormation User Guide*.	May 18, 2023

Added security information for forecasting, capacity planning, and scheduling capabilities	For more information, see Data protection in Connect Customer.	May 16, 2023
Updated GetMetricDataV2	GetMetricDataV2 API supports metric data up to the last 35 days. For more information, see GetMetricDataV2.	May 11, 2023
Rich formatting in chat titles and subtitles	You can add rich formatting to the titles and subtitles of your chat messages. For example, you can add links, italics, bold, numbered lists, and bulleted lists. You use markdown to format your text. For more information, see Rich formatting in titles and subtitles in the *Add interactive messages to chat* topic.	May 2, 2023

GA for Connect Customer evaluation capabilities	Released Connect Customer evaluation capabilities for general availability. This release includes the capabilities to create rules based on evaluation results, and search for evaluations and evaluation forms. For more information, see Evaluate agent performance. To manage evaluation forms programmatically, see the Evaluation actions in the *Connect Customer API Reference*. To create a shared template for evaluation forms, see the AWS::Connect::EvaluationForm resource in the *CloudFormation User Guide*.	April 25, 2023
Added new `CreateParticipant` API	Added the CreateParticipant API which you can use to customize chat flow experiences. You use it to integrate custom participants. For more information, see Customize chat flow experiences by integrating custom participants.	April 21, 2023

Customer Profiles displays case information in the agent workspace	Using Connect Customer Customer Profiles inside the agent workspace, agents can see cases from third-party case management solutions and Connect Customer Cases inside a particular customer profile. For more information, see Use Customer Profiles and Access Customer Profiles in the agent workspace.	April 19, 2023
Updated Set recording and analytics flow block topic	Added information that explains how to disable Contact Lens conversational analytics. See Configuration tips in the *Flow block: Set recording and analytics behavior* topic.	April 14, 2023
Updated Service quotas page	Clarified how long it takes for quota increases to be processed. Corrected **Scheduled reports per instance** to indicate it is not adjustable. For more information, see Connect Customer service quotas.	April 13, 2023
Added Wisdom support for Microsoft SharePoint Online	You can choose Microsoft SharePoint Online as knowledge base for Wisdom articles.	April 12, 2023

Update to Set Voice ID block	Updated the Set Voice ID block so it supports fraud watchlist ID for fraud detection.	April 10, 2023
Added Cross-channel concurrency	You can configure an agent's routing profile to receive contacts from multiple channels at the same time. For example, while an agent is on a voice contact, they can be offered contacts from any other channels enabled in the routing profile, such as chats and tasks. For more information, see Create a routing profile. Also see the CrossChannelBehavior API.	April 10, 2023
Search, sort, and filter published agent schedules	Schedulers can quickly search, sort, and filter agent schedules from within the published schedule calendar. For more information, see Search and sort a schedule.	April 4, 2023

Added staff level shift profile	You can assign a shift profile to individual agents. This is useful to do when, for example, you have part-time agents who are in the same staffing group as your full-time agents, but they require their own shift profile. For more information, see the **Associate to shift profile** option described in Create staff rules for scheduling.	March 31, 2023
Updated Set up outbound caller ID	As of March 31, 2023, Connect Customer no longer sets CNAM configurations. For more information, see CNAM in the *Set up outbound caller ID* topic.	March 30, 2023

Create step-by-step guides for your agents	Inside the out-of-the-box Connect Customer agent workspace, you can create workflows that walk agents through custom UI pages that suggest what to do at a given moment during a customer interaction. You can create guides that help agents identify customer issues and recommend subsequen t actions, as well as surface screen-pops and forms for submitting transactions and disposition codes. For more information, see Agent Workspace guided experience.	March 27, 2023
Added support for nested JSON in Invoke AWS Lambda function flow block	The Invoke AWS Lambda function flow block supports JSON responses. For more information, see Flow block: Invoke AWS Lambda function.	March 27, 2023
Added support for multiple fraudster watchlists	Every domain has a default watchlist where all existing fraudsters are placed by default. You can create and manage custom watchlists to be evaluated against for known fraudster detection . For more information, see Known fraudster detection , and see new actions in the Connect Customer Voice ID API Reference.	March 27, 2023

Added Show View flow block	This block is used to configure UI based workflows that you can surface to users in front end applications. For more information, see Flow block: Show view.	March 27, 2023
Search and sort schedules in the Schedule Manager	Schedulers can quickly search for schedule names using partial keywords or sort the schedule list based on start date, end date, creation date, or updated date. For more information, see Search and sort a schedule.	March 24, 2023
Configure multiple IAM roles that can be assigned to a single user when using SAML 2.0	You can configure multiple IAM roles that can be assigned to a single user when using SAML 2.0 which enables you to support user access from multiple identity providers simultaneously. For example, if you are migrating identity providers, you can configure multiple IAM roles associated to a single user and that user will be able to access Connect Customer from either provider. To learn more about configuring IAM roles for SAML 2.0 in Connect Customer, see the Configure SAML with IAM for Connect Customer documentation.	March 17, 2023

Panel template for interactive chat messages	With a panel template, you can present customers with up to 10 choices under one question in a chat message. For more information, see Add interactive messages to chat.	March 10, 2023
Added `GetMetricDataV2` API	Added the GetMetricDataV2 API to the *Connect Customer API Reference Guide*. This API enables you to programmatically access trailing 14 days of historical agent and contact metrics data. It extends the capabilities of the GetMetricData API, provides new historical metrics (for example, the number of contacts disconnected, and the number of callback attempts), and provides the ability to filter metrics with more granularity.	March 8, 2023
Added permission for managing Connect Customer Customer Profiles Service Linked Roles	Added `iam:CreateServiceLinkedRole` which allows you to create service-linked roles for Customer Profiles.	March 7, 2023
Updated Set up US emergency calling	Updated the steps involved in setting up US emergency calling. For more information, see Set up US emergency calling in Connect Customer.	March 6, 2023

Added the DeleteDomain API for Cases	For more information, see the DeleteDomain API in the *Connect Customer Cases API Reference Guide*.	February 24, 2023
Added new attribute type ENHANCED_CONTACT_MONITORING to Describe, List and Update Instance Attribute APIs	This release updates the APIs: DescribeInstanceAttribute, ListInstanceAttributes, and UpdateInstanceAttribute. You can use it to programmatically enable/disable enhanced contact monitoring using attribute type ENHANCED_CONTACT_MONITORING on the specified Amazon Connect instance. For more information, see DescribeInstanceAttribute, ListInstanceAttributes, and UpdateInstanceAttribute.	February 24, 2023
Added RelatedContactId to StartTaskContact API	You can link together an unlimited number of task contacts using the RelatedContactID parameter supported in the StartTaskContact API. For more information, see Linked tasks and the StartTaskContact API in the *Connect Customer API Reference Guide*.	February 24, 2023

