Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Global Accelerator accelerator has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the accelerator doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the accelerator isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Global Accelerator global accelerator, see see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

Security Hub CSPM controls for AWS Glue

These AWS Security Hub CSPM controls evaluate the AWS Glue service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Glue.1] AWS Glue jobs should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Glue::Job`

AWS Config rule: `tagged-glue-job` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource	StringList (maximum of 6 items)	1–6 tag keys that meet AWS	No default value

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
	must contain. Tag keys are case sensitive.		requirements.	

This control checks whether an AWS Glue job has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the job doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the job isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a AWS Glue job, see AWS tags in AWS Glue in the *AWS Glue User Guide*.

[Glue.3] AWS Glue machine learning transforms should be encrypted at rest

Related requirements: CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::Glue::MLTransform`

AWS Config rule: glue-ml-transform-encrypted-at-rest

Schedule type: Change triggered

Parameters: No

This control checks whether an AWS Glue machine learning transform is encrypted at rest. The control fails if the machine learning transform isn't encrypted at rest.

Data at rest refers to data that's stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it.

Remediation

To configure encryption for AWS Glue machine learning transforms, see Working with machine learning transforms in the *AWS Glue User Guide*.

[Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-02.03

Category: Identify > Vulnerability, patch, and version management

Severity: Medium

Resource type: `AWS::Glue::Job`

AWS Config rule: glue-spark-job-supported-version

Schedule type: Change triggered

Parameters: `minimumSupportedGlueVersion`: `3.0` (not customizable)

This control checks whether an AWS Glue for Spark job is configured to run on a supported version of AWS Glue. The control fails if the Spark job is configured to run on a version of AWS Glue that's earlier than the minimum supported version.

> **Note**
>
> This control also generates a `FAILED` finding for an AWS Glue for Spark job if the AWS Glue version (`GlueVersion`) property doesn't exist or is null in the configuration item (CI) for the job. In such cases, the finding includes the following annotation: `GlueVersion is null or missing in glueetl job configuration`. To address this type of `FAILED` finding, add the `GlueVersion` property to the job's configuration. For a list of supported versions and runtime environments, see AWS Glue Versions in the *AWS Glue User Guide*.

Running AWS Glue Spark jobs on current versions of AWS Glue can optimize performance, security, and access to the latest features of AWS Glue. It can also help safeguard against security vulnerabilities. For example, a new version might be released to provide security updates, address issues, or introduce new features.

Remediation

For information about migrating a Spark job to a supported version of AWS Glue, see Migrating AWS Glue for Spark jobs in the *AWS Glue User Guide*.

Security Hub CSPM controls for Amazon GuardDuty

These AWS Security Hub CSPM controls evaluate the Amazon GuardDuty service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[GuardDuty.1] GuardDuty should be enabled

Related requirements: NIST.800-53.r5 AC-2(12), NIST.800-53.r5 AU-6(1), NIST.800-53.r5 AU-6(5), NIST.800-53.r5 CA-7, NIST.800-53.r5 CM-8(3), NIST.800-53.r5 RA-3(4), NIST.800-53.r5 SA-11(1), NIST.800-53.r5 SA-11(6), NIST.800-53.r5 SA-15(2), NIST.800-53.r5 SA-15(8), NIST.800-53.r5 SA-8(19), NIST.800-53.r5 SA-8(21), NIST.800-53.r5 SA-8(25), NIST.800-53.r5 SC-5, NIST.800-53.r5

SC-5(1), NIST.800-53.r5 SC-5(3), NIST.800-53.r5 SI-20, NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4, NIST.800-53.r5 SI-4(1), NIST.800-53.r5 SI-4(13), NIST.800-53.r5 SI-4(2), NIST.800-53.r5 SI-4(22), NIST.800-53.r5 SI-4(25), NIST.800-53.r5 SI-4(4), NIST.800-53.r5 SI-4(5), NIST.800-171.r2 3.4.2, NIST.800-171.r2 3.14.6, NIST.800-171.r2 3.14.7, PCI DSS v3.2.1/11.4, PCI DSS v4.0.1/11.5.1, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.02, CRI Profile v2.2/DE.CM-01.03

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: guardduty-enabled-centralized

Schedule type: Periodic

Parameters: None

This control checks whether Amazon GuardDuty is enabled in your GuardDuty account and Region.

It is highly recommended that you enable GuardDuty in all supported AWS Regions. Doing so allows GuardDuty to generate findings about unauthorized or unusual activity, even in Regions that you do not actively use. This also allows GuardDuty to monitor CloudTrail events for global AWS services such as IAM.

Remediation

To enable GuardDuty, see Getting started with GuardDuty in the *Amazon GuardDuty User Guide*.

[GuardDuty.2] GuardDuty filters should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::GuardDuty::Filter`

AWS Config rule: `tagged-guardduty-filter` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon GuardDuty filter has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the filter doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the filter isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a GuardDuty filter, see TagResource in the *Amazon GuardDuty API Reference*.

[GuardDuty.3] GuardDuty IPSets should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::GuardDuty::IPSet`

AWS Config rule: `tagged-guardduty-ipset` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon GuardDuty IPSet has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the IPSet doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the IPSet isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging,

you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a GuardDuty IPSet, see TagResource in the *Amazon GuardDuty API Reference*.

[GuardDuty.4] GuardDuty detectors should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: `tagged-guardduty-detector` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon GuardDuty detector has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the detector doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the detector isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a GuardDuty detector, see TagResource in the *Amazon GuardDuty API Reference*.

[GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Detect > Detection services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-eks-protection-audit-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty EKS Audit Log Monitoring is enabled. For a standalone account, the control fails if GuardDuty EKS Audit Log Monitoring is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have EKS Audit Log Monitoring enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the EKS Audit Log Monitoring feature for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty EKS Audit Log Monitoring enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

GuardDuty EKS Audit Log Monitoring helps you detect potentially suspicious activities in your Amazon Elastic Kubernetes Service (Amazon EKS) clusters. EKS Audit Log Monitoring uses Kubernetes audit logs to capture chronological activities from users, applications using the Kubernetes API, and the control plane.

Remediation

To enable GuardDuty EKS Audit Log Monitoring, see EKS Audit Log Monitoring in the *Amazon GuardDuty User Guide*.

[GuardDuty.6] GuardDuty Lambda Protection should be enabled

Related requirements: PCI DSS v4.0.1/11.5.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/DE.CM-02.01

Category: Detect > Detection services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-lambda-protection-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty Lambda Protection is enabled. For a standalone account, the control fails if GuardDuty Lambda Protection is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have Lambda Protection enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty Lambda Protection enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

GuardDuty Lambda Protection helps you identify potential security threats when an AWS Lambda function gets invoked. After your enable Lambda Protection, GuardDuty starts monitoring Lambda network activity logs associated with the Lambda functions in your AWS account. When a Lambda function gets invoked and GuardDuty identifies suspicious network traffic that indicates the presence of a potentially malicious piece of code in your Lambda function, GuardDuty generates a finding.

Remediation

To enable GuardDuty Lambda Protection, see Configuring Lambda Protection in the *Amazon GuardDuty User Guide*.

[GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled

Related requirements: PCI DSS v4.0.1/11.5.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection Services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-eks-protection-runtime-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty EKS Runtime Monitoring with automated agent management is enabled. For a standalone account, the control fails if GuardDuty EKS Runtime Monitoring with automated agent management is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have EKS Runtime Monitoring with automated agent management enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the EKS Runtime Monitoring feature with automated agent management for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty EKS Runtime Monitoring enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters.

Remediation

To enable EKS Runtime Monitoring with automated agent management, see Enabling GuardDuty Runtime Monitoring in the *Amazon GuardDuty User Guide*.

[GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/GV.OC-04.03, CRI Profile v2.2/GV.RM-09.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.DS-01.02, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/

PR.PS-04.03, CRI Profile v2.2/PR.PS-05.01, CRI Profile v2.2/RS.AN-07.01, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-malware-protection-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty Malware Protection is enabled. For a standalone account, the control fails if GuardDuty Malware Protection is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have Malware Protection enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Malware Protection feature for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty Malware Protection enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

GuardDuty Malware Protection for EC2 helps you detect the potential presence of malware by scanning the Amazon Elastic Block Store (Amazon EBS) volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances and container workloads. Malware Protection provides scan options where you can decide if you want to include or exclude specific EC2 instances and container workloads at the time of scanning. It also provides an option to retain the snapshots of EBS volumes attached to the EC2 instances or container workloads, in your GuardDuty accounts. The snapshots get retained only when malware is found and Malware Protection findings are generated.

Remediation

To enable GuardDuty Malware Protection for EC2, see Configuring GuardDuty-initiated malware scan in the *Amazon GuardDuty User Guide*.

[GuardDuty.9] GuardDuty RDS Protection should be enabled

Related requirements: PCI DSS v4.0.1/11.5.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-02.01, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-rds-protection-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty RDS Protection is enabled. For a standalone account, the control fails if GuardDuty RDS Protection is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have RDS Protection enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty RDS Protection enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

RDS Protection in GuardDuty analyzes and profiles RDS login activity for potential access threats to your Amazon Aurora databases (Aurora MySQL-Compatible Edition and Aurora PostgreSQL-Compatible Edition). This feature allows you to identify potentially suspicious login behavior. RDS Protection doesn't require additional infrastructure; it is designed so as not to affect the performance of your database instances. When RDS Protection detects a potentially suspicious or anomalous login attempt that indicates a threat to your database, GuardDuty generates a new finding with details about the potentially compromised database.

Remediation

To enable GuardDuty RDS Protection, see GuardDuty RDS Protection in the *Amazon GuardDuty User Guide*.

[GuardDuty.10] GuardDuty S3 Protection should be enabled

Related requirements: PCI DSS v4.0.1/11.5.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.01, CRI Profile v2.2/DE.CM-02.01, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-s3-protection-enabled

Schedule type: Periodic

Parameters: None

This control checks whether GuardDuty S3 Protection is enabled. For a standalone account, the control fails if GuardDuty S3 Protection is disabled in the account. In a multi-account environment, the control fails if the delegated GuardDuty administrator account or any associated member account doesn't have S3 Protection enabled.

In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the S3 Protection feature for the member accounts in the organization. GuardDuty member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated GuardDuty administrator has a suspended member account that doesn't have GuardDuty S3 Protection enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in GuardDuty.

S3 Protection enables GuardDuty to monitor object-level API operations to identify potential security risks for data within your Amazon Simple Storage Service (Amazon S3) buckets. GuardDuty monitors threats against your S3 resources by analyzing AWS CloudTrail management events and CloudTrail S3 data events.

Remediation

To enable GuardDuty S3 Protection, see Amazon S3 Protection in Amazon GuardDuty in the *Amazon GuardDuty User Guide*.

[GuardDuty.11] GuardDuty Runtime Monitoring should be enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection Services

Severity: High

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-runtime-monitoring-enabled

Schedule type: Periodic

Parameters: None

This control checks whether Runtime Monitoring is enabled in Amazon GuardDuty. For a standalone account, the control fails if GuardDuty Runtime Monitoring is disabled for the account. In a multi-account environment, the control fails if GuardDuty Runtime Monitoring is disabled for the delegated GuardDuty administrator account or any associated member account.

In a multi-account environment, only the delegated GuardDuty administrator can enable or disable GuardDuty Runtime Monitoring for accounts in their organization. In addition, only the GuardDuty administrator can configure and manage the security agents that GuardDuty uses for runtime monitoring of AWS workloads and resources for accounts in the organization. GuardDuty member accounts can't enable, configure, or disable Runtime Monitoring for their own accounts.

GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats, such as Amazon EKS clusters and Amazon EC2 instances.

Remediation

For information about configuring and enabling GuardDuty Runtime Monitoring, see GuardDuty Runtime Monitoring and Enabling GuardDuty Runtime Monitoring in the *Amazon GuardDuty User Guide*.

[GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection Services

Severity: Medium

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-ecs-protection-runtime-enabled

Schedule type: Periodic

Parameters: None

This control checks whether the Amazon GuardDuty automated security agent is enabled for runtime monitoring of Amazon ECS clusters on AWS Fargate. For a standalone account, the control fails if the security agent is disabled for the account. In a multi-account environment, the control fails if the security agent is disabled for the delegated GuardDuty administrator account or any associated member account.

In a multi-account environment, this control generates findings only in the delegated GuardDuty administrator account. This is because only the delegated GuardDuty administrator can enable or disable Runtime Monitoring of ECS-Fargate resources for accounts in their organization. GuardDuty member accounts can't do this for their own accounts. In addition, this control generates `FAILED` findings if GuardDuty is suspended for a member account and Runtime Monitoring of ECS-Fargate resources is disabled for the member account. To receive a `PASSED` finding, the GuardDuty administrator must disassociate the suspended member account from their administrator account by using GuardDuty.

GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate.

Remediation

To enable and manage the security agent for GuardDuty Runtime Monitoring of ECS-Fargate resources, you must use GuardDuty directly. You can't enable or manage it manually for ECS-Fargate resources. For information about enabling and managing the security agent, see Prerequisites for AWS Fargate (Amazon ECS only) support and Managing the automated security agent for AWS Fargate (Amazon ECS only) in the *Amazon GuardDuty User Guide*.

[GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.01, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-03.02

Category: Detect > Detection Services

Severity: Medium

Resource type: `AWS::GuardDuty::Detector`

AWS Config rule: guardduty-ec2-protection-runtime-enabled

Schedule type: Periodic

Parameters: None

This control checks whether the Amazon GuardDuty automated security agent is enabled for runtime monitoring of Amazon EC2 instances. For a standalone account, the control fails if the security agent is disabled for the account. In a multi-account environment, the control fails if the security agent is disabled for the delegated GuardDuty administrator account or any associated member account.

In a multi-account environment, this control generates findings only in the delegated GuardDuty administrator account. This is because only the delegated GuardDuty administrator can enable or disable Runtime Monitoring of Amazon EC2 instances for accounts in their organization. GuardDuty

member accounts can't do this for their own accounts. In addition, this control generates `FAILED` findings if GuardDuty is suspended for a member account and Runtime Monitoring of EC2 instances is disabled for the member account. To receive a `PASSED` finding, the GuardDuty administrator must disassociate the suspended member account from their administrator account by using GuardDuty.

GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances.

Remediation

For information about configuring and managing the automated security agent for GuardDuty Runtime Monitoring of EC2 instances, see Prerequisites for Amazon EC2 instance support and Enabling the automated security agent for Amazon EC2 instances in the *Amazon GuardDuty User Guide*.

Security Hub CSPM controls for AWS Identity and Access Management

These AWS Security Hub CSPM controls evaluate the AWS Identity and Access Management (IAM) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IAM.1] IAM policies should not allow full "*" administrative privileges

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.22, CIS AWS Foundations Benchmark v1.4.0/1.16, NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-5, NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(10), NIST.800-53.r5 AC-6(2), NIST.800-53.r5 AC-6(3), NIST.800-171.r2 3.1.4, PCI DSS v3.2.1/7.2.1, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure access management

Severity: High

Resource type: `AWS::IAM::Policy`

AWS Config rule: `iam-policy-no-statements-with-admin-access`

Schedule type: Change triggered

Parameters:

- `excludePermissionBoundaryPolicy: true` (not customizable)

This control checks whether the default version of IAM policies (also known as customer managed policies) has administrator access by including a statement with `"Effect": "Allow"` with `"Action": "*"` over `"Resource": "*"`. The control fails if you have IAM policies with such a statement.

The control only checks the customer managed policies that you create. It does not check inline and AWS managed policies.

IAM policies define a set of privileges that are granted to users, groups, or roles. Following standard security advice, AWS recommends that you grant least privilege, which means to grant only the permissions that are required to perform a task. When you provide full administrative privileges instead of the minimum set of permissions that the user needs, you expose the resources to potentially unwanted actions.

Instead of allowing full administrative privileges, determine what users need to do and then craft policies that let the users perform only those tasks. It is more secure to start with a minimum set of permissions and grant additional permissions as necessary. Do not start with permissions that are too lenient and then try to tighten them later.

You should remove IAM policies that have a statement with `"Effect": "Allow"` with `"Action": "*"` over `"Resource": "*"`.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To modify your IAM policies so that they do not allow full "*" administrative privileges, see Editing IAM policies in the *IAM User Guide*.

[IAM.2] IAM users should not have IAM policies attached

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.14, CIS AWS Foundations Benchmark v3.0.0/1.15, CIS AWS Foundations Benchmark v1.2.0/1.16, NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(3), NIST.800-171.r2 3.1.1, NIST.800-171.r2 3.1.2, NIST.800-171.r2 3.1.7, NIST.800-171.r2 3.3.9, NIST.800-171.r2 3.13.3, PCI DSS v3.2.1/7.2.1, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::IAM::User`

AWS Config rule: `iam-user-no-policies-check`

Schedule type: Change triggered

Parameters: None

This control checks whether your IAM users have policies attached. The control fails if your IAM users have policies attached. Instead, IAM users must inherit permissions from IAM groups or assume a role.

By default, IAM users, groups, and roles have no access to AWS resources. IAM policies grant privileges to users, groups, or roles. We recommend that you apply IAM policies directly to groups and roles but not to users. Assigning privileges at the group or role level reduces the complexity of access management as the number of users grows. Reducing access management complexity might in turn reduce the opportunity for a principal to inadvertently receive or retain excessive privileges.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, you can disable this control in all Regions except the Region where you record global resources.

Remediation

To resolve this issue, create an IAM group, and attach the policy to the group. Then, add the users to the group. The policy is applied to each user in the group. To remove a policy attached directly to a user, see Adding and removing IAM identity permissions in the *IAM User Guide*.

[IAM.3] IAM users' access keys should be rotated every 90 days or less

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.13, CIS AWS Foundations Benchmark v3.0.0/1.14, CIS AWS Foundations Benchmark v1.4.0/1.14, CIS AWS Foundations Benchmark v1.2.0/1.4, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-2(3), NIST.800-53.r5 AC-3(15), PCI DSS v4.0.1/8.3.9, PCI DSS v4.0.1/8.6.3, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-05.03

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::User`

AWS Config rule: `access-keys-rotated`

Schedule type: Periodic

Parameters:

- `maxAccessKeyAge`: `90` (not customizable)

This control checks whether the active access keys are rotated within 90 days.

We highly recommend that you do not generate and remove all access keys in your account. Instead, the recommended best practice is to either create one or more IAM roles or to use federation through AWS IAM Identity Center. You can use these methods to allow your users to access the AWS Management Console and AWS CLI.

Each approach has its use cases. Federation is generally better for enterprises that have an existing central directory or plan to need more than the current limit on IAM users. Applications that run outside of an AWS environment need access keys for programmatic access to AWS resources.

However, if the resources that need programmatic access run inside AWS, the best practice is to use IAM roles. Roles allow you to grant a resource access without hardcoding an access key ID and secret access key into the configuration.

To learn more about protecting your access keys and account, see Best practices for managing AWS access keys in the *AWS General Reference*. Also see the blog post Guidelines for protecting your AWS account while using programmatic access.

If you already have an access key, Security Hub CSPM recommends that you rotate the access keys every 90 days. Rotating access keys reduces the chance that an access key that is associated with a compromised or terminated account is used. It also ensures that data cannot be accessed with an old key that might have been lost, cracked, or stolen. Always update your applications after you rotate access keys.

Access keys consist of an access key ID and a secret access key. They are used to sign programmatic requests that you make to AWS. Users need their own access keys to make programmatic calls to AWS from the AWS CLI, Tools for Windows PowerShell, the AWS SDKs, or direct HTTP calls using the API operations for individual AWS services.

If your organization uses AWS IAM Identity Center (IAM Identity Center), your users can sign in to Active Directory, a built-in IAM Identity Center directory, or another identity provider (IdP) connected to IAM Identity Center. They can then be mapped to an IAM role that enables them to run AWS CLI commands or call AWS API operations without the need for access keys. To learn more, see Configuring the AWS CLI to use AWS IAM Identity Center in the *AWS Command Line Interface User Guide*.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To rotate access keys that are older than 90 days, see Rotating access keys in the *IAM User Guide*. Follow the instructions for any user with an **Access key age** greater than 90 days.

[IAM.4] IAM root user access key should not exist

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.3, CIS AWS Foundations Benchmark v3.0.0/1.4, CIS AWS Foundations Benchmark v1.4.0/1.4, CIS AWS Foundations Benchmark v1.2.0/1.12, PCI DSS v3.2.1/2.1, PCI DSS v3.2.1/2.2, PCI DSS v3.2.1/7.2.1,

NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(10), NIST.800-53.r5 AC-6(2), CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Critical

Resource type: `AWS::::Account`

AWS Config rule: `iam-root-access-key-check`

Schedule type: Periodic

Parameters: None

This control checks whether the root user access key is present.

The root user is the most privileged user in an AWS account. AWS access keys provide programmatic access to a given account.

Security Hub CSPM recommends that you remove all access keys that are associated with the root user. This limits that vectors that can be used to compromise your account. It also encourages the creation and use of role-based accounts that are least privileged.

Remediation

To delete the root user access key, see Deleting access keys for the root user in the *IAM User Guide*. To delete the root user access keys from an AWS account in AWS GovCloud (US), see Deleting my AWS GovCloud (US) account root user access keys in the *AWS GovCloud (US) User Guide*.

[IAM.5] MFA should be enabled for all IAM users that have a console password

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.9, CIS AWS Foundations Benchmark v3.0.0/1.10, CIS AWS Foundations Benchmark v1.4.0/1.10, CIS AWS Foundations Benchmark v1.2.0/1.2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 IA-2(1), NIST.800-53.r5 IA-2(2), NIST.800-53.r5 IA-2(6), NIST.800-53.r5 IA-2(8), PCI DSS v4.0.1/8.4.2, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::User`

AWS Config rule: `mfa-enabled-for-iam-console-access`

Schedule type: Periodic

Parameters: None

This control checks whether AWS multi-factor authentication (MFA) is enabled for all IAM users that use a console password.

Multi-factor authentication (MFA) adds an extra layer of protection on top of a user name and password. With MFA enabled, when a user signs in to an AWS website, they are prompted for their user name and password. In addition, they are prompted for an authentication code from their AWS MFA device.

We recommend that you enable MFA for all accounts that have a console password. MFA is designed to provide increased security for console access. The authenticating principal must possess a device that emits a time-sensitive key and must have knowledge of a credential.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To add MFA for IAM users, see Using multi-factor authentication (MFA) in AWS in the *IAM User Guide*.

[IAM.6] Hardware MFA should be enabled for the root user

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.5, CIS AWS Foundations Benchmark v3.0.0/1.6, CIS AWS Foundations Benchmark v1.4.0/1.6, CIS AWS Foundations Benchmark v1.2.0/1.14, PCI DSS v3.2.1/8.3.1, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 IA-2(1), NIST.800-53.r5 IA-2(2), NIST.800-53.r5 IA-2(6), NIST.800-53.r5 IA-2(8), PCI DSS v4.0.1/8.4.2, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Critical

Resource type: `AWS::::Account`

AWS Config rule: `root-account-hardware-mfa-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether your AWS account is enabled to use a hardware multi-factor authentication (MFA) device to sign in with root user credentials. The control fails if hardware MFA isn't enabled or virtual MFA devices are permitted for signing in with root user credentials.

Virtual MFA might not provide the same level of security as hardware MFA devices. We recommend that you use a virtual MFA device only while you wait for hardware purchase approval or for your hardware to arrive. To learn more, see Assign a virtual MFA device (console) in the *IAM User Guide*.

Note

Security Hub CSPM evaluates this control based on the presence of root user credentials (login profile) in an AWS account. The control generates `PASSED` findings in the following cases:

- Root user credentials are present in the account and hardware MFA is enabled for the root user.
- Root user credentials aren't present in the account.

The control generates a `FAILED` finding if root user credentials are present in the account and hardware MFA is not enabled for the root user.

Remediation

For information about enabling hardware MFA for the root user, see Multi-factor authentication for an AWS account root user in the *IAM User Guide*.

[IAM.7] Password policies for IAM users should have strong configurations

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-2(3), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 IA-5(1), NIST.800-171.r2 3.5.2, NIST.800-171.r2 3.5.7, NIST.800-171.r2 3.5.8, PCI DSS v4.0.1/8.3.6, PCI DSS v4.0.1/8.3.7, PCI DSS v4.0.1/8.3.9, PCI DSS v4.0.1/8.3.10.1, PCI DSS v4.0.1/8.6.3, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`RequireUppercaseCharacters`	Require at least one uppercase character in password	Boolean	`true` or `false`	`true`
`RequireLowercaseCharacters`	Require at least one lowercase character in password	Boolean	`true` or `false`	`true`
`RequireSymbols`	Require at least one symbol in password	Boolean	`true` or `false`	`true`
`RequireNumbers`	Require at least one number in password	Boolean	`true` or `false`	`true`

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`MinimumPasswordLength`	Minimum number of characters in the password	Integer	8 to 128	8
`PasswordReusePrevention`	Number of password rotations before an old password can be reused	Integer	12 to 24	No default value
`MaxPasswordAge`	Number of days before password expiration	Integer	1 to 90	No default value

This control checks whether the account password policy for IAM users uses strong configurations. The control fails if the password policy doesn't use strong configurations. Unless you provide custom parameter values, Security Hub CSPM uses the default values mentioned in the preceding table. The `PasswordReusePrevention` and `MaxPasswordAge` parameters have no default value, so if you exclude these parameters, Security Hub CSPM ignores number of password rotations and password age when evaluating this control.

To access the AWS Management Console, IAM users need passwords. As a best practice, Security Hub CSPM highly recommends that instead of creating IAM users, you use federation. Federation allows users to use their existing corporate credentials to log into the AWS Management Console. Use AWS IAM Identity Center (IAM Identity Center) to create or federate the user, and then assume an IAM role into an account.

To learn more about identity providers and federation, see Identity providers and federation in the *IAM User Guide*. To learn more about IAM Identity Center, see the *AWS IAM Identity Center User Guide*.

If you need to use IAM users, Security Hub CSPM recommends that you enforce the creation of strong user passwords. You can set a password policy on your AWS account to specify complexity requirements and mandatory rotation periods for passwords. When you create or change a password policy, most of the password policy settings are enforced the next time users change their passwords. Some of the settings are enforced immediately.

Remediation

To update your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*.

[IAM.8] Unused IAM user credentials should be removed

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.3, NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-2(3), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, NIST.800-171.r2 3.1.2, PCI DSS v3.2.1/8.1.4, PCI DSS v4.0.1/8.2.6, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-05.03

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::User`

AWS Config rule: `iam-user-unused-credentials-check`

Schedule type: Periodic

Parameters:

- `maxCredentialUsageAge`: `90` (not customizable)

This control checks whether your IAM users have passwords or active access keys that have not been used for 90 days.

IAM users can access AWS resources using different types of credentials, such as passwords or access keys.

Security Hub CSPM recommends that you remove or deactivate all credentials that were unused for 90 days or more. Disabling or removing unnecessary credentials reduces the window of opportunity for credentials associated with a compromised or abandoned account to be used.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record

global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

When you view user information in the IAM console, there are columns for **Access key age**, **Password age**, and **Last activity**. If the value in any of these columns is greater than 90 days, make the credentials for those users inactive.

You can also use credential reports to monitor users and identify those with no activity for 90 or more days. You can download credential reports in `.csv` format from the IAM console.

After you identify the inactive accounts or unused credentials, deactivate them. For instructions, see Creating, changing, or deleting an IAM user password (console) in the *IAM User Guide*.

[IAM.9] MFA should be enabled for the root user

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.4, PCI DSS v3.2.1/8.3.1, PCI DSS v4.0.1/8.4.2, CIS AWS Foundations Benchmark v3.0.0/1.5, CIS AWS Foundations Benchmark v1.4.0/1.5, CIS AWS Foundations Benchmark v1.2.0/1.13, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 IA-2(1), NIST.800-53.r5 IA-2(2), NIST.800-53.r5 IA-2(6), NIST.800-53.r5 IA-2(8), CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Critical

Resource type: `AWS::::Account`

AWS Config rule: `root-account-mfa-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether multi-factor authentication (MFA) is enabled for the IAM root user of an AWS account to sign in to the AWS Management Console. The control fails if MFA isn't enabled for the root user of the account.

The IAM root user of an AWS account has complete access to all the services and resources in the account. If MFA is enabled, the user must enter a username, a password, and an authentication

code from their AWS MFA device in order to sign in to the AWS Management Console. MFA adds an extra layer of protection on top of a username and password.

This control generates PASSED findings in the following cases:

- Root user credentials are present in the account and MFA is enabled for the root user.
- Root user credentials aren't present in the account.

The control generates FAILED findings if root user credentials are present in the account and MFA isn't enabled for the root user.

Remediation

For information about enabling MFA for the root user of an AWS account, see Multi-factor authentication for the AWS account root user in the *AWS Identity and Access Management User Guide*.

[IAM.10] Password policies for IAM users should have strong configurations

Related requirements: NIST.800-171.r2 3.5.2, NIST.800-171.r2 3.5.7, NIST.800-171.r2 3.5.8, PCI DSS v3.2.1/8.1.4, PCI DSS v3.2.1/8.2.3, PCI DSS v3.2.1/8.2.4, PCI DSS v3.2.1/8.2.5, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

This control checks whether the account password policy for IAM users uses the following minimum PCI DSS configurations.

- `RequireUppercaseCharacters` – Require at least one uppercase character in password. (Default = `true`)

- `RequireLowercaseCharacters` – Require at least one lowercase character in password. (Default = `true`)
- `RequireNumbers` – Require at least one number in password. (Default = `true`)
- `MinimumPasswordLength` – Password minimum length. (Default = 7 or longer)
- `PasswordReusePrevention` – Number of passwords before allowing reuse. (Default = 4)
- `MaxPasswordAge` – Number of days before password expiration. (Default = 90)

> **Note**
>
> On May 30, 2025, Security Hub CSPM removed this control from the PCI DSS v4.0.1 standard. PCI DSS v4.0.1 now requires passwords to have a minimum of 8 characters. This control continues to apply to the PCI DSS v3.2.1 standard, which has different password requirements.
>
> To evaluate account password policies against PCI DSS v4.0.1 requirements, you can use the IAM.7 control. This control requires passwords to have a minimum of 8 characters. It also supports custom values for password length and other parameters. The IAM.7 control is part of the PCI DSS v4.0.1 standard in Security Hub CSPM.

Remediation

To update your password policy to use the recommended configuration, see Setting an account password policy for IAM users in the *IAM User Guide*.

[IAM.11] Ensure IAM password policy requires at least one uppercase letter

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.5, NIST.800-171.r2 3.5.7, PCI DSS v4.0.1/8.3.6, PCI DSS v4.0.1/8.6.3, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

Password policies, in part, enforce password complexity requirements. Use IAM password policies to ensure that passwords use different character sets.

CIS recommends that the password policy require at least one uppercase letter. Setting a password complexity policy increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Password strength**, select **Require at least one uppercase letter from the Latin alphabet (A–Z)**.

[IAM.12] Ensure IAM password policy requires at least one lowercase letter

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.6, NIST.800-171.r2 3.5.7, PCI DSS v4.0.1/8.3.6, PCI DSS v4.0.1/8.6.3, CRI Profile v2.2/PR.AA-01.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

Password policies, in part, enforce password complexity requirements. Use IAM password policies to ensure that passwords use different character sets. CIS recommends that the password policy require at least one lowercase letter. Setting a password complexity policy increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Password strength**, select **Require at least one lowercase letter from the Latin alphabet (A–Z)**.

[IAM.13] Ensure IAM password policy requires at least one symbol

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.7, NIST.800-171.r2 3.5.7, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

Password policies, in part, enforce password complexity requirements. Use IAM password policies to ensure that passwords use different character sets.

CIS recommends that the password policy require at least one symbol. Setting a password complexity policy increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Password strength**, select **Require at least one nonalphanumeric character**.

[IAM.14] Ensure IAM password policy requires at least one number

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.8, NIST.800-171.r2 3.5.7, PCI DSS v4.0.1/8.3.6, PCI DSS v4.0.1/8.6.3, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

Password policies, in part, enforce password complexity requirements. Use IAM password policies to ensure that passwords use different character sets.

CIS recommends that the password policy require at least one number. Setting a password complexity policy increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Password strength**, select **Require at least one number**.

[IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.7, CIS AWS Foundations Benchmark v3.0.0/1.8, CIS AWS Foundations Benchmark v1.4.0/1.8, CIS AWS Foundations Benchmark v1.2.0/1.9, NIST.800-171.r2 3.5.7, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

Password policies, in part, enforce password complexity requirements. Use IAM password policies to ensure that passwords are at least a given length.

CIS recommends that the password policy require a minimum password length of 14 characters. Setting a password complexity policy increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Password minimum length**, enter **14** or a larger number.

[IAM.16] Ensure IAM password policy prevents password reuse

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.8, CIS AWS Foundations Benchmark v3.0.0/1.9, CIS AWS Foundations Benchmark v1.4.0/1.9, CIS AWS Foundations

Benchmark v1.2.0/1.10, NIST.800-171.r2 3.5.8, PCI DSS v4.0.1/8.3.7, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

This control checks whether the number of passwords to remember is set to 24. The control fails if the value is not 24.

IAM password policies can prevent the reuse of a given password by the same user.

CIS recommends that the password policy prevent the reuse of passwords. Preventing password reuse increases account resiliency against brute force login attempts.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Prevent password reuse**, enter **24**.

[IAM.17] Ensure IAM password policy expires passwords within 90 days or less

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.11, PCI DSS v4.0.1/8.3.9, PCI DSS v4.0.1/8.3.10.1, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-03.01

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::::Account`

AWS Config rule: `iam-password-policy`

Schedule type: Periodic

Parameters: None

IAM password policies can require passwords to be rotated or expired after a given number of days.

CIS recommends that the password policy expire passwords after 90 days or less. Reducing the password lifetime increases account resiliency against brute force login attempts. Requiring regular password changes also helps in the following scenarios:

- Passwords can be stolen or compromised without your knowledge. This can happen via a system compromise, software vulnerability, or internal threat.
- Certain corporate and government web filters or proxy servers can intercept and record traffic even if it's encrypted.
- Many people use the same password for many systems such as work, email, and personal.
- Compromised end-user workstations might have a keystroke logger.

Remediation

To change your password policy, see Setting an account password policy for IAM users in the *IAM User Guide*. For **Turn on password expiration**, enter **90** or a smaller number.

[IAM.18] Ensure a support role has been created to manage incidents with AWS Support

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.16, CIS AWS Foundations Benchmark v3.0.0/1.17, CIS AWS Foundations Benchmark v1.4.0/1.17, CIS AWS Foundations Benchmark v1.2.0/1.20, NIST.800-171.r2 3.1.2, PCI DSS v4.0.1/12.10.3, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-04.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::::Account`

AWS Config rule: `iam-policy-in-use`

Schedule type: Periodic

Parameters:

- `policyARN`: `arn:partition:iam::aws:policy/AWSSupportAccess` (not customizable)
- `policyUsageType`: ANY (not customizable)

AWS provides a support center that can be used for incident notification and response, as well as technical support and customer services.

Create an IAM role to allow authorized users to manage incidents with AWS Support. By implementing least privilege for access control, an IAM role will require an appropriate IAM policy to allow support center access in order to manage incidents with Support.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To remediate this issue, create a role to allow authorized users to manage Support incidents.

To create the role to use for Support access

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the IAM navigation pane, choose **Roles**, then choose **Create role**.
3. For **Role type**, choose the **Another AWS account**.
4. For **Account ID**, enter the AWS account ID of the AWS account to which you want to grant access to your resources.

   If the users or groups that will assume this role are in the same account, then enter the local account number.

   > **Note**
   >
   > The administrator of the specified account can grant permission to assume this role to any user in that account. To do this, the administrator attaches a policy to the user or a group that grants permission for the `sts:AssumeRole` action. In that policy, the resource must be the role ARN.

5. Choose **Next: Permissions**.
6. Search for the managed policy `AWSSupportAccess`.

7. Select the check box for the `AWSSupportAccess` managed policy.
8. Choose **Next: Tags**.
9. (Optional) To add metadata to the role, attach tags as key-value pairs.

   For more information about using tags in IAM, see Tagging IAM users and roles in the *IAM User Guide*.
10. Choose **Next: Review**.
11. For **Role name**, enter a name for your role.

    Role names must be unique within your AWS account. They are not case sensitive.
12. (Optional) For **Role description**, enter a description for the new role.
13. Review the role, then choose **Create role**.

[IAM.19] MFA should be enabled for all IAM users

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 IA-2(1), NIST.800-53.r5 IA-2(2), NIST.800-53.r5 IA-2(6), NIST.800-53.r5 IA-2(8), NIST.800-171.r2 3.3.8, NIST.800-171.r2 3.5.3, NIST.800-171.r2 3.5.4, NIST.800-171.r2 3.7.5, PCI DSS v3.2.1/8.3.1, PCI DSS v4.0.1/8.4.2, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::User`

AWS Config rule: `iam-user-mfa-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether the IAM users have multi-factor authentication (MFA) enabled.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record

global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To add MFA for IAM users, see Enabling MFA devices for users in AWS in the *IAM User Guide*.

[IAM.20] Avoid the use of the root user

Important

Security Hub CSPM retired this control in April 2024. For more information, see Change log for Security Hub CSPM controls.

Related requirements: CIS AWS Foundations Benchmark v1.2.0/1.1

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::IAM::User`

AWS Config rule: `use-of-root-account-test` (custom Security Hub CSPM rule)

Schedule type: Periodic

Parameters: None

This control checks whether an AWS account has restrictions on the usage of the root user. The control evaluates the following resources:

- Amazon Simple Notification Service (Amazon SNS) topics
- AWS CloudTrail trails
- Metric filters associated with the CloudTrail trails
- Amazon CloudWatch alarms based on the filters

This check results in a `FAILED` finding if one or more of the following statements is true:

- No CloudTrail trails exist in the account.
- A CloudTrail trail is enabled, but not configured with at-least one multi-Region trail that includes read and write management events.
- A CloudTrail trail is enabled, but not associated with a CloudWatch Logs log group.
- The exact metric filter prescribed by the Center for Internet Security (CIS) is not used. The prescribed metric filter is `'{$.userIdentity.type="Root" && $.userIdentity.invokedBy NOT EXISTS && $.eventType !="AwsServiceEvent"}'`.
- No CloudWatch alarms based on the metric filter exist in the account.
- CloudWatch alarms configured to send notification to the associated SNS topic don't trigger based on the alarm condition.
- The SNS topic doesn't comply with the constraints for sending a message to an SNS topic.
- The SNS topic doesn't have at least one subscriber.

This check results in a control status of `NO_DATA` if one or more of the following statements is true:

- A multi-Region trail is based in a different Region. Security Hub CSPM can only generate findings in the Region where the trail is based.
- A multi-Region trail belongs to a different account. Security Hub CSPM can only generate findings for the account that owns the trail.

This check results in a control status of `WARNING` if one or more of the following statements is true:

- The current account doesn't own the SNS topic referenced in the CloudWatch alarm.
- The current account doesn't have access to the SNS topic when invoking the `ListSubscriptionsByTopic` SNS API.

Note

We recommend using organization trails to log events from many accounts in an organization. Organization trails are multi-Region trails by default and can only be managed by the AWS Organizations management account or the CloudTrail delegated administrator account. Using an organization trail results in a control status of NO_DATA for controls evaluated in organization member accounts. In member accounts, Security Hub CSPM only generates findings for member-owned resources. Findings that pertain

to organization trails are generated in the resource owner's account. You can see these findings in your Security Hub CSPM delegated administrator account by using cross-Region aggregation.

As a best practice, use your root user credentials only when required to perform account and service management tasks. Apply IAM policies directly to groups and roles but not to users. For instructions on setting up an administrator for daily use, see Creating your first IAM admin user and group in the *IAM User Guide*.

Remediation

The steps to remediate this issue include setting up an Amazon SNS topic, a CloudTrail trail, a metric filter, and an alarm for the metric filter.

To create an Amazon SNS topic

1. Open the Amazon SNS console at https://console.aws.amazon.com/sns/v3/home.
2. Create an Amazon SNS topic that receives all CIS alarms.

   Create at least one subscriber to the topic. For more information, see Getting started with Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

Next, set up an active CloudTrail that applies to all Regions. To do so, follow the remediation steps in the section called "[CloudTrail.1] CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events".

Make a note of the name of the CloudWatch Logs log group that you associate with the CloudTrail trail. You create the metric filter for that log group.

Finally, create the metric filter and alarm.

To create a metric filter and alarm

1. Open the CloudWatch console at https://console.aws.amazon.com/cloudwatch/.
2. In the navigation pane, choose **Log groups**.
3. Select the check box for the CloudWatch Logs log group that is associated with the CloudTrail trail that you created.
4. From **Actions**, choose **Create Metric Filter**.

5. Under **Define pattern**, do the following:

   a. Copy the following pattern and then paste it into the **Filter Pattern** field.

   ```
   {$.userIdentity.type="Root" && $.userIdentity.invokedBy NOT EXISTS &&
    $.eventType !="AwsServiceEvent"}
   ```

   b. Choose **Next**.

6. Under **Assign Metric**, do the following:

   a. In **Filter name**, enter a name for your metric filter.

   b. For **Metric Namespace**, enter **`LogMetrics`**.

   If you use the same namespace for all of your CIS log metric filters, then all CIS Benchmark metrics are grouped together.

   c. For **Metric Name**, enter a name for the metric. Remember the name of the metric. You will need to select the metric when you create the alarm.

   d. For **Metric value**, enter **1**.

   e. Choose **Next**.

7. Under **Review and create**, verify the information that you provided for the new metric filter. Then, choose **Create metric filter**.

8. In the navigation pane, choose **Log groups**, and then choose the filter you created under **Metric filters**.

9. Select the check box for the filter. Choose **Create alarm**.

10. Under **Specify metric and conditions**, do the following:

    a. Under **Conditions**, for **Threshold**, choose **Static**.

    b. For **Define the alarm condition**, choose **Greater/Equal**.

    c. For **Define the threshold value**, enter **1**.

    d. Choose **Next**.