Connect Customer Cases integrates with AWS PrivateLink	For more information, see Connect Customer and interface VPC endpoints (AWS PrivateLink).	February 20, 2023
Added `CONTACT_EVALUATIONS` to `ResourceType`	In the *Connect Customer API Reference Guide*, added `CONTACT_EVALUATIONS` as a valid value to the `ResourceType` parameter. This affects the following APIs: AssociateInstanceStorageConfig, DescribeInstanceStorageConfig, DisassociateInstanceStorageConfig, ListInstanceStorageConfig, and UpdateInstanceStorageConfig.	February 20, 2023
Added support to provide visibility into an agent's next activity	You can view an agent's next activity in the real-time metrics agent table in the Connect Customer real-time metrics UI and by using the public API. For more information, see the NextStatus API reference.	February 17, 2023

Added support to provide more granular permissions to metrics reports, including new permissions for real-time metrics, historical metrics, and agent activity audit	You can configure more granular permissions to metrics and reports from within security profiles in the Connect Customer admin website. For more informati on, see Permissions required to view real-time metrics reports and Agent activity audit permissions.	February 17, 2023
Added support for more granular access controls (using resource tags) to view real-time metrics for agents, queues, and routing profiles	You can enable more granular access controls for real-time metrics by configuri ng resource tags and access control tags within security profiles in the Connect Customer admin website. For more information, see Real-time tag-based access control and Tag based access control in Connect Customer.	February 17, 2023
S3 Object Lock for the call recordings bucket	You can use Amazon S3 Object Lock in combinati on with your call recording bucket to help prevent call recordings from being deleted or overwritten for a fixed amount of time, or indefinit ely. For more information, see How to set up S3 Object Lock for immutable call recordings.	February 3, 2023

CloudFormation templates for instance management	You can use CloudFormation templates to manage Connect Customer instances for associating Amazon Lex and Lex V2 bots, Lambda functions, security keys, and approved origins—along with the rest of your AWS infrastructure—in a secure, efficient, and repeatable way. For more information, see Connect Customer resource type reference in the *CloudFormation User Guide*.	February 2, 2023
Added information about key highlights	To learn about the agent's key highlights experience in the Contact Control Panel, see Design a flow for key highlights.	January 30, 2023
Updated Concurrent post-chat analytics jobs quota	Changed **Concurrent post-chat analytics jobs** quota from 100 to 200. For more information, see conversational analytics service quotas.	January 27, 2023

Added persistent chat	Customers often start a chat, then leave the conversation and return later to continue chatting. This might happen many times over the course of several days, months, or even years. To support long running chats like these, you enable persistent chat. For more information, see Enable persistent chat. Also see changes to StartChatContact in the *Connect Customer API Reference Guide*, and see the GetTranscript API the *Connect Customer Participant Service API Reference Guide*.	January 20, 2023
Added documentation requirements Brazil, Caribbean, Iceland, and other numbers	Updated documentation requirements for Austria, France, and Japan as well. For more information, see Region requirements for ordering and porting phone numbers.	January 13, 2023
Added documentation requirements for porting Argentina numbers	For more information, see Region requirements for ordering and porting phone numbers.	January 9, 2023

Updates to GetCurrentMetricData and GetCurrentUserData	For the GetCurrentMetricData API, added support for routing profile filter, sort criteria, and grouping by routing profiles. For the GetCurrentUserData API, added support for routing profiles, user hierarchy groups, and agents as filters, and next status and agent status name. For both APIs, added ApproximateTotalCount.	December 23, 2022
Added message receipts feature for chat messages	The message receipts feature allows customers to receive *Message delivered* and *Read* receipts after they send a chat message. For more information, see Enable message Delivered and Read receipts in your chat user interface. Also see the SendEvent action, and the Item, MessageMetadata, and Receipt data types in the *Connect Customer Participant Service API Reference Guide*.	December 23, 2022
Microsoft Edge Chromium support	Connect Customer now supports Microsoft Edge Chromium. For more information about supported browsers, see Browsers supported by Connect Customer.	December 22, 2022

Added chat timeouts for chat participants	When a chat conversation between an agent and a customer has been inactive (no messages sent) for a certain amount of time, you might want to consider a chat participant to be idle, and you might even want to automatically disconnect an agent from the chat. To set up chat timeout timers, see Set up chat timeouts for chat participants.	December 22, 2022
Updated definition of DequeueTimestamp	For the updated definitio n, see Contact records data model.	December 21, 2022

Connect Customer supports JSON as a content type for chat messages	By supporting JSON as a content type, Connect Customer provides you with a way to pass additional information over chat to provide rich personalized experiences. For example, rendering updates to a custom UI, customer-built interactive messages, language translation capabilities, and passing customer metadata to a third party bot. For more information, see StartChatContact in the *Connect Customer API Reference Guide*, and SendMessage in the *Connect Customer Participant Service API Reference Guide*.	December 21, 2022
Added feature availability by Region	Added Connect Customer features (such as Agent workspace, Tasks, and Wisdom), and the Regions where they are available . For more information, see Availability of Connect Customer services by Region.	December 20, 2022
Added topic on Connect Customer availability by Region	For more information, see Availability of Connect Customer services by Region.	December 16, 2022

conversational analytics granular data redaction	When you set up conversational analytics sensitive data redaction, you can choose which entities you want to redact, and how you want the redaction to appear in the transcript. For more information, see Enable redaction of sensitive data.	December 15, 2022
Released Barge to allow contact center managers to join ongoing calls	Barge allows managers to join and participate in an ongoing customer service call between a contact center agent and customer. After joining the call, a manager can speak with the customer, add participants, and even choose to remove an agent if needed. For more information, see Barge live conversations.	December 14, 2022
Additional conversational analytics language support and Region availability	Documented that conversational analytics supports the following languages: English - New Zealand, English - South Africa. It is also available in the following Regions: Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore).	December 14, 2022

Added user hierarchy to bulk user upload	You can assign the user hierarchy in the .csv file when you add users in bulk. For more information, see Add users in bulk.	December 13, 2022
Granular access controls using resource tags for users, security profiles, routing profiles, and queues	You can now enable more granular access controls for security profiles, users, routing profiles, and queues by configuring resource tags within the Connect Customer console. You can add resource tags to filter and organize these resources logically, and configure access control tags within security profiles to enforce granular permissio ns. For more information, see Tagging resources in Connect Customer and Tag based access controls in Connect Customer.	December 9, 2022
Bulk user import now includes agent hierarchy and tags	Connect Customer now allows you to configure hierarchi es and resource tags for users in bulk. You can now assign agent hierarchies and resource tags to each agent using the CSV bulk upload template which is available on the user management page. For more information, see Tagging resources in Connect Customer.	December 9, 2022