11. Under **Configure actions**, do the following:

    a. Under **Alarm state trigger**, choose **In alarm**.

    b. Under **Select an SNS topic**, choose **Select an existing SNS topic**.

    c. For **Send a notification to**, enter the name of the SNS topic that you created in the previous procedure.

d. Choose **Next**.

12. Under **Add name and description**, enter a **Name** and **Description** for the alarm, such as **`CIS-1.1-RootAccountUsage`**. Then choose **Next**.
13. Under **Preview and create**, review the alarm configuration. Then choose **Create alarm**.

[IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services

Related requirements: NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-5, NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(10), NIST.800-53.r5 AC-6(2), NIST.800-53.r5 AC-6(3), NIST.800-171.r2 3.1.1, NIST.800-171.r2 3.1.2, NIST.800-171.r2 3.1.5, NIST.800-171.r2 3.1.7, NIST.800-171.r2 3.3.8, NIST.800-171.r2 3.3.9, NIST.800-171.r2 3.13.3, NIST.800-171.r2 3.13.4, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.01

Category: Detect > Secure access management

Severity: Low

Resource type: `AWS::IAM::Policy`

AWS Config rule: `iam-policy-no-statements-with-full-access`

Schedule type: Change triggered

Parameters:

- `excludePermissionBoundaryPolicy`: `True` (not customizable)

This control checks whether the IAM identity-based policies that you create have Allow statements that use the * wildcard to grant permissions for all actions on any service. The control fails if any policy statement includes `"Effect": "Allow"` with `"Action": "Service:*"`.

For example, the following statement in a policy results in a failed finding.

```
"Statement": [
{
  "Sid": "EC2-Wildcard",
  "Effect": "Allow",
  "Action": "ec2:*",
```

```
  "Resource": "*"
}
```

The control also fails if you use `"Effect": "Allow"` with `"NotAction": "service:*"`. In that case, the `NotAction` element provides access to all of the actions in an AWS service, except for the actions specified in `NotAction`.

This control only applies to customer managed IAM policies. It does not apply to IAM policies that are managed by AWS.

When you assign permissions to AWS services, it is important to scope the allowed IAM actions in your IAM policies. You should restrict IAM actions to only those actions that are needed. This helps you to provision least privilege permissions. Overly permissive policies might lead to privilege escalation if the policies are attached to an IAM principal that might not require the permission.

In some cases, you might want to allow IAM actions that have a similar prefix, such as `DescribeFlowLogs` and `DescribeAvailabilityZones`. In these authorized cases, you can add a suffixed wildcard to the common prefix. For example, `ec2:Describe*`.

This control passes if you use a prefixed IAM action with a suffixed wildcard. For example, the following statement in a policy results in a passed finding.

```
"Statement": [
{
  "Sid": "EC2-Wildcard",
  "Effect": "Allow",
  "Action": "ec2:Describe*",
  "Resource": "*"
}
```

When you group related IAM actions in this way, you can also avoid exceeding the IAM policy size limits.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, global resource recording can be enabled in a single Region. If you only record global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

To remediate this issue, update your IAM policies so that they do not allow full "*" administrative privileges. For details about how to edit an IAM policy, see Editing IAM policies in the *IAM User Guide*.

[IAM.22] IAM user credentials unused for 45 days should be removed

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.11, CIS AWS Foundations Benchmark v3.0.0/1.12, CIS AWS Foundations Benchmark v1.4.0/1.12, NIST.800-171.r2 3.1.2, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-05.03

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::User`

AWS Config rule: `iam-user-unused-credentials-check`

Schedule type: Periodic

Parameters: None

This control checks whether your IAM users have passwords or active access keys that have not been used for 45 days or more. To do so, it checks whether the `maxCredentialUsageAge` parameter of the AWS Config rule is equal to 45 or more.

Users can access AWS resources using different types of credentials, such as passwords or access keys.

CIS recommends that you remove or deactivate all credentials that have been unused for 45 days or more. Disabling or removing unnecessary credentials reduces the window of opportunity for credentials associated with a compromised or abandoned account to be used.

The AWS Config rule for this control uses the `GetCredentialReport` and `GenerateCredentialReport` API operations, which are only updated every four hours. Changes to IAM users can take up to four hours to be visible to this control.

> **Note**
>
> AWS Config should be enabled in all Regions in which you use Security Hub CSPM. However, you can enable recording of global resources in a single Region. If you only record

global resources in a single Region, then you can disable this control in all Regions except the Region where you record global resources.

Remediation

When you view user information in the IAM console, there are columns for **Access key age**, **Password age**, and **Last activity**. If the value in any of these columns is greater than 45 days, make the credentials for those users inactive.

You can also use credential reports to monitor users and identify those with no activity for 45 or more days. You can download credential reports in `.csv` format from the IAM console.

After you identify the inactive accounts or unused credentials, deactivate them. For instructions, see Creating, changing, or deleting an IAM user password (console) in the *IAM User Guide*.

[IAM.23] IAM Access Analyzer analyzers should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::AccessAnalyzer::Analyzer`

AWS Config rule: `tagged-accessanalyzer-analyzer` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an analyzer managed by AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the analyzer doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the analyzer isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an analyzer, see TagResource in the *AWS IAM Access Analyzer API Reference*.

[IAM.24] IAM roles should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IAM::Role`

AWS Config rule: `tagged-iam-role` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Identity and Access Management (IAM) role has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the role doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the role isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an IAM role, see Tagging IAM resources in the *IAM User Guide*.

[IAM.25] IAM users should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IAM::User`

AWS Config rule: `tagged-iam-user` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Identity and Access Management (IAM) user has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the user doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the user isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging,

you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an IAM user, see Tagging IAM resources in the *IAM User Guide*.

[IAM.26] Expired SSL/TLS certificates managed in IAM should be removed

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.18, CIS AWS Foundations Benchmark v3.0.0/1.19, CRI Profile v2.2/PR.PS-01.07

Category: Identify > Compliance

Severity: Medium

Resource type: `AWS::IAM::ServerCertificate`

AWS Config rule: `iam-server-certificate-expiration-check`

Schedule type: Periodic

Parameters: None

This controls checks whether an active SSL/TLS server certificate that is managed in IAM has expired. The control fails if the expired SSL/TLS server certificate isn't removed.

To enable HTTPS connections to your website or application in AWS, you need an SSL/TLS server certificate. You can use IAM or AWS Certificate Manager (ACM) to store and deploy server certificates. Use IAM as a certificate manager only when you must support HTTPS connections in an AWS Region that isn't supported by ACM. IAM securely encrypts your private keys and stores

the encrypted version in IAM SSL certificate storage. IAM supports deploying server certificates in all Regions, but you must obtain your certificate from an external provider for use with AWS. You can't upload an ACM certificate to IAM. Additionally, you can't manage your certificates from the IAM console. Removing expired SSL/TLS certificates eliminates the risk that an invalid certificate is deployed accidentally to a resource, which can damage the credibility of the underlying application or website.

Remediation

To remove a server certificate from IAM, see Managing server certificates in IAM in the *IAM User Guide*.

[IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.21, CIS AWS Foundations Benchmark v3.0.0/1.22, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure access management > Secure IAM policies

Severity: Medium

Resource type: `AWS::IAM::Role`, `AWS::IAM::User`, `AWS::IAM::Group`

AWS Config rule: `iam-policy-blacklisted-check`

Schedule type: Change triggered

Parameters:

- "policyArns": "arn:aws:iam::aws:policy/AWSCloudShellFullAccess,arn:aws-cn:iam::aws:policy/AWSCloudShellFullAccess, arn:aws-us-gov:iam::aws:policy/AWSCloudShellFullAccess"

This control checks whether an IAM identity (user, role, or group) has the AWS managed policy `AWSCloudShellFullAccess` attached. The control fails if an IAM identity has the `AWSCloudShellFullAccess` policy attached.

AWS CloudShell provides a convenient way to run CLI commands against AWS services. The AWS managed policy `AWSCloudShellFullAccess` provides full access to CloudShell, which allows file upload and download capability between a user's local system and the CloudShell environment. Within the CloudShell environment, a user has sudo permissions, and can access the internet. As a result, atttaching this managed policy to an IAM identity gives them the ability to install file

transfer software and move data from CloudShell to external internet servers. We recommend following the principle of least privilege and attaching narrower permissions to your IAM identities.

Remediation

To detach the `AWSCloudShellFullAccess` policy from an IAM identity, see Adding and removing IAM identity permissions in the *IAM User Guide*.

[IAM.28] IAM Access Analyzer external access analyzer should be enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/1.19, CIS AWS Foundations Benchmark v3.0.0/1.20, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.AA-05.04

Category: Detect > Detection services > Privileged usage monitoring

Severity: High

Resource type: `AWS::AccessAnalyzer::Analyzer`

AWS Config rule: `iam-external-access-analyzer-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether an AWS account has an IAM Access Analyzer external access analyzer enabled. The control fails if the account doesn't have an external access analyzer enabled in your currently selected AWS Region.

IAM Access Analyzer external access analyzers help identify resources, such as Amazon Simple Storage Service (Amazon S3) buckets or IAM roles, that are shared with an external entity. This helps you avoid unintended access to your resources and data. IAM Access Analyzer is Regional and must be enabled in each Region. To identify resources that are shared with external principals, an access analyzer uses logic-based reasoning to analyze resource-based policies in your AWS environment. When you create an external access analyzer, you can create and enable it for your entire organization or individual accounts.

> **Note**
>
> If an account is part of an organization in AWS Organizations, this control doesn't factor external access analyzers that specify the organization as the zone of trust and are

enabled for the organization in the current Region. If your organization uses this type of configuration, consider disabling this control for individual member accounts in your organization in the Region.

Remediation

For information about enabling an external access analyzer in a specific Region, see Getting started with IAM Access Analyzer in the *IAM User Guide*. You must enable an analyzer in each Region in which you want to monitor access to your resources.

Security Hub CSPM controls for Amazon Inspector

These AWS Security Hub CSPM controls evaluate the Amazon Inspector service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Inspector.1] Amazon Inspector EC2 scanning should be enabled

Related requirements: PCI DSS v4.0.1/11.3.1, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: `inspector-ec2-scan-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether Amazon Inspector EC2 scanning is enabled. For a standalone account, the control fails if Amazon Inspector EC2 scanning is disabled in the account. In a multi-account environment, the control fails if the delegated Amazon Inspector administrator account or any associated member account doesn't have EC2 scanning enabled.

In a multi-account environment, the control generates findings in only the delegated Amazon Inspector administrator account. Only the delegated administrator can enable or disable the

EC2 scanning feature for the member accounts in the organization. Amazon Inspector member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated administrator has a suspended member account that doesn't have Amazon Inspector EC2 scanning enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in Amazon Inspector.

Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning.

Remediation

To enable Amazon Inspector EC2 scanning, see Activating scans in the *Amazon Inspector User Guide*.

[Inspector.2] Amazon Inspector ECR scanning should be enabled

Related requirements: PCI DSS v4.0.1/11.3.1, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: `inspector-ecr-scan-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether Amazon Inspector ECR scanning is enabled. For a standalone account, the control fails if Amazon Inspector ECR scanning is disabled in the account. In a multi-account environment, the control fails if the delegated Amazon Inspector administrator account or any associated member account doesn't have ECR scanning enabled.

In a multi-account environment, the control generates findings in only the delegated Amazon Inspector administrator account. Only the delegated administrator can enable or disable the

ECR scanning feature for the member accounts in the organization. Amazon Inspector member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated administrator has a suspended member account that doesn't have Amazon Inspector ECR scanning enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in Amazon Inspector.

Amazon Inspector scans container images stored in Amazon Elastic Container Registry (Amazon ECR) for software vulnerabilities to generate package vulnerability findings. When you activate Amazon Inspector scans for Amazon ECR, you set Amazon Inspector as your preferred scanning service for your private registry. This replaces basic scanning, which is provided at no charge by Amazon ECR, with enhanced scanning, which is provided and billed through Amazon Inspector. Enhanced scanning gives you the benefit of vulnerability scanning for both operating system and programming language packages at the registry level. You can review findings discovered using enhanced scanning at the image level, for each layer of the image, on the Amazon ECR console. Additionally, you can review and work with these findings in other services not available for basic scanning findings, including AWS Security Hub CSPM and Amazon EventBridge.

Remediation

To enable Amazon Inspector ECR scanning, see Activating scans in the *Amazon Inspector User Guide*.

[Inspector.3] Amazon Inspector Lambda code scanning should be enabled

Related requirements: PCI DSS v4.0.1/6.2.4, PCI DSS v4.0.1/6.3.1, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: `inspector-lambda-code-scan-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether Amazon Inspector Lambda code scanning is enabled. For a standalone account, the control fails if Amazon Inspector Lambda code scanning is disabled in the account. In

a multi-account environment, the control fails if the delegated Amazon Inspector administrator account or any associated member account doesn't have Lambda code scanning enabled.

In a multi-account environment, the control generates findings in only the delegated Amazon Inspector administrator account. Only the delegated administrator can enable or disable the Lambda code scanning feature for the member accounts in the organization. Amazon Inspector member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated administrator has a suspended member account that doesn't have Amazon Inspector Lambda code scanning enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in Amazon Inspector.

Amazon Inspector Lambda code scanning scans the custom application code within an AWS Lambda function for code vulnerabilities based on AWS security best practices. Lambda code scanning can detect injection flaws, data leaks, weak cryptography, or missing encryption in your code. This feature is available in specific AWS Regions only. You can activate Lambda code scanning together with Lambda standard scanning (see [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled).

Remediation

To enable Amazon Inspector Lambda code scanning, see Activating scans in the *Amazon Inspector User Guide*.

[Inspector.4] Amazon Inspector Lambda standard scanning should be enabled

Related requirements: PCI DSS v4.0.1/6.2.4, PCI DSS v4.0.1/6.3.1, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: `inspector-lambda-standard-scan-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether Amazon Inspector Lambda standard scanning is enabled. For a standalone account, the control fails if Amazon Inspector Lambda standard scanning is disabled in

the account. In a multi-account environment, the control fails if the delegated Amazon Inspector administrator account or any associated member account doesn't have Lambda standard scanning enabled.

In a multi-account environment, the control generates findings in only the delegated Amazon Inspector administrator account. Only the delegated administrator can enable or disable the Lambda standard scanning feature for the member accounts in the organization. Amazon Inspector member accounts can't modify this configuration from their accounts. This control generates `FAILED` findings if the delegated administrator has a suspended member account that doesn't have Amazon Inspector Lambda standard scanning enabled. To receive a `PASSED` finding, the delegated administrator must disassociate these suspended accounts in Amazon Inspector.

Amazon Inspector Lambda standard scanning identifies software vulnerabilities in the application package dependencies you add to your AWS Lambda function code and layers. If Amazon Inspector detects a vulnerability in your Lambda function application package dependencies, Amazon Inspector produces a detailed `Package Vulnerability` type finding. You can activate Lambda code scanning together with Lambda standard scanning (see [Inspector.3] Amazon Inspector Lambda code scanning should be enabled).

Remediation

To enable Amazon Inspector Lambda standard scanning, see Activating scans in the *Amazon Inspector User Guide*.

Security Hub CSPM controls for AWS IoT

These AWS Security Hub CSPM controls evaluate the AWS IoT service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IoT.1] AWS IoT Device Defender security profiles should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::SecurityProfile`

AWS Config rule: `tagged-iot-securityprofile` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS IoT Device Defender security profile has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the security profile doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the security profile isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Device Defender security profile, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

[IoT.2] AWS IoT Core mitigation actions should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::MitigationAction`

AWS Config rule: `tagged-iot-mitigationaction` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS IoT Core mitigation action has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the mitigation action doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the mitigation action isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Core mitigation action, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

[IoT.3] AWS IoT Core dimensions should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::Dimension`

AWS Config rule: `tagged-iot-dimension` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource	StringList (maximum of 6 items)	1–6 tag keys that meet AWS	`No default value`

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
	must contain. Tag keys are case sensitive.		requirements.	

This control checks whether an AWS IoT Core dimension has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the dimension doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the dimension isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Core dimension, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

[IoT.4] AWS IoT Core authorizers should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::Authorizer`

AWS Config rule: `tagged-iot-authorizer` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS IoT Core authorizer has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the authorizer doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the authorizer isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS

resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Core authorizer, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

[IoT.5] AWS IoT Core role aliases should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::RoleAlias`

AWS Config rule: `tagged-iot-rolealias` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS IoT Core role alias has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the role alias doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the role alias isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Core role alias, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

[IoT.6] AWS IoT Core policies should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoT::Policy`

AWS Config rule: `tagged-iot-policy` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS IoT Core policy has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the policy doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the policy isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an AWS IoT Core policy, see Tagging your AWS IoT resources in the *AWS IoT Developer Guide*.

Security Hub CSPM controls for AWS IoT SiteWise

These AWS Security Hub CSPM controls evaluate the AWS IoT SiteWise service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTSiteWise::AssetModel`

AWS Config rule: `iotsitewise-asset-model-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT SiteWise asset model has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the asset model doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the

parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the asset model isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don’t add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT SiteWise asset model, see Tag your AWS IoT SiteWise resources in the *AWS IoT SiteWise User Guide*.

[IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTSiteWise::Dashboard`

AWS Config rule: `iotsitewise-dashboard-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT SiteWise dashboard has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the dashboard doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the dashboard isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT SiteWise dashboard, see Tag your AWS IoT SiteWise resources in the *AWS IoT SiteWise User Guide*.

[IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTSiteWise::Gateway`

AWS Config rule: `iotsitewise-gateway-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT SiteWise gateway has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the gateway doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the gateway isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other

criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT SiteWise gateway, see Tag your AWS IoT SiteWise resources in the *AWS IoT SiteWise User Guide*.

[IoTSiteWise.4] AWS IoT SiteWise portals should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTSiteWise::Portal`

AWS Config rule: `iotsitewise-portal-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT SiteWise portal has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the portal doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the portal isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT SiteWise portal, see Tag your AWS IoT SiteWise resources in the *AWS IoT SiteWise User Guide*.

[IoTSiteWise.5] AWS IoT SiteWise projects should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTSiteWise::Project`

AWS Config rule: `iotsitewise-project-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT SiteWise project has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the project doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the project isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT SiteWise project, see Tag your AWS IoT SiteWise resources in the *AWS IoT SiteWise User Guide*.

Security Hub CSPM controls for AWS IoT TwinMaker

These AWS Security Hub CSPM controls evaluate the AWS IoT TwinMaker service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTTwinMaker::SyncJob`

AWS Config rule: `iottwinmaker-sync-job-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT TwinMaker sync job has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the sync job doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the sync job isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT TwinMaker sync job, see TagResource in the *AWS IoT TwinMaker User Guide*.

[IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged

Related requirements: CRI Profile v2.2/ID.AM-01.01, CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTTwinMaker::Workspace`

AWS Config rule: `iottwinmaker-workspace-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT TwinMaker workspace has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the workspace doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the workspace isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT TwinMaker workspace, see TagResource in the *AWS IoT TwinMaker User Guide*.

[IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTTwinMaker::Scene`

AWS Config rule: `iottwinmaker-scene-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT TwinMaker scene has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the scene doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the scene isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT TwinMaker scene, see TagResource in the *AWS IoT TwinMaker User Guide*.

[IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTTwinMaker::Entity`

AWS Config rule: `iottwinmaker-entity-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT TwinMaker entity has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the entity doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the entity isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT TwinMaker entity, see TagResource in the *AWS IoT TwinMaker User Guide*.

Security Hub CSPM controls for AWS IoT Wireless

These AWS Security Hub CSPM controls evaluate the AWS IoT Wireless service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IoTWireless.1] AWS IoT Wireless multicast groups should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTWireless::MulticastGroup`

AWS Config rule: `iotwireless-multicast-group-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT Wireless multicast group has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the multicast group doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the multicast group isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT Wireless multicast group, see Tagging your AWS IoT Wireless resources in the *AWS IoT Wireless Developer Guide*.

[IoTWireless.2] AWS IoT Wireless service profiles should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTWireless::ServiceProfile`

AWS Config rule: `iotwireless-service-profile-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT Wireless service profile has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the service profile doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the service profile isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other

criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT Wireless service profile, see Tagging your AWS IoT Wireless resources in the *AWS IoT Wireless Developer Guide*.

[IoTWireless.3] AWS IoT FUOTA tasks should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IoTWireless::FuotaTask`

AWS Config rule: `iotwireless-fuota-task-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS IoT Wireless firmware update over-the-air (FUOTA) task has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the FUOTA task doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the FUOTA task isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS IoT Wireless FUOTA task, see Tagging your AWS IoT Wireless resources in the *AWS IoT Wireless Developer Guide*.

Security Hub CSPM controls for Amazon IVS

These AWS Security Hub CSPM controls evaluate the Amazon Interactive Video Service (IVS) service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[IVS.1] IVS playback key pairs should be tagged

Related requirements: CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IVS::PlaybackKeyPair`

AWS Config rule: `ivs-playback-key-pair-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon IVS playback key pair has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the playback key pair doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the playback key pair isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an IVS playback key pair, see TagResource in the *Amazon IVS Real-Time Streaming API Reference*.

[IVS.2] IVS recording configurations should be tagged

Related requirements: CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IVS::RecordingConfiguration`

AWS Config rule: `ivs-recording configuration-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon IVS recording configuration has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the recording configuration doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the recording configuration isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an IVS recording configuration, see TagResource in the *Amazon IVS Real-Time Streaming API Reference*.

[IVS.3] IVS channels should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::IVS::Channel`

AWS Config rule: `ivs-channel-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon IVS channel has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the channel doesn't have any tag keys or

if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the channel isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an IVS channel, see TagResource in the *Amazon IVS Real-Time Streaming API Reference*.

Security Hub CSPM controls for Amazon Keyspaces

These AWS Security Hub CSPM controls evaluate the Amazon Keyspaces service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Keyspaces.1] Amazon Keyspaces keyspaces should be tagged

Related requirements: CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Cassandra::Keyspace`

AWS Config rule: `cassandra-keyspace-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon Keyspaces keyspace has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the keyspace doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the keyspace isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an Amazon Keyspaces keyspace, see Add tags to a keyspace in the *Amazon Keyspaces Developer Guide*.

Security Hub CSPM controls for Kinesis

These AWS Security Hub CSPM controls evaluate the Amazon Kinesis service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Kinesis.1] Kinesis streams should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::Kinesis::Stream`

AWS Config rule: kinesis-stream-encrypted

Schedule type: Change triggered

Parameters: None

This control checks if Kinesis Data Streams are encrypted at rest with server-side encryption. This control fails if a Kinesis stream is not encrypted at rest with server-side encryption.

Server-side encryption is a feature in Amazon Kinesis Data Streams that automatically encrypts data before it's at rest by using an AWS KMS key. Data is encrypted before it's written to the Kinesis

stream storage layer, and decrypted after it's retrieved from storage. As a result, your data is encrypted at rest within the Amazon Kinesis Data Streams service.

Remediation

For information about enabling server-side encryption for Kinesis streams, see How do I get started with server-side encryption? in the *Amazon Kinesis Developer Guide*.

[Kinesis.2] Kinesis streams should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Kinesis::Stream`

AWS Configrule: `tagged-kinesis-stream` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon Kinesis data stream has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the data stream doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the data stream isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Kinesis data stream, see Tagging your streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Developer Guide*.

[Kinesis.3] Kinesis streams should have an adequate data retention period

Severity: Medium

Resource type: `AWS::Kinesis::Stream`

AWS Configrule: kinesis-stream-backup-retention-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`minimumBackupRetentionPeriod`	Minimum number of hours that the data should be retained.	String	24 to 8760	168

This control checks whether an Amazon Kinesis data stream has a data retention period greater than or equal to the specified time frame. The control fails if the data retention period is less than the specified time frame. Unless you provide a custom parameter value for the data retention period, Security Hub CSPM uses a default value of 168 hours.

In Kinesis Data Streams, a data stream is an ordered sequence of data records meant to be written to and read from in real time. Data records are stored in shards in your stream temporarily. The time period from when a record is added to when it is no longer accessible is called the retention period. Kinesis Data Streams almost immediately makes records older than the new retention period inaccessible after decreasing the retention period. For example, changing the retention period from 24 hours to 48 hours means that records added to the stream 23 hours 55 minutes prior are still available after 24 hours.

Remediation

To change the backup retention period for your Kinesis Data Streams, see Change the data retention period in the *Amazon Kinesis Data Streams Developer Guide*.

Security Hub CSPM controls for AWS KMS

These AWS Security Hub CSPM controls evaluate the AWS Key Management Service (AWS KMS) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys

Related requirements: NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-5, NIST.800-53.r5 AC-6,

NIST.800-53.r5 AC-6(3), CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::IAM::Policy`

AWS Config rule: iam-customer-policy-blocked-kms-actions

Schedule type: Change triggered

Parameters:

- `blockedActionsPatterns: kms:ReEncryptFrom, kms:Decrypt` (not customizable)
- `excludePermissionBoundaryPolicy`: `True` (not customizable)

Checks whether the default version of IAM customer managed policies allow principals to use the AWS KMS decryption actions on all resources. The control fails if the policy is open enough to allow `kms:Decrypt` or `kms:ReEncryptFrom` actions on all KMS keys.

The control only checks KMS keys in the Resource element and doesn't take into account any conditionals in the Condition element of a policy. In addition, the control evaluates both attached and unattached customer managed policies. It doesn't check inline policies or AWS managed policies.

With AWS KMS, you control who can use your KMS keys and gain access to your encrypted data. IAM policies define which actions an identity (user, group, or role) can perform on which resources. Following security best practices, AWS recommends that you allow least privilege. In other words, you should grant to identities only the `kms:Decrypt` or `kms:ReEncryptFrom` permissions and only for the keys that are required to perform a task. Otherwise, the user might use keys that are not appropriate for your data.

Instead of granting permissions for all keys, determine the minimum set of keys that users need to access encrypted data. Then design policies that allow users to use only those keys. For example, do not allow `kms:Decrypt` permission on all KMS keys. Instead, allow `kms:Decrypt` only on keys in a particular Region for your account. By adopting the principle of least privilege, you can reduce the risk of unintended disclosure of your data.

Remediation

To modify an IAM customer managed policy, see Editing customer managed policies in the *IAM User Guide*. When editing your policy, for the `Resource` field, provide the Amazon Resource Name (ARN) of the specific key or keys that you want to allow decryption actions on.

[KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys

Related requirements: NIST.800-53.r5 AC-2, NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-5, NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(3), CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.07

Category: Protect > Secure access management

Severity: Medium

Resource type:

- `AWS::IAM::Group`
- `AWS::IAM::Role`
- `AWS::IAM::User`

AWS Config rule: iam-inline-policy-blocked-kms-actions

Schedule type: Change triggered

Parameters:

- `blockedActionsPatterns: kms:ReEncryptFrom, kms:Decrypt` (not customizable)

This control checks whether the inline policies that are embedded in your IAM identities (role, user, or group) allow the AWS KMS decryption and re-encryption actions on all KMS keys. The control fails if the policy is open enough to allow `kms:Decrypt` or `kms:ReEncryptFrom` actions on all KMS keys.

The control only checks KMS keys in the Resource element and doesn't take into account any conditionals in the Condition element of a policy.

With AWS KMS, you control who can use your KMS keys and gain access to your encrypted data. IAM policies define which actions an identity (user, group, or role) can perform on which resources. Following security best practices, AWS recommends that you allow least privilege. In other words, you should grant to identities only the permissions they need and only for keys that are required to perform a task. Otherwise, the user might use keys that are not appropriate for your data.

Instead of granting permission for all keys, determine the minimum set of keys that users need to access encrypted data. Then design policies that allow the users to use only those keys. For example, do not allow `kms:Decrypt` permission on all KMS keys. Instead, allow the permission only on specific keys in a specific Region for your account. By adopting the principle of least privilege, you can reduce the risk of unintended disclosure of your data.

Remediation

To modify an IAM inline policy, see Editing inline policies in the *IAM User Guide*. When editing your policy, for the `Resource` field, provide the Amazon Resource Name (ARN) of the specific key or keys that you want to allow decryption actions on.

[KMS.3] AWS KMS keys should not be deleted unintentionally

Related requirements: NIST.800-53.r5 SC-12, NIST.800-53.r5 SC-12(2), CRI Profile v2.2/PR.DS-01.02, CRI Profile v2.2/PR.PS-01.07

Category: Protect > Data protection > Data deletion protection

Severity: Critical

Resource type: `AWS::KMS::Key`

AWS Config rule: `kms-cmk-not-scheduled-for-deletion-2` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether KMS keys are scheduled for deletion. The control fails if a KMS key is scheduled for deletion.

KMS keys cannot be recovered once deleted. Data encrypted under a KMS key is also permanently unrecoverable if the KMS key is deleted. If meaningful data has been encrypted under a KMS key scheduled for deletion, consider decrypting the data or re-encrypting the data under a new KMS key unless you are intentionally performing a *cryptographic erasure*.

When a KMS key is scheduled for deletion, a mandatory waiting period is enforced to allow time to reverse the deletion, if it was scheduled in error. The default waiting period is 30 days, but it can be reduced to as short as 7 days when the KMS key is scheduled for deletion. During the waiting period, the scheduled deletion can be canceled and the KMS key will not be deleted.

For additional information regarding deleting KMS keys, see Deleting KMS keys in the *AWS Key Management Service Developer Guide*.

Remediation

To cancel a scheduled KMS key deletion, see **To cancel key deletion** under Scheduling and canceling key deletion (console) in the *AWS Key Management Service Developer Guide*.

[KMS.4] AWS KMS key rotation should be enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/3.6, CIS AWS Foundations Benchmark v3.0.0/3.6, CIS AWS Foundations Benchmark v1.4.0/3.8, CIS AWS Foundations Benchmark v1.2.0/2.8, NIST.800-53.r5 SC-12, NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-28(3), PCI DSS v3.2.1/3.6.4, PCI DSS v4.0.1/3.7.4, CRI Profile v2.2/PR.PS-01.06, CRI Profile v2.2/PR.PS-01.07

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::KMS::Key`

AWS Config rule: cmk-backing-key-rotation-enabled

Schedule type: Periodic

Parameters: None

AWS KMS enables customers to rotate the backing key, which is key material stored in AWS KMS and is tied to the key ID of the KMS key. It's the backing key that is used to perform cryptographic operations such as encryption and decryption. Automated key rotation currently retains all previous backing keys so that decryption of encrypted data can take place transparently.

CIS recommends that you enable KMS key rotation. Rotating encryption keys helps reduce the potential impact of a compromised key because data encrypted with a new key can't be accessed with a previous key that might have been exposed.

Remediation

To enable KMS key rotation, see How to enable and disable automatic key rotation in the *AWS Key Management Service Developer Guide*.

[KMS.5] KMS keys should not be publicly accessible

Related requirements: CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.07

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Critical

Resource type: `AWS::KMS::Key`

AWS Config rule: kms-key-policy-no-public-access

Schedule type: Change triggered

Parameters: None

This controls checks whether an AWS KMS key is publicly accessible. The control fails if the KMS key is publicly accessible.

Implementing least privilege access is fundamental to reducing security risk and the impact of errors or malicious intent. If the key policy for an AWS KMS key allows access from external accounts, third parties might be able to encrypt and decrypt data by using the key. This could result in an internal or external threat exfiltrating data from AWS services that use the key.

Note

This control also returns a `FAILED` finding for an AWS KMS key if your configurations prevent AWS Config from recording the key policy in the Configuration Item (CI) for the KMS key. For AWS Config to populate the key policy in the CI for the KMS key, the AWS Config role must have access to read the key policy by using the GetKeyPolicy API call. To resolve this type of `FAILED` finding, check policies that can prevent the AWS Config role from having read access to the key policy for the KMS key. For example, check the following:

- The key policy for the KMS key.

- Service control policies (SCPs) and resource control policies (RCPs) in AWS Organizations that apply to your account.
- Permissions for the AWS Config role, if you are not using the AWS Config service-linked role.

In addition, this control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a PASSED finding, conditions in the key policy must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

Remediation

For information about updating the key policy for an AWS KMS key, see Key policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

Security Hub CSPM controls for AWS Lambda

These AWS Security Hub CSPM controls evaluate the AWS Lambda service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Lambda.1] Lambda function policies should prohibit public access

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/7.2.1, PCI DSS v4.0.1/7.2.1, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-04.01, CRI Profile v2.2/PR.AA-05.01

Category: Protect > Secure network configuration

Severity: Critical

Resource type: `AWS::Lambda::Function`

AWS Config rule: lambda-function-public-access-prohibited

Schedule type: Change triggered

Parameters: None

This control checks whether the Lambda function resource-based policy prohibits public access outside of your account. The control fails if public access is permitted. The control also fails if a Lambda function is invoked from Amazon S3, and the policy doesn't include a condition to limit public access, such as `AWS:SourceAccount`. We recommend using other S3 conditions along with `AWS:SourceAccount` in your bucket policy for more refined access.

> **Note**
>
> This control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a `PASSED` finding, conditions in the policy for the Lambda function must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

The Lambda function should not be publicly accessible, as this may allow unintended access to your function code.

Remediation

To remediate this issue, you must update your function's resource-based policy to remove permissions or to add the `AWS:SourceAccount` condition. You can only update the resource-based policy from the Lambda API or AWS CLI.

To start, review the resource-based policy on the Lambda console. Identify the policy statement that has `Principal` field values that make the policy public, such as `"*"` or `{ "AWS": "*" }`.

You cannot edit the policy from the console. To remove permissions from the function, run the remove-permission command from the AWS CLI.

```
$ aws lambda remove-permission --function-name <function-name> --statement-
id <statement-id>
```

Replace *<function-name>* with the name of the Lambda function, and *<statement-id>* with the statement ID (`Sid`) of the statement that you want to remove.

[Lambda.2] Lambda functions should use supported runtimes

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), PCI DSS v4.0.1/12.3.4, CRI Profile v2.2/PR.PS-02.01, CRI Profile v2.2/PR.PS-02.03

Category: Protect > Secure development

Severity: Medium

Resource type: `AWS::Lambda::Function`

AWS Config rule: lambda-function-settings-check

Schedule type: Change triggered

Parameters:

- `runtime`: `dotnet10, java25, java21, java17, java11, java8.al2, java17.al2023, java11.al2023, java8.al2023, nodejs26.x, nodejs24.x, nodejs22.x, python3.15, python3.14, python3.13, python3.12, python3.11, ruby4.0, ruby3.4, ruby3.3` (not customizable)

This control checks whether AWS Lambda function runtime settings match the expected values set for the supported runtimes in each language. The control fails if the Lambda function doesn't use a supported runtime, as noted in the Parameters section. Security Hub CSPM ignores functions that have a package type of `Image`.

Lambda runtimes are built around a combination of operating system, programming language, and software libraries that are subject to maintenance and security updates. When a runtime component is no longer supported for security updates, Lambda deprecates the runtime. Even though you can't create functions that use the deprecated runtime, the function is still available to process invocation events. We recommend ensuring that your Lambda functions are current and don't use deprecated runtime environments. For a list of supported runtimes, see Lambda runtimes in the *AWS Lambda Developer Guide*.

Remediation

For more information about supported runtimes and deprecation schedules, see Runtime deprecation policy in the *AWS Lambda Developer Guide*. When you migrate your runtimes to

the latest version, follow the syntax and guidance from the publishers of the language. We also recommend applying runtime updates to help reduce the risk of impact to your workloads in the rare event of a runtime version incompatibility.

[Lambda.3] Lambda functions should be in a VPC

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03

Category: Protect > Secure network configuration

Severity: Low

Resource type: `AWS::Lambda::Function`

AWS Config rule: lambda-inside-vpc

Schedule type: Change triggered

Parameters: None

This control checks whether a Lambda function is deployed in a virtual private cloud (VPC). The control fails if the Lambda function isn't deployed in a VPC. Security Hub CSPM doesn't evaluate the VPC subnet routing configuration to determine public reachability. You might see failed findings for Lambda@Edge resources.

Deploying resources in a VPC strengthens security and control over network configurations. Such deployments also offer scalability and high fault tolerance across multiple Availability Zones. You can customize VPC deployments to meet diverse application requirements.

Remediation

To configure an existing function to connect to private subnets in your VPC, see Configuring VPC access in the *AWS Lambda Developer Guide*. We recommend choosing at least two private subnets for high availability and at least one security group that meets the connectivity requirements of the function.

[Lambda.5] VPC Lambda functions should operate in multiple Availability Zones

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/GV.RM-09.02, CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::Lambda::Function`

AWS Config rule: lambda-vpc-multi-az-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`availabilityZones`	Minimum number of Availability Zones	Enum	`2, 3, 4, 5, 6`	`2`

This control checks if an AWS Lambda function that connects to a virtual private cloud (VPC) operates in at least the specified number of Availability Zone (AZs). The control fails if the function doesn't operate in at least the specified number of AZs. Unless you provide a custom parameter value for the minimum number of AZs, Security Hub CSPM uses a default value of two AZs.

Deploying resources across multiple AZs is an AWS best practice to ensure high availability within your architecture. Availability is a core pillar in the confidentiality, integrity, and availability triad security model. All Lambda functions that connect to a VPC should have a multi-AZ deployment to ensure that a single zone of failure doesn't cause a total disruption of operations.

Remediation

If you configure your function to connect to a VPC in your account, specify subnets in multiple AZs to ensure high availability. For instructions, see Configuring VPC access in the *AWS Lambda Developer Guide*.

Lambda automatically runs other functions in multiple AZs to ensure that it is available to process events in case of a service interruption in a single zone.

[Lambda.6] Lambda functions should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Lambda::Function`

AWS Config rule: `tagged-lambda-function` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Lambda function has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the function doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the function isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging,

you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Lambda function, see Using tags on Lambda functions in the *AWS Lambda Developer Guide*.

[Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled

Related requirements: NIST.800-53.r5 CA-7, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/PR.PS-04.02

Category: Identify > Logging

Severity: Low

Resource type: `AWS::Lambda::Function`

AWS Config rule: lambda-function-xray-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether active tracing with AWS X-Ray is enabled for an AWS Lambda function. The control fails if active tracing with X-Ray is disabled for the Lambda function.

AWS X-Ray can provide tracing and monitoring capabilities for AWS Lambda functions, which can save time and effort debugging and operating Lambda functions. It can help you diagnose errors and identify performance bottlenecks, slowdowns, and timeouts by breaking down latency for

Lambda functions. It can also help with data privacy and compliance requirements. If you enable active tracing for a Lambda function, X-Ray provides a holistic view of data flow and processing within the Lambda function, which can help you identify potential security vulnerabilities or non-compliant data handling practices. This visibility can help you maintain data integrity, confidentiality, and compliance with relevant regulations.

> **Note**
>
> AWS X-Ray tracing is currently not supported for Lambda functions with Amazon Managed Streaming for Apache Kafka (Amazon MSK), self-managed Apache Kafka, Amazon MQ with ActiveMQ and RabbitMQ, or Amazon DocumentDB event source mappings.

Remediation

For information about enabling active tracing for an AWS Lambda function, see Visualize Lambda function invocations using AWS X-Ray in the *AWS Lambda Developer Guide*.

Security Hub CSPM controls for Macie

These AWS Security Hub CSPM controls evaluate the Amazon Macie service.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Macie.1] Amazon Macie should be enabled

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 RA-5, NIST.800-53.r5 SA-8(19), NIST.800-53.r5 SI-4, CRI Profile v2.2/ID.AM-05.01, CRI Profile v2.2/ID.AM-05.02, CRI Profile v2.2/ID.AM-07.01, CRI Profile v2.2/PR.DS-01.02

Category: Detect > Detection services

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: `macie-status-check`

Schedule type: Periodic

This control checks whether Amazon Macie is enabled for an account. The control fails if Macie isn't enabled for the account.

Amazon Macie discovers sensitive data using machine learning and pattern matching, provides visibility into data security risks, and enables automated protection against those risks. Macie automatically and continually evaluates your Amazon Simple Storage Service (Amazon S3) buckets for security and access control, and generates findings to notify you of potential issues with the security or privacy of your Amazon S3 data. Macie also automates discovery and reporting of sensitive data, such as personally identifiable information (PII), to provide you with a better understanding of the data that you store in Amazon S3. To learn more, see the *Amazon Macie User Guide*.

Remediation

To enable Macie, see Enable Macie in the *Amazon Macie User Guide*.

[Macie.2] Macie automated sensitive data discovery should be enabled

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 RA-5, NIST.800-53.r5 SA-8(19), NIST.800-53.r5 SI-4, CRI Profile v2.2/PR.DS-01.02

Category: Detect > Detection services

Severity: High

Resource type: `AWS::::Account`

AWS Config rule: `macie-auto-sensitive-data-discovery-check`

Schedule type: Periodic

This control checks whether automated sensitive data discovery is enabled for an Amazon Macie administrator account. The control fails if automated sensitive data discovery isn't enabled for a Macie administrator account. This control applies only to administrator accounts.

Macie automates discovery and reporting of sensitive data, such as personally identifiable information (PII), in Amazon Simple Storage Service (Amazon S3) buckets. With automated sensitive data discovery, Macie continually evaluates your bucket inventory and uses sampling techniques to identify and select representative S3 objects from your buckets. Macie then analyzes the selected objects, inspecting them for sensitive data. As the analyses progress, Macie updates

statistics, inventory data, and other information that it provides about your S3 data. Macie also generates findings to report sensitive data that it finds.

Remediation

To create and configure automated sensitive data discovery jobs to analyze objects in S3 buckets, see Configuring automated sensitive data discovery for your account in the *Amazon Macie User Guide*.

Security Hub CSPM controls for Amazon MSK

These AWS Security Hub CSPM controls evaluate the Amazon Managed Streaming for Apache Kafka (Amazon MSK) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[MSK.1] MSK clusters should be encrypted in transit among broker nodes

Related requirements: NIST.800-53.r5 AC-4, NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-23, NIST.800-53.r5 SC-23(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-8, NIST.800-53.r5 SC-8(1), NIST.800-53.r5 SC-8(2), PCI DSS v4.0.1/4.2.1, CRI Profile v2.2/PR.DS-02.01

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::MSK::Cluster`

AWS Config rule: msk-in-cluster-node-require-tls

Schedule type: Change triggered

Parameters: None

This controls checks whether an Amazon MSK cluster is encrypted in transit with HTTPS (TLS) among the broker nodes of the cluster. The control fails if plain text communication is enabled for a cluster broker node connection.