Rules Function language	The Rules Function language is a JSON-based represent ation of a series of rule conditions. Use it to programmatically add conditions to rules. For more information, see Connect Customer Rules Function language in the *Connect Customer API Reference Guide*.	December 7, 2022
Search contacts by agent's first or last name is available in AWS GovCloud	For more information, see Search contacts by agent's first or last name.	December 5, 2022
GA for Rules APIs	Released a set of Rules APIs that enable you to programmatically create and manage rules. For more information, see Rules actions in the *Connect Customer API Reference*.	December 5, 2022
conversational analytics supports chat	Connect Customer conversat ional analytics provides conversational analytics capabilities for Connect Customer chat, extending the machine learning powered analytics to better assess chat contacts. For more informati on, see Analyze conversat ions using Connect Customer conversational analytics.	November 29, 2022

GA for Forecasting, scheduling, and capacity planning	Released Forecasting, scheduling, and capacity planning for General Availability. These features help you have the right number of agents working at the right times to achieve your operational goals. For more information, see Forecasting, capacity planning, and scheduling.	November 29, 2022
Create step-by-step guides for your agents	Inside the out-of-the-box Connect agent workspace, you can now create workflows that walk agents through custom UI pages that suggest what to do at a given moment during a customer interaction. You can create guides that help agents identify customer issues and recommend subsequent actions, as well as surface screen-pops and forms for submitting transactions and disposition codes. For more information, see Agent Workspace guided experience.	November 29, 2022

Added evaluation form features to conversational analytics (Preview)	You can create evaluation forms, and then make them available to managers to review conversations along side contact details, recordings, transcripts, and summaries, without the need to switch applications. Conversational analytics automatically pre-populates evaluation scores for criteria like script adherence, sensitive data collection, and customer greetings. For more information, see Evaluate performance (Preview).	November 29, 2022
Added configurable Lex timeouts in chat	You can configure how long to wait for a response from a customer in a chatbot conversation before the session expires. For more information, see *Configurable time-outs for chat input* in the Get customer input topic.	November 22, 2022
Create rules that send email notifications	You can create conversational analytics rules that send email notifications to people in your organization. For more information, see Create conversational analytics rules that send email notifications.	November 17, 2022

Added MonitorContact API	Added a new API for programmatically initiating monitoring of ongoing contacts. For more information, see MonitorContact API.	November 17, 2022
Search for profiles using multiple search keys	In addition to searching for profiles with a single search key (that is, a key-values(s) pair), the SearchProfiles API has been enhanced to support searching for profiles using multiple keys and logical operators. This new functionality allows you to use between 1 and 5 search keys with AND or OR logic to find profiles with attributes that match the search criteria.. For more information, see the SearchProfiles API reference.	November 14, 2022
Increased Cases domain quota from 2 to 5	Increased the default maximum number of Cases domains per AWS account from 2 to 5. For more information, see Connect Customer Cases service quotas.	November 9, 2022
Added new fields to the GetFederationToken response payload	Added `SignInUrl` , `UserArn`, and `UserId` to the GetFederationToken response payload.	November 9, 2022

Added ability to disable case templates through the UpdateTemplate API	Disabling templates prevents users from creating cases by using the template. For more information, see the Connect Customer Cases API Reference .	November 9, 2022
Renamed external quick connects to phone number quick connects	For more information, see Types of quick connects.	November 8, 2022
Delete quick connects using the Connect Customer console	For more information, see Delete quick connects.	November 4, 2022
Added DismissUserContact API	Added a new API for programmatically clearing the notifications agents receive after they have missed or rejected a contact, making them eligible to be routed new contacts. This API can also be used to clear similar notifications when an agent encounters an error with accepting the contact or is handling After Contact Work. For more information, see the DismissUserContact API reference.	November 1, 2022
Added secondary email address and mobile number to user account	You can now add a secondary email address and mobile number to a user account. For more information, see Add users to Connect Customer.	October 28, 2022

Enhanced 911 (E911)	Enhanced 911 (E911) enables location information to be sent to 911 dispatch when a 911 call is placed. In addition to connecting a user with 911 emergency services, customers in the United States can build E911 capabilities to automatically provide the caller's address information to 911 dispatchers. For more information, see Set up US emergency calling in Connect Customer.	October 21, 2022
GA for Connect Customer Global Resiliency	Released Connect Customer Global Resiliency for General Availability. It enables you to provide customer service anywhere in the world with the highest reliability, performance, and efficiency, while meeting international regulatory requirements. For more information, see Set up Connect Customer Global Resiliency.	October 19, 2022
Corrected Wisdom service quota	The originally published quota for **Content per knowledge base** was incorrect. Corrected the documentation to indicate the quota is 5,000.	October 17, 2022

Feature specifications for the integration association resource	For more information, see Integration association resource feature specifications.	October 13, 2022
Added Ctrl+Shift+F to search flow block titles and metadata	For more information, see the Release notes.	October 10, 2022
GA for Connect Customer Cases	We've released Connect Customer Cases for General Availability. Connect Customer Cases allows your agents to quickly track and manage customer issues that require multiple interactions, follow-up tasks, and teams in your contact center. For more information, see Connect Customer Cases and Connect Customer Cases API Reference .	October 3, 2022
Updated flow designer	We've released a number of improvements to the flow designer experience to make building and editing flows easier. For a detailed list of changes, see Updated flow designer in the *Release notes*.	September 24, 2022

Search for Connect Customer users by first name, last name, and more	You can search for Connect Customer users by first name, last name, user login, agent hierarchy, security profile, and routing profile. For example, you can search for all Connect Customer users who have the first name "Jane."	September 22, 2022
Visualize historical queue data	You can now visualize historical queue data by using time series graphs to help identify patterns, trends, and outliers specifically for **Service Level**, **Contacts Queued**, and **Average Handle Time**. For more informati on, see Visualize: Queue dashboard.	September 21, 2022
Voice spoofing	Use Voice ID to evaluate calls for voice spoofing. For more information, see Voice spoofing detection and the Connect Customer Voice ID API Reference.	August 29, 2022
Released SearchSecurityProf iles API	Added a new API for programmatically searching security profiles. For more information, see SearchSec urityProfiles.	August 19, 2022

Released Schedule Adherence (Preview)	Contact center supervisors or managers track schedule adherence to understand when agents are following the schedule that you have created. This helps ensure you achieve your service level targets, while improving agent productivity and customer satisfaction. For more information, see Schedule Adherence.	August 1, 2022
Attachments per chat conversation now at 35	Updated the limit for attachments per chat conversations from 5 to 35. See Feature specifications.	July 20, 2022
Added Voice ID Flow language actions	Added topics for the following Voice ID Flow language actions: CheckOutboundCallStatus, CheckVoiceId, and StartVoiceIdStream.	July 19, 2022
Search for contacts by using the agent's first or last name	You can search for contacts using the agent's first or last name. The filter name is **Agent**.	July 15, 2022

Released updates for rich text format rendering	On the **Contact Search** and **Contact Detail** pages, you can now view chat transcripts that have rich text formattin g, such as bold or italic font, bullet points, numbered lists, and hyperlinks. For more information about getting started with Connect Customer Chat, see Set up your customer's chat experience.	July 13, 2022
View call transcript in CCP or agent application	For more information, see View a call transcript during ACW.	July 7, 2022
Added feature specifications for conversational analytics	For more information, see Connect Customer conversat ional analytics feature specifications.	July 1, 2022
Support for Lex intent confidence scores and sentiment analysis	You can further personali ze the automated self-serv ice customer experienc e using Amazon Lex V2 intent confidence scores and sentiment analysis as a branch within your flows. For more information, see the Get customer input block. For a list of new contact attribute s see Amazon Lex V2 contact attributes.	June 29, 2022

GA for Connect Customer Outbound Campaigns	Released Connect Customer Outbound Campaigns, formally known as High-volume outbound communications, for General Availability. This release includes a set of APIs for creating and managing outbound campaigns. For more information, see Enable Connect Customer outbound campaigns and Connect Customer Connect Customer Outbound Campaigns API Reference.	June 20, 2022
Connect Customer Cases (Preview)	Connect Customer Cases (Preview) allows your agents to quickly track and manage customer issues that require multiple interactions, follow-up tasks, and teams in your contact center. For more information, see Connect Customer Cases (Preview) and Connect Customer Cases API Reference (Preview).	June 20, 2022
Updated Amazon Lex bot per instance quota	Updated the Amazon Lex bot per instance quota from 50 to 70. For more information, see Connect Customer service quotas.	June 7, 2022

New GetCurrentUserData API	Released the GetCurrentUserData API. It enables you to return the real-time active user data from the specified Connect Customer instance.	June 6, 2022
Released task templates	You can now create custom task templates, making it easy for agents to consistently capture the relevant and required information to create or complete tasks. For more information, see Create task templates. For information about using the API to programmatically create and manage task templates, see the Connect Customer API Reference and the Connect Customer Resource Type Reference in the *AWS CloudFormation User Guide*.	June 2, 2022
New API to transfer contacts	Added a new API that you can use to transfer contacts from one agent or queue to another agent or queue at any point after a contact is created. For information, see TransferContact in the *Connect Customer API Reference*.	June 2, 2022

Updated workflow for outbound campaigns	Updated the workflow for onboarding to outbound campaigns using the Connect Customer and Amazon Pinpoint user interface. For more information, see Enable outbound campaigns.	May 27, 2022
Voice ID expires speakers	For BIPA Compliance, Connect Customer Voice ID automatically expires speakers that have not been accessed for enrollment, re-enrollment, or successful authentication for three years. You can see a speaker's last access time by looking at the `lastAccessedAt` attribute returned by the DescribeSpeaker and ListSpeakers APIs, and the What data is stored? section of the Connect Customer Admin Guide.	May 25, 2022
Search Voice ID results	Added topic Search and review Voice ID results.	April 28, 2022

New API to change agent's current status	Connect Customer provides an API to programmatically change the current status of an agent. Agent statuses are used to determine when an agent is **Available** to be routed contacts in Connect Customer, versus when they are set to **Offline** or a custom status such as **Lunch** or **Break** and should not be routed contacts. For more informati on, see PutUserStatus in the Connect Customer API Reference.	April 28, 2022
New APIs	Added API to search for user records by first name, last name, username, routing profile, security profile, agent hierarchies or tags. Added API to claim new phone numbers and configure them programmatically. For more information, see the Connect Customer API Reference.	April 25, 2022

Multi-party calls	You can enable Connect Customer to allow up to six parties on a call: the agent, the caller, and four more participants. For more information, including a comparison of how multi-party calling differs from the default three-party calling, see Telephony: Multi-party calls.	April 6, 2022
Play prompts from an Amazon S3 bucket	Added the ability to source prompts from an Amazon S3 bucket. This enables you to store as many voice prompts as needed in Amazon S3 and access them in real time using contact attributes in the following flow blocks that play prompts: Get customer input, Loop prompts, Play prompt, and Store customer input.	April 5, 2022
Real-time contact analysis segment streams	Added support for accessing Contact Lens analytics in near real-time. For more informati on, see Use streaming for real-time contact analysis.	March 28, 2022

Rich messaging for chat	Added support for rich messaging for your customer's chat experience. Agents and customers can use bold, italic, bulleted lists, numbered list, hyperlinks, and attachments. For more For more information, see Enable text formatting for your customer's chat experience.	March 13, 2022
Object type mapping user interface	Added a user interface for creating object type mapping by using the Connect Customer admin console. For more information, see Create an object type mapping.	March 8, 2022
Updates to `AmazonConnectServiceLinkedRolePolicy`	Added actions for Amazon CloudWatch metrics. For more information, see Connect Customer updates to AWS managed policies.	February 22, 2022
Added bulk ingestion of data for Customer Profiles	For more information, see *Bulk ingestion of data* in the Set up integration for Salesforce, ServiceNow, Marketo, or Zendesk topic.	February 21, 2022
New quotas for APIs	For StartChatContact , StartContactStreaming , StopContactStreaming , a RateLimit of 5 requests per second, and a BurstLimit of 8 requests per second.	February 11, 2022

New CloudWatch metrics for chat	Added the following Amazon CloudWatch metrics for chat: **ConcurrentActiveChats**, **ConcurrentActiveChatsPercentage**, **ChatBreachingActiveChatQuota**, and **SuccessfulChatsPerInterval**. For more information, see Monitoring your instance using CloudWatch.	February 11, 2022
Documented Rules feature specifications	Documented the feature specifications for Connect Customer Rules. For more information, see Connect Customer Rules feature specifications.	January 28, 2022
Documented Identity Resolution quotas	Documented three quotas for Identity Resolution. For more information, see Customer Profiles quotas.	January 28, 2022
Configure maximum chat duration	You can configure the total duration per chat to be up to 7 days, including wait time. For more information, see the `ChatDurationInMinutes` parameter in the StartChatContact API.	January 27, 2022
conversational analytics supports custom vocabularies	For more information, see Add custom vocabularies.	January 25, 2022
Released tagging support for UserHierarchyGroup resource	For more information, see CreateUserHierarchyGroup.	January 20, 2022

Communications widget supports browser notifications	For more information, see Browser notifications.	December 21, 2021
Integrate Customer Profiles with Segment and Shopify	For more information, see Set up integration for Segment and Set up integration for Shopify.	December 20, 2021
Updated compliance for tasks	Tasks is in compliance with GDPR, and is approved for SOC, PIC, HITRUST, ISO, and HIPAA.	December 17, 2021
Released unified agent application	Connect Customer released the unified agent application to improve the agent experience and customer interactions. For more information, see Agent training guide.	November 30, 2021
Released key highlights	Connect Customer conversational analytics provides the option for you to view key highlights. The key highlights show only those lines where conversational analytics has identified an issue, outcome, or action item in the transcript. For more information, see View key highlights.	November 30, 2021