HTTPS offers an extra layer of security as it uses TLS to move data and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. By default, Amazon MSK encrypts data in transit with TLS. However, you can override this default at the time that you create the cluster. We recommend using encrypted connections over HTTPS (TLS) for-broker node connections.

Remediation

For information about updating the encryption settings for an Amazon MSK cluster, see Updating security settings of a cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

[MSK.2] MSK clusters should have enhanced monitoring configured

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.IR-04.01, CRI Profile v2.2/PR.IR-04.02

Category: Detect > Detection services

Severity: Low

Resource type: `AWS::MSK::Cluster`

AWS Config rule: msk-enhanced-monitoring-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon MSK cluster has enhanced monitoring configured, specified by a monitoring level of at least `PER_TOPIC_PER_BROKER`. The control fails if the monitoring level for the cluster is set to `DEFAULT` or `PER_BROKER`.

The `PER_TOPIC_PER_BROKER` monitoring level provides more granular insights into the performance of your MSK cluster, and also provides metrics related to resource utilization, such as CPU and memory usage. This helps you identify performance bottlenecks and resource utilization patterns for individual topics and brokers. This visibility, in turn, can optimize the performance of your Kafka brokers.

Remediation

To configure enhanced monitoring for an MSK cluster, complete the following steps:

1. Open the Amazon MSK console at https://console.aws.amazon.com/msk/home?region=us-east-1#/home/.
2. In the navigation pane, choose **Clusters**. Then, choose a cluster.
3. For **Action**, select **Edit monitoring**.

4. Select the option for **Enhanced topic-level monitoring**.
5. Choose **Save changes**.

For more information about monitoring levels, see Amazon MSK metrics for monitoring Standard brokers with CloudWatch in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

[MSK.3] MSK Connect connectors should be encrypted in transit

Related requirements: PCI DSS v4.0.1/4.2.1, CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::KafkaConnect::Connector`

AWS Config rule: `msk-connect-connector-encrypted` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon MSK Connect connector is encrypted in transit. This control fails if the connector isn't encrypted in transit.

Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic.

Remediation

You can enable encryption in transit when you create an MSK Connect connector. You can't change encryption settings after creating a connector. For more information, see Create a connector in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

[MSK.4] MSK clusters should have public access disabled

Related requirements: CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.02

Category: Protect > Secure access management > Resource not publicly accessible

Severity: Critical

Resource type: `AWS::MSK::Cluster`

AWS Config rule: msk-cluster-public-access-disabled

Schedule type: Change triggered

Parameters: None

This control checks whether public access is disabled for an Amazon MSK cluster. The control fails if public access is enabled for the MSK cluster.

By default, clients can access an Amazon MSK cluster only if they're in the same VPC as the cluster. All communication between Kafka clients and an MSK cluster are private by default and streaming data doesn't traverse the internet. However, if an MSK cluster is configured to allow public access, anyone on the internet can establish a connection to Apache Kafka brokers that are running within the cluster. This can lead to issues such as unauthorized access, data breaches, or exploitation of vulnerabilities. If you restrict access to a cluster by requiring authentication and authorization measures, you can help protect sensitive information and maintain the integrity of your resources.

Remediation

For information about managing public access to an Amazon MSK cluster, see Turn on public access to an MSK Provisioned cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

[MSK.5] MSK connectors should have logging enabled

Related requirements: CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/PR.PS-04.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::KafkaConnect::Connector`

AWS Config rule: msk-connect-connector-logging-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether logging is enabled for an Amazon MSK connector. The control fails if logging is disabled for the MSK connector.

Amazon MSK connectors integrate external systems and Amazon services with Apache Kafka by continuously copying streaming data from a data source into an Apache Kafka cluster, or continuously copying data from a cluster into a data sink. MSK Connect can write log events that can help debug a connector. When you create a connector, you can specify zero or more of the following log destinations: Amazon CloudWatch Logs, Amazon S3, and Amazon Data Firehose.

> **Note**
>
> Sensitive configuration values can appear in connector logs if a plugin does not define those values as secret. Kafka Connect treats undefined configuration values the same as any other plaintext value.

Remediation

To enable logging for an existing Amazon MSK connector, you have to re-create the connector with the appropriate logging configuration. For information about configuration options, see Logging for MSK Connect in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

[MSK.6] MSK clusters should disable unauthenticated access

Related requirements: CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-04.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure access management > Passwordless authentication

Severity: Medium

Resource type: `AWS::MSK::Cluster`

AWS Config rule: msk-unrestricted-access-check

Schedule type: Change triggered

Parameters: None

This control checks whether unauthenticated access is enabled for an Amazon MSK cluster. The control fails if unauthenticated access is enabled for the MSK cluster.

Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptions. We recommend enabling authentication mechanisms such as IAM authentication, SASL/SCRAM, or mutual TLS to ensure proper access control and maintain security compliance.

Remediation

For information about changing the authentication settings for an Amazon MSK cluster, see the following sections of the *Amazon Managed Streaming for Apache Kafka Developer Guide*: Update security settings of an Amazon MSK cluster and Authentication and authorization for Apache Kafka APIs.

Security Hub CSPM controls for Amazon MQ

These AWS Security Hub CSPM controls evaluate the Amazon MQ service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch

Related requirements: NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-12, NIST.800-53.r5 SI-4, PCI DSS v4.0.1/10.3.3, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::AmazonMQ::Broker`

AWS Config rule: `mq-cloudwatch-audit-log-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon MQ ActiveMQ broker streams audit logs to Amazon CloudWatch Logs. The control fails if the broker doesn't stream audit logs to CloudWatch Logs.

By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information.

Remediation

To stream ActiveMQ broker logs to CloudWatch Logs, see Configuring Amazon MQ for ActiveMQ logs in the *Amazon MQ Developer Guide*.

[MQ.4] Amazon MQ brokers should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::AmazonMQ::Broker`

AWS Config rule: `tagged-amazonmq-broker` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon MQ broker has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the broker doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the broker isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Amazon MQ broker, see Tagging resources in the *Amazon MQ Developer Guide*.

[MQ.5] ActiveMQ brokers should use active/standby deployment mode

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-03.01

Category: Recover > Resilience > High availability

Severity: Low

Resource type: `AWS::AmazonMQ::Broker`

AWS Config rule: `mq-active-deployment-mode`

Schedule type: Change triggered

Parameters: None

This control checks whether the deployment mode for an Amazon MQ ActiveMQ broker is set to active/standby. The control fails if a single-instance broker (enabled by default) is set as the deployment mode.

Active/standby deployment provides high availability for your Amazon MQ ActiveMQ brokers in an AWS Region. The active/standby deployment mode includes two broker instances in two different Availability Zones, configured in a redundant pair. These brokers communicate synchronously with your application, which can reduce downtime and loss of data in the event of a failure.

Remediation

To create a new ActiveMQ broker with active/standby deployment mode, see Creating and configuring an ActiveMQ broker in the *Amazon MQ Developer Guide*. For **Deployment mode**, choose **Active/standby broker**. You can't change the deployment mode for an existing broker. Instead, you must create a new broker and copy the settings over from the old broker.

[MQ.6] RabbitMQ brokers should use cluster deployment mode

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/GV.RM-09.02, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Low

Resource type: `AWS::AmazonMQ::Broker`

AWS Config rule: `mq-rabbit-deployment-mode`

Schedule type: Change triggered

Parameters: None

This control checks whether the deployment mode for an Amazon MQ RabbitMQ broker is set to cluster deployment. The control fails if a single-instance broker (enabled by default) is set as the deployment mode.

Cluster deployment provides high availability for your Amazon MQ RabbitMQ brokers in an AWS Region. The cluster deployment is a logical grouping of three RabbitMQ broker nodes, each with its own Amazon Elastic Block Store (Amazon EBS) volume and a shared state. The cluster deployment ensures that data is replicated to all nodes in the cluster, which can reduce downtime and loss of data in the event of a failure.

Remediation

To create a new RabbitMQ broker with cluster deployment mode, see Creating and connecting to a RabbitMQ broker in the *Amazon MQ Developer Guide*. For **Deployment mode**, choose **Cluster deployment**. You can't change the deployment mode for an existing broker. Instead, you must create a new broker and copy the settings over from the old broker.

Security Hub CSPM controls for Neptune

These AWS Security Hub CSPM controls evaluate the Amazon Neptune service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Neptune.1] Neptune DB clusters should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-encrypted`

Schedule type: Change triggered

Parameters: None

This control checks whether a Neptune DB cluster is encrypted at rest. The control fails if a Neptune DB cluster isn't encrypted at rest.

Data at rest refers to any data that's stored in persistent, non-volatile storage for any duration. Encryption helps you protect the confidentiality of such data, reducing the risk that an unauthorized user can access it. Encrypting your Neptune DB clusters protects your data and metadata against unauthorized access. It also fulfills compliance requirements for data-at-rest encryption of production file systems.

Remediation

You can enable encryption at rest when you create a Neptune DB cluster. You can't change encryption settings after creating a cluster. For more information, see Encrypting Neptune resources at rest in the *Neptune User Guide*.

[Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(1), NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 AU-6(5), NIST.800-53.r5 AU-7(1), NIST.800-53.r5 AU-9(7), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-20, NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-4(5), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.3.3, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-cloudwatch-log-export-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether a Neptune DB cluster publishes audit logs to Amazon CloudWatch Logs. The control fails if a Neptune DB cluster doesn't publish audit logs to CloudWatch Logs. `EnableCloudWatchLogsExport` should be set to `Audit`.

Amazon Neptune and Amazon CloudWatch are integrated so that you can gather and analyze performance metrics. Neptune automatically sends metrics to CloudWatch and also supports

CloudWatch Alarms. Audit logs are highly customizable. When you audit a database, each operation on the data can be monitored and logged to an audit trail, including information about which database cluster is accessed and how. We recommend sending these logs to CloudWatch to help you monitor your Neptune DB clusters.

Remediation

To publish Neptune audit logs to CloudWatch Logs, see Publishing Neptune logs to Amazon CloudWatch Logs in the *Neptune User Guide*. In the **Log exports** section, choose **Audit**.

[Neptune.3] Neptune DB cluster snapshots should not be public

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Critical

Resource type: `AWS::RDS::DBClusterSnapshot`

AWS Config rule: `neptune-cluster-snapshot-public-prohibited`

Schedule type: Change triggered

Parameters: None

This control checks whether a Neptune manual DB cluster snapshot is public. The control fails if a Neptune manual DB cluster snapshot is public.

A Neptune DB cluster manual snapshot should not be public unless intended. If you share an unencrypted manual snapshot as public, the snapshot is available to all AWS accounts. Public snapshots may result in unintended data exposure.

Remediation

To remove public access for Neptune manual DB cluster snapshots, see Sharing a DB cluster snapshot in the *Neptune User Guide*.

[Neptune.4] Neptune DB clusters should have deletion protection enabled

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.DS-01.02, CRI Profile v2.2/PR.IR-03.01

Category: Protect > Data protection > Data deletion protection

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-deletion-protection-enabled`

Schedule type: Change triggered

Parameters: None

This control checks if a Neptune DB cluster has deletion protection enabled. The control fails if a Neptune DB cluster doesn't have deletion protection enabled.

Enabling cluster deletion protection offers an additional layer of protection against accidental database deletion or deletion by an unauthorized user. A Neptune DB cluster can't be deleted while deletion protection is enabled. You must first disable deletion protection before a delete request can succeed.

Remediation

To enable deletion protection for an existing Neptune DB cluster, see Modifying the DB cluster by using the console, CLI, and API in the *Amazon Aurora User Guide*.

[Neptune.5] Neptune DB clusters should have automated backups enabled

Related requirements: NIST.800-53.r5 SI-12, CRI Profile v2.2/PR.DS-11.01, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02, CRI Profile v2.2/RC.RP-03.01

Category: Recover > Resilience > Backups enabled

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: neptune-cluster-backup-retention-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
minimumBackupRetentionPeriod	Minimum backup retention period in days	Integer	7 to 35	7	

This control checks whether a Neptune DB cluster has automated backups enabled, and a backup retention period greater than or equal to the specified time frame. The control fails if backups aren't enabled for the Neptune DB cluster, or if the retention period is less than the specified time frame. Unless you provide a custom parameter value for the backup retention period, Security Hub CSPM uses a default value of 7 days.

Backups help you recover more quickly from a security incident and strengthen the resilience of your systems. By automating backups for your Neptune DB clusters, you'll be able to restore your systems to a point in time and minimize downtime and data loss.

Remediation

To enable automated backups and set a backup retention period for your Neptune DB clusters, see Enabling automated backups in the *Amazon RDS User Guide*. For **Backup retention period**, choose a value greater than or equal to 7.

[Neptune.6] Neptune DB cluster snapshots should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-7(18), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RDS::DBClusterSnapshot`

AWS Config rule: `neptune-cluster-snapshot-encrypted`

Schedule type: Change triggered

Parameters: None

This control checks whether a Neptune DB cluster snapshot is encrypted at rest. The control fails if a Neptune DB cluster isn't encrypted at rest.

Data at rest refers to any data that's stored in persistent, non-volatile storage for any duration. Encryption helps you protect the confidentiality of such data, reducing the risk that an unauthorized user gets access to it. Data in Neptune DB clusters snapshots should be encrypted at rest for an added layer of security.

Remediation

You can't encrypt an existing Neptune DB cluster snapshot. Instead, you must restore the snapshot to a new DB cluster and enable encryption on the cluster. You can create an encrypted snapshot from the encrypted cluster. For instructions, see Restoring from a DB cluster snapshot and Creating a DB cluster snapshot in Neptune in the *Neptune User Guide*.

[Neptune.7] Neptune DB clusters should have IAM database authentication enabled

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.PS-06.10

Category: Protect > Secure access management > Passwordless authentication

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-iam-database-authentication`

Schedule type: Change triggered

Parameters: None

This control checks if a Neptune DB cluster has IAM database authentication enabled. The control fails if IAM database authentication isn't enabled for a Neptune DB cluster.

IAM database authentication for Amazon Neptune database clusters removes the need to store user credentials within the database configuration because authentication is managed externally using IAM. When IAM database authentication is enabled, each request needs to be signed using AWS Signature Version 4.

Remediation

By default, IAM database authentication is disabled when you create a Neptune DB cluster. To enable it, see Enabling IAM database authentication in Neptune in the *Neptune User Guide*.

[Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01, CRI Profile v2.2/ID.AM-08.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-copy-tags-to-snapshot-enabled`

Schedule type: Change triggered

Parameters: None

This control checks if a Neptune DB cluster is configured to copy all tags to snapshots when the snapshots are created. The control fails if a Neptune DB cluster isn't configured to copy tags to snapshots.

Identification and inventory of your IT assets is a crucial aspect of governance and security. You should tag snapshots in the same way as their parent Amazon RDS database clusters. Copying tags ensures that the metadata for the DB snapshots matches that of the parent database clusters, and that access policies for the DB snapshot also match those of the parent DB instance.

Remediation

To copy tags to snapshots for Neptune DB clusters, see Copying tags in Neptune in the *Neptune User Guide*.

[Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `neptune-cluster-multi-az-enabled`

Schedule type: Change triggered

Parameters: None

This control checks if an Amazon Neptune DB cluster has read-replica instances in multiple Availability Zones (AZs). The control fails if the cluster is deployed in only one AZ.

If an AZ is unavailable and during regular maintenance events, read-replicas serve as failover targets for the primary instance. That is, if the primary instance fails, Neptune promotes a read-replica instance to become the primary instance. By contrast, if your DB cluster doesn't include any read-replica instances, your DB cluster remains unavailable when the primary instance fails until it has been re-created. Re-creating the primary instance takes considerably longer than promoting a read-replica. To ensure high availability, we recommend that you create one or more read-replica instances that have the same DB instance class as the primary instance and are located in different AZs than the primary instance.

Remediation

To deploy a Neptune DB cluster in multiple AZs,, see Read-replica DB instances in a Neptune DB cluster in the *Neptune User Guide*.

Security Hub CSPM controls for AWS Network Firewall

These AWS Security Hub CSPM controls evaluate the AWS Network Firewall service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::NetworkFirewall::Firewall`

AWS Config rule: netfw-multi-az-enabled

Schedule type: Change triggered

Parameters: None

This control evaluates whether a firewall managed through AWS Network Firewall is deployed across multiple Availability Zones (AZs). The control fails if a firewall is deployed in only one AZ.

AWS global infrastructure includes multiple AWS Regions. AZs are physically separated, isolated locations within each Region that are connected by low-latency, high-throughput, and highly redundant networking. By deploying a Network Firewall firewall across multiple AZs, you can balance and shift traffic among AZs, which helps you design highly available solutions.

Remediation

Deploying a Network Firewall firewall across multiple AZs

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, under **Network Firewall**, choose **Firewalls**.
3. On the **Firewalls** page, select the firewall that you want to edit.
4. On the firewall details page, choose the **Firewall details** tab.
5. In the **Associated policy and VPC** section, choose **Edit**
6. To add a new AZ, choose **Add New Subnet**. Select the AZ and subnet that you would like to use. Ensure that you select at least two AZs.
7. Choose **Save**.

[NetworkFirewall.2] Network Firewall logging should be enabled

Related requirements: NIST.800-53.r5 AC-2(12), NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 AU-9(7), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4, NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), NIST.800-171.r2 3.1.20, NIST.800-171.r2 3.13.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/PR.PS-04.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::NetworkFirewall::LoggingConfiguration`

AWS Config rule: netfw-logging-enabled

Schedule type: Periodic

Parameters: None

This control checks whether logging is enabled for an AWS Network Firewall firewall. The control fails if logging isn't enabled for at least one log type or if the logging destination doesn't exist.

Logging helps you maintain the reliability, availability, and performance of your firewalls. In Network Firewall, logging gives you detailed information about network traffic, including the time that the stateful engine received a packet flow, detailed information about the packet flow, and any stateful rule action taken against the packet flow.

Remediation

To enable logging for a firewall, see Updating a firewall's logging configuration in the *AWS Network Firewall Developer Guide*.

[NetworkFirewall.3] Network Firewall policies should have at least one rule group associated

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-171.r2 3.1.3, NIST.800-171.r2 3.13.1, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure Network Configuration

Severity: Medium

Resource type: `AWS::NetworkFirewall::FirewallPolicy`

AWS Config rule: netfw-policy-rule-group-associated

Schedule type: Change triggered

Parameters: None

This control checks whether a Network Firewall policy has any stateful or stateless rule groups associated. The control fails if stateless or stateful rule groups are not assigned.

A firewall policy defines how your firewall monitors and handles traffic in Amazon Virtual Private Cloud (Amazon VPC). Configuration of stateless and stateful rule groups helps to filter packets and traffic flows, and defines default traffic handling.

Remediation

To add a rule group to a Network Firewall policy, see Updating a firewall policy in the *AWS Network Firewall Developer Guide*. For information about creating and managing rule groups, see Rule groups in AWS Network Firewall.

[NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure Network Configuration

Severity: Medium

Resource type: `AWS::NetworkFirewall::FirewallPolicy`

AWS Config rule: netfw-policy-default-action-full-packets

Schedule type: Change triggered

Parameters:

- `statelessDefaultActions: aws:drop,aws:forward_to_sfe` (not customizable)

This control checks whether the default stateless action for full packets for a Network Firewall policy is drop or forward. The control passes if `Drop` or `Forward` is selected, and fails if `Pass` is selected.

A firewall policy defines how your firewall monitors and handles traffic in Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows. Defaulting to `Pass` can allow unintended traffic.

Remediation

To change your firewall policy, see Updating a firewall policy in the *AWS Network Firewall Developer Guide*. For **Stateless default actions**, choose **Edit**. Then, choose **Drop** or **Forward to stateful rule groups** as the **Action**.

[NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-171.r2 3.1.3, NIST.800-171.r2 3.1.14, NIST.800-171.r2 3.13.1, NIST.800-171.r2 3.13.6, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.02, CRI Profile v2.2/PR.IR-01.03

Category: Protect > Secure Network Configuration

Severity: Medium

Resource type: `AWS::NetworkFirewall::FirewallPolicy`

AWS Config rule: netfw-policy-default-action-fragment-packets

Schedule type: Change triggered

Parameters:

- `statelessFragDefaultActions (Required) : aws:drop, aws:forward_to_sfe` (not customizable)

This control checks whether the default stateless action for fragmented packets for a Network Firewall policy is drop or forward. The control passes if `Drop` or `Forward` is selected, and fails if `Pass` is selected.

A firewall policy defines how your firewall monitors and handles traffic in Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows. Defaulting to `Pass` can allow unintended traffic.

Remediation

To change your firewall policy, see Updating a firewall policy in the *AWS Network Firewall Developer Guide*. For **Stateless default actions**, choose **Edit**. Then, choose **Drop** or **Forward to stateful rule groups** as the **Action**.

[NetworkFirewall.6] Stateless Network Firewall rule group should not be empty

Related requirements: NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(5), NIST.800-171.r2 3.1.3, NIST.800-171.r2 3.1.14, NIST.800-171.r2 3.13.1, NIST.800-171.r2 3.13.6, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/DE.CM-01.05

Category: Protect > Secure Network Configuration

Severity: Medium

Resource type: `AWS::NetworkFirewall::RuleGroup`

AWS Config rule: netfw-stateless-rule-group-not-empty

Schedule type: Change triggered

Parameters: None

This control checks if a stateless rule group in AWS Network Firewall contains rules. The control fails if there are no rules in the rule group.

A rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic.

Remediation

To add rules to your Network Firewall rule group, see Updating a stateful rule group in the *AWS Network Firewall Developer Guide*. On the firewall details page, for **Stateless rule group**, choose **Edit** to add rules.

[NetworkFirewall.7] Network Firewall firewalls should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::NetworkFirewall::Firewall`

AWS Config rule: `tagged-networkfirewall-firewall` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Network Firewall firewall has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the firewall doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the firewall isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals.

You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Network Firewall firewall, see Tagging AWS Network Firewall resources in the *AWS Network Firewall Developer Guide*.

[NetworkFirewall.8] Network Firewall firewall policies should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::NetworkFirewall::FirewallPolicy`

AWS Config rule: `tagged-networkfirewall-firewallpolicy` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Network Firewall firewall policy has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the firewall policy doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the firewall policy isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Network Firewall policy, see Tagging AWS Network Firewall resources in the *AWS Network Firewall Developer Guide*.

[NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), CRI Profile v2.2/PR.IR-01.02

Category: Protect > Network Security

Severity: Medium

Resource type: `AWS::NetworkFirewall::Firewall`

AWS Config rule: netfw-deletion-protection-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS Network Firewall firewall has deletion protection enabled. The control fails if deletion protection isn't enabled for a firewall.

AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that enables you to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). The deletion protection setting protects against accidental deletion of the firewall.

Remediation

To enable delete protection on an existing Network Firewall firewall, see Updating a firewall in the *AWS Network Firewall Developer Guide*. For **Change protections**, select **Enable**. You can also enable deletion protection by invoking the UpdateFirewallDeleteProtection API and setting the `DeleteProtection` field to `true`.

[NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.02, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03

Category: Protect > Network Security

Severity: Medium

Resource type: `AWS::NetworkFirewall::Firewall`

AWS Config rule: netfw-subnet-change-protection-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether subnet change protection is enabled for an AWS Network Firewall firewall. The control fails if subnet change protection isn't enabled for the firewall.

AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewall's subnet associations.

Remediation

For information about enabling subnet change protection for an existing Network Firewall firewall, see Updating a firewall in the *AWS Network Firewall Developer Guide*.

Security Hub CSPM controls for Amazon OpenSearch Service

These AWS Security Hub CSPM controls evaluate the Amazon OpenSearch Service (OpenSearch Service) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Opensearch.1] OpenSearch domains should have encryption at rest enabled

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/7.2.1, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-encrypted-at-rest`

Schedule type: Change triggered

Parameters: None

This control checks whether OpenSearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled.

For an added layer of security for sensitive data, you should configure your OpenSearch Service domain to be encrypted at rest. When you configure encryption of data at rest, AWS KMS stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

To learn more about OpenSearch Service encryption at rest, see Encryption of data at rest for Amazon OpenSearch Service in the *Amazon OpenSearch Service Developer Guide*.

Remediation

To enable encryption at rest for new and existing OpenSearch domains, see Enabling encryption of data at rest in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.2] OpenSearch domains should not be publicly accessible

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration > Resources within VPC

Severity: Critical

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-in-vpc-only`

Schedule type: Change triggered

Parameters: None

This control checks whether OpenSearch domains are in a VPC. It does not evaluate the VPC subnet routing configuration to determine public access.

You should ensure that OpenSearch domains are not attached to public subnets. See Resource-based policies in the Amazon OpenSearch Service Developer Guide. You should also ensure that your VPC is configured according to the recommended best practices. See Security best practices for your VPC in the Amazon VPC User Guide.

OpenSearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to OpenSearch domains, including network ACL and security groups.

Security Hub recommends that you migrate public OpenSearch domains to VPCs to take advantage of these controls.

Remediation

If you create a domain with a public endpoint, you cannot later place it within a VPC. Instead, you must create a new domain and migrate your data. The reverse is also true. If you create a domain within a VPC, it cannot have a public endpoint. Instead, you must either create another domain or disable this control.

For instructions, see Launching your Amazon OpenSearch Service domains within a VPC in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.3] OpenSearch domains should encrypt data sent between nodes

Related requirements: NIST.800-53.r5 AC-4, NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-23, NIST.800-53.r5 SC-23(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-8, NIST.800-53.r5 SC-8(1), NIST.800-53.r5 SC-8(2), CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.IR-01.05, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-node-to-node-encryption-check`

Schedule type: Change triggered

Parameters: None

This control checks whether OpenSearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain.

HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for OpenSearch domains ensures that intra-cluster communications are encrypted in transit.

There can be a performance penalty associated with this configuration. You should be aware of and test the performance trade-off before enabling this option.

Remediation

To enable node-to-node encryption on an OpenSearch domain, see Enabling node-to-node encryption in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-logs-to-cloudwatch`

Schedule type: Change triggered

Parameters:

- `logtype = 'error'` (not customizable)

This control checks whether OpenSearch domains are configured to send error logs to CloudWatch Logs. This control fails if error logging to CloudWatch is not enabled for a domain.

You should enable error logs for OpenSearch domains and send those logs to CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Remediation

To enable log publishing, see Enabling log publishing (console) in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.5] OpenSearch domains should have audit logging enabled

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3,

NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-audit-logging-enabled`

Schedule type: Change triggered

Parameters:

- `cloudWatchLogsLogGroupArnList` (not customizable) – Security Hub CSPM does not populate this parameter. Comma-separated list of CloudWatch Logs log groups that should be configured for audit logs.

This control checks whether OpenSearch domains have audit logging enabled. This control fails if an OpenSearch domain does not have audit logging enabled.

Audit logs are highly customizable. They allow you to track user activity on your OpenSearch clusters, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.

Remediation

For instructions on enabling audit logs, see Enabling audit logs in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.6] OpenSearch domains should have at least three data nodes

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: opensearch-data-node-fault-tolerance

Schedule type: Change triggered

Parameters: None

This control checks whether OpenSearch domains are configured with at least three data nodes and `zoneAwarenessEnabled` is `true`. This control fails for an OpenSearch domain if `instanceCount` is less than 3 or `zoneAwarenessEnabled` is `false`.

To achieve cluster-level high availability and fault tolerance, an OpenSearch domain should have at least three data nodes. Deploying an OpenSearch domain with at least three data nodes ensures cluster operations if a node fails.

Remediation

To modify the number of data nodes in an OpenSearch domain

1. Sign in to the AWS console and open the Amazon OpenSearch Service console at https://console.aws.amazon.com/aos/.
2. Under **My domains**, choose the name of the domain to edit, and choose **Edit**.
3. Under **Data nodes** set **Number of nodes** to a number greater than 3. If you are deploying to three Availability Zones, set the number to a multiple of three to ensure equal distribution across Availability Zones.
4. Choose **Submit**.

[Opensearch.7] OpenSearch domains should have fine-grained access control enabled

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-5, NIST.800-53.r5 AC-6, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03, CRI Profile v2.2/PR.PS-04.02

Category: Protect > Secure Access Management > Sensitive API actions restricted

Severity: High

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-access-control-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether OpenSearch domains have fine-grained access control enabled. The control fails if the fine-grained access control is not enabled. Fine-grained access control requires `advanced-security-options`in the OpenSearch parameter `update-domain-config` to be enabled.

Fine-grained access control offers additional ways of controlling access to your data on Amazon OpenSearch Service.

Remediation

To enable fine-grained access control, see Fine-grained access control in Amazon OpenSearch Service in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy

Related requirements: NIST.800-53.r5 AC-17(2), NIST.800-53.r5 AC-4, NIST.800-53.r5 IA-5(1), NIST.800-53.r5 SC-12(3), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-23, NIST.800-53.r5 SC-23(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-8, NIST.800-53.r5 SC-8(1), NIST.800-53.r5 SC-8(2), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.IR-01.05, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `opensearch-https-required`

Schedule type: Change triggered

Parameters:

- `tlsPolicies: Policy-Min-TLS-1-2-PFS-2023-10, Policy-Min-TLS-1-2-RFC9151-FIPS-2024-08` (not customizable)

This controls checks whether an Amazon OpenSearch Service domain endpoint is configured to use the latest TLS security policy. The control fails if the OpenSearch domain endpoint isn't configured to use the latest supported policy or if HTTPs isn't enabled.

HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. Encrypting data in transit can affect performance. You should test your application with this feature to understand the performance profile and the impact of TLS. TLS 1.2 provides several security enhancements over previous versions of TLS.

Remediation

To enable TLS encryption, use the UpdateDomainConfig API operation. Configure the DomainEndpointOptions field to specify the value for `TLSSecurityPolicy`. For more information, see Node-to-node encryption in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.9] OpenSearch domains should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: `tagged-opensearch-domain` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon OpenSearch Service domain has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the domain doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the domain isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an OpenSearch Service domain, see Working with tags in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.10] OpenSearch domains should have the latest software update installed

Related requirements: NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), PCI DSS v4.0.1/6.3.3, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.01

Category: Identify > Vulnerability, patch, and version management

Severity: Medium

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: opensearch-update-check

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon OpenSearch Service domain has the latest software update installed. The control fails if a software update is available but not installed for the domain.

OpenSearch Service software updates provide the latest platform fixes, updates, and features available for the environment. Keeping up-to-date with patch installation helps maintain domain security and availability. If no action is taken on required updates, the service software is updated automatically (typically after 2 weeks). We recommend scheduling updates during a time of low traffic to the domain to minimize service disruption.

Remediation

To install software updates for an OpenSearch domain, see Starting an update in the *Amazon OpenSearch Service Developer Guide*.

[Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-2, NIST.800-53.r5 SC-5, NIST.800-53.r5 SC-36, NIST.800-53.r5 SI-13, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Low

Resource type: `AWS::OpenSearch::Domain`

AWS Config rule: opensearch-primary-node-fault-tolerance

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon OpenSearch Service domain is configured with at least three dedicated primary nodes. The control fails if the domain has fewer than three dedicated primary nodes.

OpenSearch Service uses dedicated primary nodes to increase cluster stability. A dedicated primary node performs cluster management tasks, but doesn't hold data or respond to data upload requests. We recommend that you use multi-AZ with standby, which adds three dedicated primary nodes to each production OpenSearch domain.

Remediation

To change the number of primary nodes for an OpenSearch domain, see Creating and managing Amazon OpenSearch Service domains in the *Amazon OpenSearch Service Developer Guide*.

Security Hub CSPM controls for AWS Private CA

These AWS Security Hub CSPM controls evaluate the AWS Private Certificate Authority (AWS Private CA) service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[PCA.1] AWS Private CA root certificate authority should be disabled

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/PR.PS-01.07

Category: Protect > Secure network configuration

Severity: Low

Resource type: `AWS::ACMPCA::CertificateAuthority`

AWS Config rule: `acm-pca-root-ca-disabled`

Schedule type: Periodic

Parameters: None

This control checks if AWS Private CA has a root certificate authority (CA) that is disabled. The control fails if the root CA is enabled.

With AWS Private CA, you can create a CA hierarchy that includes a root CA and subordinate CAs. You should minimize the use of the root CA for daily tasks, especially in production environments. The root CA should only be used to issue certificates for intermediate CAs. This allows the root CA to be stored out of harm's way while the intermediate CAs perform the daily task of issuing end-entity certificates.

Remediation

To disable the root CA, see Update CA status in the *AWS Private Certificate Authority User Guide*.

[PCA.2] AWS Private CA certificate authorities should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::ACMPCA::CertificateAuthority`

AWS Config rule: `acmpca-certificate-authority-tagged`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Private CA certificate authority has tags with the specific keys defined in the parameter `requiredKeyTags`. The control fails if the certificate authority doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredKeyTags`. If the parameter `requiredKeyTags` isn't provided, the control only checks for the existence of a tag key and fails if the certificate authority isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

Remediation

To add tags to an AWS Private CA authority, see Add tags for your private CA in the *AWS Private Certificate Authority User Guide*.

Security Hub CSPM controls for Amazon RDS

These AWS Security Hub CSPM controls evaluate the Amazon Relational Database Service (Amazon RDS) and Amazon RDS resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[RDS.1] RDS snapshot should be private

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v3.2.1/7.2.1, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03

Category: Protect > Secure network configuration

Severity: Critical

Resource type: `AWS::RDS::DBClusterSnapshot`, `AWS::RDS::DBSnapshot`

AWS Config rule: `rds-snapshots-public-prohibited`

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon RDS snapshots are public. The control fails if RDS snapshots are public. This control evaluates RDS instances, Aurora DB instances, Neptune DB instances, and Amazon DocumentDB clusters.

RDS snapshots are used to back up the data on your RDS instances at a specific point in time. They can be used to restore previous states of RDS instances.

An RDS snapshot must not be public unless intended. If you share an unencrypted manual snapshot as public, this makes the snapshot available to all AWS accounts. This may result in unintended data exposure of your RDS instance.

Note that if the configuration is changed to allow public access, the AWS Config rule may not be able to detect the change for up to 12 hours. Until the AWS Config rule detects the change, the check passes even though the configuration violates the rule.

To learn more about sharing a DB snapshot, see Sharing a DB snapshot in the *Amazon RDS User Guide*.

Remediation

To remove public access from RDS snapshots, see Sharing a snapshot in the *Amazon RDS User Guide*. For **DB snapshot visibility**, we choose **Private**.

[RDS.2] RDS DB Instances should prohibit public access, as determined by the PubliclyAccessible configuration

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.2.3, CIS AWS Foundations Benchmark v3.0.0/2.3.3, NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(5), PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v3.2.1/7.2.1, PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration

Severity: Critical

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-instance-public-access-check`

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon RDS instances are publicly accessible by evaluating the `PubliclyAccessible` field in the instance configuration item.

The `PubliclyAccessible` value in the RDS instance configuration indicates whether the DB instance is publicly accessible. When the DB instance is configured with `PubliclyAccessible`, it is an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. When the DB instance isn't publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address.

Unless you intend for your RDS instance to be publicly accessible, the RDS instance should not be configured with `PubliclyAccessible` value. Doing so might allow unnecessary traffic to your database instance.

Remediation

To remove public access from RDS DB instances, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*. For **Public access**, choose **No**.

[RDS.3] RDS DB instances should have encryption at-rest enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.2.1, CIS AWS Foundations Benchmark v3.0.0/2.3.1, CIS AWS Foundations Benchmark v1.4.0/2.3.1, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-storage-encrypted`

Schedule type: Change triggered

Parameters: None

This control checks whether storage encryption is enabled for your Amazon RDS DB instances.

This control is intended for RDS DB instances. However, it can also generate findings for Aurora DB instances, Neptune DB instances, and Amazon DocumentDB clusters. If these findings are not useful, then you can suppress them.

For an added layer of security for your sensitive data in RDS DB instances, you should configure your RDS DB instances to be encrypted at rest. To encrypt your RDS DB instances and snapshots at rest, enable the encryption option for your RDS DB instances. Data that is encrypted at rest includes the underlying storage for DB instances, its automated backups, read replicas, and snapshots.

RDS encrypted DB instances use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts your RDS DB instances. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data transparently with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Amazon RDS encryption is currently available for all database engines and storage types. Amazon RDS encryption is available for most DB instance classes. To learn about DB instance classes that do not support Amazon RDS encryption, see Encrypting Amazon RDS resources in the *Amazon RDS User Guide*.

Remediation

For information about encrypting DB instances in Amazon RDS, see Encrypting Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.4] RDS cluster snapshots and database snapshots should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RDS::DBClusterSnapshot, AWS::RDS::DBSnapshot`

AWS Config rule: `rds-snapshot-encrypted`

Schedule type: Change triggered

Parameters: None

This control checks whether an RDS DB snapshot is encrypted. The control fails if an RDS DB snapshot isn't encrypted.

This control is intended for RDS DB instances. However, it can also generate findings for snapshots of Aurora DB instances, Neptune DB instances, and Amazon DocumentDB clusters. If these findings are not useful, then you can suppress them.

Encrypting data at rest reduces the risk that an unauthenticated user gets access to data that is stored on disk. Data in RDS snapshots should be encrypted at rest for an added layer of security.

Remediation

To encrypt an RDS snapshot, see Encrypting Amazon RDS resources in the *Amazon RDS User Guide*. When you encrypt an RDS DB instance, the encrypted data includes the underlying storage for the instance, its automated backups, read replicas, and snapshots.

You can only encrypt an RDS DB instance when you create it, not after the DB instance is created. However, because you can encrypt a copy of an unencrypted snapshot, you can effectively add encryption to an unencrypted DB instance. That is, you can create a snapshot of your DB instance, and then create an encrypted copy of that snapshot. You can then restore a DB instance from the encrypted snapshot, and thus you have an encrypted copy of your original DB instance.

[RDS.5] RDS DB instances should be configured with multiple Availability Zones

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.2.4, NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-03.01

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-multi-az-support`

Schedule type: Change triggered

Parameters: None

This control checks whether high availability is enabled for your RDS DB instances. The control fails if an RDS DB instance isn't configured with multiple Availability Zones (AZs). This control doesn't apply to RDS DB instances that are part of a Multi-AZ DB cluster deployment.

Configuring Amazon RDS DB instances with AZs helps ensure the availability of stored data. Multi-AZ deployments allow for automated failover if there is an issue with AZ availability and during regular RDS maintenance.

Remediation

To deploy your DB instances in multiple AZs, Modifying a DB instance to be a Multi-AZ DB instance deployment in the *Amazon RDS User Guide*.

[RDS.6] Enhanced monitoring should be configured for RDS DB instances

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.IR-04.01, CRI Profile v2.2/PR.PS-04.02

Category: Detect > Detection services

Severity: Low

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-enhanced-monitoring-enabled`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`monitoringInterval`	Number of seconds between monitorin	Enum	`1`, `5`, `10`, `15`, `30`, `60`	No default value	

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
	g metric collection intervals				

This control checks whether enhanced monitoring is enabled for an Amazon Relational Database Service (Amazon RDS) DB instance. The control fails if enhanced monitoring isn't enabled for the instance. If you provide a custom value for the `monitoringInterval` parameter, the control passes only if enhanced monitoring metrics are collected for the instance at the specified interval.

In Amazon RDS, Enhanced Monitoring enables a more rapid response to performance changes in underlying infrastructure. These performance changes could result in a lack of availability of the data. Enhanced Monitoring provides real-time metrics of the operating system that your RDS DB instance runs on. An agent is installed on the instance. The agent can obtain metrics more accurately than is possible from the hypervisor layer.

Enhanced Monitoring metrics are useful when you want to see how different processes or threads on a DB instance use the CPU. For more information, see Enhanced Monitoring in the *Amazon RDS User Guide*.

Remediation

For detailed instructions on enabling Enhanced Monitoring for your DB instance, see Setting up for and enabling Enhanced Monitoring in the *Amazon RDS User Guide*.

[RDS.7] RDS clusters should have deletion protection enabled

Related requirements: NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), CRI Profile v2.2/PR.IR-03.01

Category: Protect > Data protection > Data deletion protection

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-deletion-protection-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an RDS DB cluster has deletion protection enabled. The control fails if an RDS DB cluster doesn't have deletion protection enabled.

This control is intended for RDS DB instances. However, it can also generate findings for Aurora DB instances, Neptune DB instances, and Amazon DocumentDB clusters. If these findings are not useful, then you can suppress them.

Enabling cluster deletion protection is an additional layer of protection against accidental database deletion or deletion by an unauthorized entity.

When deletion protection is enabled, an RDS cluster cannot be deleted. Before a deletion request can succeed, deletion protection must be disabled.

Remediation

To enable deletion protection for an RDS DB cluster, see Modifying the DB cluster by using the console, CLI, and API in the *Amazon RDS User Guide*. For **Deletion protection**, choose **Enable deletion protection**.

[RDS.8] RDS DB instances should have deletion protection enabled

Related requirements: NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.IR-03.01

Category: Protect > Data protection > Data deletion protection

Severity: Low

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-instance-deletion-protection-enabled`

Schedule type: Change triggered

Parameters:

- `databaseEngines`: `mariadb,mysql,custom-oracle-ee,oracle-ee-cdb,oracle-se2-cdb,oracle-ee,oracle-se2,oracle-se1,oracle-se,postgres,sqlserver-ee,sqlserver-se,sqlserver-ex,sqlserver-web` (not customizable)

This control checks whether your RDS DB instances that use one of the listed database engines have deletion protection enabled. The control fails if an RDS DB instance doesn't have deletion protection enabled.

Enabling instance deletion protection is an additional layer of protection against accidental database deletion or deletion by an unauthorized entity.

While deletion protection is enabled, an RDS DB instance cannot be deleted. Before a deletion request can succeed, deletion protection must be disabled.

Remediation

To enable deletion protection for an RDS DB instance, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*. For **Deletion protection**, choose **Enable deletion protection**.

[RDS.9] RDS DB instances should publish logs to CloudWatch Logs

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/PR.IR-04.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-logging-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS DB instance is configured to publish the following logs to Amazon CloudWatch Logs. The control fails if the instance isn’t configured to publish the following logs to CloudWatch Logs:

- Oracle: Alert, Audit, Trace, Listener

- PostgreSQL: Postgresql, Upgrade
- MySQL: Audit, Error, General, SlowQuery
- MariaDB: Audit, Error, General, SlowQuery
- SQL Server: Error, Agent
- Aurora-MySQL: Audit, Error, General, SlowQuery
- Aurora-PostgreSQL: Postgresql

RDS databases should have relevant logs enabled. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits and can help to diagnose availability issues.