Documented Average API Connecting Time	Documented the real-time metric **Average API Connecting Time**. For more information, see Average API Connecting Time.	November 26, 2021
Released Identity Resolution to consolidate similar profiles	Connect Customer Customer Profiles offers Identity Resolution, a feature that is designed to automatic ally detect similar customer profiles by comparing name, email address, phone number, date of birth, and address. For more information, see Use Identity Resolution to consolidate similar profiles and the Connect Customer Customer Profiles API Reference.	November 24, 2021
Updated Customer Profiles service quotas	Connect Customer Customer Profiles now supports 1000 objects per profile (increase d from 100), and 50MB Maximum size of all objects for a profile (increased from 5MB). For more informati on, see Connect Customer Customer Profiles service quotas.	November 23, 2021

Connect Customer Customer Profiles stores contact history at no charge	Connect Customer Customer Profiles now provides contact history and customer information together in unified customer profiles at no charge, helping contact center managers personalize the contact center experienc e. In new instances, Customer Profiles is enabled by default. For more information, see Step 4: Data Storage in the *Create an Connect Customer instance* topic.	November 23, 2021
New APIs to archive/u narchive and delete flows	Added new APIs that provide a programmatic and flexible way to manage your library of flows at scale. For example, flows used only during certain times of the year can be archived when not in use and then unarchived when needed. You can now also delete a flow so it is no longer available for use. For more information, see the Connect Customer API Reference.	November 22, 2021

Added modular flows to help you create common functions	Flow modules are reusable sections of a flow. You can create them to extract repeatable logic across your flows, and create common functions. For more informati on, see Flow modules for reusable functions.	November 22, 2021
Search contacts by custom contact attributes	Added support for searching contacts by custom contact attributes (also called user-defined attributes). For more information, see Search by custom contact attributes.	November 15, 2021
Added **Customer profiles** block	Added the Customer profiles block. It enables you to retrieve, create, and update a customer profile.	November 15, 2021
Updated `AmazonCon nect_FullAccess`	Added permissions for managing Connect Customer Customer Profiles. See Connect Customer updates to AWS managed policies.	November 12, 2021
Released security profiles APIs	Added APIs so you can create and manage security profiles programmatically. For more information, see the Connect Customer API Reference.	November 12, 2021

Released scheduled tasks	Added the ability to schedule tasks up to six days in the future to follow-up on customer issues when promised. You can also update the scheduled date and time using the UpdateContactSchedule API. For more information, see the Create task block and the Create a task topic in the *Agent training guide*.	November 12, 2021
Released Contact APIs	Added APIs so you can get and update contact details programmatically. For example, you can describe contact details such as queue information, chat attachments, task references, and update contact information such as task name. For more information, see DescribeContact, UpdateContact, and ListReferences in the *Connect Customer API Reference*.	November 12, 2021

Changes to real-time metrics agent tables	We are rolling out a new service to maintain the high availability from metrics that you expect from Connect Customer. Due to this change, the agent tables are sorted by agent status instead of by agent login. Additionally, the queues and routing profiles table are sorted by agents online instead of by queue or routing profile name.	November 12, 2021
Added actions to `AmazonConnectServiceLinkedRolePolicy`	Added actions for Connect Customer Customer Profiles. See Connect Customer updates to AWS managed policies.	November 12, 2021
Added new metrics	Added following new historical metrics: **Contacts transferred in by agent** and **Contacts transferred out by agent**. Added new real-time metrics: **Transferred in by agent** and **Transferred out by agent**. See Historical metrics definitions and Real-time metrics definitions.	November 9, 2021
Released real-time chat message streaming	You can subscribe to a real-time stream of chat messages. For more information, see Enable real-time chat message streaming.	October 29, 2021

Cross-service confused deputy prevention for Customer Profiles	Updated Cross-service confused deputy prevention with more sample policies you can apply for Connect Customer Customer Profiles.	October 26, 2021
GA for HoursOfOperation APIs	Released the Connect Customer `HoursOfOperation` APIs for general availability (GA). Also launched CloudFormation support for Users, User Hierarchies, and Hours of Operation. For more information, see the Connect Customer API Reference and the AWS CloudFormation User Guide.	October 22, 2021
Example: Programmatically integrate S3 with Customer Profiles	Added a topic that shows how to programmatically integrate S3 with Customer Profiles.	October 21, 2021
Cross-service confused deputy prevention	Added a topic with example policies you can apply for Cross-service confused deputy prevention.	October 18, 2021
How long unanswered callbacks stay in queue	In the Set up queued callback topic, clarified that unanswered queued callbacks stay in queue at least 7 days and up to 14 days before Connect Customer automatically removes them.	October 13, 2021

Updated endpoint for client-side metrics	In the Set up your network topic, changed the endpoint for client-side metrics from `*.execute-api.{region}.amazonaws.com` to `*.telemetry.connect.{region}.amazonaws.com` .	October 11, 2021
Corrected errors in Service quota topic	Corrected errors in the Service quotas topic: For Connect Customer Wisdom, **Maximum size per document** is 1MB not 10MB. For Connect Customer Customer Profiles, the name of the quota is **Object Types per domain** not Objects per domain. Updated the Connect Customer Voice ID quotas table with correct information.	October 8, 2021
Preview release of outbound campaigns	Added content for the preview release of outbound campaigns. By using Amazon Pinpoint Journeys and Connect Customer, you can now create outbound campaigns for voice, SMS, and email. For more information, see Enable outbound campaigns.	September 27, 2021

New Amazon AppIntegrations Service APIs	New DataIntegration APIs for the Amazon AppIntegrations Service: `CreateDataIntegration`, `DeleteDataIntegration`, `GetDataIntegration`, `ListDataIntegrationAssociations`, `ListDataIntegrations`, `UpdateDataIntegration`. For more information, see Amazon AppIntegrations Service API Reference.	September 27, 2021
Connect Customer Wisdom - General Availability	In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.	September 27, 2021
Connect Customer Voice ID - General Availability	For more information, see Use real-time caller authentication with Voice ID and the Connect Customer Voice ID API Reference.	September 27, 2021

Added new service-linked role policy	Added `AmazonConnectVoiceIDFullAccess` . Use this AWS managed policy so you can set up your users to use Voice ID. This policy provides full access to Connect Customer Voice ID through the AWS console, SDK, or other means. For more information, see AWS managed policy: AmazonConnectVoiceIDFullAccess.	September 27, 2021
Added new service-linked role policy	Added `AmazonConnectCampaignsServiceLinkedRolePolicy` , a new service-linked role policy for outbound campaigns. The policy provides access to retrieve all the outbound campaigns. For more information, see Enable outbound campaigns.	September 27, 2021

Display name and contact attributes in chat	You can now personalize the chat experience, as you can specify the name of your customer that interacts using the chat user interface. You can also securely pass the contact attributes to capture information about the contact which can be used in the flow to further personalize the experience. For more information, see Pass the customer display name when a chat initializes and Pass contact attributes when a chat initializes.	September 17, 2021
Preview of agent application	Launched an updated UI for the agent application preview that combines Customer Profiles and the Contact Control Panel (CCP). For more information, see Access Customer Profiles in the agent application.	September 16, 2021
Added Create task block	Added the **Create task** block. It creates a new task, sets the tasks attributes, and initiates a flow to start the task. For more information, see Flow block: Create task.	September 16, 2021

More languages for Contact Lens	Contact Lens now supports the following languages for post-call and real-time analytics: Japanese, Korean, and Mandarin. The following languages are supported for real-time analytics: French (Canada), French (France), Portuguese (Brazil), German (Germany), and Italian (Italy). For more information, see Contact Lens for Connect Customer in the *Languages supported by Connect Customer* topic.	September 13, 2021
Updated historical metrics definitions	Updated the definitions of **Contacts transferred in** and **Contacts transferred out**. For more information, see Historical metrics definitions.	September 10, 2021
Improved user interface for Connect Customer console	Released a redesigned user interface for the Connect Customer console, making it easier and faster to manage Connect Customer instances . For more information, see Create an Connect Customer instance.	August 27, 2021
Customer Profiles is HIPAA compliant	Customer Profiles is now HIPAA compliant. Removed note stating it is not.	August 23, 2021

Porting numbers in Singapore	Updated documentation requirements. For more information, see Singapore in the *Region requirements for ordering and porting phone numbers* topic.	August 10, 2021
APIs for hours of operation and agent status	Released for ungated preview new APIs for managing hours of operation and agent status. For more information, see Connect Customer Service API Reference.	August 6, 2021
Contant Lens rules create tasks and EventBridge events	Contact Lens rules now allow you to generate tasks and EventBridge events based on uttered keywords, sentiment scores, customer attributes, and other criteria. For more information, see Build rule with Contact Lens.	August 5, 2021
Countries you can call by default	We have updated the list of countries you can call by default when you create a new instance in a given Region. For more information, see Countries you can call.	August 4, 2021

Add AWS Global Accelerator to your allowlist	When using SAML Sign-In to your Connect Customer instance, you now need to add the AWS Global Accelerat or domain, ***. awsglobal accelerator.com**, to your allowlist. For more informati on, see Set up your network.	August 3, 2021
New "Next status" feature	To help agents manage their time, we have released a feature that lets agents pause new contacts being routed to them while they finish their current contacts. For more information, see "Next status" feature for the CCP.	July 30, 2021
Update to Contact search functionality	To use the **Agent** filter on the **Contact search** page, in your Connect Customer security profile you must have **Users - View** permissions. For more information, see Contact search: To search contacts by Agent login requires Users - View permissions in your security profile.	July 23, 2021
Added two task metrics sent to CloudWatch	Connect Customer sends the following two new metrics to CloudWatch: ConcurrentTasks and ConcurrentTasksPer centage. For more informati on, see Monitoring your instance using CloudWatch.	July 7, 2021

Updated required permissions for custom IAM policies	Added permissions for Amazon Lex V2. For more information, see Connect Customer updates to AWS managed policies.	June 29, 2021
Apple Messages for Business GA	Released Apple Messages for Business for general availability (GA). For more information, see Enable Apple Messages for Business.	June 28, 2021
Quick connects management API GA	Released Connect Customer quick connects management API for general availability (GA). For more information, see Connect Customer Service API Reference. The quick connects API also supports AWS CloudFormation. For more information, see Connect Customer Resource Type Reference in the AWS CloudFormation User Guide.	June 24, 2021
Added service quota for Amazon Lex V2 V2 bot aliases per instance = 100	For more information about service quotas, see Connect Customer service quotas.	June 17, 2021

Support for Amazon Lex V2 console and APIs	For information on using the Amazon Lex V2 V2 console, see Add an Amazon Lex V2 bot. Added these three APIs: AssociateLexBot, DisassociateLexBot, and ListLexBots. See the Connect Customer Service API Reference.	June 15, 2021
Coming soon: Faster load times for Real-time metrics page	Rollout to all Regions July 19, 2021, to September 19, 2021, subject to change. For more information, see Upcoming change: Faster reload times for the Real-time metrics page.	June 11, 2021
Coming soon: New DataIntegration APIs	On May 20, 2021, we published that new DataIntegration APIs were added to the Amazon AppIntegrations service. These APIs are not yet available.	June 8, 2021
Chat agent concurrency increased	Increased chat agent concurrency from 5 to 10. For more information, see Create a routing profile.	June 7, 2021
Object type mapping for Customer Profiles	Added object type mapping for the Customer Profiles standard profile. For more information, see the Object type mapping for the standard profile.	June 1, 2021

Channels supported by blocks	Added a topic that lists all the blocks and which channels each one supports. For more information, see the Channels each block supports.	May 18, 2021
Added contact events	For more information, see the Connect Customer contact events.	May 12, 2021
Announced upcoming change to Agent audit report	In a future release, you'll be able to download the Agent audit report. For more information, see the Upcoming changes: Download the Agent audit report.	May 4, 2021
Added identity resolution APIs (preview) to Customer Profiles.	For more information, see the GetMatches and MergeProfiles APIs in the Connect Customer Customer Profiles API reference.	April 30, 2021
Added topic on how to apply permissions that restrict which AWS resources can be associated with Connect Customer.	For more information, see Restrict AWS resources that can be associated with Connect Customer.	April 28, 2021
Added chapter on architectural guidance, authored by AWS Solution Architects	For more information, see Architectural guidance for Connect Customer.	April 28, 2021
Announced upcoming fix to agent event stream	For more information, see Upcoming change: Fix for agent event stream.	April 27, 2021

Revised the topics on porting phone numbers	For more information, see Port your phone number.	April 24, 2021
Using Customer Profiles with CCP out-of-the-box is in ungated preview	For more information, see Access the Customer Profiles Agent UI.	April 22, 2021
Announced upcoming changes for Contact search	For more information, see Upcoming changes: Contact search.	April 20, 2021
Added NLB endpoint for Canada (Central) Region	Updated Set up your network with the NLB endpoint for Canada (Central) Region.	April 15, 2021
Connect Customer is now available in the Canada (Central) Region	You can claim toll-free and local telephone numbers from Canadian telephony suppliers . For a list of countries that support the Canada (Central) Region, see Region requirements for phone numbers. Also see Availability of Contact Lens features by Region.	March 31, 2021

Announced upcoming fixes for chat metrics	Currently Connect Customer incorrectly reports that chat contacts that were created from disconnect flows were created from transfer flows. When the fixes are released, Connect Customer will correctly reflect in the contact records and agent event stream that these chat contacts were created from disconnect flows. For more information, see Upcoming change: Fixes for chat metrics in the Release notes.	March 25, 2021
Completed release of new domain name	The domain for the Connect Customer access URL has changed to **my.connect.aws**. For more information, see March 2021 Updates in the Release notes.	March 22, 2021
Default service quota for reports per instance	Updated the default service quota for reports per instance to 2000. This default applies to accounts created in October, 2020 or later. For more information, see Connect Customer service quotas.	March 16, 2021