Remediation

For information about publishing RDS database logs to CloudWatch Logs, see Specifying the logs to publish to CloudWatch Logs in the *Amazon RDS User Guide*.

[RDS.10] IAM authentication should be configured for RDS instances

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Secure access management > Passwordless authentication

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-instance-iam-authentication-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an RDS DB instance has IAM database authentication enabled. The control fails if IAM authentication is not configured for RDS DB instances. This control only evaluates RDS instances with the following engine types: `mysql`, `postgres`, `aurora`, `aurora-mysql`, `aurora-postgresql`, and `mariadb`. An RDS instance must also be in one of the following

states for a finding to be generated: `available`, `backing-up`, `storage-optimization`, or `storage-full`.

IAM database authentication allows authentication to database instances with an authentication token instead of a password. Network traffic to and from the database is encrypted using SSL. For more information, see IAM database authentication in the *Amazon Aurora User Guide*.

Remediation

To activate IAM database authentication on an RDS DB instance, see Enabling and disabling IAM database authentication in the *Amazon RDS User Guide*.

[RDS.11] RDS instances should have automatic backups enabled

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-12, NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.DS-11.01

Category: Recover > Resilience > Backups enabled

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `db-instance-backup-enabled`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`backupRetentionMinimum`	Minimum backup retention period in days	Integer	7 to 35	7	
`checkReadReplicas`	Checks whether RDS DB instances have backups enabled for read replicas	Boolean	Not customizable	`false`	

This control checks whether an Amazon Relational Database Service instance has automated backups enabled, and a backup retention period greater than or equal to the specified time frame. Read replicas are excluded from evaluation. The control fails if backups aren't enabled for the instance, or if the retention period is less than the specified time frame. Unless you provide a custom parameter value for the backup retention period, Security Hub CSPM uses a default value of 7 days.

Backups help you more quickly recover from a security incident and strengthens the resilience of your systems. Amazon RDS lets you configure daily full instance volume snapshots. For more information about Amazon RDS automated backups, see Working with Backups in the *Amazon RDS User Guide*.

Remediation

To enable automated backups on an RDS DB instance, see Enabling automated backups in the *Amazon RDS User Guide*.

[RDS.12] IAM authentication should be configured for RDS clusters

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Secure access management > Passwordless authentication

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-iam-authentication-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS DB cluster has IAM database authentication enabled.

IAM database authentication allows for password-free authentication to database instances. The authentication uses an authentication token. Network traffic to and from the database is encrypted using SSL. For more information, see IAM database authentication in the *Amazon Aurora User Guide*.

Remediation

To enable IAM authentication for a DB cluster, see Enabling and disabling IAM database authentication in the *Amazon Aurora User Guide*.

[RDS.13] RDS automatic minor version upgrades should be enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.2.2, CIS AWS Foundations Benchmark v3.0.0/2.3.2, NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), PCI DSS v4.0.1/6.3.3, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.01

Category: Identify > Vulnerability, patch, and version management

Severity: High

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-automatic-minor-version-upgrade-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS DB instance has automatic minor version upgrades enabled. The control fails if automatic minor version upgrades are not enabled for the RDS DB instance.

> **Note**
>
> This control evaluates each Amazon RDS DB instance independently. For Amazon Aurora clusters, automatic minor version upgrades require that you enable this setting on the cluster. You must also enable this setting on all instances in the cluster. A PASSED finding for an individual instance doesn't guarantee that upgrades occur if you haven't also enabled the setting at the cluster level.
> This control also doesn't account for configurations that don't support automatic minor version upgrades. These include Aurora clusters in an Aurora global database and Aurora MySQL clusters with cross-Region read replicas. For these configurations, the control might produce evaluation results that don't accurately reflect the actual upgrade behavior.

Automatic minor version upgrades periodically update a database to recent database engine versions. However, the upgrade might not always include the latest database engine version. If you need to keep your databases on specific versions at particular times, we recommend that you manually upgrade to the database versions that you need according to your required schedule. In cases of critical security issues or when a version reaches its end-of-support date, Amazon RDS might apply a minor version upgrade even if you haven't enabled the **Auto minor version upgrade** option. For more information, see the Amazon RDS upgrade documentation for your specific database engine:

- Automatic minor version upgrades for RDS for MariaDB
- Automatic minor version upgrades for RDS for MySQL
- Automatic minor version upgrades for RDS for PostgreSQL
- Db2 on Amazon RDS versions
- Oracle minor version upgrades
- Upgrades of the Microsoft SQL Server DB engine

Remediation

To enable automatic minor version upgrades for an existing DB instance, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*. For **Auto minor version upgrade**, select **Yes**.

[RDS.14] Amazon Aurora clusters should have backtracking enabled

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SI-13(5), CRI Profile v2.2/GV.OC-05.04, CRI Profile v2.2/ID.IM-02.06, CRI Profile v2.2/PR.DS-11.01, CRI Profile v2.2/PR.IR-03.01

Category: Recover > Resilience > Backups enabled

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `aurora-mysql-backtracking-enabled`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`BacktrackWindowInHours`	Number of hours to backtrack an Aurora MySQL cluster	Double	`0.1` to `72`	No default value	

This control checks whether an Amazon Aurora cluster has backtracking enabled. The control fails if the cluster doesn't have backtracking enabled. If you provide a custom value for the `BacktrackWindowInHours` parameter, the control passes only if the cluster is backtracked for the specified length of time.

Backups help you to recover more quickly from a security incident. They also strengthens the resilience of your systems. Aurora backtracking reduces the time to recover a database to a point in time. It does not require a database restore to do so.

Remediation

To enable Aurora backtracking, see Configuring backtracking in the *Amazon Aurora User Guide*.

Note that you cannot enable backtracking on an existing cluster. Instead, you can create a clone that has backtracking enabled. For more information about the limitations of Aurora backtracking, see the list of limitations in Overview of backtracking.

[RDS.15] RDS DB clusters should be configured for multiple Availability Zones

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.2.4, NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 SC-36, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.DS-11.01, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-multi-az-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether high availability is enabled for your RDS DB clusters. The control fails if an RDS DB cluster isn't deployed in multiple Availability Zones (AZs).

RDS DB clusters should be configured for multiple AZs to ensure availability of stored data. Deployment to multiple AZs allows for automated failover in the event of an AZ availability issue and during regular RDS maintenance events.

Remediation

To deploy your DB clusters in multiple AZs, Modifying a DB instance to be a Multi-AZ DB instance deployment in the *Amazon RDS User Guide*.

Remediation steps differ for Aurora global databases. To configure multiple Availability Zones for an Aurora global database, select your DB cluster. Then, choose **Actions** and **Add reader**, and specify multiple AZs. For more information, see Adding Aurora Replicas to a DB cluster in the *Amazon Aurora User Guide*.

[RDS.16] Aurora DB clusters should be configured to copy tags to DB snapshots

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), CRI Profile v2.2/ID.AM-08.01, CRI Profile v2.2/ID.AM-08.03

Category: Identify > Inventory

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-copy-tags-to-snapshots-enabled` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Aurora DB cluster is configured to automatically copy tags to snapshots of the DB cluster when the snapshots are created. The control fails if the Aurora DB cluster isn't configured to automatically copy tags to snapshots of the cluster when the snapshots are created.

Identification and inventory of your IT assets is a crucial aspect of governance and security. You need to have visibility of all your Amazon Aurora DB clusters so that you can assess their security posture and take action on potential areas of weakness. Aurora DB snapshots should have the same tags as their parent DB clusters. In Amazon Aurora, you can configure a DB cluster to automatically copy all the tags for the cluster to snapshots of the cluster. Enabling this setting ensures that DB snapshots inherit the same tags as their parent DB clusters.

Remediation

For information about configuring an Amazon Aurora DB cluster to automatically copy tags to DB snapshots, see Modifying an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

[RDS.17] RDS DB instances should be configured to copy tags to snapshots

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), CRI Profile v2.2/ID.AM-08.01, CRI Profile v2.2/ID.AM-08.03

Category: Identify > Inventory

Severity: Low

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-instance-copy-tags-to-snapshots-enabled` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether RDS DB instances are configured to copy all tags to snapshots when the snapshots are created.

Identification and inventory of your IT assets is a crucial aspect of governance and security. You need to have visibility of all your RDS DB instances so that you can assess their security posture and take action on potential areas of weakness. Snapshots should be tagged in the same way as their parent RDS database instances. Enabling this setting ensures that snapshots inherit the tags of their parent database instances.

Remediation

To automatically copy tags to snapshots for an RDS DB instance, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*. Select **Copy tags to snapshots**.

[RDS.19] Existing RDS event notification subscriptions should be configured for critical cluster events

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, CRI Profile v2.2/DE.AE-02.02, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection services > Application monitoring

Severity: Low

Resource type: `AWS::RDS::EventSubscription`

AWS Config rule: `rds-cluster-event-notifications-configured` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an existing Amazon RDS event subscription for database clusters has notifications enabled for the following source type and event category key-value pairs:

```
DBCluster: ["maintenance","failure"]
```

The control passes if there are no existing event subscriptions in your account.

RDS event notifications uses Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response. For additional information about RDS event notifications, see Using Amazon RDS event notification in the *Amazon RDS User Guide*.

Remediation

To subscribe to RDS cluster event notifications, see Subscribing to Amazon RDS event notification in the *Amazon RDS User Guide*. Use the following values:

Field	Value
Source type	Clusters
Clusters to include	All clusters

Field	Value
Event categories to include	Select specific event categories or All event categories

[RDS.20] Existing RDS event notification subscriptions should be configured for critical database instance events

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, PCI DSS v4.0.1/11.5.2, CRI Profile v2.2/DE.AE-02.02, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection services > Application monitoring

Severity: Low

Resource type: `AWS::RDS::EventSubscription`

AWS Config rule: `rds-instance-event-notifications-configured` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an existing Amazon RDS event subscription for database instances has notifications enabled for the following source type and event category key-value pairs:

```
DBInstance: ["maintenance","configuration change","failure"]
```

The control passes if there are no existing event subscriptions in your account.

RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response. For additional information about RDS event notifications, see Using Amazon RDS event notification in the *Amazon RDS User Guide*.

Remediation

To subscribe to RDS instance event notifications, see Subscribing to Amazon RDS event notification in the *Amazon RDS User Guide*. Use the following values:

Field	Value
Source type	Instances
Instances to include	All instances
Event categories to include	Select specific event categories or All event categories

[RDS.21] An RDS event notifications subscription should be configured for critical database parameter group events

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, PCI DSS v4.0.1/11.5.2, CRI Profile v2.2/DE.AE-02.02, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection services > Application monitoring

Severity: Low

Resource type: `AWS::RDS::EventSubscription`

AWS Config rule: `rds-pg-event-notifications-configured` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS event subscription exists with notifications enabled for the following source type, event category key-value pairs. The control passes if there are no existing event subscriptions in your account.

```
DBParameterGroup: ["configuration change"]
```

RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response. For additional information about RDS event notifications, see Using Amazon RDS event notification in the *Amazon RDS User Guide*.

Remediation

To subscribe to RDS database parameter group event notifications, see Subscribing to Amazon RDS event notification in the *Amazon RDS User Guide*. Use the following values:

Field	Value
Source type	Parameter groups
Parameter groups to include	All parameter groups
Event categories to include	Select specific event categories or All event categories

[RDS.22] An RDS event notifications subscription should be configured for critical database security group events

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-2, PCI DSS v4.0.1/11.5.2, CRI Profile v2.2/DE.AE-02.02, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/RS.MA-02.01

Category: Detect > Detection Services > Application monitoring

Severity: Low

Resource type: `AWS::RDS::EventSubscription`

AWS Config rule: `rds-sg-event-notifications-configured` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS event subscription exists with notifications enabled for the following source type, event category key-value pairs. The control passes if there are no existing event subscriptions in your account.

```
DBSecurityGroup: ["configuration change","failure"]
```

RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for a rapid response. For additional information about RDS event notifications, see Using Amazon RDS event notification in the *Amazon RDS User Guide*.

Remediation

To subscribe to RDS instance event notifications, see Subscribing to Amazon RDS event notification in the *Amazon RDS User Guide*. Use the following values:

Field	Value
Source type	Security groups
Security groups to include	All security groups
Event categories to include	Select specific event categories or All event categories

[RDS.23] RDS instances should not use a database engine default port

Related requirements: NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(5), CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03

Category: Protect > Secure network configuration

Severity: Low

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-no-default-ports` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an RDS cluster or instance uses a port other than the default port of the database engine. The control fails if the RDS cluster or instance uses the default port. This control doesn't apply to RDS instances that are part of a cluster.

If you use a known port to deploy an RDS cluster or instance, an attacker can guess information about the cluster or instance. The attacker can use this information in conjunction with other information to connect to an RDS cluster or instance or gain additional information about your application.

When you change the port, you must also update the existing connection strings that were used to connect to the old port. You should also check the security group of the DB instance to ensure that it includes an ingress rule that allows connectivity on the new port.

Remediation

To modify the default port of an existing RDS DB instance, see Modifying an Amazon RDS DB instance in the *Amazon RDS User Guide*. To modify the default port of an existing RDS DB cluster, see Modifying the DB cluster by using the console, CLI, and API in the *Amazon Aurora User Guide*. For **Database port**, change the port value to a non-default value.

[RDS.24] RDS Database clusters should use a custom administrator username

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, PCI DSS v4.0.1/2.2.2, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.PS-01.01

Category: Identify > Resource Configuration

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-default-admin-check`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS database cluster has changed the admin username from its default value. The control does not apply to engines of the type neptune (Neptune DB) or docdb (DocumentDB). This rule will fail if the admin username is set to the default value.

When creating an Amazon RDS database, you should change the default admin username to a unique value. Default usernames are public knowledge and should be changed during RDS database creation. Changing the default usernames reduces the risk of unintended access.

Remediation

For changing the admin username associated with the Amazon RDS database cluster, create a new RDS database cluster and change the default admin username while creating the database.

[RDS.25] RDS database instances should use a custom administrator username

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, PCI DSS v4.0.1/2.2.2, CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.PS-01.01

Category: Identify > Resource Configuration

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-instance-default-admin-check`

Schedule type: Change triggered

Parameters: None

This control checks whether you've changed the administrative username for Amazon Relational Database Service (Amazon RDS) database instances from the default value. The control fails if the administrative username is set to the default value. The control doesn't apply to engines of the type neptune (Neptune DB) or docdb (DocumentDB), and to RDS instances that are part of a cluster.

Default administrative usernames on Amazon RDS databases are public knowledge. When creating an Amazon RDS database, you should change the default administrative username to a unique value to reduce the risk of unintended access.

Remediation

To change the administrative username associated with an RDS database instance, first create a new RDS database instance. Change the default administrative username while creating the database.

[RDS.26] RDS DB instances should be protected by a backup plan

Category: Recover > Resilience > Backups enabled

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-12,

NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.DS-11.01, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/RC.RP-01.01

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: `rds-resources-protected-by-backup-plan`

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`backupVaultLockCheck`	The control produces a PASSED finding if the parameter is set to true and the resource uses AWS Backup Vault Lock.	Boolean	`true` or `false`	No default value	

This control evaluates if Amazon RDS DB instances are covered by a backup plan. This control fails if the RDS DB instance isn't covered by a backup plan. If you set the `backupVaultLockCheck` parameter equal to `true`, the control passes only if the instance is backed up in an AWS Backup locked vault.

> **Note**
>
> This control doesn't evaluate Neptune and DocumentDB instances. It also doesn't evaluate RDS DB instances that are members of a cluster.

AWS Backup is a fully managed backup service that centralizes and automates the backing up of data across AWS services. With AWS Backup, you can create backup policies called backup plans. You can use these plans to define your backup requirements, such as how frequently to back up

your data and how long to retain those backups. Including RDS DB instances in a backup plan helps you protect your data from unintended loss or deletion.

Remediation

To add an RDS DB instance to an AWS Backup backup plan, see Assigning resources to a backup plan in the *AWS Backup Developer Guide*.

[RDS.27] RDS DB clusters should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-encrypted-at-rest`

Schedule type: Change triggered

Parameters: None

This control checks if an RDS DB cluster is encrypted at rest. The control fails if an RDS DB cluster isn't encrypted at rest.

Data at rest refers to any data that's stored in persistent, non-volatile storage for any duration. Encryption helps you protect the confidentiality of such data, reducing the risk that an unauthorized user can access it. Encrypting your RDS DB clusters protects your data and metadata against unauthorized access. It also fulfills compliance requirements for data-at-rest encryption of production file systems.

Remediation

You can enable encryption at rest when you create an RDS DB cluster. You can't change encryption settings after creating a cluster. For more information, see Encrypting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

[RDS.28] RDS DB clusters should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule:`tagged-rds-dbcluster` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon RDS DB cluster has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB cluster doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB cluster isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB cluster, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.29] RDS DB cluster snapshots should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBClusterSnapshot`

AWS Config rule:`tagged-rds-dbclustersnapshot` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon RDS DB cluster snapshot has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB cluster snapshot doesn't

have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB cluster snapshot isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB cluster snapshot, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.30] RDS DB instances should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBInstance`

AWS Config rule:`tagged-rds-dbinstance` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon RDS DB instance has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB instance doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB instance isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB instance, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.31] RDS DB security groups should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBSecurityGroup`

AWS Config rule:`tagged-rds-dbsecuritygroup` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon RDS DB security group has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB security group doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB security group isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB security group, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.32] RDS DB snapshots should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBSnapshot`

AWS Config rule:`tagged-rds-dbsnapshot` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource	StringList (maximum of 6 items)	1–6 tag keys that meet AWS	No default value

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
	must contain. Tag keys are case sensitive.		requirements.	

This control checks whether an Amazon RDS DB snapshot has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB snapshot doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB snapshot isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB snapshot, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.33] RDS DB subnet groups should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBSubnetGroup`

AWS Config rule:`tagged-rds-dbsubnetgroups` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon RDS DB subnet group has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the DB subnet group doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the DB subnet group isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals.

You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an RDS DB subnet group, see Tagging Amazon RDS resources in the *Amazon RDS User Guide*.

[RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-aurora-mysql-audit-logging-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Aurora MySQL DB cluster is configured to publish audit logs to Amazon CloudWatch Logs. The control fails if the cluster isn't configured to publish audit logs to CloudWatch Logs. The control doesn't generate findings for Aurora Serverless v1 DB clusters.

Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. When you configure an Aurora MySQL DB cluster to publish audit logs to a log group in Amazon CloudWatch Logs, you can perform real-time analysis of the log data. CloudWatch Logs retains logs in highly durable storage. You can also create alarms and view metrics in CloudWatch.

> **Note**
>
> An alternative way to publish audit logs to CloudWatch Logs is by enabling advanced auditing and setting the cluster-level DB parameter `server_audit_logs_upload` to 1. The default for the `server_audit_logs_upload parameter` is `0`. However, we recommend you use the following remediation instructions instead to pass this control.

Remediation

To publish Aurora MySQL DB cluster audit logs to CloudWatch Logs, see Publishing Amazon Aurora MySQL logs to Amazon CloudWatch Logs in the *Amazon Aurora User Guide*.

[RDS.35] RDS DB clusters should have automatic minor version upgrade enabled

Related requirements: NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), PCI DSS v4.0.1/6.3.3, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.01

Category: Identify > Vulnerability, patch, and version management

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: `rds-cluster-auto-minor-version-upgrade-enable`

Schedule type: Change triggered

Parameters: None

This control checks if automatic minor version upgrade is enabled for an Amazon RDS DB cluster, including Aurora DB clusters. The control fails if automatic minor version upgrade isn't enabled for the DB cluster.

With automatic minor version upgrade, you can keep your DB cluster up to date. Minor versions can introduce new software features, bug fixes, security patches, and performance improvements. By enabling automatic minor version upgrade on RDS database clusters, the cluster, along with the instances in the cluster, will receive automatic updates to the minor version when new versions are available. The updates are applied automatically during the maintenance window.

Remediation

To enable automatic minor version upgrade on Multi-AZ DB clusters, see Modifying a Multi-AZ DB cluster in the *Amazon RDS User Guide*.

To enable automatic minor version upgrade on Aurora DB clusters, see Modifying an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

[RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs

Related requirements: PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-postgresql-logs-to-cloudwatch

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`logTypes`	Comma-separated list of log types to be published to CloudWatch Logs	StringList	Not customizable	`postgresql`

This control checks whether an Amazon RDS for PostgreSQL DB instance is configured to publish logs to Amazon CloudWatch Logs. The control fails if the PostgreSQL DB instance isn't configured to publish the log types mentioned in the `logTypes` parameter to CloudWatch Logs.

Database logging provides detailed records of requests made to an RDS instance. PostgreSQL generates event logs that contain useful information for administrators. Publishing these logs to CloudWatch Logs centralizes log management and helps you perform real-time analysis of the log data. CloudWatch Logs retains logs in highly durable storage. You can also create alarms and view metrics in CloudWatch.

Remediation

To publish PostgreSQL DB instance logs to CloudWatch Logs, see Publishing PostgreSQL logs to Amazon CloudWatch Logs in the *Amazon RDS User Guide*.

[RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs

Related requirements: PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: rds-aurora-postgresql-logs-to-cloudwatch

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Aurora PostgreSQL DB cluster is configured to publish logs to Amazon CloudWatch Logs. The control fails if the Aurora PostgreSQL DB cluster isn't configured to publish PostgreSQL logs to CloudWatch Logs.

Database logging provides detailed records of requests made to an RDS cluster. Aurora PostgreSQL generates event logs that contain useful information for administrators. Publishing these logs to CloudWatch Logs centralizes log management and helps you perform real-time analysis of the log

data. CloudWatch Logs retains logs in highly durable storage. You can also create alarms and view metrics in CloudWatch.

Remediation

To publish Aurora PostgreSQL DB cluster logs to CloudWatch Logs, see Publishing Aurora PostgreSQL logs to Amazon CloudWatch Logs in the *Amazon RDS User Guide*.

[RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit

Related requirements: CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-postgres-instance-encrypted-in-transit

Schedule type: Periodic

Parameters: None

This control checks whether a connection to an Amazon RDS for PostgreSQL database (DB) instance is encrypted in transit. The control fails if the `rds.force_ssl` parameter for the parameter group associated with the instance is set to `0` (off). This control doesn't evaluate RDS DB instances that are part of a DB cluster.

Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic.

Remediation

To require all connections to your RDS for PostgreSQL DB instance to use SSL, see Using SSL with a PostgreSQL DB instance in the *Amazon RDS User Guide*.

[RDS.39] RDS for MySQL DB instances should be encrypted in transit

Related requirements: CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-mysql-instance-encrypted-in-transit

Schedule type: Periodic

Parameters: None

This control checks whether a connection to an Amazon RDS for MySQL database (DB) instance is encrypted in transit. The control fails if the `rds.require_secure_transport` parameter for the parameter group associated with the instance is set to `0` (off). This control doesn't evaluate RDS DB instances that are part of a DB cluster.

Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic.

Remediation

To require all connections to your RDS for MySQL DB instance to use SSL, see SSL/TLS support for MySQL DB instances on Amazon RDS in the *Amazon RDS User Guide*.

[RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8)

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-sql-server-logs-to-cloudwatch

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`logTypes`	A list of the types of logs that an RDS for SQL Server DB instance should be configure d to publish to CloudWatch Logs. This control fails if a DB instance isn't configured to publish a type of log specified in the list.	EnumList (maximum of 2 items)	`agent`, `error`	`agent`, `error`

This control checks whether an Amazon RDS for Microsoft SQL Server DB instance is configured to publish logs to Amazon CloudWatch Logs. The control fails if the RDS for SQL Server DB instance isn't configured to publish logs to CloudWatch Logs. You can optionally specify the types of logs that a DB instance should be configured to publish.

Database logging provides detailed records of requests made to an Amazon RDS DB instance. Publishing logs to CloudWatch Logs centralizes log management and helps you perform real-time analysis of log data. CloudWatch Logs retains logs in highly durable storage. In addition, you can use it to create alarms for specific errors that can occur, such as frequent restarts that are recorded in an error log. Similarly, you can create alarms for errors or warnings that are recorded in SQL Server agent logs related to SQL agent jobs.

Remediation

For information about publishing logs to CloudWatch Logs for an RDS for SQL Server DB instance, see Amazon RDS for Microsoft SQL Server database log files in the *Amazon Relational Database Service User Guide*.

[RDS.41] RDS for SQL Server DB instances should be encrypted in transit

Related requirements: CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-sqlserver-encrypted-in-transit

Schedule type: Periodic

Parameters: None

This control checks whether a connection to an Amazon RDS for Microsoft SQL Server DB instance is encrypted in transit. The control fails if the `rds.force_ssl` parameter of the parameter group associated with the DB instance is set to `0 (off)`.

Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic.

Remediation

For information about enabling SSL/TLS for connections to Amazon RDS DB instances running Microsoft SQL Server, see Using SSL with a Microsoft SQL Server DB Instance in the *Amazon Relational Database Service User Guide*.

[RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8)

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: mariadb-publish-logs-to-cloudwatch-logs

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`logTypes`	A list of the types of logs that a MariaDB DB instance should be configured to publish to CloudWatch Logs. The control generates a `FAILED` finding if a DB instance isn't configured to publish a log type specified in the list.	EnumList (maximum of 4 items)	`audit`, `error`, `general`, `slowquery`	`audit`, `error`

This control checks whether an Amazon RDS for MariaDB DB instance is configured to publish certain types of logs to Amazon CloudWatch Logs. The control fails if the MariaDB DB instance isn't configured to publish the logs to CloudWatch Logs. You can optionally specify which types of logs a MariaDB DB instance should be configured to publish.

Database logging provides detailed records of requests made to an Amazon RDS for MariaDB DB instance. Publishing logs to Amazon CloudWatch Logs centralizes log management and helps you perform real-time analysis of the log data. In addition, CloudWatch Logs retains the logs in durable storage, which can support security, access, and availability reviews and audits. With CloudWatch Logs, you can also create alarms and review metrics.

Remediation

For information about configuring an Amazon RDS for MariaDB DB instance to publish logs to Amazon CloudWatch Logs, see Publishing MariaDB logs to Amazon CloudWatch Logs in the *Amazon Relational Database Service User Guide*.

[RDS.43] RDS DB proxies should require TLS encryption for connections

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RDS::DBProxy`

AWS Config rule: rds-proxy-tls-encryption

Schedule type: Periodic

Parameters: None

This control checks whether an Amazon RDS DB proxy requires TLS for all connections between the proxy and the underlying RDS DB instance. The control fails if the proxy doesn't require TLS for all connections between the proxy and the RDS DB instance.

Amazon RDS Proxy can act as an additional layer of security between client applications and underlying RDS DB instances. For example, you can connect to an RDS proxy using TLS 1.3, even if the underlying DB instance supports an older version of TLS. By using RDS Proxy, you can enforce strong authentication requirements for database applications.

Remediation

For information about changing the settings for an Amazon RDS proxy to require TLS, see Modifying an RDS proxy in the *Amazon Relational Database Service User Guide*.

[RDS.44] RDS for MariaDB DB instances should be encrypted in transit

Related requirements: CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06, CRI Profile v2.2/PR.PS-06.10

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-mariadb-instance-encrypted-in-transit

Schedule type: Periodic

Parameters: None

This control checks whether connections to an Amazon RDS for MariaDB DB instance are encrypted in transit. The control fails if the DB parameter group associated with the DB instance is not in sync, or the `require_secure_transport` parameter of the parameter group is not set to `ON`.

> **Note**
>
> This control doesn't evaluate Amazon RDS DB instances that use MariaDB versions earlier than version 10.5. The `require_secure_transport` parameter is supported only for MariaDB versions 10.5 and later.

Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic.

Remediation

For information about enabling SSL/TLS for connections to an Amazon RDS for MariaDB DB instance, see Requiring SSL/TLS for all connections to a MariaDB DB instance in the *Amazon Relational Database Service User Guide*.

[RDS.45] Aurora MySQL DB clusters should have audit logging enabled

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: aurora-mysql-cluster-audit-logging

Schedule type: Periodic

Parameters: None

This control checks whether an Amazon Aurora MySQL DB cluster has audit logging enabled. The control fails if the DB parameter group associated with the DB cluster is not in sync, the

`server_audit_logging` parameter is not set to 1, or the `server_audit_events` parameter is set to an empty value.

Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes.

Remediation

For information about enabling logging for an Amazon Aurora MySQL DB cluster, see Publishing Amazon Aurora MySQL logs to Amazon CloudWatch Logs in the *Amazon Aurora User Guide*.

[RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: High

Resource type: `AWS::RDS::DBInstance`

AWS Config rule: rds-instance-subnet-igw-check

Schedule type: Periodic

Parameters: None

This control checks whether an Amazon RDS DB instance is deployed in a public subnet that has a route to an internet gateway. The control fails if the RDS DB instance is deployed in a subnet that has a route to an internet gateway and the destination is set to `0.0.0.0/0` or `::/0`.

By provisioning your Amazon RDS resources in private subnets, you can prevent your RDS resources from receiving inbound traffic from the public internet, which can prevent unintended access to your RDS DB instances. If RDS resources are provisioned in a public subnet that is open to the internet, they might be vulnerable to risks such as data exfiltration.

Remediation

For information about provisioning a private subnet for an Amazon RDS DB instance, see Working with a DB instance in a VPC in the *Amazon Relational Database Service User Guide*.

[RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: rds-pgsql-cluster-copy-tags-to-snapshot-check

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS for PostgreSQL DB cluster is configured to automatically copy tags to snapshots of the DB cluster when the snapshots are created. The control fails if the `CopyTagsToSnapshot` parameter is set to `false` for the RDS for PostgreSQL DB cluster.

Copying tags to DB snapshots helps maintain proper resource tracking, governance, and cost allocation across backup resources. This enables consistent resource identification, access control, and compliance monitoring across both active databases and their snapshots. Properly tagged snapshots improve security operations by ensuring backup resources inherit the same metadata as their source databases.

Remediation

For information about configuring an Amazon RDS for PostgreSQL DB cluster to automatically copy tags to DB snapshots, see Tagging Amazon RDS resources in the *Amazon Relational Database Service User Guide*.

[RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: rds-mysql-cluster-copy-tags-to-snapshot-check

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon RDS for MySQL DB cluster is configured to automatically copy tags to snapshots of the DB cluster when the snapshots are created. The control fails if the `CopyTagsToSnapshot` parameter is set to `false` for the RDS for MySQL DB cluster.

Copying tags to DB snapshots helps maintain proper resource tracking, governance, and cost allocation across backup resources. This enables consistent resource identification, access control, and compliance monitoring across both active databases and their snapshots. Properly tagged snapshots improve security operations by ensuring backup resources inherit the same metadata as their source databases.

Remediation

For information about configuring an Amazon RDS for MySQL DB cluster to automatically copy tags to DB snapshots, see Tagging Amazon RDS resources in the *Amazon Relational Database Service User Guide*.

[RDS.50] RDS DB clusters should have enough backup retention period set

Category: Recover > Resilience > Backups enabled

Severity: Medium

Resource type: `AWS::RDS::DBCluster`

AWS Config rule: rds-cluster-backup-retention-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`minimumBackupRetentionPeriod`	The minimum backup retention period in days for the control to check	Integer	7 to 35	7	

This control checks whether an RDS DB cluster has a minimum backup retention period. The control fails if the backup retention period is less than the specified parameter value. Unless you provide a custom parameter value, Security Hub uses a default value of 7 days.

This control checks whether an RDS DB cluster has a minimum backup retention period. The control fails if the backup retention period is less than the specified parameter value. Unless you provide a customer parameter value, Security Hub uses a default value of 7 days. This control applies to all types of RDS DB clusters including Aurora DB cluster, DocumentDB clusters, NeptuneDB clusters, etc.

Remediation

To configure the backup retention period for an RDS DB cluster, modify the cluster settings and set the backup retention period to at least 7 days (or the value specified in the control parameter). For detailed instructions, see Backup retention period in the *Amazon Relational Database Service User Guide*. For Aurora DB clusters, see Overview of backing up and restoring an Aurora DB cluster in the *Amazon Aurora User Guide for Aurora*. For other type of DB clusters (e.g. DocumentDB clusters), see the corresponding service user guide for how to update the backup retention period for the cluster.

[RDS.51] RDS global clusters should run on a supported Aurora MySQL version

Category: Identify > Vulnerability, patch, and version management

Severity: High

Resource type: `AWS::RDS::GlobalCluster`

AWS Config rule: rds-global-cluster-aurora-mysql-supported-version

Schedule type: Change triggered

Parameters:

- `minSupportedEngineVersion`: `8.0.mysql_aurora.3.08.0` (not customizable)
- `longTermSupportVersion`: `8.0.mysql_aurora.3.04.0, 8.0.mysql_aurora.3.04.1, 8.0.mysql_aurora.3.04.2, 8.0.mysql_aurora.3.04.3` (not customizable)

This control checks whether an Amazon Aurora MySQL global cluster is running on a minimum supported engine version. The control fails if the Aurora MySQL global cluster engine version is below the specified minimum supported version and is not listed in the long-term support version parameter.

Running Aurora MySQL global databases on supported engine versions helps ensure that you have access to the latest security patches, bug fixes, and performance improvements. Aurora MySQL minor versions have defined end-of-standard-support dates, after which they no longer

receive critical patches. Running an unsupported version can expose your global database to security vulnerabilities and may result in Amazon RDS Extended Support charges. Because Aurora MySQL follows a non-contiguous support lifecycle where long-term support (LTS) versions remain supported longer than subsequent non-LTS versions, this control also checks for LTS versions that are still under standard support. For more information, see Release calendars for Amazon Aurora MySQL in the *Amazon Aurora Release Notes for Aurora MySQL*.

Remediation

For information about upgrading an Aurora MySQL global database to a supported engine version, see Upgrading an Amazon Aurora global database and Upgrading Aurora MySQL by modifying the engine version in the *Amazon Aurora User Guide*.

Security Hub CSPM controls for Amazon Redshift

These AWS Security Hub CSPM controls evaluate the Amazon Redshift service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Redshift.1] Amazon Redshift clusters should prohibit public access

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Critical

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-cluster-public-access-check

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon Redshift clusters are publicly accessible. It evaluates the `PubliclyAccessible` field in the cluster configuration item.

The `PubliclyAccessible` attribute of the Amazon Redshift cluster configuration indicates whether the cluster is publicly accessible. When the cluster is configured with `PubliclyAccessible` set to `true`, it is an Internet-facing instance that has a publicly resolvable DNS name, which resolves to a public IP address.

When the cluster is not publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address. Unless you intend for your cluster to be publicly accessible, the cluster should not be configured with `PubliclyAccessible` set to `true`.

Remediation

To update an Amazon Redshift cluster to disable public access, see Modifying a cluster in the *Amazon Redshift Management Guide*. Set **Publicly accessible** to **No**.

[Redshift.2] Connections to Amazon Redshift clusters should be encrypted in transit

Related requirements: NIST.800-53.r5 AC-4, NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-23, NIST.800-53.r5 SC-23(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-8, NIST.800-53.r5 SC-8(1), NIST.800-53.r5 SC-8(2), PCI DSS v4.0.1/4.2.1, CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::Redshift::Cluster` `AWS::Redshift::ClusterParameterGroup`

AWS Config rule: redshift-require-tls-ssl

Schedule type: Change triggered

Parameters: None

This control checks whether connections to Amazon Redshift clusters are required to use encryption in transit. The check fails if the Amazon Redshift cluster parameter `require_SSL` isn't set to `True`.

TLS can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Only encrypted connections over TLS should be allowed. Encrypting data in transit can affect performance. You should test your application with this feature to understand the performance profile and the impact of TLS.

Remediation

To update an Amazon Redshift parameter group to require encryption, see Modifying a parameter group in the *Amazon Redshift Management Guide*. Set `require_ssl` to **True**.

[Redshift.3] Amazon Redshift clusters should have automatic snapshots enabled

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/PR.DS-11.01

Category: Recover > Resilience > Backups enabled

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-backup-enabled

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value	
`MinRetentionPeriod`	Minimum snapshot retention period in days	Integer	7 to 35	7	

This control checks whether an Amazon Redshift cluster has automated snapshots enabled, and a retention period greater than or equal to the specified time frame. The control fails if automated snapshots aren't enabled for the cluster, or if the retention period is less than the specified time frame. Unless you provide a custom parameter value for the snapshot retention period, Security Hub CSPM uses a default value of 7 days.

Backups help you to recover more quickly from a security incident. They strengthen the resilience of your systems. Amazon Redshift takes periodic snapshots by default. This control checks whether

automatic snapshots are enabled and retained for at least seven days. For more details on Amazon Redshift automated snapshots, see Automated snapshots in the *Amazon Redshift Management Guide*.

Remediation

To update the snapshot retention period for an Amazon Redshift cluster, see Modifying a cluster in the *Amazon Redshift Management Guide*. For **Backup**, set **Snapshot retention** to a value of 7 or greater.

[Redshift.4] Amazon Redshift clusters should have audit logging enabled

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: `redshift-cluster-audit-logging-enabled` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Redshift cluster has audit logging enabled.

Amazon Redshift audit logging provides additional information about connections and user activities in your cluster. This data can be stored and secured in Amazon S3 and can be helpful in security audits and investigations. For more information, see Database audit logging in the *Amazon Redshift Management Guide*.

Remediation

To configure audit logging for an Amazon Redshift cluster, see Configuring auditing using the console in the *Amazon Redshift Management Guide*.

[Redshift.6] Amazon Redshift should have automatic upgrades to major versions enabled

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), CRI Profile v2.2/PR.PS-02.01, CRI Profile v2.2/PR.PS-02.03

Category: Identify > Vulnerability, patch, and version management

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-cluster-maintenancesettings-check

Schedule type: Change triggered

Parameters:

- `allowVersionUpgrade = true` (not customizable)

This control checks whether automatic major version upgrades are enabled for the Amazon Redshift cluster.

Enabling automatic major version upgrades ensures that the latest major version updates to Amazon Redshift clusters are installed during the maintenance window. These updates might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Remediation

To remediate this issue from the AWS CLI, use the Amazon Redshift `modify-cluster` command, and set the `--allow-version-upgrade` attribute. *`clustername`* is the name of your Amazon Redshift cluster.

```
aws redshift modify-cluster --cluster-identifier clustername --allow-version-upgrade
```

[Redshift.7] Redshift clusters should use enhanced VPC routing

Related requirements: NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.03

Category: Protect > Secure network configuration > API private access

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-enhanced-vpc-routing-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Redshift cluster has `EnhancedVpcRouting` enabled.

Enhanced VPC routing forces all `COPY` and `UNLOAD` traffic between the cluster and data repositories to go through your VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC Flow Logs to monitor network traffic.

Remediation

For detailed remediation instructions, see Enabling enhanced VPC routing in the *Amazon Redshift Management Guide*.

[Redshift.8] Amazon Redshift clusters should not use the default Admin username

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/PR.AA-01.01

Category: Identify > Resource Configuration

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-default-admin-check

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon Redshift cluster has changed the admin username from its default value. This control will fail if the admin username for a Redshift cluster is set to `awsuser`.

When creating a Redshift cluster, you should change the default admin username to a unique value. Default usernames are public knowledge and should be changed upon configuration. Changing the default usernames reduces the risk of unintended access.

Remediation

You can't change the admin username for your Amazon Redshift cluster after creating it. To create a new cluster with a non-default username, see Step 1: Create a sample Amazon Redshift cluster in the *Amazon Redshift Getting Started Guide*.

[Redshift.10] Redshift clusters should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-cluster-kms-enabled

Schedule type: Change triggered

Parameters: None

This control checks if Amazon Redshift clusters are encrypted at rest. The control fails if a Redshift cluster isn't encrypted at rest or if the encryption key is different from the provided key in the rule parameter.

In Amazon Redshift, you can turn on database encryption for your clusters to help protect data at rest. When you turn on encryption for a cluster, the data blocks and system metadata are encrypted for the cluster and its snapshots. Encryption of data at rest is a recommended best practice because it adds a layer of access management to your data. Encrypting Redshift clusters at rest reduces the risk that an unauthorized user can access the data stored on disk.

Remediation

To modify a Redshift cluster to use KMS encryption, see Changing cluster encryption in the *Amazon Redshift Management Guide*.

[Redshift.11] Redshift clusters should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: `tagged-redshift-cluster` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon Redshift cluster has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the cluster doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the cluster isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Redshift cluster, see Tagging resources in Amazon Redshift in the *Amazon Redshift Management Guide*.

[Redshift.12] Redshift event notification subscriptions should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Redshift::EventSubscription`

AWS Config rule: `tagged-redshift-eventsubscription` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon Redshift cluster snapshot has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the cluster snapshot doesn't have

any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the cluster snapshot isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Redshift event notification subscription, see Tagging resources in Amazon Redshift in the *Amazon Redshift Management Guide*.

[Redshift.13] Redshift cluster snapshots should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Redshift::ClusterSnapshot`

AWS Config rule: `tagged-redshift-clustersnapshot` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon Redshift cluster snapshot has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the cluster snapshot doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the cluster snapshot isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Redshift cluster snapshot, see Tagging resources in Amazon Redshift in the *Amazon Redshift Management Guide*.

[Redshift.14] Redshift cluster subnet groups should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Redshift::ClusterSubnetGroup`

AWS Config rule: `tagged-redshift-clustersubnetgroup` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon Redshift cluster subnet group has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the cluster subnet group doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the cluster subnet group isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps

you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Redshift cluster subnet group, see Tagging resources in Amazon Redshift in the *Amazon Redshift Management Guide*.

[Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins

Related requirements: PCI DSS v4.0.1/1.3.1, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.DS-01.02, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration > Security group configuration

Severity: High

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-unrestricted-port-access

Schedule type: Periodic

Parameters: None

This control checks whether a security group associated with an Amazon Redshift cluster has ingress rules that permit access to the cluster port from the internet (0.0.0.0/0 or ::/0). The control fails if the security group ingress rules permit access to the cluster port from the internet.

Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules.

Remediation

To restrict ingress on the Redshift cluster port to restricted origins, see Work with security group rules in the *Amazon VPC User Guide*. Update rules where the port range matches the Redshift cluster port and the IP port range is 0.0.0.0/0.

[Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones

Related requirements: CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::Redshift::ClusterSubnetGroup`

AWS Config rule: redshift-cluster-subnet-group-multi-az

Schedule type: Change triggered

Parameters: None

The control checks whether an Amazon Redshift cluster subnet group has subnets from more than one Availability Zone (AZ). The control fails if the cluster subnet group doesn't have subnets from at least two different AZs.

Configuring subnets across multiple AZs help ensure that your Redshift data warehouse can continue operating even when failure events occur.

Remediation

To modify a Redshift cluster subnet group to span multiple AZs, see Modifying a cluster subnet group in the *Amazon Redshift Management Guide*.

[Redshift.17] Redshift cluster parameter groups should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Redshift::ClusterParameterGroup`

AWS Config rule: redshift-cluster-parameter-group-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon Redshift cluster parameter group has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the parameter group doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the parameter group doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

For information about adding tags to an Amazon Redshift cluster parameter group, see Tag resources in Amazon Redshift in the *Amazon Redshift Management Guide*.

[Redshift.18] Redshift clusters should have Multi-AZ deployments enabled

Related requirements: CRI Profile v2.2/GV.OC-04.03, CRI Profile v2.2/GV.RM-09.02, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::Redshift::Cluster`

AWS Config rule: redshift-cluster-multi-az-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether multiple Availability Zones (Multi-AZ) deployments are enabled for an Amazon Redshift cluster. The control fails if Multi-AZ deployments aren't enabled for the Amazon Redshift cluster.

Amazon Redshift supports multiple Availability Zones (Multi-AZ) deployments for provisioned clusters. If Multi-AZ deployments are enabled for a cluster, an Amazon Redshift data warehouse can continue operating in failure scenarios when an unexpected event happens in an Availability Zone (AZ). A Multi-AZ deployment deploys compute resources in more than one AZ and these compute resources can be accessed through a single endpoint. In the event of an entire AZ failure, the remaining compute resources in another AZ are available to continue processing workloads. You can convert an existing Single-AZ data warehouse to a Multi-AZ data warehouse. Additional compute resources are then provisioned in a second AZ.

Remediation

For information about configuring Multi-AZ deployments for an Amazon Redshift cluster, see Converting a Single-AZ data warehouse to a Multi-AZ data warehouse in the *Amazon Redshift Management Guide*.

Security Hub CSPM controls for Amazon Redshift Serverless

These AWS Security Hub CSPM controls evaluate the Amazon Redshift Serverless service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing

Related requirements: CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-06.10

Category: Protect > Secure network configuration > Resources within VPC

Severity: High

Resource type: `AWS::RedshiftServerless::Workgroup`

AWS Config rule: redshift-serverless-workgroup-routes-within-vpc

Schedule type: Periodic

Parameters: None

This control checks whether enhanced VPC routing is enabled for an Amazon Redshift Serverless workgroup. The control fails if enhanced VPC routing is disabled for the workgroup.

If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all `COPY` and `UNLOAD` traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint policies, network access

control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic.

Remediation

For more information about enhanced VPC routing and how to enable it for a workgroup, see Controlling network traffic with Redshift enhanced VPC routing in the *Amazon Redshift Management Guide*.

[RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL

Related requirements: CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::RedshiftServerless::Workgroup`

AWS Config rule: redshift-serverless-workgroup-encrypted-in-transit

Schedule type: Periodic

Parameters: None

This control checks whether connections to an Amazon Redshift Serverless workgroup are required to encrypt data in transit. The control fails if the `require_ssl` configuration parameter for the workgroup is set to `false`.

An Amazon Redshift Serverless workgroup is a collection of compute resources that groups together compute resources like RPUs, VPC subnet groups, and security groups. Properties of a workgroup include network and security settings. These settings specify whether connections to a workgroup should be required to use SSL to encrypt data in transit.

Remediation

For information about updating the settings for an Amazon Redshift Serverless workgroup to require SSL connections, see Connecting to Amazon Redshift Serverless in the *Amazon Redshift Management Guide*.

[RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access

Related requirements: CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.DS-01.02, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.PS-01.02

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: High

Resource type: `AWS::RedshiftServerless::Workgroup`

AWS Config rule: redshift-serverless-workgroup-no-public-access

Schedule type: Periodic

Parameters: None

This control checks whether public access is disabled for an Amazon Redshift Serverless workgroup. It evaluates the `publiclyAccessible` property of a Redshift Serverless workgroup. The control fails if public access is enabled (`true`) for the workgroup.

The public access (`publiclyAccessible`) setting for an Amazon Redshift Serverless workgroup specifies whether the workgroup can be accessed from a public network. If public access is enabled (`true`) for a workgroup, Amazon Redshift creates an Elastic IP address that makes the workgroup publicly accessible from outside the VPC. If you don't want a workgroup to be publicly accessible, disable public access for it.

Remediation

For information about changing the public access setting for an Amazon Redshift Serverless workgroup, see Viewing the properties for a workgroup in the *Amazon Redshift Management Guide*.

[RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys

Related requirements: NIST.800-53.r5 AU-9, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6)

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::RedshiftServerless::Namespace`

AWS Config rule: redshift-serverless-namespace-cmk-encryption

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`kmsKeyArns`	A list of Amazon Resource Names (ARNs) of AWS KMS keys to include in the evaluation. The control generates a `FAILED` finding if a Redshift Serverless namespace isn't encrypted with a KMS key in the list.	StringList (maximum of 3 items)	1–3 ARNs of existing KMS keys. For example: `arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab` .	No default value

This control checks whether an Amazon Redshift Serverless namespace is encrypted at rest with a customer managed AWS KMS key. The control fails if the Redshift Serverless namespace isn't encrypted with a customer managed KMS key. You can optionally specify a list of KMS keys for the control to include in the evaluation.

In Amazon Redshift Serverless, a namespace defines a logical container for database objects. This control periodically checks whether the encryption settings for a namespace specify a customer managed AWS KMS key, instead of an AWS managed KMS key, for encryption of data in the

namespace. With a customer managed KMS key, you have full control of the key. This includes defining and maintaining the key policy, managing grants, rotating cryptographic material, assigning tags, creating aliases, and enabling and disabling the key.

Remediation

For information about updating the encryption settings for an Amazon Redshift Serverless namespace and specifying a customer managed AWS KMS key, see Changing the AWS KMS key for a namespace in the *Amazon Redshift Management Guide*.

[RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username

Category: Identify > Resource configuration

Severity: Medium

Resource type: `AWS::RedshiftServerless::Namespace`

AWS Config rule: redshift-serverless-default-admin-check

Schedule type: Periodic

Parameters: None

This control checks whether the admin username for an Amazon Redshift Serverless namespace is the default admin username, `admin`. The control fails if the admin username for the Redshift Serverless namespace is `admin`.

When creating an Amazon Redshift Serverless namespace, you should specify a custom admin username for the namespace. The default admin username is public knowledge. By specifying a custom admin username, you can, for example, help mitigate the risk or effectiveness of brute force attacks against the namespace.

Remediation

You can change the admin username for an Amazon Redshift Serverless namespace by using the Amazon Redshift Serverless console or API. To change it by using the console, choose the namespace configuration, and then choose **Edit admin credentials** on the **Actions** menu. To change it programmatically, use the UpdateNamespace operation or, if you're using the AWS CLI, run the update-namespace command. If you change the admin username, you must also change the admin password at the same time.

[RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs

Related requirements: CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::RedshiftServerless::Namespace`

AWS Config rule: redshift-serverless-publish-logs-to-cloudwatch

Schedule type: Periodic

Parameters: None

This control checks whether an Amazon Redshift Serverless namespace is configured to export connection and user logs to Amazon CloudWatch Logs. The control fails if the Redshift Serverless namespace isn't configured to export the logs to CloudWatch Logs.

If you configure Amazon Redshift Serverless to export connection log (`connectionlog`) and user log (`userlog`) data to a log group in Amazon CloudWatch Logs, you can collect and store your log records in durable storage, which can support security, access, and availability reviews and audits. With CloudWatch Logs, you can also perform real-time analysis of log data and use CloudWatch to create alarms and review metrics.

Remediation

To export log data for an Amazon Redshift Serverless namespace to Amazon CloudWatch Logs, the respective logs must be selected for export in the audit logging configuration settings for the namespace. For information about updating these settings, see Editing security and encryption in the *Amazon Redshift Management Guide*.

Security Hub CSPM controls for Route 53

These AWS Security Hub CSPM controls evaluate the Amazon Route 53 service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Route53.1] Route 53 health checks should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Route53::HealthCheck`

AWS Config rule:`tagged-route53-healthcheck` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon Route 53 health check has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the health check doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the health check isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS

resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Route 53 health check, see Naming and tagging health checks in the *Amazon Route 53 Developer Guide*.

[Route53.2] Route 53 public hosted zones should log DNS queries

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::Route53::HostedZone`

AWS Config rule: `route53-query-logging-enabled`

Schedule type: Change triggered

Parameters: None

This control checks if DNS query logging is enabled for an Amazon Route 53 public hosted zone. The control fails if DNS query logging isn't enabled for a Route 53 public hosted zone.

Logging DNS queries for a Route 53 hosted zone addresses DNS security and compliance requirements and grants visibility. The logs include information such as the domain or subdomain

that was queried, the date and time of the query, the DNS record type (for example, A or AAAA), and the DNS response code (for example, `NoError` or `ServFail`). When DNS query logging is enabled, Route 53 publishes the log files to Amazon CloudWatch Logs.

Remediation

To log DNS queries for Route 53 public hosted zones, see Configuring logging for DNS queries in the *Amazon Route 53 Developer Guide*.

Security Hub CSPM controls for Amazon S3

These AWS Security Hub CSPM controls evaluate the Amazon Simple Storage Service (Amazon S3) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[S3.1] S3 general purpose buckets should have block public access settings enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.1.4, CIS AWS Foundations Benchmark v3.0.0/2.1.4, CIS AWS Foundations Benchmark v1.4.0/2.1.5, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: s3-account-level-public-access-blocks-periodic

Schedule type: Periodic

Parameters:

- `ignorePublicAcls`: `true` (not customizable)
- `blockPublicPolicy`: `true` (not customizable)
- `blockPublicAcls`: `true` (not customizable)

- `restrictPublicBuckets`: `true` (not customizable)

This control checks whether the preceding Amazon S3 block public access settings are configured at the account level for an S3 general purpose bucket. The control fails if one or more of the block public access settings are set to `false`.

The control fails if any of the settings are set to `false`, or if any of the settings are not configured.

Amazon S3 public access block is designed to provide controls across an entire AWS account or at the individual S3 bucket level to ensure that objects never have public access. Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both.

Unless you intend to have your S3 buckets be publicly accessible, you should configure the account level Amazon S3 Block Public Access feature.

To learn more, see Using Amazon S3 Block Public Access in the *Amazon Simple Storage Service User Guide*.

Remediation

To enable Amazon S3 Block Public Access for your AWS account, see Configuring block public access settings for your account in the *Amazon Simple Storage Service User Guide*.

[S3.2] S3 general purpose buckets should block public read access

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.6, PCI DSS v3.2.1/7.2.1, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration

Severity: Critical

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-public-read-prohibited

Schedule type: Periodic and change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket permits public read access. It evaluates the block public access settings, the bucket policy, and the bucket access control list (ACL). The control fails if the bucket permits public read access.

> **Note**
>
> If an S3 bucket has a bucket policy, this control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a PASSED finding, conditions in the bucket policy must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

Some use cases may require that everyone on the internet be able to read from your S3 bucket. However, those situations are rare. To ensure the integrity and security of your data, your S3 bucket should not be publicly readable.

Remediation

To block public read access on your Amazon S3 buckets, see Configuring block public access settings for your S3 buckets in the *Amazon Simple Storage Service User Guide*.

[S3.3] S3 general purpose buckets should block public write access

Related requirements: PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v3.2.1/7.2.1, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration

Severity: Critical

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-public-write-prohibited

Schedule type: Periodic and change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket permits public write access. It evaluates the block public access settings, the bucket policy, and the bucket access control list (ACL). The control fails if the bucket permits public write access.

> **Note**
>
> If an S3 bucket has a bucket policy, this control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a PASSED finding, conditions in the bucket policy must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

Some use cases require that everyone on the internet be able to write to your S3 bucket. However, those situations are rare. To ensure the integrity and security of your data, your S3 bucket should not be publicly writable.

Remediation

To block public write access on your Amazon S3 buckets, see Configuring block public access settings for your S3 buckets in the *Amazon Simple Storage Service User Guide*.

[S3.5] S3 general purpose buckets should require requests to use TLS

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.1.1, CIS AWS Foundations Benchmark v3.0.0/2.1.1, CIS AWS Foundations Benchmark v1.4.0/2.1.2, NIST.800-53.r5 AC-17(2), NIST.800-53.r5 AC-4, NIST.800-53.r5 IA-5(1), NIST.800-53.r5 SC-12(3), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-23, NIST.800-53.r5 SC-23(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-8, NIST.800-53.r5 SC-8(1), NIST.800-53.r5 SC-8(2), NIST.800-53.r5 SI-7(6), NIST.800-171.r2 3.13.8, NIST.800-171.r2 3.13.15, PCI DSS v3.2.1/4.1, PCI DSS v4.0.1/4.2.1, CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-ssl-requests-only

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket has a policy that requires requests to use TLS. The control fails if the bucket policy doesn't require requests to use TLS.

S3 buckets should have policies that require all requests (`Action: S3:*`) to only accept transmission of data over HTTPS in the S3 resource policy, indicated by the condition key `aws:SecureTransport`.

Remediation

To update an Amazon S3 bucket policy to deny nonsecure transport, see Adding a bucket policy by using the Amazon S3 console in the *Amazon Simple Storage Service User Guide*.

Add a policy statement similar to the one in the following policy. Replace `amzn-s3-demo-bucket` with the name of the bucket you're modifying.

JSON

```
{
    "Id": "ExamplePolicy",
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowSSLRequestsOnly",
            "Action": "s3:*",
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ],
            "Condition": {
                "Bool": {
                     "aws:SecureTransport": "false"
                }
            },
           "Principal": "*"
        }
```

```
    ]
}
```

For more information, see What S3 bucket policy should I use to comply with the AWS Config rule s3-bucket-ssl-requests-only? in the *AWS Official Knowledge Center*.

[S3.6] S3 general purpose bucket policies should restrict access to other AWS accounts

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-171.r2 3.13.4, CRI Profile v2.2/PR.AA-05.01

Category: Protect > Secure access management > Sensitive API operations actions restricted

Severity: High

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-blacklisted-actions-prohibited

Schedule type: Change triggered

Parameters:

- `blacklistedactionpatterns`: `s3:DeleteBucketPolicy, s3:PutBucketAcl, s3:PutBucketPolicy, s3:PutEncryptionConfiguration, s3:PutObjectAcl` (not customizable)

This control checks whether an Amazon S3 general purpose bucket policy prevents principals from other AWS accounts from performing denied actions on resources in the S3 bucket. The control fails if the bucket policy allows one or more of the preceding actions for a principal in another AWS account.

Implementing least privilege access is fundamental to reducing security risk and the impact of errors or malicious intent. If an S3 bucket policy allows access from external accounts, it could result in data exfiltration by an insider threat or an attacker.

The `blacklistedactionpatterns` parameter allows for successful evaluation of the rule for S3 buckets. The parameter grants access to external accounts for action patterns that are not included in the `blacklistedactionpatterns` list.

Remediation

To update an Amazon S3 bucket policy to remove permissions, see.Adding a bucket policy by using the Amazon S3 console in the *Amazon Simple Storage Service User Guide*.

On the **Edit bucket policy** page, in the policy editing text box, take one of the following actions:

- Remove the statements that grant other AWS accounts access to denied actions.
- Remove the permitted denied actions from the statements.

[S3.7] S3 general purpose buckets should use cross-Region replication

Related requirements: PCI DSS v3.2.1/2.2, NIST.800-53.r5 AU-9(2), NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-36(2), NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/GV.OC-05.03, CRI Profile v2.2/GV.OC-05.04, CRI Profile v2.2/PR.DS-11.01, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02, CRI Profile v2.2/RC.RP-03.01

Category: Protect > Secure access management

Severity: Low

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-cross-region-replication-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket has cross-Region replication enabled. The control fails if the bucket doesn't have cross-Region replication enabled.

Replication is the automatic, asynchronous copying of objects across buckets in the same or different AWS Regions. Replication copies newly created objects and object updates from a source bucket to a destination bucket or buckets. AWS best practices recommend replication for source and destination buckets that are owned by the same AWS account. In addition to availability, you should consider other systems hardening settings.

This control produces a `FAILED` finding for a replication destination bucket if it doesn't have cross-region replication enabled. If there's a legitimate reason that the destination bucket doesn't need cross-region replication to be enabled, you can suppress findings for this bucket.

Remediation

To enable Cross-Region Replication on an S3 bucket, see Configuring replication for source and destination buckets owned by the same account in the *Amazon Simple Storage Service User Guide*. For **Source bucket**, choose **Apply to all objects in the bucket**.

[S3.8] S3 general purpose buckets should block public access

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.1.4, CIS AWS Foundations Benchmark v3.0.02.1.4, CIS AWS Foundations Benchmark v1.4.0/2.1.5, NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.03, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01

Category: Protect > Secure access management > Access control

Severity: High

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-level-public-access-prohibited

Schedule type: Change triggered

Parameters:

- `excludedPublicBuckets` (not customizable) – A comma-separated list of known allowed public S3 bucket names

This control checks whether an Amazon S3 general purpose bucket blocks public access at the bucket level. The control fails if any of the following settings are set to `false`:

- `ignorePublicAcls`
- `blockPublicPolicy`
- `blockPublicAcls`
- `restrictPublicBuckets`

Block Public Access at the S3 bucket level provides controls to ensure that objects never have public access. Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both.

Unless you intend to have your S3 buckets publicly accessible, you should configure the bucket level Amazon S3 Block Public Access feature.

Remediation

For information on how to remove public access at a bucket level, see Blocking public access to your Amazon S3 storage in the *Amazon S3 User Guide*.

[S3.9] S3 general purpose buckets should have server access logging enabled

Related requirements: NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), NIST.800-171.r2 3.3.8, PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/PR.PS-04.02

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-logging-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether server access logging is enabled for an Amazon S3 general purpose bucket. The control fails if server access logging isn't enabled. When logging is enabled, Amazon S3 delivers access logs for a source bucket to a chosen target bucket. The target bucket must be in the same AWS Region as the source bucket and must not have a default retention period configured. The target logging bucket does not need to have server access logging enabled, and you should suppress findings for this bucket.

Server access logging provides detailed records of requests made to a bucket. Server access logs can assist in security and access audits. For more information, see Security Best Practices for Amazon S3: Enable Amazon S3 server access logging.

Remediation

To enable Amazon S3 server access logging, see Enabling Amazon S3 server access logging in the *Amazon S3 User Guide*.

[S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/ID.AM-08.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-version-lifecycle-policy-check

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose versioned bucket has a Lifecycle configuration. The control fails if the bucket doesn't have a Lifecycle configuration.

We recommended creating a Lifecycle configuration for your S3 bucket to help you define actions that you want Amazon S3 to take during an object's lifetime.

> **Tip**
>
> Enabling versioning without lifecycle management can lead to unbounded storage growth and increased costs. Every object modification creates a new version that is retained indefinitely. Configure S3 Lifecycle rules to automatically transition noncurrent versions to cheaper storage classes or expire them after a defined retention period.

Remediation

For more information on configuring lifecycle on an Amazon S3 bucket, see Using S3 Versioning with S3 Lifecycle, Setting lifecycle configuration on a bucket and Managing the lifecycle of objects in the *Amazon S3 User Guide*.

[S3.11] S3 general purpose buckets should have event notifications enabled

Related requirements: NIST.800-53.r5 CA-7, NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4, NIST.800-53.r5 SI-4(4), NIST.800-171.r2 3.3.8, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.PS-04.01, CRI Profile v2.2/PR.PS-04.02

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-event-notifications-enabled

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`eventTypes`	List of preferred S3 event types	EnumList (maximum of 28 items)	`s3:IntelligentTiering`, `s3:LifecycleExpiration:*`, `s3:LifecycleExpiration:Delete`, `s3:LifecycleExpiration:DeleteMarkerCreated`, `s3:Lifecy`	No default value

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
			cleTransition, s3:ObjectAcl:Put, s3:ObjectCreated:*, s3:ObjectCreated:CompleteMultipartUpload, s3:ObjectCreated:Copy, s3:ObjectCreated:Post, s3:ObjectCreated:Put, s3:ObjectRemoved:*, s3:ObjectRemoved:Delete, s3:ObjectRemoved:DeleteMarkerCreated	

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
			, s3:ObjectRestore:* , s3:ObjectRestore:Completed, s3:ObjectRestore:Delete, s3:ObjectRestore:Post, s3:ObjectTagging:* , s3:ObjectTagging:Delete, s3:ObjectTagging:Put, s3:ReducedRedundancyLostObject, s3:Replication:*, s3:Replication:OperationFai	

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
			ledReplication, s3:Replication:OperationMissedThreshold, s3:Replication:OperationNotTracked, s3:Replication:OperationReplicatedAfterThreshold, s3:TestEvent	

This control checks whether S3 Event Notifications are enabled on an Amazon S3 general purpose bucket. The control fails if S3 Event Notifications are not enabled on the bucket. If you provide custom values for the `eventTypes` parameter, the control passes only if event notifications are enabled for the specified types of events.

When you enable S3 Event Notifications, you receive alerts when specific events occur that impact your S3 buckets. For example, you can be notified of object creation, object removal, and object restoration. These notifications can alert relevant teams to accidental or intentional modifications that may lead to unauthorized data access.

Remediation

For information about detecting changes to S3 buckets and objects, see Amazon S3 Event Notifications in the *Amazon S3 User Guide*.

[S3.12] ACLs should not be used to manage user access to S3 general purpose buckets

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Secure access management > Access control

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-acl-prohibited

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket provides user permissions with an access control list (ACL). The control fails if an ACL is configured for managing user access on the bucket.

ACLs are legacy access control mechanisms that predate IAM. Instead of ACLs, we recommend using S3 bucket policies or AWS Identity and Access Management (IAM) policies to manage access to your S3 buckets.

Remediation

To pass this control, you should disable ACLs for your S3 buckets. For instructions, see Controlling ownership of objects and disabling ACLs for your bucket in the *Amazon Simple Storage Service User Guide*.

To create an S3 bucket policy, see Adding a bucket policy by using the Amazon S3 console. To create an IAM user policy on an S3 bucket, see Controlling access to a bucket with user policies.

[S3.13] S3 general purpose buckets should have Lifecycle configurations

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-13(5), CRI Profile v2.2/ID.AM-08.01

Category: Protect > Data protection

Severity: Low

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-lifecycle-policy-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`targetTransitionDays`	Number of days after object creation when objects are transitioned to a specified storage class	Integer	`1` to `36500`	No default value
`targetExpirationDays`	Number of days after object creation when objects are deleted	Integer	`1` to `36500`	No default value
`targetTransitionStorageClass`	Destination S3 storage class type	Enum	`STANDARD_IA`, `INTELLIGENT_TIERING`, `ONEZONE_IA`, `GLACIER`, `GLACIER_IR`, `DEEP_ARCHIVE`	No default value

This control checks whether an Amazon S3 general purpose bucket has a Lifecycle configuration. The control fails if the bucket doesn't have a Lifecycle configuration. If you provide custom values for one or more of the preceding parameters, the control passes only if the policy includes the specified storage class, deletion time, or transition time.

Creating a Lifecycle configuration for your S3 bucket defines actions that you want Amazon S3 to take during an object's lifetime. For example, you can transition objects to another storage class, archive them, or delete them after a specified period of time.

Remediation

For information about configuring lifecycle policies on an Amazon S3 bucket, see Setting lifecycle configuration on a bucket and see Managing your storage lifecycle in the *Amazon S3 User Guide*.

[S3.14] S3 general purpose buckets should have versioning enabled

Category: Protect > Data protection > Data deletion protection

Related requirements: NIST.800-53.r5 AU-9(2), NIST.800-53.r5 CP-10, NIST.800-53.r5 CP-6, NIST.800-53.r5 CP-6(1), NIST.800-53.r5 CP-6(2), NIST.800-53.r5 CP-9, NIST.800-53.r5 SC-5(2), NIST.800-53.r5 SI-12, NIST.800-53.r5 SI-13(5), NIST.800-171.r2 3.3.8, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.PS-01.03

Severity: Low

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-versioning-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket has versioning enabled. The control fails if versioning is suspended for the bucket.

Versioning keeps multiple variants of an object in the same S3 bucket. You can use versioning to preserve, retrieve, and restore all versions of all objects stored in your S3 bucket. Versioning helps you recover from both unintended user actions and application failures.

Tip

Enabling versioning without lifecycle management can lead to unbounded storage growth and increased costs. Every object modification creates a new version that is retained indefinitely. Configure S3 Lifecycle rules to automatically transition noncurrent versions to cheaper storage classes or expire them after a defined retention period. For more information, see Using S3 Versioning with S3 Lifecycle and Managing the lifecycle of objects.

Remediation

To use versioning on an S3 bucket, see Enabling versioning on buckets in the *Amazon S3 User Guide*.

[S3.15] S3 general purpose buckets should have Object Lock enabled

Category: Protect > Data protection > Data deletion protection

Related requirements: NIST.800-53.r5 CP-6(2), PCI DSS v4.0.1/10.5.1, CRI Profile v2.2/DE.CM-09.01, CRI Profile v2.2/DE.CM-09.03, CRI Profile v2.2/PR.DS-11.01

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-default-lock-enabled

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`mode`	S3 Object Lock retention mode	Enum	`GOVERNANCE`, `COMPLIANCE`	No default value

This control checks whether an Amazon S3 general purpose bucket has Object Lock enabled. The control fails if Object Lock isn't enabled for the bucket. If you provide a custom value for the `mode` parameter, the control passes only if S3 Object Lock uses the specified retention mode.

You can use S3 Object Lock to store objects using a write-once-read-many (WORM) model. Object Lock can help prevent objects in S3 buckets from being deleted or overwritten for a fixed amount of time or indefinitely. You can use S3 Object Lock to meet regulatory requirements that require WORM storage, or add an extra layer of protection against object changes and deletion.

Remediation

To configure Object Lock for new and existing S3 buckets, see Configuring S3 Object Lock in the *Amazon S3 User Guide*.

[S3.17] S3 general purpose buckets should be encrypted at rest with AWS KMS keys

Category: Protect > Data Protection > Encryption of data-at-rest

Related requirements: NIST.800-53.r5 SC-12(2), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 CA-9(1), NIST.800-53.r5 SI-7(6), NIST.800-53.r5 AU-9, NIST.800-171.r2 3.8.9, NIST.800-171.r2 3.13.11, NIST.800-171.r2 3.13.16, PCI DSS v4.0.1/3.5.1, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06, CRI Profile v2.2/PR.PS-01.07

Severity: Medium

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-default-encryption-kms

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 general purpose bucket is encrypted with an AWS KMS key (SSE-KMS or DSSE-KMS). The control fails if the bucket is encrypted with default encryption (SSE-S3).

Server-side encryption (SSE) is the encryption of data at its destination by the application or service that receives it. Unless you specify otherwise, S3 buckets use Amazon S3 managed keys (SSE-S3) by default for server-side encryption. However, for added control, you can choose to

configure buckets to use server-side encryption with AWS KMS keys (SSE-KMS or DSSE-KMS) instead. Amazon S3 encrypts your data at the object level as it writes it to disks in AWS data centers and decrypts it for you when you access it.

Remediation

To encrypt an S3 bucket using SSE-KMS, see Specifying server-side encryption with AWS KMS (SSE-KMS) in the *Amazon S3 User Guide*. To encrypt an S3 bucket using DSSE-KMS, see Specifying dual-layer server-side encryption with AWS KMS keys (DSSE-KMS) in the *Amazon S3 User Guide*.

[S3.19] S3 access points should have block public access settings enabled

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-04.01, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Secure access management > Resource not publicly accessible

Severity: Critical

Resource type: `AWS::S3::AccessPoint`

AWS Config rule: s3-access-point-public-access-blocks

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 access point has block public access settings enabled. The control fails if block public access settings aren't enabled for the access point.

The Amazon S3 Block Public Access feature helps you manage access to your S3 resources at three levels: the account, bucket, and access point levels. The settings at each level can be configured independently, allowing you to have different levels of public access restrictions for your data. The access point settings can't individually override the more restrictive settings at higher levels (account level or bucket assigned to the access point). Instead, the settings at the access point level are additive, meaning they complement and work alongside the settings at the other levels. Unless

you intend an S3 access point to be publicly accessible, you should enable block public access settings.

Remediation

Amazon S3 currently doesn't support changing an access point's block public access settings after the access point has been created. All block public access settings are enabled by default when you create a new access point. We recommend that you keep all settings enabled unless you know that you have a specific need to disable any of them. For more information, see Managing public access to access points in the *Amazon Simple Storage Service User Guide*.

[S3.20] S3 general purpose buckets should have MFA delete enabled

Related requirements: CIS AWS Foundations Benchmark v5.0.0/2.1.2, CIS AWS Foundations Benchmark v3.0.0/2.1.2, CIS AWS Foundations Benchmark v1.4.0/2.1.3, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-3, NIST.800-53.r5 SC-5(2), CRI Profile v2.2/PR.AA-03.01, CRI Profile v2.2/PR.AA-05.02, CRI Profile v2.2/PR.DS-01.01

Category: Protect > Data protection > Data deletion protection

Severity: Low

Resource type: `AWS::S3::Bucket`

AWS Config rule: s3-bucket-mfa-delete-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether multi-factor authentication (MFA) delete is enabled for an Amazon S3 general purpose bucket. The control fails if MFA delete is not enabled for the bucket. The control doesn't produce findings for buckets that have a lifecycle configuration.

If you enable versioning for an S3 general purpose bucket, you can optionally add another layer of security by configuring MFA delete for the bucket. If you do this, the bucket owner must include two forms of authentication in any request to delete a version of an object in the bucket or change the versioning state of the bucket. MFA delete provides added security if, for example, the bucket owner's security credentials are compromised. MFA delete can also help prevent accidental bucket deletions by requiring the user who initiates the delete action to prove physical possession of an MFA device with an MFA code, which adds an extra layer of friction and security to the delete action.

> **Note**
>
> This control produces a PASSED finding only if MFA delete is enabled for the S3 general purpose bucket. To enable MFA delete for a bucket, versioning must also be enabled for the bucket. Bucket versioning is a method of storing multiple variations of an S3 object in the same bucket. In addition, only the bucket owner who is logged in as a root user can enable MFA delete and perform delete actions on the bucket. You cannot use MFA delete with a bucket that has a lifecycle configuration.

Remediation

For information about enabling versioning and configuring MFA delete for an S3 bucket, see Configuring MFA delete in the *Amazon Simple Storage Service User Guide*.

[S3.22] S3 general purpose buckets should log object-level write events

Related requirements: CIS AWS Foundations Benchmark v5.0.0/3.8, CIS AWS Foundations Benchmark v3.0.0/3.8, PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/PR.PS-04.02

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: cloudtrail-all-write-s3-data-event-check

Schedule type: Periodic

Parameters: None

This control checks whether an AWS account has at least one AWS CloudTrail multi-Region trail that logs all write data events for Amazon S3 buckets. The control fails if the account doesn't have a multi-Region trail that logs write data events for S3 buckets.

S3 object-level operations, such as `GetObject`, `DeleteObject`, and `PutObject`, are called data events. By default, CloudTrail doesn't log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for write data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you

meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets.

Remediation

To enable object-level logging for S3 buckets, see Enabling CloudTrail event logging for S3 buckets and objects in the *Amazon Simple Storage Service User Guide*.

[S3.23] S3 general purpose buckets should log object-level read events

Related requirements: CIS AWS Foundations Benchmark v5.0.0/3.9, CIS AWS Foundations Benchmark v3.0.0/3.9, PCI DSS v4.0.1/10.2.1, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.AE-07.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.AN-07.01, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: cloudtrail-all-read-s3-data-event-check

Schedule type: Periodic

Parameters: None

This control checks whether an AWS account has at least one AWS CloudTrail multi-Region trail that logs all read data events for Amazon S3 buckets. The control fails if the account doesn't have a multi-Region trail that logs read data events for S3 buckets.

S3 object-level operations, such as `GetObject`, `DeleteObject`, and `PutObject`, are called data events. By default, CloudTrail doesn't log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets.

Remediation

To enable object-level logging for S3 buckets, see Enabling CloudTrail event logging for S3 buckets and objects in the *Amazon Simple Storage Service User Guide*.

[S3.24] S3 Multi-Region Access Points should have block public access settings enabled

Related requirements: PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: High

Resource type: `AWS::S3::MultiRegionAccessPoint`

AWS Config rule: `s3-mrap-public-access-blocked` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon S3 Multi-Region Access Point has block public access settings enabled. The control fails when the Multi-Region Access Point doesn't have block public access settings enabled.

Publicly accessible resources can be lead to unauthorized access, data breaches, or exploitation of vulnerabilities. Restricting access through authentication and authorization measures helps to safeguard sensitive information and maintain the integrity of your resources.

Remediation

By default, all Block Public Access settings are enabled for an S3 Multi-Region Access Point. For more information , see Blocking public access with Amazon S3 Multi-Region Access Points in the *Amazon Simple Storage Service User Guide*. You can't change the Block Public Access settings for a Multi-Region Access Point after it has been created.

[S3.25] S3 directory buckets should have lifecycle configurations

Category: Protect > Data Protection

Severity: Low

Resource type: `AWS::S3Express::DirectoryBucket`

AWS Config rule: s3express-dir-bucket-lifecycle-rules-check

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`targetExpirationDays`	The number of days, after object creation, when objects should expire.	Integer	1 to 2147483647	No default value

This control checks whether lifecycle rules are configured for an S3 directory bucket. The control fails if lifecycle rules aren't configured for the directory bucket, or a lifecycle rule for the bucket specifies expiration settings that don't match the parameter value that you optionally specify.

In Amazon S3, a lifecycle configuration is a set of rules that define actions for Amazon S3 to apply to a group of objects in a bucket. For an S3 directory bucket, you can create a lifecycle rule that specifies when objects expire based on age (in days). You can also create a lifecycle rule that deletes incomplete multipart uploads. Unlike other types of S3 buckets, such as general purpose buckets, directory buckets do not support other types of actions for lifecycle rules, such as transitioning objects between storage classes.

Remediation

To define a lifecycle configuration for an S3 directory bucket, create a lifecycle rule for the bucket. For more information, see Creating and managing a lifecycle configuration for your directory bucket in the *Amazon Simple Storage Service User Guide*.

Security Hub CSPM controls for SageMaker AI

These AWS Security Hub CSPM controls evaluate the Amazon SageMaker AI service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), PCI DSS v3.2.1/1.2.1, PCI DSS v3.2.1/1.3.1, PCI DSS v3.2.1/1.3.2, PCI DSS v3.2.1/1.3.4, PCI DSS v3.2.1/1.3.6, PCI DSS v4.0.1/1.4.4, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration

Severity: High

Resource type: `AWS::SageMaker::NotebookInstance`

AWS Config rule: sagemaker-notebook-no-direct-internet-access

Schedule type: Periodic

Parameters: None

This control checks whether direct internet access is disabled for an SageMaker AI notebook instance. The control fails if the `DirectInternetAccess` field is enabled for the notebook instance.

If you configure your SageMaker AI instance without a VPC, then by default direct internet access is enabled on your instance. You should configure your instance with a VPC and change the default setting to **Disable—Access the internet through a VPC**. To train or host models from a notebook, you need internet access. To enable internet access, your VPC must have either an interface endpoint (AWS PrivateLink) or a NAT gateway and a security group that allows outbound connections. To learn more about how to connect a notebook instance to resources in a VPC, see Connect a notebook instance to resources in a VPC in the *Amazon SageMaker AI Developer Guide*. You should also ensure that access to your SageMaker AI configuration is limited to only authorized users. Restrict IAM permissions that permit users to change SageMaker AI settings and resources.

Remediation

You can't change the internet access setting after creating a notebook instance. Instead, you can stop, delete, and recreate the instance with blocked internet access. To delete a notebook instance that permits direct internet access, see Use notebook instances to build models: Clean up in the

Amazon SageMaker AI Developer Guide. To recreate a notebook instance that denies internet access, see Create a notebook instance. For **Network, Direct internet access**, choose **Disable—Access the internet through a VPC**.

[SageMaker.2] SageMaker notebook instances should be launched in a custom VPC

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure network configuration > Resources within VPC

Severity: High

Resource type: `AWS::SageMaker::NotebookInstance`

AWS Config rule: sagemaker-notebook-instance-inside-vpc

Schedule type: Change triggered

Parameters: None

This control checks if an Amazon SageMaker AI notebook instance is launched within a custom virtual private cloud (VPC). This control fails if a SageMaker AI notebook instance is not launched within a custom VPC or if it is launched in the SageMaker AI service VPC.

Subnets are a range of IP addresses within a VPC. We recommend keeping your resources inside a custom VPC whenever possible to ensure secure network protection of your infrastructure. An Amazon VPC is a virtual network dedicated to your AWS account. With an Amazon VPC, you can control the network access and internet connectivity of your SageMaker AI Studio and notebook instances.

Remediation

You can't change the VPC setting after creating a notebook instance. Instead, you can stop, delete, and recreate the instance. For instructions, see Use notebook instances to build models: Clean up in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.3] Users should not have root access to SageMaker notebook instances

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-6, NIST.800-53.r5 AC-6(10), NIST.800-53.r5 AC-6(2), CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.AA-05.02

Category: Protect > Secure access management > Root user access restrictions

Severity: High

Resource type: `AWS::SageMaker::NotebookInstance`

AWS Config rule: sagemaker-notebook-instance-root-access-check

Schedule type: Change triggered

Parameters: None

This control checks whether root access is turned on for an Amazon SageMaker AI notebook instance. The control fails if root access is turned on for a SageMaker AI notebook instance.

In adherence to the principal of least privilege, it is a recommended security best practice to restrict root access to instance resources to avoid unintentionally over provisioning permissions.

Remediation

To restrict root access to SageMaker AI notebook instances, see Control root access to a SageMaker AI notebook instance in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1

Related requirements: NIST.800-53.r5 CP-10, NIST.800-53.r5 SC-5, NIST.800-53.r5 SC-36, NIST.800-53.r5 SA-13, CRI Profile v2.2/PR.IR-03.01, CRI Profile v2.2/PR.IR-04.02

Category: Recover > Resilience > High availability

Severity: Medium

Resource type: `AWS::SageMaker::EndpointConfig`

AWS Config rule: sagemaker-endpoint-config-prod-instance-count

Schedule type: Periodic

Parameters: None

This control checks whether production variants of an Amazon SageMaker AI endpoint have an initial instance count greater than 1. The control fails if the endpoint's production variants have only 1 initial instance.

Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architecture. High availability helps you to recover from security incidents.

> **Note**
>
> This control applies only to instance-based endpoint configuration.

Remediation

For more information about the parameters of endpoint configuration, see Create an endpoint configuration in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.5] SageMaker models should have network isolation enabled

Related requirements: CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.02

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Medium

Resource type: `AWS::SageMaker::Model`

AWS Config rule: sagemaker-model-isolation-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI hosted model has network isolation enabled. The control fails if the `EnableNetworkIsolation` parameter for the hosted model is set to `False`.

SageMaker AI training and deployed inference containers are internet-enabled by default. If you don't want SageMaker AI to provide external network access to your training or inference containers, you can enable network isolation. If you enable network isolation, no inbound or outbound network calls can be made to or from the model container, including calls to or from other AWS services. Additionally, no AWS credentials are made available to the container runtime environment. Enabling network isolation helps prevent unintended access to your SageMaker AI resources from the internet.

> **Note**
>
> On August 13, 2025, Security Hub CSPM changed the title and description of this control. The new title and description more accurately reflect that the control checks the setting for the `EnableNetworkIsolation` parameter of Amazon SageMaker AI hosted models. Previously, the title of this control was: *SageMaker models should block inbound traffic*.

Remediation

For more information about network isolation for SageMaker AI models, see Run training and inference containers in internet-free mode in the *Amazon SageMaker AI Developer Guide*. When you create a model, you can enable network isolation by setting the value for the `EnableNetworkIsolation` parameter to `True`.

[SageMaker.6] SageMaker app image configurations should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SageMaker::AppImageConfig`

AWS Config rule: sagemaker-app-image-config-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon SageMaker AI app image configuration (`AppImageConfig`) has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the app image configuration doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the app image configuration doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

Note

Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

To add tags to an Amazon SageMaker AI app image configuration (`AppImageConfig`), you can use the AddTags operation of the SageMaker AI API or, if you're using the AWS CLI, run the add-tags command.

[SageMaker.7] SageMaker images should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SageMaker::Image`

AWS Config rule: sagemaker-image-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon SageMaker AI image has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the image doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the image doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner,

environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

To add tags to an Amazon SageMaker AI image, you can use the AddTags operation of the SageMaker AI API or, if you're using the AWS CLI, run the add-tags command.

[SageMaker.8] SageMaker notebook instances should run on supported platforms

Related requirements: CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-02.02

Category: Detect > Vulnerability, patch, and version management

Severity: Medium

Resource type: `AWS::SageMaker::NotebookInstance`

AWS Config rule: sagemaker-notebook-instance-platform-version

Schedule type: Periodic

Parameters:

- `supportedPlatformIdentifierVersions`: `notebook-al2023-v1` (not customizable)

This control checks whether an Amazon SageMaker AI notebook instance is configured to run on a supported platform, based on the platform identifier specified for the notebook instance. The control fails if the notebook instance is configured to run on a platform that's no longer supported.

If the platform for an Amazon SageMaker AI notebook instance is no longer supported, it might not receive security patches, bug fixes, or other types of updates. Notebook instances might continue to function, but they won't receive SageMaker AI security updates or critical bug fixes. You assume the risks associated with using an unsupported platform. For more information, see JupyterLab versioning in the *Amazon SageMaker AI Developer Guide*.

Remediation

For information about the platforms that Amazon SageMaker AI currently supports and how to migrate to them, see Amazon Linux 2 notebook instances in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::SageMaker::DataQualityJobDefinition`

AWS Config rule: sagemaker-data-quality-job-encrypt-in-transit

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI data quality job definition has encryption enabled for inter-container traffic. The control fails if the definition for a job that monitors data quality and drift does not have encryption enabled for inter-container traffic.

Enabling inter-container traffic encryption protects sensitive ML data during distributed processing for data quality analysis.

Remediation

For more information about inter-container traffic encryption for Amazon SageMaker AI, see Protect Communications Between ML Compute Instances in a Distributed Training Job in the *Amazon SageMaker AI Developer Guide*. When you create a data quality job definition, you can enable inter-container traffic encryption by setting the value for the `EnableInterContainerTrafficEncryption` parameter to `True`.

[SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::SageMaker::ModelExplainabilityJobDefinition`

AWS Config rule: sagemaker-model-explainability-job-encrypt-in-transit

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker model explainability job definition has inter-container traffic encryption enabled. The control fails if the model explainability job definition does not have inter-container traffic encryption enabled.

Enabling inter-container traffic encryption protects sensitive ML data such as model data, training datasets, intermediate processing results, parameters and model weights during distributed processing for explainability analysis.

Remediation

For an existing SageMaker model explainability job definition, inter-container traffic encryption cannot be updated in place. To create a new SageMaker model explainability job definition with inter-container traffic encryption enabled, use API or CLI or CloudFormation and set `EnableInterContainerTrafficEncryption` to `True`.

[SageMaker.11] SageMaker data quality job definitions should have network isolation enabled

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::SageMaker::DataQualityJobDefinition`

AWS Config rule: sagemaker-data-quality-job-isolation

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI data quality monitoring job definition has network isolation enabled. The control fails if the definition for a job that monitors data quality and drift has network isolation disabled.

Network isolation reduces the attack surface and prevents external access thereby protecting against unauthorized external access, accidental data exposure and potential data exfiltration.

Remediation

For more information about network isolation for SageMaker AI, see Run training and inference containers in internet-free mode in the *Amazon SageMaker AI Developer Guide*. When you create a data quality job definition, you can enable network isolation by setting the value for the `EnableNetworkIsolation` parameter to `True`.

[SageMaker.12] SageMaker model bias job definitions should have network isolation enabled

Category: Protect > Secure network configuration > Resources policy configuration

Severity: Medium

Resource type: `AWS::SageMaker::ModelBiasJobDefinition`

AWS Config rule: sagemaker-model-bias-job-isolation

Schedule type: Change triggered

Parameters: None

This control checks whether a SageMaker model bias job definition has network isolation enabled. The control fails if model bias job definition does not have network isolation enabled.

Network isolation prevents SageMaker model bias jobs from communicating with external resources over the internet. By enabling network isolation, you ensure that the job's containers cannot make outbound connections, reducing the attack surface and protecting sensitive data from exfiltration. This is particularly important for jobs processing regulated or sensitive data.

Remediation

To enable network isolation, you must create a new model bias job definition with `EnableNetworkIsolation` parameter set to `True`. Network isolation cannot be modified after job definition creation. To create a new model bias job definition, see CreateModelBiasJobDefinition in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::SageMaker::ModelQualityJobDefinition`

AWS Config rule: ssagemaker-model-quality-job-encrypt-in-transit

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon SageMaker model quality job definitions have encryption in transit enabled for inter-container traffic. The control fails if a model quality job definition does not have inter-container traffic encryption enabled.

Inter-container traffic encryption protects data transmitted between containers during distributed model quality monitoring jobs. By default, inter-container traffic is unencrypted. Enabling encryption helps maintain data confidentiality during processing and supports compliance with regulatory requirements for data in transit protection.

Remediation

To enable inter-container traffic encryption for your Amazon SageMaker model quality job definition, you must re-create the job definition with the appropriate in-transit encryption configuration. To create a model quality job definition, see CreateModelQualityJobDefinition in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.14] SageMaker monitoring schedules should have network isolation enabled

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::SageMaker::MonitoringSchedule`

AWS Config rule: sagemaker-monitoring-schedule-isolation

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon SageMaker monitoring schedules have network isolation enabled. The control fails if a monitoring schedule has EnableNetworkIsolation set to false or not configured

Network isolation prevents monitoring jobs from making outbound network calls, reducing the attack surface by eliminating internet access from containers.

Remediation

For information about configuring network isolation in the NetworkConfig parameter when creating or updating a monitoring schedule, see CreateMonitoringSchedule or UpdateMonitoringSchedule in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::SageMaker::ModelBiasJobDefinition`

AWS Config rule: sagemaker-model-bias-job-encrypt-in-transit

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon SageMaker model bias job definitions have inter-container traffic encryption enabled when using multiple compute instances. The control fails if `EnableInterContainerTrafficEncryption` is set to false or is not configured for job definitions with an instance count of 2 or greater.

Inter-container traffic encryption protects data transmitted between compute instances during distributed model bias monitoring jobs. Encryption prevents unauthorized access to model-related information such as weights that are transmitted between instances.

Remediation

To enable inter-container traffic encryption for SageMaker model bias job definitions, set the `EnableInterContainerTrafficEncryption` parameter to `True` when the job definition

uses multiple compute instances. For information about protecting communications between ML compute instances, see Protect Communications Between ML Compute Instances in a Distributed Training Job in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.16] SageMaker models should use private registry in VPC for primary containers

Category: Protect > Secure network configuration > Resources within VPC

Severity: Medium

Resource type: `AWS::SageMaker::Model`

AWS Config rule: sagemaker-model-private-registry-required

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI model pulls container image from a private registry in a VPC for the primary container. The control fails if the image is not configured or repository access mode is `Platform`.

Using a private Docker registry in a VPC for SageMaker model containers ensures container images are pulled from trusted, controlled sources within your VPC. Also, it ensures container images are accessed through VPC endpoints, without traversing the public internet.

Remediation

To configure private docker registries for SageMaker AI real-time inference containers, see Use a Private Docker Registry for Real-Time Inference Containers in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::SageMaker::FeatureGroup`

AWS Config rule: sagemaker-featuregroup-encryption-at-rest

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker offline store for a feature group is encrypted at rest with an AWS KMS key. The control fails if the offline store S3 storage for a feature group is not encrypted with a KMS key.

Using customer-managed AWS KMS keys for encryption at rest of SageMaker feature group offline stores provide enhanced security. Customer-managed KMS keys provide you full control over encryption key lifecycle and key policies. Additionally, all encryption key usage can be logged and monitored through AWS CloudTrail for auditability.

Remediation

For information on enabling encryption at rest for SageMaker Feature Store offline stores using AWS KMS customer-managed keys, see Security and access control in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys

Related requirements: NIST.800-53.r5 AU-9, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6)

Category: Protect > Data protection > Encryption of data at rest

Severity: Medium

Resource type: `AWS::SageMaker::FeatureGroup`

AWS Config rule: sagemaker-featuregroup-online-store-encryption

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker online store for a feature group with standard storage is encrypted at rest with an AWS KMS key. The control fails if KMS key encryption is not configured for the online store.

Using customer-managed AWS KMS keys for encryption at rest of SageMaker feature group online stores provides enhanced security. Customer-managed KMS keys give you full control over encryption key lifecycle and key policies. Additionally, all encryption key usage can be logged and monitored through AWS CloudTrail for auditability.

Remediation

For information on enabling encryption at rest for SageMaker Feature Store online stores using AWS KMS customer-managed keys, see Security and access control in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines

Category: Protect > Secure network configuration > Resources within VPC

Severity: Medium

Resource type: `AWS::SageMaker::Model`

AWS Config rule: sagemaker-model-multicontainer-private-registry

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon SageMaker AI models with multi-container inference pipelines pull container images from a private Docker registry in a VPC. The control fails if any container definition does not have image configuration or has repository access mode set to platform.

Using a private Docker registry in a VPC for SageMaker AI multi-container inference pipelines ensures container images are pulled from trusted, controlled sources within your VPC. This ensures container images are accessed through VPC endpoints, without traversing the public internet, reducing the risk of supply chain attacks or image tampering.

Remediation

To configure private docker registries for SageMaker AI real-time inference containers, see Use a Private Docker Registry for Real-Time Inference Containers in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: High

Resource type: `AWS::SageMaker::ModelExplainabilityJobDefinition`

AWS Config rule: sagemaker-model-explainability-job-network-isolation

Schedule type: Change triggered

Parameters: None

This control checks whether a SageMaker AI model explainability job definition has network isolation enabled. The control fails if the job definition does not have network isolation enabled.

Network isolation prevents model explainability job containers from making outbound network calls, reducing the risk of data exfiltration and providing defense-in-depth for sensitive model and training data.

Remediation

To enable network isolation for a SageMaker AI model explainability job definition, set `NetworkConfig.EnableNetworkIsolation` to `true` when creating the job definition. For more information about network isolation for SageMaker AI, see Run training and inference containers in internet-free mode in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys

Related requirements: NIST.800-53.r5 AU-9, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6)

Category: Protect > Data protection > Encryption of data at rest

Severity: Medium

Resource type: `AWS::SageMaker::NotebookInstance`

AWS Config rule: sagemaker-notebook-instance-storage-vol-kms-encrypted

Schedule type: Change triggered

Parameters: None

This control checks whether a SageMaker AI notebook instance is configured with an AWS KMS key for storage volume encryption. The control fails if a KMS key is not configured for the notebook instance.

Encryption of data at rest with a customer managed KMS key provides additional access control over the default AWS managed encryption. SageMaker AI notebook instances store user notebooks, datasets, model artifacts, and temporary processing data on ML storage volumes. A customer managed key enables fine-grained key policy control, CloudTrail audit logging of key usage, and compliance with frameworks requiring customer-controlled encryption.

Remediation

To configure a KMS key for a SageMaker AI notebook instance, see Notebook instances, SageMaker AI jobs, and Endpoints in the *Amazon SageMaker AI Developer Guide*. Note that `KmsKeyId` can only be set at notebook instance creation time. To remediate, create a new notebook instance with the KMS key specified and migrate your data from the existing instance.

[SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled

Category: Protect > Data protection > Encryption of data in transit

Severity: Medium

Resource type: `AWS::SageMaker::MonitoringSchedule`

AWS Config rule: sagemaker-monitoring-schedule-traffic-encryption

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI monitoring schedule has encryption enabled for inter-container traffic. The control fails if the monitoring job definition does not have encryption enabled for inter-container traffic.

Inter-container traffic encryption ensures that data transmitted between containers during monitoring jobs is encrypted in transit. Without this encryption, sensitive data processed during

model monitoring could be exposed to unauthorized access within the network. Enabling this setting helps meet compliance requirements for protecting data in transit.

Remediation

For an existing SageMaker AI monitoring schedule, inter-container traffic encryption cannot be updated in place. To create a new SageMaker AI monitoring schedule with inter-container traffic encryption enabled, use API or CLI or CloudFormation and set `EnableInterContainerTrafficEncryption` to `true` in the `NetworkConfig` of the `MonitoringJobDefinition`.

[SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys

Related requirements: NIST.800-53.r5 AU-9, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6)

Category: Protect > Data protection > Encryption of data at rest

Severity: Medium

Resource type: `AWS::SageMaker::InferenceExperiment`

AWS Config rule: sagemaker-inf-experiment-instance-storage-kms-encrypted

Schedule type: Change triggered

Parameters: None

This control checks whether a SageMaker AI inference experiment is configured with an AWS KMS key for instance storage volume encryption. The control fails if a KMS key is not specified for instance storage volume encryption.

Encrypting instance storage volumes with customer managed KMS keys provides centralized key management, audit logging, and key rotation control for model artifacts and temporary inference data stored on ML compute instances during shadow tests.

Remediation

To configure a KMS key for a SageMaker AI inference experiment, specify the `KmsKey` parameter when calling `CreateInferenceExperiment`. The `KmsKey` can be a KMS key ID, ARN, alias, or

alias ARN. The SageMaker AI execution role must have `kms:CreateGrant` permission on the key. For more information on specifying a customer managed AWS KMS key to SageMaker AI, see Notebook instances, SageMaker AI jobs, and Endpoints in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys

Related requirements: NIST.800-53.r5 AU-9, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-12(2), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SI-7(6)

Category: Protect > Data protection > Encryption of data at rest

Severity: Medium

Resource type: `AWS::SageMaker::InferenceExperiment`

AWS Config rule: sagemaker-inf-experiment-data-storage-kms-encrypted

Schedule type: Change triggered

Parameters: None

This control checks whether a SageMaker AI inference experiment with data capture enabled has a KMS key configured to encrypt captured data at rest. The control fails if the data storage configuration does not specify a KMS key for encryption.

Encrypting captured inference request and response data with customer managed KMS keys ensures that sensitive inference payloads stored in Amazon S3 are protected with centralized key management and audit capabilities.

Remediation

To configure a KMS key for data storage in a SageMaker AI inference experiment, specify the `KmsKey` field within `DataStorageConfig` when calling `CreateInferenceExperiment`. The `KmsKey` encrypts captured inference request and response data at rest in the specified Amazon S3 bucket. For more information on specifying a customer managed AWS KMS key to SageMaker AI, see Notebook instances, SageMaker AI jobs, and Endpoints in the *Amazon SageMaker AI Developer Guide*.

[SageMaker.25] SageMaker model quality job definitions should have network isolation enabled

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: High

Resource type: `AWS::SageMaker::ModelQualityJobDefinition`

AWS Config rule: sagemaker-model-quality-job-definition-isolation

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SageMaker AI model quality job definition has network isolation enabled. The control fails if the model quality job definition does not have network isolation enabled.

Network isolation reduces the attack surface and prevents external access, thereby protecting against unauthorized external access, accidental data exposure, and potential data exfiltration.

Remediation

When you create a model quality job definition, you can enable network isolation by setting the value for the `EnableNetworkIsolation` parameter to `True`. For more information about network isolation for SageMaker AI, see Run training and inference containers in internet-free mode in the *Amazon SageMaker AI Developer Guide*.

Security Hub CSPM controls for Secrets Manager

These AWS Security Hub CSPM controls evaluate the AWS Secrets Manager service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SecretsManager.1] Secrets Manager secrets should have automatic rotation enabled

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), PCI DSS v4.0.1/8.6.3, PCI DSS v4.0.1/8.3.9, CRI Profile v2.2/PR.AA-01.01

Category: Protect > Secure development

Severity: Medium

Resource type: `AWS::SecretsManager::Secret`

AWS Config rule: `secretsmanager-rotation-enabled-check`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`maximumAllowedRotationFrequency`	Maximum number of days allowed for secret rotation frequency	Integer	1 to 365	No default value

This control checks whether a secret stored in AWS Secrets Manager is configured with automatic rotation. The control fails if the secret isn't configured with automatic rotation. If you provide a custom value for the `maximumAllowedRotationFrequency` parameter, the control passes only if the secret is automatically rotated within the specified window of time.

Secrets Manager helps you improve the security posture of your organization. Secrets include database credentials, passwords, and third-party API keys. You can use Secrets Manager to store secrets centrally, encrypt secrets automatically, control access to secrets, and rotate secrets safely and automatically.

Secrets Manager can rotate secrets. You can use rotation to replace long-term secrets with short-term ones. Rotating your secrets limits how long an unauthorized user can use a compromised secret. For this reason, you should rotate your secrets frequently. To learn more about rotation, see Rotating your AWS Secrets Manager secrets in the *AWS Secrets Manager User Guide*.

Remediation

To turn on automatic rotation for Secrets Manager secrets, see Set up automatic rotation for AWS Secrets Manager secrets using the console in the *AWS Secrets Manager User Guide*. You must choose and configure an AWS Lambda function for rotation.

[SecretsManager.2] Secrets Manager secrets configured with automatic rotation should rotate successfully

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), PCI DSS v4.0.1/8.6.3, PCI DSS v4.0.1/8.3.9, CRI Profile v2.2/PR.AA-01.01

Category: Protect > Secure development

Severity: Medium

Resource type: `AWS::SecretsManager::Secret`

AWS Config rule: `secretsmanager-scheduled-rotation-success-check`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS Secrets Manager secret rotated successfully based on the rotation schedule. The control fails if `RotationOccurringAsScheduled` is `false`. The control only evaluates secrets that have rotation turned on.

Secrets Manager helps you improve the security posture of your organization. Secrets include database credentials, passwords, and third-party API keys. You can use Secrets Manager to store secrets centrally, encrypt secrets automatically, control access to secrets, and rotate secrets safely and automatically.

Secrets Manager can rotate secrets. You can use rotation to replace long-term secrets with short-term ones. Rotating your secrets limits how long an unauthorized user can use a compromised secret. For this reason, you should rotate your secrets frequently.

In addition to configuring secrets to rotate automatically, you should ensure that those secrets rotate successfully based on the rotation schedule.

To learn more about rotation, see Rotating your AWS Secrets Manager secrets in the *AWS Secrets Manager User Guide*.

Remediation

If the automatic rotation fails, then Secrets Manager might have encountered errors with the configuration. To rotate secrets in Secrets Manager, you use a Lambda function that defines how to interact with the database or service that owns the secret.

For help diagnosing and fixing common errors related to secrets rotation, see Troubleshooting AWS Secrets Manager rotation of secrets in the *AWS Secrets Manager User Guide*.

[SecretsManager.3] Remove unused Secrets Manager secrets

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), CRI Profile v2.2/PR.AA-01.01, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.AA-05.03

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::SecretsManager::Secret`

AWS Config rule: `secretsmanager-secret-unused`

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`unusedForDays`	Maximum number of days that a secret can remain unused	Integer	`1 to 365`	`90`

This control checks whether an AWS Secrets Manager secret has been accessed within the specified time frame. The control fails if a secret is unused beyond the specified time frame. Unless you provide a custom parameter value for the access period, Security Hub CSPM uses a default value of 90 days.

Deleting unused secrets is as important as rotating secrets. Unused secrets can be abused by their former users, who no longer need access to these secrets. Also, as more users get access to a secret, someone might have mishandled and leaked it to an unauthorized entity, which increases the risk of abuse. Deleting unused secrets helps revoke secret access from users who no longer need it. It also helps to reduce the cost of using Secrets Manager. Therefore, it is essential to routinely delete unused secrets.

Remediation

To delete inactive Secrets Manager secrets, see Delete an AWS Secrets Manager secret in the *AWS Secrets Manager User Guide*.

[SecretsManager.4] Secrets Manager secrets should be rotated within a specified number of days

Related requirements: NIST.800-53.r5 AC-2(1), NIST.800-53.r5 AC-3(15), PCI DSS v4.0.1/8.6.3, PCI DSS v4.0.1/8.3.9, CRI Profile v2.2/PR.AA-01.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::SecretsManager::Secret`

AWS Config rule: `secretsmanager-secret-periodic-rotation`

Schedule type: Periodic

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`maxDaysSinceRotation`	Maximum number of days that a secret can remain unchanged	Integer	`1` to `180`	`90`

This control checks whether an AWS Secrets Manager secret is rotated at least once within the specified time frame. The control fails if a secret isn't rotated at least this frequently. Unless you provide a custom parameter value for the rotation period, Security Hub CSPM uses a default value of 90 days.

Rotating secrets can help you to reduce the risk of an unauthorized use of your secrets in your AWS account. Examples include database credentials, passwords, third-party API keys, and even arbitrary text. If you do not change your secrets for a long period of time, the secrets are more likely to be compromised.

As more users get access to a secret, it can become more likely that someone mishandled and leaked it to an unauthorized entity. Secrets can be leaked through logs and cache data. They can be shared for debugging purposes and not changed or revoked once the debugging completes. For all these reasons, secrets should be rotated frequently.

You can configure automatic rotation for secrets in AWS Secrets Manager. With automatic rotation, you can replace long-term secrets with short-term ones, significantly reducing the risk of compromise. We recommend that you configure automatic rotation for your Secrets Manager secrets. For more information, see Rotating your AWS Secrets Manager secrets in the *AWS Secrets Manager User Guide*.

Remediation

To turn on automatic rotation for Secrets Manager secrets, see Set up automatic rotation for AWS Secrets Manager secrets using the console in the *AWS Secrets Manager User Guide*. You must choose and configure an AWS Lambda function for rotation.

[SecretsManager.5] Secrets Manager secrets should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SecretsManager::Secret`

AWS Config rule: `tagged-secretsmanager-secret` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS	`No default value`

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
			requirements.	

This control checks whether an AWS Secrets Manager secret has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the secret doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the secret isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Secrets Manager secret, see Tag AWS Secrets Manager secrets in the *AWS Secrets Manager User Guide*.

Security Hub CSPM controls for AWS Service Catalog

This AWS Security Hub CSPM control evaluates the AWS Service Catalog service and resources. The control might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only

Related requirements: NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-6, NIST.800-53.r5 CM-8, NIST.800-53.r5 SC-7, CRI Profile v2.2/PR.AA-04.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure access management

Severity: Medium

Resource type: `AWS::ServiceCatalog::Portfolio`

AWS Config rule: service-catalog-shared-within-organization

Schedule type: Change triggered

Parameters: None

This control checks whether AWS Service Catalog shares portfolios within an organization when the integration with AWS Organizations is enabled. The control fails if portfolios aren't shared within an organization.

Portfolio sharing only within Organizations helps ensure that a portfolio isn't shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub CSPM recommends using `ORGANIZATION_MEMBER_ACCOUNT` instead of `ACCOUNT`. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it.

Remediation

To enable portfolio sharing with AWS Organizations, see Sharing with AWS Organizations in the *AWS Service Catalog Administrator Guide*.

Security Hub CSPM controls for Amazon SES

These AWS Security Hub CSPM controls evaluate the Amazon Simple Email Service (Amazon SES) service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SES.1] SES contact lists should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SES::ContactList`

AWS Configrule: `tagged-ses-contactlist` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon SES contact list has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the contact list doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the contact list isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Amazon SES contact list, see TagResource in the *Amazon SES API v2 Reference*.

[SES.2] SES configuration sets should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SES::ConfigurationSet`

AWS Configrule: `tagged-ses-configurationset` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an Amazon SES configuration set has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the configuration set doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the configuration set isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

Note

Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Amazon SES configuration set, see TagResource in the *Amazon SES API v2 Reference*.

[SES.3] SES configuration sets should have TLS enabled for sending emails

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::SES::ConfigurationSet`

AWS Config rule: ses-sending-tls-required

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SES configuration set requires TLS connections. The control fails if the TLS Policy is not set to `'REQUIRE'` for a configuration set.

By default, Amazon SES uses opportunistic TLS, which means emails can be sent unencrypted if a TLS connection cannot be established with the receiving mail server. Enforcing TLS for email sending ensures that messages are only delivered when a secure encrypted connection can be established. This helps protect the confidentiality and integrity of email content during transmission between Amazon SES and the recipient's mail server. If a secure TLS connection cannot be established, the message will not be delivered, preventing potential exposure of sensitive information.

Note

While TLS 1.3 is the default delivery method for Amazon SES, without enforcing TLS requirement through configuration sets, messages could potentially be delivered in plaintext if a TLS connection fails. To pass this control, you must configure the TLS Policy to `'REQUIRE'` in your SES configuration set's delivery options. When TLS is required, messages are only delivered if a TLS connection can be established with the receiving mail server.

Remediation

To configure Amazon SES to require TLS connections for a configuration set, see Amazon SES and security protocols in the *Amazon SES Developer Guide*.

Security Hub CSPM controls for Amazon SNS

These AWS Security Hub CSPM controls evaluate the Amazon Simple Notification Service (Amazon SNS) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SNS.1] SNS topics should be encrypted at-rest using AWS KMS

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), NIST.800-171.r2 3.13.11, NIST.800-171.r2 3.13.16, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::SNS::Topic`

AWS Config rule: `sns-encrypted-kms`

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SNS topic is encrypted at rest using keys managed in AWS Key Management Service (AWS KMS). The controls fails if the SNS topic doesn't use a KMS key for server-side encryption (SSE). By default, SNS stores messages and files using disk encryption. To pass this control, you must choose to use a KMS key for encryption instead. This adds an additional layer of security and provides more access control flexibility.

Encrypting data at rest reduces the risk of data stored on disk being accessed by a user not authenticated to AWS. API permissions are required to decrypt the data before it can be read. We recommend encrypting SNS topics with KMS keys for an added layer of security.

Remediation

To enable SSE for an SNS topic, see Enabling server-side encryption (SSE) for an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*. Before you can use SSE, you must also configure AWS KMS key policies to allow encryption of topics and encryption and decryption of messages. For more information, see Configuring AWS KMS permissions in the *Amazon Simple Notification Service Developer Guide*.

[SNS.3] SNS topics should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SNS::Topic`

AWS Config rule: `tagged-sns-topic` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon SNS topic has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the topic doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the topic isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an SNS topic, see Configuring Amazon SNS topic tags in the *Amazon Simple Notification Service Developer Guide*.

[SNS.4] SNS topic access policies should not allow public access

Related requirements: CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Critical

Resource type: `AWS::SNS::Topic`

AWS Config rule: sns-topic-no-public-access

Schedule type: Change triggered

Parameters: None

This control checks if the Amazon SNS topic access policy allows public access. This control fails if the SNS topic access policy allows public access.

You use an Amazon SNS access policy with a particular topic to restrict who can work with that topic (for example, who can publish messages to it or who can subscribe to it). SNS policies can grant access to other AWS accounts, or to users within your own AWS account. Providing a wildcard (*) in the `Principal` field of the topic policy and a lack of conditions to limit the topic policy can result in data exfiltration, denial of service, or undesired injection of messages into your service by an attacker.

> **Note**
>
> This control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a PASSED finding, conditions in the Amazon SNS access policy for a topic must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

Remediation

To update access policies for an SNS topic, see Overview of managing access in Amazon SNS in the *Amazon Simple Notification Service Developer Guide*.

Security Hub CSPM controls for Amazon SQS

These AWS Security Hub CSPM controls evaluate the Amazon Simple Queue Service (Amazon SQS) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SQS.1] Amazon SQS queues should be encrypted at rest

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-3(6), NIST.800-53.r5 SC-13, NIST.800-53.r5 SC-28, NIST.800-53.r5 SC-28(1), NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SI-7(6), CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::SQS::Queue`

AWS Config rule: `sqs-queue-encrypted` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters: None

This control checks whether an Amazon SQS queue is encrypted at rest. The control fails if the queue isn't encrypted with an SQS-managed key (SSE-SQS) or an AWS Key Management Service (AWS KMS) key (SSE-KMS).

Encrypting data at rest reduces the risk of an unauthorized user accessing data stored on disk. Server-side encryption (SSE) protects the contents of messages in SQS queues using SQS-managed encryption keys (SSE-SQS) or AWS KMS keys (SSE-KMS).

Remediation

To configure SSE for an SQS queue, see Configuring server-side encryption (SSE) for a queue (console) in the *Amazon Simple Queue Service Developer Guide*.

[SQS.2] SQS queues should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SQS::Queue`

AWS Config rule: `tagged-sqs-queue` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an Amazon SQS queue has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the queue doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the queue isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an existing queue using the Amazon SQS console, see Configuring cost allocation tags for an Amazon SQS queue (console) in the *Amazon Simple Queue Service Developer Guide*.

[SQS.3] SQS queue access policies should not allow public access

Related requirements: CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.IR-01.01, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure access management > Resource not publicly accessible

Severity: Critical

Resource type: `AWS::SQS::Queue`

AWS Config rule: sqs-queue-no-public-access

Schedule type: Change triggered

Parameters: None

This controls checks whether an Amazon SQS access policy allows public access to an SQS queue. The control fails if an SQS access policy allows public access to the queue.

An Amazon SQS access policy can allow public access to an SQS queue, which might allow an anonymous user or any authenticated AWS IAM identity to access the queue. SQS access policies typically provide this access by specifying the wildcard character (*) in the `Principal` element of the policy, not using proper conditions to restrict access to the queue, or both. If an SQS access policy allows public access, third parties might be able to perform tasks such as receive messages from the queue, send messages to the queue, or modify the access policy for the queue. This could result in events such as data exfiltration, a denial of service, or injection of messages into the queue by a threat actor.

> **Note**
>
> This control doesn't evaluate policy conditions that use wildcard characters or variables. To produce a PASSED finding, conditions in the Amazon SQS access policy for a queue must only use fixed values, which are values that don't contain wildcard characters or policy variables. For information about policy variables, see Variables and tags in the *AWS Identity and Access Management User Guide*.

Remediation

For information about configuring the SQS access policy for an SQS queue, see Using custom policies with the Amazon SQS Access Policy Language in the *Amazon Simple Queue Service Developer Guide*.

Security Hub CSPM controls for Step Functions

These AWS Security Hub CSPM controls evaluate the AWS Step Functions service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[StepFunctions.1] Step Functions state machines should have logging turned on

Related requirements: PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::StepFunctions::StateMachine`

AWS Config rule: `step-functions-state-machine-logging-enabled`

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`logLevel`	Minimum logging level	Enum	`ALL`, `ERROR`, `FATAL`	No default value

This controls checks whether an AWS Step Functions state machine has logging turned on. The control fails if a state machine doesn't have logging turned on. If you provide a custom value for the `logLevel` parameter, the control passes only if the state machine has the specified logging level turned on.

Monitoring helps you maintain the reliability, availability, and performance of Step Functions. You should collect as much monitoring data from the AWS services that you use so you can more easily debug multi-point failures. Having a logging configuration defined for your Step Functions state machines allows for you to track execution history and results in Amazon CloudWatch Logs. Optionally, you can track only errors or fatal events.

Remediation

To turn on logging for a Step Functions state machine, see Configure logging in the *AWS Step Functions Developer Guide*.

[StepFunctions.2] Step Functions activities should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::StepFunctions::Activity`

AWS Config rule:`tagged-stepfunctions-activity` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Step Functions activity has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the activity doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the activity isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principals.

You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to an Step Functions activity, see Tagging in Step Functions in the *AWS Step Functions Developer Guide*.

Security Hub CSPM controls for Systems Manager

These AWS Security Hub CSPM controls evaluate the AWS Systems Manager (SSM) service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[SSM.1] Amazon EC2 instances should be managed by AWS Systems Manager

Related requirements: PCI DSS v3.2.1/2.4, NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-8, NIST.800-53.r5 CM-8(1), NIST.800-53.r5 CM-8(2), NIST.800-53.r5 CM-8(3), NIST.800-53.r5 SA-15(2), NIST.800-53.r5 SA-15(8), NIST.800-53.r5 SA-3, NIST.800-53.r5 SI-2(3), CRI Profile v2.2/PR.PS-01.01

Category: Identify > Inventory

Severity: Medium

Evaluated resource: `AWS::EC2::Instance`

Required AWS Config recording resources: `AWS::EC2::Instance`, `AWS::SSM::ManagedInstanceInventory`

AWS Config rule: ec2-instance-managed-by-systems-manager

Schedule type: Change triggered

Parameters: None

This control checks whether the stopped and running EC2 instances in your account are managed by AWS Systems Manager. Systems Manager is an AWS service that you can use to view and control your AWS infrastructure.

To help you maintain security and compliance, Systems Manager scans your stopped and running managed instances. A managed instance is a machine that's configured for use with Systems Manager. Systems Manager then reports or takes corrective action on any policy violations that it detects. Systems Manager also helps you configure and maintain your managed instances. To learn more, see the AWS Systems Manager User Guide.

> **Note**
>
> This control generates `FAILED` findings for EC2 instances that are AWS Elastic Disaster Recovery Replication Server instances managed by AWS. A Replication Server instance is an EC2 Instance that's automatically launched by AWS Elastic Disaster Recovery to support continuous data replication from source servers. AWS intentionally removes the Systems Manager (SSM) Agent from these instances to maintain isolation and help prevent potential unintended access paths.

Remediation

For information about managing EC2 instances with AWS Systems Manager, see Amazon EC2 host management in the *AWS Systems Manager User Guide*. In the **Configuration options** section on the AWS Systems Manager console, you can keep the default settings or change them as necessary for your preferred configuration.

[SSM.2] Amazon EC2 instances managed by Systems Manager should have a patch compliance status of COMPLIANT after a patch installation

Related requirements: NIST.800-53.r5 CM-8(3), NIST.800-53.r5 SI-2, NIST.800-53.r5 SI-2(2), NIST.800-53.r5 SI-2(3), NIST.800-53.r5 SI-2(4), NIST.800-53.r5 SI-2(5), NIST.800-171.r2 3.7.1, PCI DSS v3.2.1/6.2, PCI DSS v4.0.1/2.2.1, PCI DSS v4.0.1/6.3.3, CRI Profile v2.2/ID.RA-01.03, CRI Profile v2.2/PR.PS-02.01

Category: Detect > Detection services

Severity: High

Resource type: `AWS::SSM::PatchCompliance`

AWS Config rule: ec2-managedinstance-patch-compliance-status-check

Schedule type: Change triggered

Parameters: None

This control checks whether the compliance status of Systems Manager patch compliance is `COMPLIANT` or `NON_COMPLIANT` after the patch installation on the instance. The control fails if the compliance status is `NON_COMPLIANT`. The control only checks instances that are managed by Systems Manager Patch Manager.

Patching your EC2 instances as required by your organization reduces the attack surface of your AWS accounts.

Remediation

Systems Manager recommends using patch policies to configure patching for your managed instances. You can also use Systems Manager documents, as described in the following procedure, to patch an instance.

To remediate noncompliant patches

1. Open the AWS Systems Manager console at https://console.aws.amazon.com/systems-manager/.
2. For **Node Management**, choose **Run Command**, and then choose **Run command**.
3. Choose the option for **AWS-RunPatchBaseline**.
4. Change the **Operation** to **Install**.
5. Choose **Choose instances manually**, and then choose the noncompliant instances.
6. Choose **Run**.
7. After the command is complete, to monitor the new compliance status of your patched instances, choose **Compliance** in the navigation pane.

[SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, NIST.800-53.r5 CM-2(2), NIST.800-53.r5 CM-8, NIST.800-53.r5 CM-8(1), NIST.800-53.r5 CM-8(3), NIST.800-53.r5 SI-2(3), PCI DSS v3.2.1/2.4, PCI DSS v4.0.1/2.2.1, PCI DSS v4.0.1/6.3.3, CRI Profile v2.2/DE.CM-01.03, CRI

Profile v2.2/DE.CM-09.03, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-02.01, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.IR-01.03, CRI Profile v2.2/PR.IR-01.05

Category: Detect > Detection services

Severity: Low

Resource type: `AWS::SSM::AssociationCompliance`

AWS Config rule: ec2-managedinstance-association-compliance-status-check

Schedule type: Change triggered

Parameters: None

This control checks whether the status of the AWS Systems Manager association compliance is `COMPLIANT` or `NON_COMPLIANT` after the association is run on an instance. The control fails if the association compliance status is `NON_COMPLIANT`.

A State Manager association is a configuration that is assigned to your managed instances. The configuration defines the state that you want to maintain on your instances. For example, an association can specify that antivirus software must be installed and running on your instances or that certain ports must be closed.

After you create one or more State Manager associations, compliance status information is immediately available to you. You can view the compliance status in the console or in response to AWS CLI commands or corresponding Systems Manager API actions. For associations, Configuration Compliance shows the compliance status (`Compliant` or `Non-compliant`). It also shows the severity level assigned to the association, such as `Critical` or `Medium`.

To learn more about State Manager association compliance, see About State Manager association compliance in the *AWS Systems Manager User Guide*.

Remediation

A failed association can be related to different things, including targets and Systems Manager document names. To remediate this issue, you must first identify and investigate the association by viewing association history. For instructions on viewing association history, see Viewing association histories in the *AWS Systems Manager User Guide*.

After investigating, you can edit the association to correct the identified issue. You can edit an association to specify a new name, schedule, severity level, or targets. After you edit an association,

AWS Systems Manager creates a new version. For instructions on editing an association, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

[SSM.4] SSM documents should not be public

Related requirements: NIST.800-53.r5 AC-21, NIST.800-53.r5 AC-3, NIST.800-53.r5 AC-3(7), NIST.800-53.r5 AC-4, NIST.800-53.r5 AC-4(21), NIST.800-53.r5 AC-6, NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(20), NIST.800-53.r5 SC-7(21), NIST.800-53.r5 SC-7(3), NIST.800-53.r5 SC-7(4), NIST.800-53.r5 SC-7(9), CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.IR-01.01

Category: Protect > Secure network configuration > Resources not publicly accessible

Severity: Critical

Resource type: `AWS::SSM::Document`

AWS Config rule: ssm-document-not-public

Schedule type: Periodic

Parameters: None

This control checks whether AWS Systems Manager documents that are owned by an account are public. The control fails if Systems Manager documents that have `Self` as the owner are public.

Systems Manager documents that are public might allow unintended access to your documents. A public Systems Manager document can expose valuable information about your account, resources, and internal processes.

Unless your use case requires public sharing, we recommend that you block public sharing for Systems Manager documents that have `Self` as the owner.

Remediation

For information about configuring sharing for Systems Manager documents, see Share an SSM document in the *AWS Systems Manager User Guide*.

[SSM.5] SSM documents should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::SSM::Document`

AWS Config rule: ssm-document-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Systems Manager document has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the document doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the document doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix. The control doesn't evaluate Systems Manager documents that are owned by Amazon.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

To add tags to an AWS Systems Manager document, you can use the AddTagsToResource operation of the AWS Systems Manager API or, if you're using the AWS CLI, run the add-tags-to-resource command. You can also use the AWS Systems Manager console.

[SSM.6] SSM Automation should have CloudWatch logging enabled

Related requirements: CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::::Account`

AWS Config rule: ssm-automation-logging-enabled

Schedule type: Periodic

Parameters: None

This control checks whether Amazon CloudWatch logging is enabled for AWS Systems Manager (SSM) Automation. The control fails if CloudWatch logging isn't enabled for SSM Automation.

SSM Automation is an AWS Systems Manager tool that helps you build automated solutions to deploy, configure, and manage AWS resources at scale using predefined or custom runbooks. To meet operational or security requirements for your organization, you might need to provide a record of the scripts that it runs. You can configure SSM Automation to send the output from `aws:executeScript` actions in your runbooks to an Amazon CloudWatch Logs log group that you specify. With CloudWatch Logs, you can monitor, store, and access log files from various AWS services.

Remediation

For information about enabling CloudWatch logging for SSM Automation, see Logging Automation action output with CloudWatch Logs in the *AWS Systems Manager User Guide*.

[SSM.7] SSM documents should have the block public sharing setting enabled

Related requirements: CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.AA-01.02, CRI Profile v2.2/PR.AA-03.02, CRI Profile v2.2/PR.AA-05.01, CRI Profile v2.2/PR.PS-01.01, CRI Profile v2.2/PR.PS-01.02

Category: Protect > Secure access management > Resource not publicly accessible

Severity: Critical

Resource type: `AWS::::Account`

AWS Config rule: ssm-automation-block-public-sharing

Schedule type: Periodic

Parameters: None

This control checks whether the block public sharing setting is enabled for AWS Systems Manager documents. The control fails if the block public sharing setting is disabled for Systems Manager documents.

The block public sharing setting for AWS Systems Manager (SSM) documents is an account-level setting. Enabling this setting can prevent unwanted access to your SSM documents. If you enable this setting, your change doesn't affect any SSM documents that you're currently sharing with the public. Unless your use case requires you to share SSM documents with the public, we recommend that you enable the block public sharing setting. The setting can differ for each AWS Region.

Remediation

For information about enabling the block public sharing setting for AWS Systems Manager (SSM) documents, see Block public sharing for SSM documents in the *AWS Systems Manager User Guide*.

Security Hub CSPM controls for AWS Transfer Family

These AWS Security Hub CSPM controls evaluate the AWS Transfer Family service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[Transfer.1] AWS Transfer Family workflows should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Transfer::Workflow`

AWS Config rule: `tagged-transfer-workflow` (custom Security Hub CSPM rule)

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredTagKeys`	List of non-system tag keys that the evaluated resource must contain. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	`No default value`

This control checks whether an AWS Transfer Family workflow has tags with the specific keys defined in the parameter `requiredTagKeys`. The control fails if the workflow doesn't have any tag keys or if it doesn't have all the keys specified in the parameter `requiredTagKeys`. If the parameter `requiredTagKeys` isn't provided, the control only checks for the existence of a tag key and fails if the workflow isn't tagged with any key. System tags, which are automatically applied and begin with `aws:`, are ignored.

A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources. Tagging also helps you track accountable resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authorization strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS

resources. You can create a single ABAC policy or a separate set of policies for your IAM principals. You can design these ABAC policies to allow operations when the principal's tag matches the resource tag. For more information, see What is ABAC for AWS? in the *IAM User Guide*.

> **Note**
>
> Don't add personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Tagging your AWS resources in the *AWS General Reference*.

Remediation

To add tags to a Transfer Family workflow (console)

1. Open the AWS Transfer Family console.
2. In the navigation pane, choose **Workflows**. Then, select the workflow that you want to tag.
3. Choose **Manage tags**, and then add the tags.

[Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection

Related requirements: NIST.800-53.r5 CM-7, NIST.800-53.r5 IA-5, NIST.800-53.r5 SC-8, PCI DSS v4.0.1/4.2.1, CRI Profile v2.2/PR.DS-02.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-in-transit

Severity: Medium

Resource type: `AWS::Transfer::Server`

AWS Config rule: transfer-family-server-no-ftp

Schedule type: Periodic

Parameters: None

This control checks whether an AWS Transfer Family server uses a protocol other than FTP for endpoint connection. The control fails if the server uses FTP protocol for a client to connect to the server's endpoint.

FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic.

Remediation

To modify the protocol for a Transfer Family server, see Edit the file transfer protocols in the *AWS Transfer Family User Guide*.