Identification requirements for ordering and porting phone numbers	Added identification requirements for ordering phone numbers. Added requirements for ordering and porting phone numbers from Argentina, Chile, Mexico, Peru, and Puerto Rico. For more information, see Region requirements for phone numbers.	March 11, 2021
Use the Connect Customer Endpoint Test Utility	To help you validate connectivity to Connect Customer, or troublesh oot when your agents are experiencing problems with the Contact Control Panel (CCP), we added the Connect Customer Endpoint Test Utility. For more informati on, see Use the Endpoint Test Utility.	March 5, 2021
Add a chat user interface to your website.	Added a communica tions widget that you can customize and add to your website. Also provided an open source example to help you get started with adding chat to your website. For more information, see Set up your customer's chat experience.	March 5, 2021

Content Lens real-time analytics is available in Europe (London), Europe (Frankfurt), and Asia (Tokyo).	For more information, see Availability of Contact Lens features by Region.	February 26, 2021
Added ability to create and ingest data into Customer Profiles from Amazon S3	For more information, see Create and ingest data into Customer Profiles from Amazon S3.	February 25, 2021
Added DisconnectReason to the contact record stream	The Connect Customer contact records stream now includes **DisconnectReason** for voice calls and tasks. For more information, see ContactTraceRecord.	February 19, 2021
Added custom service levels	Added the ability to create custom service levels, and update the metrics user interface. For details, see New metric groups and categories.	February 16, 2021
Queue APIs (Preview)	Added APIs so you can programmatically create and manage queues. Queue APIs (Preview).	January 29, 2021
Amazon AppIntegrations APIs - GA	Released Amazon AppIntegrations APIs for general availability (GA). For more information, see Amazon AppIntegrations APIs - GA.	January 29, 2021
New Contact search page	Updated the **Contact search** page. For more information, see Search for contacts.	January 5, 2021

Connect Customer Service API Reference	Added APIs so you can programmatically create and manage quick connects. For more information, see Connect Customer Service API Reference.	December 22, 2020
Chat: Support for sharing attachments	Added support for sharing chat attachments. For more information, see Chat: Support for attachments.	December 21, 2020
Configurable DTMF timeouts for Lex bots	Added support for configurable DTMF timeouts for Lex bots. For more information, see Configurable DTMF timeouts for Lex bots.	December 4, 2020
Connect Customer with Apple Messages for Business (Preview)	Added support for using Connect Customer with Apple Messages for Business. For more information, see Connect Customer with Apple Messages for Business (Preview)	December 3, 2020
Tasks	Added support for tasks, allowing you to prioritize, assign, track, and even automate tasks across the disparate tools agents use to support customers. For more information, see Tasks.	December 1, 2020

Real-time analytics using Contact Lens for Connect Customer	Added real-time analytics for Contact Lens so you can detect and resolve customer issues more proactively while the call is in progress. For more information, see Analyze Conversations with Contact Lens for Connect Customer.	December 1, 2020
Connect Customer Wisdom (Preview)	In November 2023, we released real-time agent assist functionality (formerly known as Amazon Q in Connect and Amazon Connect Wisdom), along with generative AI-powered recommended responses, actions, and links to more information.	December 1, 2020
Connect Customer Voice ID (Preview)	Added Connect Customer Voice ID (Preview), which provides for real-time caller authentication. For more information, see Connect Customer Voice ID (Preview).	December 1, 2020

Connect Customer Customer Profiles	Added Connect Customer Customer Profiles, enabling agents to create a customer profile for every new contact that comes in. You can also integrate with external applications that provide customer profile data. For more information, see Connect Customer APIs.	December 1, 2020
Connect Customer APIs	Added an Connect Customer API that provides the ability to create tasks (`StartTaskContact`), and added a set of preview APIs. For more information, see Connect Customer APIs.	December 1, 2020
Connect Customer supports interact messages for chat	Added interactive message templates. For more informati on, see Add interactive messages to chat.	November 24, 2020
Telephony call metadata attributes	Added call attributes to improve fraud detection and routing. For more informati on, see Telephony call metadata attributes (call attributes).	November 20, 2020

APIs to manage user hierarchies	Added APIs so you can programmatically manage your agent hierarchies and agent groups. For more information, see Connect Customer Service API Reference.	November 18, 2020
Service quotas	Noted that up to 700 quick connects can be added to a queue. See Feature specifications. (This update was published erroneously and has since been removed.)	October 5, 2020
Security	Added new topic on Required permissions for managing access to the Amazon Connect console.	September 24, 2020
Quick filters	Added new topic that explains how to use quick filters in real-time metrics reports. For more information, see Use quick filters to drill into Routing profiles and Queues tables.	September 23, 2020

Service quotas	Updated the service quotas for the following Connect Customer Participant Service APIs: `CreateParticipantConnection` , `DisconnectParticipant` , and `GetTranscript` . For more information, see Amazon Connect Participant Service API throttling quotas.	September 22, 2020
Show agent queues in a Queues table.	By default, agent queues don't appear in a Queues table in a historical metrics report. You can choose to show them. For more information, see Show agent queues in a Queues table.	September 18, 2020
Migrate contact flows to a different instance	You can migrate hundreds of flows using a set of flow APIs. For more information, see Migrate contact flows to a different instance.	September 18, 2020
Languages supported by Connect Customer	Learn about which languages are supported in the Connect Customer console, Contact Control Panel, Contact Lens, Amazon Lex, and Amazon Polly. For more information, see Languages supported by Connect Customer.	September 18, 2020

Connect Customer Flow language	You can use the Connect Customer Flow language to efficiently update flows that you're migrating from one instance to another, and Write flows rather than drag blocks onto the flow designer. For more informati on, see Connect Customer Flow language in the *Connect Customer API Reference Guide*.	September 18, 2020
Option 2 (not recommended): Allow IP address ranges	Removed tip from *Option 2: Allow IP address ranges*, that said if you don't see an entry for your Region, use GLOBAL. For more information, see Option 2 (not recommended): Allow IP address ranges.	September 11, 2020
Option 1 (recommended): Replace Amazon EC2 and CloudFront IP range requirements with a domain allowlist	Updated Option 1, second row of table, with a line break between {myInstanceName}.a wsapps.com/connect/api and *.cloudfront.net. For more information, see Option 1 (recommended): Replace Amazon EC2 and CloudFront IP range requirements with a domain allowlist.	September 11, 2020

Connect Customer resource-level policy examples	Changed title of "Connect Customer resource-based policy examples" topic to "Connect Customer resource-level policy examples." For more information, see Connect Customer resource-level policy examples.	September 8, 2020