[Transfer.3] Transfer Family connectors should have logging enabled

Related requirements: NIST.800-53.r5 AC-2(12), NIST.800-53.r5 AC-2(4), NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AC-6(9), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 AU-9(7), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-3(8), NIST.800-53.r5 SI-4, NIST.800-53.r5 SI-4(20), NIST.800-53.r5 SI-7(8), CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/DE.AE-03.02, CRI Profile v2.2/DE.CM-03.01, CRI Profile v2.2/DE.CM-03.02, CRI Profile v2.2/DE.CM-03.03, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::Transfer::Connector`

AWS Config rule: transfer-connector-logging-enabled

Schedule type: Change triggered

Parameters: None

This control checks whether Amazon CloudWatch logging is enabled for an AWS Transfer Family connector. The control fails if CloudWatch logging isn't enabled for the connector.

Amazon CloudWatch is a monitoring and observability service that provides visibility into your AWS resources, including AWS Transfer Family resources. For Transfer Family, CloudWatch provides consolidated auditing and logging for workflow progress and results. This includes several metrics

that Transfer Family defines for workflows. You can configure Transfer Family to automatically log connector events in CloudWatch. To do this, you specify a logging role for the connector. For the logging role, you create an IAM role and a resource-based IAM policy that defines the permissions for the role.

Remediation

For information about enabling CloudWatch logging for a Transfer Family connector, see Amazon CloudWatch logging for AWS Transfer Family servers in the *AWS Transfer Family User Guide*.

[Transfer.4] Transfer Family agreements should be tagged

Related requirements: CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Transfer::Agreement`

AWS Config rule: transfer-agreement-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Transfer Family agreement has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the agreement doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any

values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the agreement doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

For information about adding tags to an AWS Transfer Family agreement, see Resource tagging methods in the *Tagging AWS Resources and Tag Editor User Guide*.

[Transfer.5] Transfer Family certificates should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Transfer::Certificate`

AWS Config rule: transfer-certificate-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Transfer Family certificate has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the certificate doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the certificate doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

Note

Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

For information about adding tags to an AWS Transfer Family certificate, see Resource tagging methods in the *Tagging AWS Resources and Tag Editor User Guide*.

[Transfer.6] Transfer Family connectors should be tagged

Related requirements: CRI Profile v2.2/ID.AM-02.01, CRI Profile v2.2/ID.AM-05.01

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Transfer::Connector`

AWS Config rule: transfer-connector-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an evaluated resource. Tag keys are case sensitive.	StringList (maximum of 6 items)	1–6 tag keys that meet AWS requirements.	No default value

This control checks whether an AWS Transfer Family connector has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the connector doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the connector doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner,

environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

For information about adding tags to an AWS Transfer Family connector, see Resource tagging methods in the *Tagging AWS Resources and Tag Editor User Guide*.

[Transfer.7] Transfer Family profiles should be tagged

Category: Identify > Inventory > Tagging

Severity: Low

Resource type: `AWS::Transfer::Profile`

AWS Config rule: transfer-profile-tagged

Schedule type: Change triggered

Parameters:

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
`requiredKeyTags`	A list of non-system tag keys that must be assigned to an	StringList (maximum of 6 items)	1–6 tag keys that meet AWS	No default value

Parameter	Description	Type	Allowed custom values	Security Hub CSPM default value
	evaluated resource. Tag keys are case sensitive.		requirements.	

This control checks whether an AWS Transfer Family profile has the tag keys specified by the `requiredKeyTags` parameter. The control fails if the profile doesn't have any tag keys, or it doesn't have all the keys specified by the `requiredKeyTags` parameter. If you don't specify any values for the `requiredKeyTags` parameter, the control checks only for the existence of a tag key and fails if the profile doesn't have any tag keys. The control ignores system tags, which are applied automatically and have the `aws:` prefix. The control evaluates local profiles and partner profiles.

A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the *IAM User Guide*. For more information about tags, see the Tagging AWS Resources and Tag Editor User Guide.

> **Note**
>
> Do not store personally identifiable information (PII) or other confidential or sensitive information in tags. Tags are accessible from many AWS services. They aren't intended to be used for private or sensitive data.

Remediation

For information about adding tags to an AWS Transfer Family profile, see Resource tagging methods in the *Tagging AWS Resources and Tag Editor User Guide*.

Security Hub CSPM controls for AWS WAF

These AWS Security Hub CSPM controls evaluate the AWS WAF service and resources. The controls might not be available in all AWS Regions. For more information, see Availability of controls by Region.

[WAF.1] AWS WAF Classic Global Web ACL logging should be enabled

Related requirements: NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.PS-04.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::WAF::WebACL`

AWS Config rule: `waf-classic-logging-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether logging is enabled for an AWS WAF global web ACL. This control fails if logging is not enabled for the web ACL.

Logging is an important part of maintaining the reliability, availability, and performance of AWS WAF globally. It is a business and compliance requirement in many organizations, and allows you to troubleshoot application behavior. It also provides detailed information about the traffic that is analyzed by the web ACL that is attached to AWS WAF.

Remediation

To enable logging for an AWS WAF web ACL, see Logging web ACL traffic information in the *AWS WAF Developer Guide*.

[WAF.2] AWS WAF Classic Regional rules should have at least one condition

Related requirements: NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAFRegional::Rule`

AWS Config rule: `waf-regional-rule-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF Regional rule has at least one condition. The control fails if no conditions are present within a rule.

A WAF Regional rule can contain multiple conditions. The rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any conditions, the traffic passes without inspection. A WAF Regional rule with no conditions, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

Remediation

To add a condition to an empty rule, see Adding and removing conditions in a rule in the *AWS WAF Developer Guide*.

[WAF.3] AWS WAF Classic Regional rule groups should have at least one rule

Related requirements: NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAFRegional::RuleGroup`

AWS Config rule: `waf-regional-rulegroup-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF Regional rule group has at least one rule. The control fails if no rules are present within a rule group.

A WAF Regional rule group can contain multiple rules. The rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any rules, the traffic passes without inspection. A WAF Regional rule group with no rules, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

Remediation

To add rules and rule conditions to an empty rule group, see Adding and deleting rules from an AWS WAF Classic rule group and Adding and removing conditions in a rule in the *AWS WAF Developer Guide*.

[WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAFRegional::WebACL`

AWS Config rule: `waf-regional-webacl-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF Classic Regional web ACL contains any WAF rules or WAF rule groups. This control fails if a web ACL does not contain any WAF rules or rule groups.

A WAF Regional web ACL can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF depending on the default action.

Remediation

To add rules or rule groups to an empty AWS WAF Classic Regional web ACL, see Editing a Web ACL in the *AWS WAF Developer Guide*.

[WAF.6] AWS WAF Classic global rules should have at least one condition

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAF::Rule`

AWS Config rule: `waf-global-rule-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF global rule contains any conditions. The control fails if no conditions are present within a rule.

A WAF global rule can contain multiple conditions. A rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any conditions, the traffic passes without inspection. A WAF global rule with no conditions, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

Remediation

For instructions on creating a rule and adding conditions, see Creating a rule and adding conditions in the *AWS WAF Developer Guide*.

[WAF.7] AWS WAF Classic global rule groups should have at least one rule

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.03

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAF::RuleGroup`

AWS Config rule: `waf-global-rulegroup-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF global rule group has at least one rule. The control fails if no rules are present within a rule group.

A WAF global rule group can contain multiple rules. The rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any rules, the traffic passes without inspection. A WAF global rule group with no rules, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

Remediation

For instructions on adding a rule to a rule group, see Creating an AWS WAF Classic rule group in the *AWS WAF Developer Guide*.

[WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Related requirements: NIST.800-53.r5 AC-4(21), NIST.800-53.r5 SC-7, NIST.800-53.r5 SC-7(11), NIST.800-53.r5 SC-7(16), NIST.800-53.r5 SC-7(21), CRI Profile v2.2/DE.CM-01.01, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAF::WebACL`

AWS Config rule: `waf-global-webacl-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF global web ACL contains at least one WAF rule or WAF rule group. The control fails if a web ACL does not contain any WAF rules or rule groups.

A WAF global web ACL can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF depending on the default action.

Remediation

To add rules or rule groups to an empty AWS WAF global web ACL, see Editing a web ACL in the *AWS WAF Developer Guide*. For **Filter**, choose **Global (CloudFront)**.

[WAF.10] AWS WAF web ACLs should have at least one rule or rule group

Related requirements: NIST.800-53.r5 CA-9(1), NIST.800-53.r5 CM-2, CRI Profile v2.2/DE.CM-01.03, CRI Profile v2.2/PR.IR-01.02, CRI Profile v2.2/PR.PS-01.01

Category: Protect > Secure network configuration

Severity: Medium

Resource type: `AWS::WAFv2::WebACL`

AWS Config rule: `wafv2-webacl-not-empty`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAFV2 web access control list (web ACL) contains at least one rule or rule group. The control fails if a web ACL does not contain any rules or rule groups.

A web ACL gives you fine-grained control over all of the HTTP(S) web requests that your protected resource responds to. A web ACL should contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by AWS WAF depending on the default action.

Remediation

To add rules or rule groups to an empty WAFV2 web ACL, see Editing a Web ACL in the *AWS WAF Developer Guide*.

[WAF.11] AWS WAF web ACL logging should be enabled

Related requirements: NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-7(8), PCI DSS v4.0.1/10.4.2, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/PR.PS-04.01, CRI Profile v2.2/PR.PS-04.02, CRI Profile v2.2/PR.PS-04.03

Category: Identify > Logging

Severity: Low

Resource type: `AWS::WAFv2::WebACL`

AWS Config rule: `wafv2-logging-enabled`

Schedule type: Periodic

Parameters: None

This control checks whether logging is activated for an AWS WAFV2 web access control list (web ACL). This control fails if logging is deactivated for the web ACL.

> **Note**
>
> This control doesn't check whether AWS WAF web ACL logging is enabled for an account through Amazon Security Lake.

Logging maintains the reliability, availability, and performance of AWS WAF. In addition, logging is a business and compliance requirement in many organizations. By logging traffic that's analyzed by your web ACL, you can troubleshoot application behavior.

Remediation

To activate logging for an AWS WAF web ACL, see Managing logging for a web ACL in the *AWS WAF Developer Guide*.

[WAF.12] AWS WAF rules should have CloudWatch metrics enabled

Related requirements: NIST.800-53.r5 AC-4(26), NIST.800-53.r5 AU-10, NIST.800-53.r5 AU-12, NIST.800-53.r5 AU-2, NIST.800-53.r5 AU-3, NIST.800-53.r5 AU-6(3), NIST.800-53.r5 AU-6(4), NIST.800-53.r5 CA-7, NIST.800-53.r5 SC-7(10), NIST.800-53.r5 SC-7(9), NIST.800-53.r5 SI-7(8), NIST.800-171.r2 3.14.6, NIST.800-171.r2 3.14.7, CRI Profile v2.2/DE.AE-02.01, CRI Profile v2.2/DE.AE-02.02, CRI Profile v2.2/DE.AE-03.01, CRI Profile v2.2/RS.MA-02.01

Category: Identify > Logging

Severity: Medium

Resource type: `AWS::WAFv2::RuleGroup`

AWS Config rule: `wafv2-rulegroup-logging-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether an AWS WAF rule or rule group has Amazon CloudWatch metrics enabled. The control fails if the rule or rule group doesn't have CloudWatch metrics enabled.

Configuring CloudWatch metrics on AWS WAF rules and rule groups provides visibility into traffic flow. You can see which ACL rules are triggered and which requests are accepted and blocked. This visibility can help you identify malicious activity on your associated resources.

Remediation

To enable CloudWatch metrics on an AWS WAF rule group, invoke the UpdateRuleGroup API. To enable CloudWatch metrics on an AWS WAF rule, invoke the UpdateWebACL API. Set the `CloudWatchMetricsEnabled` field to `true`. When you use the AWS WAF console to create rules or rule groups, CloudWatch metrics are automatically enabled.

Security Hub CSPM controls for WorkSpaces

These AWS Security Hub CSPM controls evaluate the Amazon WorkSpaces service and resources.

These controls may not be available in all AWS Regions. For more information, see Availability of controls by Region.

[WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest

Related requirements: CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::WorkSpaces::Workspace`

AWS Config rule: `workspaces-user-volume-encryption-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether a user volume in an Amazon WorkSpaces WorkSpace is encrypted at rest. The control fails if the WorkSpace user volume isn't encrypted at rest.

Data at rest refers to data that's stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it.

Remediation

To encrypt a WorkSpaces user volume, see Encrypt a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

[WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Related requirements: CRI Profile v2.2/PR.DS-01.01, CRI Profile v2.2/PR.PS-01.06, CRI Profile v2.2/PR.PS-01.08

Category: Protect > Data Protection > Encryption of data-at-rest

Severity: Medium

Resource type: `AWS::WorkSpaces::Workspace`

AWS Config rule: `workspaces-root-volume-encryption-enabled`

Schedule type: Change triggered

Parameters: None

This control checks whether a root volume in an Amazon WorkSpaces WorkSpace is encrypted at rest. The control fails if the WorkSpace root volume isn't encrypted at rest.

Data at rest refers to data that's stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it.

Remediation

To encrypt a WorkSpaces root volume, see Encrypt a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

Required permissions to configure controls in Security Hub CSPM

To view information about security controls and enable and disable security controls in standards, the AWS Identity and Access Management (IAM) role that you use to access AWS Security Hub CSPM needs permissions to call the following operations of the Security Hub CSPM API.

To get the necessary permissions, you can use Security Hub CSPM managed policies. Alternatively, you can update custom IAM policies to include permissions for these actions.

- **BatchGetSecurityControls** – Returns information about a batch of security controls for the current account and AWS Region.
- **ListSecurityControlDefinitions** – Returns information about security controls that apply to a specified standard.
- **ListStandardsControlAssociations** – Identifies whether a security control is currently enabled in or disabled from each enabled standard in the account.
- **BatchGetStandardsControlAssociations** – For a batch of security controls, identifies whether each control is currently enabled in or disabled from a specified standard.
- **BatchUpdateStandardsControlAssociations** – Used to enable a security control in standards that include the control, or to disable a control in standards. This is a batch substitute for the existing `UpdateStandardsControl` operation.
- **BatchUpdateStandardsControlAssociations** – Used to enable or disable a batch of security controls in standards that include the controls. This is a batch substitute for the existing `UpdateStandardsControl` operation.
- **UpdateStandardsControl** – Used to enable or disable a single security control in standards that include the control
- **DescribeStandardsControl** – Returns details about specified security controls.

In addition to the preceding APIs, you should add permission to call `BatchGetControlEvaluations` to your IAM role. This permission is necessary to view the enablement and compliance status of a control, the findings count for a control, and the overall security score for controls on the Security Hub CSPM console. Because only the console calls `BatchGetControlEvaluations`, this permission doesn't directly correspond to publicly documented Security Hub CSPM APIs or AWS CLI commands.

Enabling controls in Security Hub CSPM

In AWS Security Hub CSPM, a control is a safeguard within a security standard that helps an organization protect the confidentiality, integrity, and availability of its information. Each Security Hub CSPM control is related to a specific AWS resource. When you enable a control, Security Hub CSPM begins to run security checks for the control and generates findings for it. Security Hub CSPM also considers all enabled controls when calculating security scores.

You can choose to enable a control across all of the security standards that it applies to. Alternatively, you can configure the enablement status differently in different standards. We recommend the former option, in which the enablement status of a control is aligned across all of your enabled standards. For instructions on enabling a control across all standards that it applies it, see Enabling a control across standards. For instructions on enabling a control in specific standards, see Enabling a control in a specific standard.

If you enable cross-Region aggregation and sign in to an aggregation Region, the Security Hub CSPM console shows controls that are available in at least one linked Region. If a control is available in a linked Region but not in the aggregation Region, you can't enable or disable that control from the aggregation Region.

You can enable and disable controls in each Region by using the Security Hub CSPM console, Security Hub CSPM API, or AWS CLI.

The instructions for enabling and disabling controls vary based on whether or not you use central configuration. This topic describes the differences. Central configuration is available to users who integrate Security Hub CSPM and AWS Organizations. We recommend using central configuration to simplify the process of enabling and disabling controls in multi-account, multi-Region environments. If you use central configuration, you can enable a control across multiple accounts and Regions through the use of configuration policies. If you don't use central configuration, you must enable a control separately in each Region and account.

Enabling a control across standards

We recommend enabling a AWS Security Hub CSPM control across all of the standards that the control applies to. If you turn on consolidated control findings, you receive one finding per control check even if a control belongs to more than one standard.

Cross-standard enablement in multi-account, multi-Region environments

To enable a security control across multiple AWS accounts and AWS Regions, you must be signed in to the delegated Security Hub CSPM administrator account and use central configuration.

Under central configuration, the delegated administrator can create Security Hub CSPM configuration policies that enable specified controls across enabled standards. You can then associate the configuration policy with specific accounts and organizational units (OUs) or the root. A configuration policy takes effect in your home Region (also called an aggregation Region) and all linked Regions.

Configuration policies offer customization. For example, you can choose to enable all controls in one OU, and you can choose to enable only Amazon Elastic Compute Cloud (EC2) controls in another OU. The level of granularity depends on your intended goals for security coverage in your organization. For instructions on creating a configuration policy that enables specified controls across standards, see Creating and associating configuration policies.

> **Note**
>
> The delegated administrator can create configuration policies to manage controls in all standards except the Service-Managed Standard: AWS Control Tower. Controls for this standard should be configured in the AWS Control Tower service.

If you want some accounts to configure their own controls rather than the delegated administrator, the delegated administrator can designate those accounts as self-managed. Self-managed accounts must configure controls separately in each Region.

Cross-standard enablement in single account and Region

If you don't use central configuration or are a self-managed account, you can't use configuration policies to centrally enable controls in multiple accounts and Regions. However, you can use the following steps to enable a control in a single account and Region.

Security Hub CSPM console

To enable a control across standards in one account and Region

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Choose **Controls** from the navigation pane.
3. Choose the **Disabled** tab.
4. Choose the option next to a control.
5. Choose **Enable Control** (this option doesn't appear for a control that's already enabled).
6. Repeat in each Region in which you want to enable the control.

Security Hub CSPM API

To enable a control across standards in one account and Region

1. Invoke the ListStandardsControlAssociations API. Provide a security control ID.

   Example request:

   ```
   {
       "SecurityControlId": "IAM.1"
   }
   ```

2. Invoke the BatchUpdateStandardsControlAssociations API. Provide the Amazon Resource Name (ARN) of any standards that the control isn't enabled in. To obtain standard ARNs, run `DescribeStandards`.
3. Set the `AssociationStatus` parameter equal to ENABLED. If you follow these steps for a control that's already enabled, the API returns an HTTP status code 200 response.

   Example request:

   ```
   {
       "StandardsControlAssociationUpdates": [{"SecurityControlId": "IAM.1",
    "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
   v/1.2.0", "AssociationStatus": "ENABLED"}, {"SecurityControlId": "IAM.1",
    "StandardsArn": "arn:aws:securityhub:::standards/aws-foundational-security-
   best-practices/v/1.0.0", "AssociationStatus": "ENABLED"}]
   }
   ```

4. Repeat in each Region in which you want to enable the control.

AWS CLI

To enable a control across standards in one account and Region

1. Run the list-standards-control-associations command. Provide a security control ID.

   ```
   aws securityhub  --region us-east-1 list-standards-control-associations --
   security-control-id CloudTrail.1
   ```

2. Run the batch-update-standards-control-associations command. Provide the Amazon Resource Name (ARN) of any standards that the control isn't enabled in. To obtain standard ARNs, run the `describe-standards` command.
3. Set the `AssociationStatus` parameter equal to `ENABLED`. If you follow these steps for a control that's already enabled, the command returns an HTTP status code 200 response.

```
aws securityhub  --region us-east-1 batch-update-standards-control-associations
 --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "ENABLED"}, {"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::standards/cis-aws-foundations-benchmark/
v/1.4.0", "AssociationStatus": "ENABLED"}]'
```

4. Repeat in each Region in which you want to enable the control.

Enabling a control in a specific standard

When you enable a standard in AWS Security Hub CSPM, all of the controls that apply to it are automatically enabled in that standard (the exception to this is service-managed standards). You can then disable and re-enable specific controls in the standard. However, we recommend aligning the enablement status of a control across all of your enabled standards. For instructions on enabling a control across all standards, see Enabling a control across standards.

The details page for a standard contains the list of applicable controls for the standard, and information about which controls are currently enabled in and disabled in that standard.

On the standards details page, you can also enable controls in specific standards. You must enable controls in specific standards separately in each AWS account and AWS Region. When you enable a control in specific standards, it only impacts the current account and Region.

To enable a control in a standard, you must first enable at least one standard to which the control applies. For instructions on enabling a standard, see Enabling a security standard. When you enable a control in one or more standards, Security Hub CSPM starts to generate findings for that control. Security Hub CSPM includes the control status in the calculation of the overall security score and standard security scores. Even if you enable a control in multiple standards, you'll receive a single finding per security check across standards if you turn on consolidated control findings. For more information, see Consolidated control findings.

To enable a control in a standard, the control must be available in your current Region. For more information, see Availability of controls by Region.

Follow these steps to enable a Security Hub CSPM control in a *specific* standard. In lieu of the following steps, you can also use the `UpdateStandardsControl` API action to enable controls in a specific standard. For instructions on enabling a control in *all* standards, see Cross-standard enablement in single account and Region.

Security Hub CSPM console

To enable a control in a specific standard

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Choose **Security standards** from the navigation pane.
3. Choose **View results** for the relevant standard.
4. Select a control.
5. Choose **Enable Control** (this option doesn't appear for a control that's already enabled). Confirm by choosing **Enable**.

Security Hub CSPM API

To enable a control in a specific standard

1. Run `ListSecurityControlDefinitions`, and provide a standard ARN to get a list of available controls for a specific standard. To obtain a standard ARN, run `DescribeStandards`. This API returns standard-agnostic security control IDs, not standard-specific control IDs.

   Example request:

   ```
   {
       "StandardsArn": "arn:aws:securityhub:::standards/aws-foundational-security-best-practices/v/1.0.0"
   }
   ```

2. Run `ListStandardsControlAssociations`, and provide a specific control ID to return the current enablement status of a control in each standard.

Example request:

```
{
    "SecurityControlId": "IAM.1"
}
```

3. Run BatchUpdateStandardsControlAssociations. Provide the ARN of the standard that you want to enable the control in.
4. Set the `AssociationStatus` parameter equal to `ENABLED`.

Example request:

```
{
    "StandardsControlAssociationUpdates": [{"SecurityControlId": "IAM.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "ENABLED"}]
}
```

AWS CLI

To enable a control in a specific standard

1. Run the `list-security-control-definitions` command, and provide a standard ARN to get a list of available controls for a specific standard. To obtain a standard ARN, run `describe-standards`. This command returns standard-agnostic security control IDs, not standard-specific control IDs.

```
aws securityhub --region us-east-1 list-security-control-definitions --
standards-arn "arn:aws:securityhub:us-east-1::standards/aws-foundational-
security-best-practices/v/1.0.0"
```

2. Run the `list-standards-control-associations` command, and provide a specific control ID to return the current enablement status of a control in each standard.

```
aws securityhub  --region us-east-1 list-standards-control-associations --
security-control-id CloudTrail.1
```

3. Run the `batch-update-standards-control-associations` command. Provide the ARN of the standard that you want to enable the control in.

4. Set the `AssociationStatus` parameter equal to `ENABLED`.

```
aws securityhub  --region us-east-1 batch-update-standards-control-associations
 --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:us-east-1::standards/aws-foundational-
security-best-practices/v/1.0.0", "AssociationStatus": "ENABLED"}]'
```

Enabling new controls in enabled standards automatically

AWS Security Hub CSPM regularly releases new controls and adds them to one or more standards. You can choose whether to automatically enable new controls in your enabled standards.

We recommend using Security Hub CSPM central configuration to automatically enable new security controls. You can create configuration policies that include a list of controls to be disabled across standards. All other controls, including newly released ones, are enabled by default. Alternatively, you can create policies that include a list of controls to be enabled across standards. All other controls, including newly released ones, are disabled by default. For more information, see Understanding central configuration in Security Hub CSPM.

Security Hub CSPM doesn't enable new controls when they are added to a standard that you haven't enabled.

The following instructions apply only if you don't use central configuration.

Choose your preferred access method, and follow the steps to automatically enable new controls in enabled standards.

> **Note**
>
> When you automatically enable new controls using the following instructions, you can interact with the controls in the console and programmatically immediately after release. However, automatically enabled controls have a temporary default status of **Disabled**. It can take up to several days for Security Hub CSPM to process the control release and designate the control as **Enabled** in your account. During the processing period, you can manually enable or disable a control, and Security Hub CSPM will maintain that designation regardless of whether you have automatic control enablement turned on.

Security Hub CSPM console

To automatically enable new controls

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Settings**, and then choose the **General** tab.
3. Under **Controls**, choose **Edit**.
4. Turn on **Auto-enable new controls in enabled standards**.
5. Choose **Save**.

Security Hub CSPM API

To automatically enable new controls

1. Run `UpdateSecurityHubConfiguration`.
2. To automatically enable new controls for enabled standards, set `AutoEnableControls` to `true`. If you don't want to automatically enable new controls, set `AutoEnableControls` to false.

AWS CLI

To automatically enable new controls

1. Run the `update-security-hub-configuration` command.
2. To automatically enable new controls for enabled standards, specify `--auto-enable-controls`. If you don't want to automatically enable new controls, specify `--no-auto-enable-controls`.

```
aws securityhub update-security-hub-configuration --auto-enable-controls | --no-auto-enable-controls
```

Example command

```
aws securityhub update-security-hub-configuration --auto-enable-controls
```

If you don't automatically enable new controls, then you must enable them manually. For instructions, see Enabling controls in Security Hub CSPM.

Disabling controls in Security Hub CSPM

To reduce finding noise, it can be helpful to disable controls that aren't relevant to your environment. In AWS Security Hub CSPM, you can disable a control across all security standards or for only specific standards.

If you disable a control across all standards, the following occurs:

- Security checks for the control are no longer performed.
- No additional findings are generated for the control.
- Existing findings are no longer updated for the control.
- Existing findings for the control are archived automatically, typically within 3–5 days on a best-effort basis.
- Security Hub CSPM removes any related AWS Config rules that it created for the control.

If you disable a control for only specific standards, Security Hub CSPM stops running security checks for the control for only those standards. This also removes the control from calculations of the security score for each of those standards. If the control is enabled in other standards, Security Hub CSPM retains the associated AWS Config rule, if applicable, and continues running security checks for the control for the other standards. Security Hub CSPM also includes the control when it calculates the security score for each of the other standards, which affects your summary security score.

If you disable a standard, all of the controls that apply to the standard are disabled automatically for that standard. However, the controls might continue to be enabled in other standards. When you disable a standard, Security Hub CSPM doesn't track which controls were disabled for the standard. Consequently, if you later re-enable the same standard, all the controls that apply to it are automatically enabled. For information about disabling a standard, see Disabling a standard.

Disabling a control isn't a permanent action. Suppose you disable a control, and then enable a standard that includes the control. The control is then enabled for that standard. When you enable a standard in Security Hub CSPM, all the controls that apply to the standard are automatically enabled. For information about enabling a standard, see Enabling a standard.

Topics

- Disabling a control across standards
- Disabling a control in a specific standard
- Suggested controls to disable in Security Hub CSPM

Disabling a control across standards

We recommend disabling an AWS Security Hub CSPM control across standards to maintain alignment throughout your organization. If you disable a control in only specific standards, you continue to receive findings for the control if it is enabled in other standards.

Cross-standard disablement in multiple accounts and Regions

To disable a security control across multiple AWS accounts and AWS Regions, you must use central configuration.

When you use central configuration, the delegated administrator can create Security Hub CSPM configuration policies that disable specified controls across enabled standards. You can then associate the configuration policy with specific accounts, OUs, or the root. A configuration policy takes effect in your home Region (also called an aggregation Region) and all linked Regions.

Configuration policies offer customization. For example, you can choose to disable all AWS CloudTrail controls in one OU, and you can choose to disable all IAM controls in another OU. The level of granularity depends on your intended goals for security coverage in your organization. For instructions on creating a configuration policy that disables specified controls across standards, see Creating and associating configuration policies.

> **Note**
>
> The delegated administrator can create configuration policies to manage controls in all standards except the Service-Managed Standard: AWS Control Tower. Controls for this standard should be configured in the AWS Control Tower service.

If you want some accounts to configure their own controls rather than the delegated administrator, the delegated administrator can designate those accounts as self-managed. Self-managed accounts must configure controls separately in each Region.

Cross-standard disablement in a single account and Region

If you don't use central configuration or are a self-managed account, you can't use configuration policies to centrally disable controls in multiple accounts and Regions. However, you can disable a control in a single account and Region.

Security Hub CSPM console

To disable a control across standards in one account and Region

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Choose **Controls** from the navigation pane.
3. Choose the option next to a control.
4. Choose **Disable Control**. This option doesn't appear for a control that's already disabled.
5. Select a reason for disabling the control, and confirm by choosing **Disable**.
6. Repeat in each Region in which you want to disable the control.

Security Hub CSPM API

To disable a control across standards in one account and Region

1. Invoke the ListStandardsControlAssociations API. Provide a security control ID.

   Example request:

   ```
   {
       "SecurityControlId": "IAM.1"
   }
   ```

2. Invoke the BatchUpdateStandardsControlAssociations API. Provide the ARN of any standards that the control is enabled in. To obtain standard ARNs, run `DescribeStandards`.
3. Set the `AssociationStatus` parameter equal to `DISABLED`. If you follow these steps for a control that's already disabled, the API returns an HTTP status code 200 response.

   Example request:

   ```
   {
   ```

```
    "StandardsControlAssociationUpdates": [{"SecurityControlId": "IAM.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not
 applicable to environment"}, {"SecurityControlId": "IAM.1", "StandardsArn":
 "arn:aws:securityhub:::standards/aws-foundational-security-best-practices/
v/1.0.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
 environment"}}]
}
```

4. Repeat in each Region in which you want to disable the control.

AWS CLI

To disable a control across standards in one account and Region

1. Run the list-standards-control-associations command. Provide a security control ID.

```
aws securityhub  --region us-east-1 list-standards-control-associations --
security-control-id CloudTrail.1
```

2. Run the batch-update-standards-control-associations command. Provide the ARN of any standards that the control is enabled in. To obtain standard ARNs, run the `describe-standards` command.
3. Set the `AssociationStatus` parameter equal to `DISABLED`. If you follow these steps for a control that's already disabled, the command returns an HTTP status code 200 response.

```
aws securityhub  --region us-east-1 batch-update-standards-control-associations
 --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable
 to environment"}, {"SecurityControlId": "CloudTrail.1", "StandardsArn":
 "arn:aws:securityhub:::standards/cis-aws-foundations-benchmark/v/1.4.0",
 "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
 environment"}]'
```

4. Repeat in each Region in which you want to disable the control.

Disabling a control in a specific standard

You can disable a control in only specific security standards, instead of across all standards. If the control applies to other enabled standards, AWS Security Hub CSPM continues to run security checks for the control and you continue to receive findings for the control.

We recommend aligning the enablement status of a control across all of the enabled standards that the control applies to. For information about disabling a control across all of the standards that it applies to, see Disabling a control across standards.

On the standards details page, you can also disable controls in specific standards. You must disable controls in specific standards separately in each AWS account and AWS Region. When you disable a control in specific standards, it affects only the current account and Region.

Choose your preferred method, and follow these steps to disable a control in one or more specific standards.

Security Hub CSPM console

To disable a control in a specific standard

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Choose **Security standards** from the navigation pane. Choose **View results** for the relevant standard.
3. Select a control.
4. Choose **Disable Control**. This option doesn't appear for a control that's already disabled.
5. Provide a reason for disabling the control, and confirm by choosing **Disable**.

Security Hub CSPM API

To disable a control in a specific standard

1. Run `ListSecurityControlDefinitions`, and provide a standard ARN to get a list of available controls for a specific standard. To obtain a standard ARN, run `DescribeStandards`. This API returns standard-agnostic security control IDs, not standard-specific control IDs.

   Example request:

```
{
    "StandardsArn": "arn:aws:securityhub:::standards/aws-foundational-security-
best-practices/v/1.0.0"
}
```

2. Run ListStandardsControlAssociations, and provide a specific control ID to return the current enablement status of a control in each standard.

   Example request:

```
{
    "SecurityControlId": "IAM.1"
}
```

3. Run BatchUpdateStandardsControlAssociations. Provide the ARN of the standard in which you want to disable the control.
4. Set the `AssociationStatus` parameter equal to `DISABLED`. If you follow these steps for a control that's already disabled, the API returns an HTTP status code 200 response.

   Example request:

```
{
    "StandardsControlAssociationUpdates": [{"SecurityControlId": "IAM.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED",  "UpdatedReason": "Not applicable to
 environment"}]
}
```

AWS CLI

To disable a control in a specific standard

1. Run the list-security-control-definitions command, and provide a standard ARN to get a list of available controls for a specific standard. To obtain a standard ARN, run `describe-standards`. This command returns standard-agnostic security control IDs, not standard-specific control IDs.

```
aws securityhub --region us-east-1 list-security-control-definitions --
standards-arn "arn:aws:securityhub:us-east-1::standards/aws-foundational-
security-best-practices/v/1.0.0"
```

2. Run the list-standards-control-associations command, and provide a specific control ID to return the current enablement status of a control in each standard.

```
aws securityhub  --region us-east-1 list-standards-control-associations --
security-control-id CloudTrail.1
```

3. Run the batch-update-standards-control-associations command. Provide the ARN of the standard in which you want to disable the control.
4. Set the `AssociationStatus` parameter equal to `DISABLED`. If you follow these steps for a control that's already enabled, the command returns an HTTP status code 200 response.

```
aws securityhub  --region us-east-1 batch-update-standards-control-
associations --standards-control-association-updates '[{"SecurityControlId":
 "CloudTrail.1", "StandardsArn": "arn:aws:securityhub:us-east-1::standards/aws-
foundational-security-best-practices/v/1.0.0", "AssociationStatus": "DISABLED",
 "UpdatedReason": "Not applicable to environment"}]'
```

Suggested controls to disable in Security Hub CSPM

We recommend disabling some AWS Security Hub CSPM controls to reduce finding noise and usage costs.

Controls that use global resources

Some AWS services support global resources, which means that you can access the resource from any AWS Region. To save on the cost of AWS Config, you can disable recording of global resources in all but one Region. After you do this, however, Security Hub CSPM stills run security checks in all Regions where a control is enabled and charges you based on the number of checks per account per Region. Accordingly, to reduce finding noise and save on the cost of Security Hub CSPM, you should also disable controls that involve global resources in all Regions except the Region that records global resources.

If a control involves global resources but is available in only one Region, disabling it in that Region prevents you from getting any findings for the underlying resource. In this case, we recommend

keeping the control enabled. When using cross-Region aggregation, the Region in which the control is available should be the aggregation Region or one of the linked Regions. The following controls involve global resources but are available in only a single Region:

- **All CloudFront controls** – Available only in the US East (N. Virginia) Region
- **GlobalAccelerator.1** – Available only in the US West (Oregon) Region
- **Route53.2** – Available only in the US East (N. Virginia) Region
- **WAF.1, WAF.6, WAF.7, WAF.8** – Available only in the US East (N. Virginia) Region

> **Note**
>
> If you use central configuration, Security Hub CSPM automatically disables controls that involve global resources in all Regions except the home Region. Other controls that you choose to enable though a configuration policy are enabled in all Regions where they are available. To limit findings for these controls to just one Region, you can update your AWS Config recorder settings and turn off global resource recording in all Regions except the home Region.
>
> If an enabled control that involves global resources isn't supported in the home Region, Security Hub CSPM tries to enable the control in one linked Region where the control is supported. With central configuration, you lack coverage for a control that isn't available in the home Region or any of the linked Regions.
>
> For more information about central configuration, see Understanding central configuration in Security Hub CSPM.

For controls that have a *periodic* schedule type, disabling them in Security Hub CSPM is required to prevent billing. Setting the AWS Config parameter `includeGlobalResourceTypes` to `false` doesn't affect periodic Security Hub CSPM controls.

The following Security Hub CSPM controls use global resources:

- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured

- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse

- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

CloudTrail logging controls

The CloudTrail.2 control evaluates the use of AWS Key Management Service (AWS KMS) to encrypt AWS CloudTrail trail logs. If you log these trails in a centralized logging account, you need to enable this control only in the account and AWS Region where centralized logging takes place.

If you use central configuration, the enablement status of a control is aligned across the home Region and linked Regions. You can't disable a control in some Regions and enable it in others. In this case, you can suppress findings from the CloudTrail.2 control to reduce finding noise.

CloudWatch alarm controls

If you prefer to use Amazon GuardDuty for anomaly detection instead of Amazon CloudWatch alarms, you can disable the following controls, which focus on CloudWatch alarms:

- [CloudWatch.1] A log metric filter and alarm should exist for usage of the "root" user
- [CloudWatch.2] Ensure a log metric filter and alarm exist for unauthorized API calls
- [CloudWatch.3] Ensure a log metric filter and alarm exist for Management Console sign-in without MFA
- [CloudWatch.4] Ensure a log metric filter and alarm exist for IAM policy changes
- [CloudWatch.5] Ensure a log metric filter and alarm exist for CloudTrail configuration changes
- [CloudWatch.6] Ensure a log metric filter and alarm exist for AWS Management Console authentication failures
- [CloudWatch.7] Ensure a log metric filter and alarm exist for disabling or scheduled deletion of customer managed keys
- [CloudWatch.8] Ensure a log metric filter and alarm exist for S3 bucket policy changes
- [CloudWatch.9] Ensure a log metric filter and alarm exist for AWS Config configuration changes
- [CloudWatch.10] Ensure a log metric filter and alarm exist for security group changes
- [CloudWatch.11] Ensure a log metric filter and alarm exist for changes to Network Access Control Lists (NACL)
- [CloudWatch.12] Ensure a log metric filter and alarm exist for changes to network gateways
- [CloudWatch.13] Ensure a log metric filter and alarm exist for route table changes
- [CloudWatch.14] Ensure a log metric filter and alarm exist for VPC changes

Understanding security checks and scores in Security Hub CSPM

For each control that you enable, AWS Security Hub CSPM runs security checks. A security check produces a finding that tells you whether a specific AWS resource is in compliance with the rules that the control includes.

Some checks run on a periodic schedule. Other checks only run when there is a change to the resource state. For more information, see Schedule for running security checks.

Many security checks use AWS Config managed or custom rules to establish the compliance requirements. To run these checks, you must set up AWS Config and turn on resource recording for required resources. For more information on setting up AWS Config, see Enabling and configuring AWS Config for Security Hub CSPM. For a list of AWS Config resources that you must record for each standard, see Required AWS Config resources for control findings. Other controls use custom Lambda functions, which are managed by Security Hub CSPM and don't require any prerequisites.

As Security Hub CSPM runs security checks, it generates findings and assigns them a compliance status. For more information about compliance status, see Evaluating the compliance status of Security Hub CSPM findings.

Security Hub CSPM uses the compliance status of control findings to determine an overall control status. Based on the control status, Security Hub CSPM also calculates a security score across all enabled controls and for specific standards. For more information, see the section called "Compliance status and control status" and the section called "Calculating security scores".

If you've turned on consolidated control findings, Security Hub CSPM generates a single finding even when a control is associated with more than one standard. For more information, see Consolidated control findings.

Topics

- Required AWS Config resources for control findings
- Schedule for running security checks
- Generating and updating control findings
- Evaluating compliance status and control status
- Calculating security scores

Required AWS Config resources for control findings

> **Note**
>
> If you are using Security Hub CSPM and Security Hub the configuration of the resource recording is managed for you. Security Hub creates a service-linked configuration recorder with AWS Config and gets direct information on all resources that are related to controls supported in Security Hub CSPM. For more information, see Using the service-linked configuration recorder.

In AWS Security Hub CSPM, some controls use service-linked AWS Config rules that detect configuration changes in your AWS resources. For Security Hub CSPM to generate accurate findings for these controls, you must enable AWS Config and turn on resource recording in AWS Config. For information about how Security Hub CSPM uses AWS Config rules and how to enable and configure AWS Config, see Enabling and configuring AWS Config for Security Hub CSPM. For

detailed information about resource recording, see Working with the configuration recorder in the *AWS Config Developer Guide*.

To receive accurate control findings, you must turn on AWS Config resource recording for enabled controls with a *change triggered* schedule type. Some controls with a *periodic* schedule type also require resource recording. This page lists the required resources for these Security Hub CSPM controls.

Security Hub CSPM controls can rely on managed AWS Config rules or custom Security Hub CSPM rules. Make sure there aren't any AWS Identity and Access Management (IAM) policies or AWS Organizations managed policies that prevent AWS Config from having permission to record your resources. Security Hub CSPM controls evaluate resource configurations directly and don't take AWS Organizations policies into account.

> **Note**
>
> In AWS Regions where a control isn't available, the corresponding resource isn't available in AWS Config. For a list of these limits, see Regional limits on Security Hub CSPM controls.

Topics

- Required resources for all Security Hub CSPM controls
- Required resources for the AWS Foundational Security Best Practices standard
- Required resources for the CIS AWS Foundations Benchmark
- Required resources for the NIST SP 800-53 Revision 5 standard
- Required resources for the NIST SP 800-171 Revision 2 standard
- Required resources for PCI DSS v3.2.1
- Required resources for the AWS Resource Tagging standard

Required resources for all Security Hub CSPM controls

For Security Hub CSPM to generate findings for change triggered controls that are enabled and use an AWS Config rule, you must record the following types of resources in AWS Config. This table also indicates which controls evaluate a particular type of resource. A single control might evaluate more than one type of resource.

AWS service	Resource types	Related controls
AWS Amplify	`AWS::Amplify::App`	Amplify.1

Required resources for the AWS Foundational Security Best Practices standard

For Security Hub CSPM to accurately report findings for change triggered controls that apply to the AWS Foundational Security Best Practices standard (v.1.0.0), are enabled, and use an AWS Config rule, you must record the following types of resources in AWS Config. For information about this standard, see AWS Foundational Security Best Practices standard in Security Hub CSPM.