Earlier updates

Change	Description	Date
Updated the **Consult** and **Contact consulted** metrics to indicate they were deprecated May 2019.	For more information, see Consult and Contacts consulted.	August 27, 2020
Added topic on setting up agent-to-agent transfers.	For more information, see Set up agent-to-agent transfers in Connect Customer.	August 19, 2020
Added section on requirements for custom termination points.	For more information, see Request numbers or international numbers for Connect Customer.	August 18, 2020
Removed the "Known differences" section from Upgrade your Contact Control Panel (CCP) when using the Connect Customer Streams API.	For more information, see Upgrade your Contact Control Panel (CCP) when using the Connect Customer Streams API.	August 3, 2020

Change	Description	Date
Changed the name of the **Metrics** chapter to **Monitor metrics & run reports**.	For more information, see Metrics, dashboards, and insights in Connect Customer.	July 16, 2020
Clarified that the following metrics are no longer supported in queue grouping: Agent on contact time, Agent idle time, Occupancy . Previously we stated that these metrics had been deprecated.	For more information, see June 2020: Changes for omnichannel support.	July 8, 2020
Updated the Set disconnect flow block, which now supports voice conversations.	For more information, see Set disconnect flow.	June 29 2020
Added upcoming metric changes: new real-time and historical metrics for inbound and outbound contact time	For more information, see Metrics, dashboards, and insights in Connect Customer.	June 26, 2020
Added how to upgrade CCP	For more information, see Upgrade to the latest Connect Customer Contact Control Panel (CCP)..	June 16, 2020
Added video on using CCP	For more information, see Training video: How to use the Contact Center Panel (CCP) in Connect Customer.	June 16, 2020
Deprecated metrics: Agent on contact time, Agent idle time, Occupancy.	For more information, see June 2020: Changes for omnichannel support.	June 12, 2020

Change	Description	Date
Added topic on quick connects work	For more information, see Quick connect scenarios for transferring contacts.	May 21, 2020
Added how to get administr ative support, and added a topic on inherited permissions	For more information, see Get administrative support for Connect Customer and Inherited permissions for Connect Customer and Contact Control Panel (CCP) security profiles.	April 16, 2020
Updated the **Get customer input** block to support timeout values for voice input	For more information, see Get customer input.	April 8, 2020
Added terminating keypress	For more information, see Store customer input.	March 31, 2020
Added NLB endpoints and required domain for softphones	For more information, see Set up your network to use the Connect Customer Contact Control Panel (CCP).	March 23, 2020
Announced upcoming changes for metrics	For more information, see June 2020: Changes for omnichannel support.	March 23, 2020
Added topic on region requirements for phone numbers	For more information, see Region requirements for ordering and porting phone numbers in Connect Customer.	March 11, 2020

Change	Description	Date
Added tutorials	For more information, see Tutorials: An introduction to Connect Customer.	March 6, 2020
Added topic on emergency admin access	For more information, see Emergency login to the Connect Customer admin website.	March 3, 2020
Added topics on saving, sharing, and publishing reports	For more information, see Save custom reports in Connect Customer, Share saved reports in Connect Customer, View a shared report in Connect Customer, and Publish reports in Connect Customer.	January 22, 2020
Added a section about queued callbacks in metrics reporting.	For more information, see Queued callbacks in real-time metrics in Connect Customer.	January 17, 2020
Updated networking guidance for the updated CCP (ccp-v2)	For more information, see Set up your network to use the Connect Customer Contact Control Panel (CCP).	January 15, 2020
Add a topic on logging Connect Customer API calls with AWS CloudTrail	For more information, see Log Connect Customer API calls with AWS CloudTrail.	December 13, 2019
Added a section on analyzing conversations	For more information, see Analyze conversations using conversational analytics in Connect Customer conversational analytics.	December 02, 2019

Change	Description	Date
Added information about live media streaming	For more information, see Set up live media streaming of customer audio in Connect Customer.	November 21, 2019
Added information about chat	For more information, see Web and mobile messaging. Also added these topics: Agent status in the Contact Control Panel (CCP), About contact states in Connect Customer, and Additional resources for Connect Customer.	November 21, 2019
Added topic on using IAM	For more information, see Identity and access management for Connect Customer.	November 14, 2019
Added dimensions	Added dimensions to the Connect Customer metrics sent to CloudWatch. See Monitoring your Connect Customer instance using CloudWatch.	October 22, 2019
Added a networking topic	Consolidated networking content into Set up your network to use the Connect Customer Contact Control Panel (CCP). Updated the guidance.	September 30, 2019

Change	Description	Date
Updated metrics topics	Improved the descriptions of the real-time metrics definitio ns. Added categories to the historical metrics definitions.	August 30, 2019
Updated historical metrics report section	Added categories to the historical metrics definitions.	August 27, 2019
Re-organized the content	Re-organized the content so it's task-based.	July 19, 2019
Added information about the updated **Transfer to phone number** block	You can use the updated **Transfer to phone number** block to transfer callers to a phone number external to your Connect Customer instance, and then optionall y resume the flow after the call with the external party ends. For more information, see Set up a flow in Connect Customer to resume a call with a customer after a transfer.	February 18, 2019
Adding information about live media streaming for customer audio streams	You can capture customer audio during interactions with your contact center and send it to a Kinesis video stream. For more information, see Set up live media streaming of customer audio in Connect Customer.	December 21, 2018

Change	Description	Date
Added content about agent queues	You can use agent queues to route calls directly to a specific agent. For more information, see Transfer contacts to a specific agent in Connect Customer.	December 21, 2018
Added information about using Connect Customer in the Asia Pacific (Tokyo) Region.	For more information, Claim phone numbers for Connect Customer in the Asia Pacific (Tokyo) Region.	December 10, 2018
Added information about how to determine agent ACW time from agent event streams	For more information, see Determine the contact center agent's ACW (After Contact Work) time.	October 30, 2018
Added troubleshooting and best practices	Troubleshooting Issues with the Contact Control Panel (CCP) covers best practices for agent connectivity using the CCP and troubleshooting connectivity and call quality issues in Connect Customer.	October 18, 2018
Added information about service-linked roles in Connect Customer	For more information, see Use service-linked roles and role permissions for Connect Customer.	October 17, 2018

Change	Description	Date
Added information about queue to queue transfers	You can use the new options of the **Transfer to queue** block to enable transferring calls that are already in a queue to another queue. For more information, see Set up a flow to manage contacts in a queue in Connect Customer.	July 31, 2018
Added information about the **Call phone number** block	Updated the content about flows to include the new **Call phone number** block, including how to use the block in a flow. For more information, see Outbound caller ID number.	July 2, 1018
Added information about contact attributes and the **Get queue metrics** block	For more information, see Use Connect Customer contact attributes.	June 18, 2018
Added information about new metrics sent to Amazon CloudWatch Logs.	Monitoring your Connect Customer instance using CloudWatch includes additional metrics.	April 19, 2018
Added information about using SAML for identity management	You can configure your instance to use SAML for identity management. You can also use SAML to enable single sign-on. For more information, see Configure SAML with IAM for Connect Customer.	March 30, 2018

Change	Description	Date