AWS service	Resource types
Amazon API Gateway	`AWS::ApiGateway::DomainName` , `AWS::ApiGateway::Stage` , `AWS::ApiGatewayV2::Stage`

AWS service	Resource types
AWS AppSync	AWS::AppSync::ApiCache , AWS::AppSync::GraphQLApi
AWS Backup	AWS::Backup::RecoveryPoint
Amazon Bedrock	AWS::Bedrock::DataSource
Amazon Bedrock AgentCore	AWS::BedrockAgentCore::BrowserCustom , AWS::BedrockAgentCore::CodeInterpreterCustom , AWS::BedrockAgentCore::Gateway , AWS::BedrockAgentCore::Runtime
AWS Certificate Manager (ACM)	AWS::ACM::Certificate
AWS CloudFormation	AWS::CloudFormation::Stack
Amazon CloudFront	AWS::CloudFront::Distribution
AWS CodeBuild	AWS::CodeBuild::Project , AWS::CodeBuild::ReportGroup
Amazon Cognito	AWS::Cognito::IdentityPool , AWS::Cognito::UserPool
AWS CloudTrail	AWS::CloudTrail::EventDataStore
Amazon Connect Customer	AWS::Connect::Instance
AWS DataSync	AWS::DataSync::Task
AWS Database Migration Service (AWS DMS)	AWS::DMS::Endpoint , AWS::DMS::ReplicationInstance , AWS::DMS::ReplicationTask
Amazon DynamoDB	AWS::DynamoDB::Table

AWS service	Resource types
Amazon EC2 Systems Manager (SSM)	AWS::SSM::AssociationCompliance ,AWS::SSM::ManagedInstanceInventory ,AWS::SSM::PatchCompliance
Amazon Elastic Compute Cloud (Amazon EC2)	AWS::EC2::ClientVpnEndpoint ,AWS::EC2::Instance ,AWS::EC2::LaunchTemplate ,AWS::EC2::NetworkAcl ,AWS::EC2::NetworkInterface ,AWS::EC2::SecurityGroup ,AWS::EC2::SnapshotBlockPublicAccess ,AWS::EC2::SpotFleet ,AWS::EC2::Subnet ,AWS::EC2::TransitGateway ,AWS::EC2::VPCBlockPublicAccessOptions ,AWS::EC2::VPNConnection ,AWS::EC2::Volume
Amazon EC2 Auto Scaling	AWS::AutoScaling::AutoScalingGroup ,AWS::AutoScaling::LaunchConfiguration
Amazon Elastic Container Registry (Amazon ECR)	AWS::ECR::Repository
Amazon Elastic Container Service (Amazon ECS)	AWS::ECS::CapacityProvider ,AWS::ECS::Cluster ,AWS::ECS::Service ,AWS::ECS::TaskDefinition ,AWS::ECS::TaskSet
Amazon Elastic File System (Amazon EFS)	AWS::EFS::AccessPoint ,AWS::EFS::FileSystem
Amazon Elastic Kubernetes Service (Amazon EKS)	AWS::EKS::Cluster ,AWS::EKS::Nodegroup

AWS service	Resource types
AWS Elastic Beanstalk	`AWS::ElasticBeanstalk::Environment`
Elastic Load Balancing	`AWS::ElasticLoadBalancing::LoadBalancer` , `AWS::ElasticLoadBalancingV2::Listener` , `AWS::ElasticLoadBalancingV2::LoadBalancer`
ElasticSearch	`AWS::Elasticsearch::Domain`
Amazon EMR	`AWS::EMR::SecurityConfiguration`
AWS Glue	`AWS::Glue::Job` , `AWS::Glue::MLTransform`
AWS Identity and Access Management (IAM)	`AWS::IAM::Group` , `AWS::IAM::Policy` , `AWS::IAM::Role` , `AWS::IAM::User`
Amazon Kinesis	`AWS::Kinesis::Stream`
AWS Key Management Service (AWS KMS)	`AWS::KMS::Key`
AWS Lambda	`AWS::Lambda::Function`
Amazon Managed Streaming for Apache Kafka (Amazon MSK)	`AWS::MSK::Cluster` , `AWS::KafkaConnect::Connector`
AWS Network Firewall	`AWS::NetworkFirewall::Firewall` , `AWS::NetworkFirewall::FirewallPolicy` , `AWS::NetworkFirewall::RuleGroup`
Amazon OpenSearch Service	`AWS::OpenSearch::Domain`

AWS service	Resource types
Amazon Relational Database Service (Amazon RDS)	AWS::RDS::DBCluster , AWS::RDS::DBClusterSnapshot , AWS::RDS::DBInstance , AWS::RDS::DBProxy , AWS::RDS::DBSnapshot , AWS::RDS::EventSubscription , AWS::RDS::GlobalCluster
Amazon Redshift	AWS::Redshift::Cluster , AWS::Redshift::ClusterSubnetGroup
Amazon Redshift Serverless	AWS::RedshiftServerless::Workgroup
Amazon Route 53	AWS::Route53::HostedZone
Amazon Simple Storage Service (Amazon S3)	AWS::S3::AccessPoint , AWS::S3::AccountPublicAccessBlock , AWS::S3::Bucket , AWS::S3::MultiRegionAccessPoint , AWS::S3Express::DirectoryBucket
Amazon SageMaker AI	AWS::SageMaker::FeatureGroup , AWS::SageMaker::InferenceExperiment , AWS::SageMaker::Model , AWS::SageMaker::ModelExplainabilityJobDefinition , AWS::SageMaker::ModelQualityJobDefinition , AWS::SageMaker::MonitoringSchedule , AWS::SageMaker::NotebookInstance
Amazon Simple Notification Service (Amazon SNS)	AWS::SNS::Topic
Amazon Simple Queue Service (Amazon SQS)	AWS::SQS::Queue

AWS service	Resource types
AWS Secrets Manager	`AWS::SecretsManager::Secret`
AWS Step Functions	`AWS::StepFunctions::StateMachine`
AWS Transfer Family	`AWS::Transfer::Connector`
AWS WAF	`AWS::WAF::Rule` , `AWS::WAF::RuleGroup` , `AWS::WAF::WebACL` , `AWS::WAFRegional::Rule` , `AWS::WAFRegional::RuleGroup` , `AWS::WAFRegional::WebACL` , `AWS::WAFv2::RuleGroup` , `AWS::WAFv2::WebACL`
Amazon WorkSpaces	`AWS::WorkSpaces::WorkSpace`

Required resources for the CIS AWS Foundations Benchmark

To run security checks for enabled controls that apply to the Center for Internet Security (CIS) AWS Foundations Benchmark, Security Hub CSPM either runs through the exact audit steps prescribed for the checks or uses specific AWS Config managed rules. For information about this standard in Security Hub CSPM, see CIS AWS Foundations Benchmark in Security Hub CSPM.

Required resources for CIS v5.0.0

For Security Hub CSPM to accurately report findings for enabled CIS v5.0.0 change triggered controls that use an AWS Config rule, you must record the following types of resources in AWS Config.

AWS service	Resource types
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::Instance` , `AWS::EC2::NetworkAcl` , `AWS::EC2::SecurityGroup` , `AWS::EC2::VPC`
Amazon Elastic File System (Amazon EFS)	`AWS::EFS::FileSystem`

AWS service	Resource types
AWS Identity and Access Management (IAM)	`AWS::IAM::Group` , `AWS::IAM::User` , `AWS::IAM::Role`
Amazon Relational Database Service (Amazon RDS)	`AWS::RDS::DBInstance` , `AWS::RDS::DBCluster`
Amazon Simple Storage Service (Amazon S3)	`AWS::S3::Bucket`

Required resources for CIS v3.0.0

For Security Hub CSPM to accurately report findings for enabled CIS v3.0.0 change triggered controls that use an AWS Config rule, you must record the following types of resources in AWS Config.

AWS service	Resource types
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::Instance` , `AWS::EC2::NetworkAcl` , `AWS::EC2::SecurityGroup` , `AWS::EC2::VPC`
AWS Identity and Access Management (IAM)	`AWS::IAM::Group` , `AWS::IAM::User` , `AWS::IAM::Role`
Amazon Relational Database Service (Amazon RDS)	`AWS::RDS::DBInstance`
Amazon Simple Storage Service (Amazon S3)	`AWS::S3::Bucket`

Required resources for CIS v1.4.0

For Security Hub CSPM to accurately report findings for enabled CIS v1.4.0 change triggered controls that use an AWS Config rule, you must record the following types of resources in AWS Config.

AWS service	Resource types
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::NetworkAcl` , `AWS::EC2::SecurityGroup`
AWS Identity and Access Management (IAM)	`AWS::IAM::Policy` , `AWS::IAM::User`
Amazon Relational Database Service (Amazon RDS)	`AWS::RDS::DBInstance`
Amazon Simple Storage Service (Amazon S3)	`AWS::S3::Bucket`

Required resources for CIS v1.2.0

For Security Hub CSPM to accurately report findings for enabled CIS v1.2.0 change triggered controls that use an AWS Config rule, you must record the following types of resources in AWS Config.

AWS service	Resource types
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::SecurityGroup`
AWS Identity and Access Management (IAM)	`AWS::IAM::Policy` , `AWS::IAM::User`

Required resources for the NIST SP 800-53 Revision 5 standard

For Security Hub CSPM to accurately report findings for change triggered controls that apply to the NIST SP 800-53 Revision 5 standard, are enabled, and use an AWS Config rule, you must record the following types of resources in AWS Config. For information about this standard, see NIST SP 800-53 Revision 5 in Security Hub CSPM.

AWS service	Resource types
Amazon API Gateway	`AWS::ApiGateway::Stage` , `AWS::ApiGatewayV2::Stage`
AWS AppSync	`AWS::AppSync::GraphQLApi`

AWS service	Resource types
AWS Backup	AWS::Backup::RecoveryPoint
Amazon Bedrock AgentCore	AWS::BedrockAgentCore::Gateway , AWS::BedrockAgentCore::Memory
AWS Certificate Manager (ACM)	AWS::ACM::Certificate
AWS CloudFormation	AWS::CloudFormation::Stack
Amazon CloudFront	AWS::CloudFront::Distribution
Amazon CloudWatch	AWS::CloudWatch::Alarm
AWS CodeBuild	AWS::CodeBuild::Project
AWS Database Migration Service (AWS DMS)	AWS::DMS::Endpoint ,AWS::DMS::ReplicationInstance ,AWS::DMS::ReplicationTask
Amazon DynamoDB	AWS::DynamoDB::Table
Amazon Elastic Compute Cloud (Amazon EC2)	AWS::EC2::ClientVpnEndpoint , AWS::EC2::EIP ,AWS::EC2::Instance ,AWS::EC2::LaunchTemplate , AWS::EC2::NetworkAcl ,AWS::EC2::NetworkInterface ,AWS::EC2::SecurityGroup ,AWS::EC2::Subnet , AWS::EC2::TransitGateway , AWS::EC2::VPNConnection ,AWS::EC2::Volume
Amazon EC2 Auto Scaling	AWS::AutoScaling::AutoScalingGroup ,AWS::AutoScaling::LaunchConfiguration
Amazon Elastic Container Registry (Amazon ECR)	AWS::ECR::Repository

AWS service	Resource types
Amazon Elastic Container Service (Amazon ECS)	`AWS::ECS::Cluster` , `AWS::ECS::Service` , `AWS::ECS::TaskDefinition`
Amazon Elastic File System (Amazon EFS)	`AWS::EFS::AccessPoint`
Amazon Elastic Kubernetes Service (Amazon EKS)	`AWS::EKS::Cluster`
AWS Elastic Beanstalk	`AWS::ElasticBeanstalk::Environment`
Elastic Load Balancing	`AWS::ElasticLoadBalancing::LoadBalancer` , `AWS::ElasticLoadBalancingV2::Listener` , `AWS::ElasticLoadBalancingV2::LoadBalancer`
Amazon ElasticSearch	`AWS::Elasticsearch::Domain`
Amazon EMR	`AWS::EMR::SecurityConfiguration`
Amazon EventBridge	`AWS::Events::Endpoint` , `AWS::Events::EventBus`
AWS Glue	`AWS::Glue::Job`
AWS Identity and Access Management (IAM)	`AWS::IAM::Group` , `AWS::IAM::Policy` , `AWS::IAM::Role` , `AWS::IAM::User`
AWS Key Management Service (AWS KMS)	`AWS::KMS::Alias` , `AWS::KMS::Key`
Amazon Kinesis	`AWS::Kinesis::Stream`
AWS Lambda	`AWS::Lambda::Function`
Amazon Managed Streaming for Apache Kafka (Amazon MSK)	`AWS::MSK::Cluster`

AWS service	Resource types
Amazon MQ	AWS::AmazonMQ::Broker
AWS Network Firewall	AWS::NetworkFirewall::Firewall , AWS::NetworkFirewall::FirewallPolicy , AWS::NetworkFirewall::RuleGroup
Amazon OpenSearch Service	AWS::OpenSearch::Domain
Amazon Relational Database Service (Amazon RDS)	AWS::RDS::DBCluster , AWS::RDS::DBClusterSnapshot , AWS::RDS::DBInstance , AWS::RDS::DBSnapshot , AWS::RDS::EventSubscription
Amazon Redshift	AWS::Redshift::Cluster , AWS::Redshift::ClusterSubnetGroup
Amazon Route 53	AWS::Route53::HostedZone
Amazon Simple Storage Service (Amazon S3)	AWS::S3::AccessPoint , AWS::S3::AccountPublicAccessBlock , AWS::S3::Bucket
AWS Service Catalog	AWS::ServiceCatalog::Portfolio
Amazon Simple Notification Service (Amazon SNS)	AWS::SNS::Topic
Amazon Simple Queue Service (Amazon SQS)	AWS::SQS::Queue
Amazon EC2 Systems Manager (SSM)	AWS::SSM::AssociationCompliance , AWS::SSM::ManagedInstanceInventory , AWS::SSM::PatchCompliance
Amazon SageMaker AI	AWS::SageMaker::FeatureGroup , AWS::SageMaker::NotebookInstance

AWS service	Resource types
AWS Secrets Manager	`AWS::SecretsManager::Secret`
AWS Transfer Family	`AWS::Transfer::Connector`
AWS WAF	`AWS::WAF::Rule` , `AWS::WAF::RuleGroup` , `AWS::WAF::WebACL` , `AWS::WAFRegional::Rule` , `AWS::WAFRegional::RuleGroup` , `AWS::WAFRegional::WebACL` , `AWS::WAFv2::RuleGroup` , `AWS::WAFv2::WebACL`

Required resources for the NIST SP 800-171 Revision 2 standard

For Security Hub CSPM to accurately report findings for change triggered controls that apply to the NIST SP 800-171 Revision 2 standard, are enabled, and use an AWS Config rule, you must record the following types of resources in AWS Config. For information about this standard, see NIST SP 800-171 Revision 2 in Security Hub CSPM.

AWS service	Resource types
AWS Certificate Manager (ACM)	`AWS::ACM::Certificate`
Amazon API Gateway	`AWS::ApiGateway::Stage`
Amazon CloudFront	`AWS::CloudFront::Distribution`
Amazon CloudWatch	`AWS::CloudWatch::Alarm`
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::ClientVpnEndpoint` , `AWS::EC2::NetworkAcl` , `AWS::EC2::SecurityGroup` , `AWS::EC2::VPC` , `AWS::EC2::VPNConnection`
Elastic Load Balancing	`AWS::ElasticLoadBalancing::LoadBalancer`

AWS service	Resource types
AWS Identity and Access Management (IAM)	`AWS::IAM::Policy` , `AWS::IAM::User`
AWS Key Management Service (AWS KMS)	`AWS::KMS::Alias` , `AWS::KMS::Key`
AWS Network Firewall	`AWS::NetworkFirewall::FirewallPolicy` , `AWS::NetworkFirewall::RuleGroup`
Amazon Simple Storage Service (Amazon S3)	`AWS::S3::Bucket`
Amazon Simple Notification Service (Amazon SNS)	`AWS::SNS::Topic`
AWS Systems Manager (SSM)	`AWS::SSM::PatchCompliance`
AWS WAF	`AWS::WAFv2::RuleGroup`

Required resources for PCI DSS v3.2.1

For Security Hub CSPM to accurately report findings for controls that apply to v3.2.1 of the Payment Card Industry Data Security Standard (PCI DSS), are enabled, and use an AWS Config rule, you must record the following types of resources in AWS Config. For information about this standard, see PCI DSS in Security Hub CSPM.

AWS service	Resource types
AWS CodeBuild	`AWS::CodeBuild::Project`
Amazon Elastic Compute Cloud (Amazon EC2)	`AWS::EC2::EIP` , `AWS::EC2::Instance` , `AWS::EC2::SecurityGroup`
Amazon EC2 Auto Scaling	`AWS::AutoScaling::AutoScalingGroup`
AWS Identity and Access Management (IAM)	`AWS::IAM::Policy` , `AWS::IAM::User`
AWS Lambda	`AWS::Lambda::Function`

AWS service	Resource types
Amazon OpenSearch Service	`AWS::OpenSearch::Domain`
Amazon Relational Database Service (Amazon RDS)	`AWS::RDS::DBClusterSnapshot` , `AWS::RDS::DBInstance` , `AWS::RDS::DBSnapshot`
Amazon Redshift	`AWS::Redshift::Cluster`
Amazon Simple Storage Service (Amazon S3)	`AWS::S3::AccountPublicAccessBlock` , `AWS::S3::Bucket`
Amazon EC2 Systems Manager (SSM)	`AWS::SSM::AssociationCompliance` , `AWS::SSM::ManagedInstanceInventory` , `AWS::SSM::PatchCompliance`

Required resources for the AWS Resource Tagging standard

All the controls that apply to the AWS Resource Tagging standard are change triggered and use an AWS Config rule. For Security Hub CSPM to accurately report findings for these controls, you must record the following types of resources in AWS Config. For information about this standard, see AWS Resource Tagging standard in Security Hub CSPM.

AWS service	Resource types
AWS Amplify	`AWS::Amplify::App` , `AWS::Amplify::Branch`
Amazon AppFlow	`AWS::AppFlow::Flow`
AWS App Runner	`AWS::AppRunner::Service` , `AWS::AppRunner::VpcConnector`
AWS AppConfig	`AWS::AppConfig::Application` , `AWS::AppConfig::ConfigurationProfile` , `AWS::AppConfig::En`

AWS service	Resource types
	vironment ,AWS::AppConfig::Extensi onAssociation
AWS AppSync	AWS::AppSync::GraphQLApi
Amazon Athena	AWS::Athena::DataCatalog , AWS::Athena::WorkGroup
AWS Backup	AWS::Backup::BackupPlan ,AWS::Backup::BackupVault ,AWS::Backup::RecoveryPlan ,AWS::Backup::ReportPlan
AWS Batch	AWS::Batch::ComputeEnvironment , AWS::Batch::JobQueue ,AWS::Batch::SchedulingPolicy
AWS Certificate Manager (ACM)	AWS::ACM::Certificate
AWS CloudFormation	AWS::CloudFormation::Stack
Amazon CloudFront	AWS::CloudFront::Distribution
AWS CloudTrail	AWS::CloudTrail::Trail
AWS CodeArtifact	AWS::CodeArtifact::Repository
Amazon CodeGuru	AWS::CodeGuruProfiler::ProfilingGroup ,AWS::CodeGuruReviewer::RepositoryAssociation
Amazon Connect Customer	AWS::CustomerProfiles::ObjectType

AWS service	Resource types
AWS Database Migration Service (AWS DMS)	AWS::DMS::Certificate ,AWS::DMS::EventSubscription AWS::DMS::ReplicationInstance , AWS::DMS::ReplicationSubnetGroup
AWS DataSync	AWS::DataSync::Task
Amazon Detective	AWS::Detective::Graph
Amazon DynamoDB	AWS::DynamoDB::Trail
Amazon Elastic Compute Cloud (EC2)	AWS::EC2::CustomerGateway , AWS::EC2::DHCPOptions ,AWS::EC2::EIP ,AWS::EC2::FlowLog ,AWS::EC2::Instance ,AWS::EC2::InternetGateway ,AWS::EC2::LaunchTemplate , AWS::EC2::NatGateway ,AWS::EC2::NetworkAcl ,AWS::EC2::NetworkInterface ,AWS::EC2::PrefixList , AWS::EC2::RouteTable ,AWS::EC2::SecurityGroup ,AWS::EC2::Subnet , AWS::EC2::TrafficMirrorFilter ,AWS::EC2::TrafficMirrorSession ,AWS::EC2::TrafficMirrorTarget ,AWS::EC2::TransitGateway , AWS::EC2::TransitGatewayAttachment ,AWS::EC2::TransitGatewayRouteTable ,AWS::EC2::Volume ,AWS::EC2::VPC ,AWS::EC2::VPCEndpointService ,AWS::EC2::VPCPeeringConnection ,AWS::EC2::VPNGateway
Amazon EC2 Auto Scaling	AWS::AutoScaling::AutoScalingGroup

AWS service	Resource types
Amazon Elastic Container Registry (Amazon ECR)	`AWS::ECR::PublicRepository`
Amazon Elastic Container Service (Amazon ECS)	`AWS::ECS::Cluster` , `AWS::ECS::Service` , `AWS::ECS::TaskDefinition`
Amazon Elastic File System (Amazon EFS)	`AWS::EFS::AccessPoint`
Amazon Elastic Kubernetes Service (Amazon EKS)	`AWS::EKS::Cluster` , `AWS::EKS::IdentityProviderConfig`
AWS Elastic Beanstalk	`AWS::ElasticBeanstalk::Environment`
ElasticSearch	`AWS::Elasticsearch::Domain`
Amazon EventBridge	`AWS::Events::EventBus`

Amazon Fraud Detector	`AWS::FraudDetector::EntityType` , `AWS::FraudDetector::Label`
	
	`AWS::FraudDetector::Outcome` , `AWS::FraudDetector::Variable`

AWS Global Accelerator	`AWS::GlobalAccelerator::Accelerator`
AWS Glue	`AWS::Glue::Job`
Amazon GuardDuty	`AWS::GuardDuty::Detector` , `AWS::GuardDuty::Filter` , `AWS::GuardDuty::IPSet`
AWS Identity and Access Management (IAM)	`AWS::IAM::Role` , `AWS::IAM::User`
AWS Identity and Access Management Access Analyzer (IAM Access Analyzer)	`AWS::AccessAnalyzer::Analyzer`

AWS service	Resource types
AWS IoT	AWS::IoT::Authorizer ,AWS::IoT::Dimension ,AWS::IoT::MitigationAction ,AWS::IoT::Policy , AWS::IoT::RoleAlias ,AWS::IoT::SecurityProfile
AWS IoT Events	AWS::IoTEvents::AlarmModel , AWS::IoTEvents::DetectorModel , AWS::IoTEvents::Input
AWS IoT SiteWise	AWS::IoTSiteWise::Dashboard ,AWS::IoTSiteWise::Gateway , AWS::IoTSiteWise::Portal , AWS::IoTSiteWise::Project
AWS IoT TwinMaker	AWS::IoTTwinMaker::Entity , AWS::IoTTwinMaker::Scene , AWS::IoTTwinMaker::SyncJob , AWS::IoTTwinMaker::Workspace
AWS IoT Wireless	AWS::IoTWireless::FuotaTask ,AWS::IoTWireless::MulticastGroup ,AWS::IoTWireless::ServiceProfile
Amazon Interactive Video Service (Amazon IVS)	AWS::IVS::Channel ,AWS::IVS::PlaybackKeyPair ,AWS::IVS::RecordingConfiguration
Amazon Keyspaces (for Apache Cassandra)	AWS::Cassandra::Keyspace
Amazon Kinesis	AWS::Kinesis::Stream
AWS Lambda	AWS::Lambda::Function
Amazon MQ	AWS::AmazonMQ::Broker

AWS service	Resource types
AWS Network Firewall	AWS::NetworkFirewall::Firewall , AWS::NetworkFirewall::FirewallPolicy
Amazon OpenSearch Service	AWS::OpenSearch::Domain
AWS Private Certificate Authority	AWS::ACMPCA::CertificateAuthority
Amazon Relational Database Service	AWS::RDS::DBCluster , AWS::RDS::DBClusterSnapshot , AWS::RDS::DBInstance , AWS::RDS::DBSecurityGroup , AWS::RDS::DBSnapshot , AWS::RDS::DBSubnetGroup
Amazon Redshift	AWS::Redshift::Cluster , AWS::Redshift::ClusterParameterGroup , AWS::Redshift::ClusterSnapshot , AWS::Redshift::ClusterSubnetGroup , AWS::Redshift::EventSubscription
Amazon Route 53	AWS::Route53::HealthCheck
Amazon SageMaker AI	AWS::SageMaker::AppImageConfig , AWS::SageMaker::Image
AWS Secrets Manager	AWS::SecretsManager::Secret
Amazon Simple Email Service (Amazon SES)	AWS::SES::ConfigurationSet , AWS::SES::ContactList
Amazon Simple Notification Service (Amazon SNS)	AWS::SNS::Topic
Amazon Simple Queue Service (Amazon SQS)	AWS::SQS::Queue

AWS service	Resource types
AWS Step Functions	`AWS::StepFunctions::Activity`
AWS Systems Manager (SSM)	`AWS::SSM::Document`
AWS Transfer Family	`AWS::Transfer::Agreement` , `AWS::Transfer::Certificate` , `AWS::Transfer::Connector` , `AWS::Transfer::Profile` , `AWS::Transfer::Workflow`

Schedule for running security checks

After you enable a security standard, AWS Security Hub CSPM begins to run all checks within two hours. Most checks begin to run within 25 minutes. Security Hub CSPM runs checks by evaluating the rule underlying a control. Until a control completes its first run of checks, its status is **No data**.

When you enable a new standard, it might take up to 24 hours for Security Hub CSPM to generate findings for controls that use the same underlying AWS Config service-linked rule as enabled controls from other enabled standards. For example, if you enable the Lambda.1 control in the AWS Foundational Security Best Practices (FSBP) standard, Security Hub CSPM creates the service-linked rule and typically generates findings within minutes. After this, if you enable the Lambda.1 control in the Payment Card Industry Data Security Standard (PCI DSS), it might take up to 24 hours for Security Hub CSPM to generate findings for the control because it uses the same service-linked rule.

After the initial check, the schedule for each control can be either periodic or change triggered. For a control that is based on a managed AWS Config rule, the control description includes a link to the rule description in the *AWS Config Developer Guide*. That description specifies whether the rule is change triggered or periodic.

Periodic security checks

Periodic security checks run automatically within 12 or 24 hours after the most recent run. Security Hub CSPM determines the periodicity, and you can't change it. Periodic controls reflect an evaluation at the moment the check runs.

If you update the workflow status of a periodic control finding, and then in the next check the compliance status of the finding stays the same, the workflow status remains in its modified state. For example, if you have a failed finding for the KMS.4 control (*AWS KMS key rotation should be enabled*), and then remediate the finding, Security Hub CSPM changes the workflow status from `NEW` to `RESOLVED`. If you disable KMS key rotation before the next periodic check, the workflow status of the finding remains `RESOLVED`.

Checks that use Security Hub CSPM custom Lambda functions are periodic.

Change-triggered security checks

Change-triggered security checks run when the associated resource changes state. AWS Config lets you choose between *continuous recording* of changes in resource state and *daily recording*. If you choose daily recording, AWS Config delivers resource configuration data at the end of each 24 hour period if there are changes in resource state. If there are no changes, no data is delivered. This may delay the generation of Security Hub CSPM findings until a 24-hour period is complete. Regardless of your chosen recording period, Security Hub CSPM checks at least once every 24 hours to ensure no resource updates from AWS Config were missed.

In general, Security Hub CSPM uses change-triggered rules whenever possible. For a resource to use a change-triggered rule, it must support AWS Config configuration items.

Generating and updating control findings

AWS Security Hub CSPM generates and updates control findings when it runs checks against security controls. Control findings use the AWS Security Finding Format (ASFF).

Security Hub CSPM normally charges for each security check for a control. However, if multiple controls use the same AWS Config rule, Security Hub CSPM charges only once for each check against the rule. For example, the AWS Config `iam-password-policy` rule is used by multiple controls in the CIS AWS Foundations Benchmark standard and the AWS Foundational Security Best Practices standard. Each time Security Hub CSPM runs a check against that rule, it generates a separate control finding for each related control, but charges only once for the check.

If the size of a control finding exceeds the maximum of 240 KB, Security Hub CSPM removes the `Resource.Details` object from the finding. For controls that are backed by AWS Config resources, you can review resource details by using the AWS Config console.

Topics

- Consolidated control findings

- Generating, updating, and archiving control findings
- Automation and suppression of control findings
- Compliance details for control findings
- ProductFields details for control findings
- Severity levels for control findings

Consolidated control findings

If consolidated control findings is enabled for your account, Security Hub CSPM generates a single finding or finding update for each security check of a control, even if a control applies to multiple enabled standards. For a list of controls and the standards that they apply to, see the Control reference for Security Hub CSPM. We recommend enabling consolidated control findings to reduce finding noise.

If you enabled Security Hub CSPM for an AWS account before February 23, 2023, you can enable consolidated control findings by following the instructions later in this section. If you enable Security Hub CSPM on or after February 23, 2023, consolidated control findings is enabled automatically for your account.

If you use the Security Hub CSPM integration with AWS Organizations or invited member accounts through a manual invitation process, consolidated control findings is enabled for member accounts only if it's enabled for the administrator account. If the feature is disabled for the administrator account, it's disabled for member accounts. This behavior applies to new and existing member accounts. In addition, if the administrator uses central configuration to manage Security Hub CSPM for multiple accounts, they cannot use central configuration policies to enable or disable consolidated control findings for the accounts.

If you disable consolidated control findings for your account, Security Hub CSPM generates or updates a separate control finding for each enabled standard that includes a control. For example, if you enable four standards that share a control, you receive four separate findings after a security check for the control. If you enable consolidated control findings, you receive only one finding.

When you enable consolidated control findings, Security Hub CSPM creates new standard-agnostic findings and archives the original standard-based findings. Some control finding fields and values will change, which might impact your existing workflows. For information about these changes, see Consolidated control findings – ASFF changes. Enabling consolidated control findings might also affect findings that integrated third-party products receive from Security Hub CSPM. If you use the

Automated Security Response on AWS v2.0.0 solution, note that it supports consolidated control findings.

To enable or disable consolidated control findings, you must be signed in to an administrator account or a standalone account.

> **Note**
>
> After you enable consolidated control findings, it can take up to 24 hours for Security Hub CSPM to generate new consolidated findings and archive the existing standard-based findings. Similarly, after disabling consolidated control findings, it can take up to 24 hours for Security Hub CSPM to generate new standard-based findings and archive the existing consolidated findings. During these times, you might see a mix of standard-agnostic and standard-based findings in your account.

Security Hub CSPM console

To enable or disable consolidated control findings

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, under **Settings**, choose **General**.
3. In the **Controls** section, choose **Edit**.
4. Use the **Consolidated control findings** switch to enable or disable consolidated control findings.
5. Choose **Save**.

Security Hub CSPM API

To enable or disable consolidated control findings programmatically, use the UpdateSecurityHubConfiguration operation of the Security Hub CSPM API. Or, if you're using the AWS CLI, run the update-security-hub-configuration command.

For the `control-finding-generator` parameter, specify `SECURITY_CONTROL` to enable consolidated control findings. To disable consolidated control findings, specify `STANDARD_CONTROL`.

For example, the following AWS CLI command enables consolidated control findings.

```
$ aws securityhub  --region us-east-1 update-security-hub-configuration --control-finding-generator SECURITY_CONTROL
```

The following AWS CLI command disables consolidated control findings.

```
$ aws securityhub  --region us-east-1 update-security-hub-configuration --control-finding-generator STANDARD_CONTROL
```

Generating, updating, and archiving control findings

Security Hub CSPM runs security checks on a schedule. The first time Security Hub CSPM runs a security check for a control, it generates a new finding for each AWS resource that the control checks. Each time Security Hub CSPM subsequently runs a security check for the control, it updates existing findings to report the results of the check. This means that you can use the data provided by individual findings to track compliance changes for particular resources against particular controls.

For example, if the compliance status of a resource changes from `FAILED` to `PASSED` for a particular control, Security Hub CSPM doesn't generate a new finding. Instead, Security Hub CSPM updates the existing finding for the control and resource. In the finding, Security Hub CSPM changes the value for the compliance status (`Compliance.Status`) field to `PASSED`. Security Hub CSPM also updates the values for additional fields to reflect the results of the check—for example, the severity label, workflow status, and timestamps that indicate when Security Hub CSPM most recently ran the check and updated the finding.

When reporting changes to compliance status, Security Hub CSPM might update any of the following fields in a control finding:

- `Compliance.Status` – The new compliance status of the resource for the specified control.
- `FindingProviderFields.Severity.Label` – The new qualitative representation of the severity of the finding, such as `LOW`, `MEDIUM`, or `HIGH`.
- `FindingProviderFields.Severity.Original` – The new quantitative representation of the severity of the finding, such as `0` for a compliant resource.
- `FirstObservedAt` – When the compliance status of the resource most recently changed.

- `LastObservedAt` – When Security Hub CSPM most recently ran the security check for the specified control and resource.
- `ProcessedAt` – When Security Hub CSPM most recently began processing the finding.
- `ProductFields.PreviousComplianceStatus` – The previous compliance status (`Compliance.Status`) of the resource for the specified control.
- `UpdatedAt` – When Security Hub CSPM most recently updated the finding.
- `Workflow.Status` – The status of the investigation into the finding, based on the new compliance status of the resource for the specified control.

Whether Security Hub CSPM updates a field depends primarily on the results of the latest security check for the applicable control and resource. For example, if the compliance status of a resource changes from `PASSED` to `FAILED` for a particular control, Security Hub CSPM changes the workflow status of the finding to `NEW`. To track updates to individual findings, you can refer to the history of a finding. For details about individual fields in findings, see AWS Security Finding Format (ASFF).

In certain cases, Security Hub CSPM generates new findings for subsequent checks by a control, instead of updating existing findings. This can occur if there's an issue with the AWS Config rule that backs a control. If this happens, Security Hub CSPM archives the existing finding and generates a new finding for each check. In the new findings, the compliance status is `NOT_AVAILABLE` and the record state is `ARCHIVED`. After you address the issue with the AWS Config rule, Security Hub CSPM generates new findings and begins updating them to track subsequent changes to the compliance status of individual resources.

In addition to generating and updating control findings, Security Hub CSPM automatically archives control findings that meet certain criteria. Security Hub CSPM archives a finding if the control is disabled, the specified resource is deleted, or the specified resource no longer exists. A resource might not exist anymore because the associated service is no longer used. More specifically, Security Hub CSPM automatically archives a control finding if the finding meets one of the following criterion:

- The finding hasn't been updated for 3-5 days. Note that archival based on this time frame is on a best-effort basis and is not guaranteed.
- The associated AWS Config evaluation returned `NOT_APPLICABLE` for the compliance status of the specified resource.

To determine whether a finding is archived, you can refer to the record state (`RecordState`) field of the finding. If a finding is archived, the value for this field is `ARCHIVED`.

Security Hub CSPM stores archived control findings for 30 days. After 30 days, the findings expire and Security Hub CSPM permanently deletes them. To determine whether an archived control finding has expired, Security Hub CSPM bases its calculation on the value for the `UpdatedAt` field of the finding.

To store archived control findings for more than 30 days, you can export the findings to an S3 bucket. You can do this by using a custom action with an Amazon EventBridge rule. For more information, see Using EventBridge for automated response and remediation.

> **Note**
>
> Prior to July 3, 2025, Security Hub CSPM generated and updated control findings differently when the compliance status of a resource changed for a control. Previously, Security Hub CSPM created a new control finding and archived the existing finding for a resource. Therefore, you might have multiple archived findings for a particular control and resource until those findings expire (after 30 days).

Automation and suppression of control findings

You can use Security Hub CSPM automation rules to update or suppress specific control findings. If you suppress a finding, you can continue to access it. However, suppression indicates your belief that no action is needed to address the finding.

By suppressing findings, you can reduce finding noise. For example, you might suppress control findings that are generated in test accounts. Or, you might suppress findings related to specific resources. To learn more about updating or suppressing findings automatically, see Understanding automation rules in Security Hub CSPM.

Automation rules are appropriate when you want to update or suppress specific control findings. However, if a control isn't relevant to your organization or use case, we recommend disabling the control. If you disable a control, Security Hub CSPM doesn't run security checks for it and you aren't charged for it.

Compliance details for control findings

In findings generated by security checks for controls, the Compliance object and fields in the AWS Security Finding Format (ASFF) provide compliance details for individual resources that a control checked. This includes the following information:

- `AssociatedStandards` – The enabled standards that the control is enabled in.
- `RelatedRequirements` – The related requirements for the control in all enabled standards. These requirements derive from third-party security frameworks for the control, such as the Payment Card Industry Data Security Standard (PCI DSS) or the NIST SP 800-171 Revision 2 standard.
- `SecurityControlId` – The identifier for the control across the standards that Security Hub CSPM supports.
- `Status` – The result of the most recent check that Security Hub CSPM ran for the control. The results of previous checks are retained in the history of the finding.
- `StatusReasons` – An array that lists reasons for the value specified by the `Status` field. For each reason, this includes a reason code and a description.

The following table lists reason codes and descriptions that a finding might include in the `StatusReasons` array. The remediation steps vary based on which control generated a finding with a specified reason code. To review the remediation guidance for a control, refer to the Control reference for Security Hub CSPM.

Reason code	Compliance status	Description
`CLOUDTRAIL_METRIC_FILTER_NOT_VALID`	`FAILED`	The multi-Region CloudTrail trail does not have a valid metric filter.
`CLOUDTRAIL_METRIC_FILTERS_NOT_PRESENT`	`FAILED`	Metric filters are not present for the multi-Region CloudTrail trail.
`CLOUDTRAIL_MULTI_REGION_NOT_PRESENT`	`FAILED`	The account does not have a multi-Region CloudTrail trail with the required configuration.

Reason code	Compliance status	Description
CLOUDTRAIL_REGION_INVAILD	WARNING	Multi-Region CloudTrail trails are not in the current Region.
CLOUDWATCH_ALARM_ACTIONS_NOT_VALID	FAILED	No valid alarm actions are present.
CLOUDWATCH_ALARMS_NOT_PRESENT	FAILED	CloudWatch alarms do not exist in the account.
CONFIG_ACCESS_DENIED	NOT_AVAILABLE AWS Config status is ConfigError	AWS Config access denied. Verify that AWS Config is enabled and has been granted sufficient permissions.
CONFIG_EVALUATIONS_EMPTY	PASSED	AWS Config evaluated your resources based on the rule. The rule did not apply to the AWS resources in its scope, the specified resources were deleted, or the evaluation results were deleted.
CONFIG_RECORDER_CUSTOM_ROLE	FAILED (for Config.1)	The AWS Config recorder uses a custom IAM role instead of the AWS Config service-linked role, and the includeConfigServiceLinkedRoleCheck custom parameter for Config.1 isn't set to false.
CONFIG_RECORDER_DISABLED	FAILED (for Config.1)	AWS Config isn't enabled with the configuration recorder turned on.

Reason code	Compliance status	Description
CONFIG_RECORDER_MISSING_REQUIRED_RESOURCE_TYPES	FAILED (for Config.1)	AWS Config isn't recording all resource types that correspond to enabled Security Hub CSPM controls. Turn on recording for the following resources: *Resources that aren't being recorded*.
CONFIG_RETURNS_NOT_APPLICABLE	NOT_AVAILABLE	The compliance status is NOT_AVAILABLE because AWS Config returned a status of **Not Applicable**. AWS Config does not provide the reason for the status. Here are some possible reasons for the **Not Applicable** status: • The resource was removed from the scope of the AWS Config rule. • The AWS Config rule was deleted. • The resource was deleted. • The AWS Config rule logic can produce a **Not Applicable** status.

Reason code	Compliance status	Description
CONFIG_RULE_EVALUATION_ERROR	NOT_AVAILABLE AWS Config status is ConfigError	This reason code is used for several different types of evaluation errors. The description provides the specific reason information. The type of error can be one of the following: • An inability to perform the evaluation because of a lack of permissions. The description provides the specific permission that is missing. • A missing or invalid value for a parameter. The description provides the parameter and the requirements for the parameter value. • An error reading from an S3 bucket. The description identifies the bucket and provides the specific error. • A missing AWS subscription. • A general timeout on the evaluation. • A suspended account.
CONFIG_RULE_NOT_FOUND	NOT_AVAILABLE AWS Config status is ConfigError	The AWS Config rule is in the process of being created.

Reason code	Compliance status	Description
INTERNAL_SERVICE_ERROR	NOT_AVAILABLE	An unknown error occurred.
LAMBDA_CUSTOM_RUNTIME_DETAILS_NOT_AVAILABLE	FAILED	Security Hub CSPM is unable to perform a check against a custom Lambda runtime.
S3_BUCKET_CROSS_ACCOUNT_CROSS_REGION	WARNING	The finding is in a WARNING state because the S3 bucket that is associated with this rule is in a different Region or account. This rule does not support cross-Region or cross-account checks. It is recommended that you disable this control in this Region or account. Only run it in the Region or account where the resource is located.
SNS_SUBSCRIPTION_NOT_PRESENT	FAILED	The CloudWatch Logs metric filters do not have a valid Amazon SNS subscription.

Reason code	Compliance status	Description
SNS_TOPIC_CROSS_ACCOUNT	WARNING	The finding is in a WARNING state. The SNS topic associated with this rule is owned by a different account. The current account cannot obtain the subscription information. The account that owns the SNS topic must grant to the current account the sns:ListSubscriptionsByTopic permission for the SNS topic.
SNS_TOPIC_CROSS_ACCOUNT_CROSS_REGION	WARNING	The finding is in a WARNING state because the SNS topic that is associated with this rule is in a different Region or account. This rule does not support cross-Region or cross-account checks. It is recommended that you disable this control in this Region or account. Only run it in the Region or account where the resource is located.
SNS_TOPIC_INVALID	FAILED	The SNS topic associated with this rule is invalid.
THROTTLING_ERROR	NOT_AVAILABLE	The relevant API operation exceeded the allowed rate.

ProductFields details for control findings

In findings generated by security checks for controls, the ProductFields attribute in the AWS Security Finding Format (ASFF) can include the following fields.

`ArchivalReasons:0/Description`

Describes why Security Hub CSPM archived a finding.

For example, Security Hub CSPM archives existing findings when you disable a control or standard, or you enable or disable consolidated control findings.

`ArchivalReasons:0/ReasonCode`

Specifies why Security Hub CSPM archived a finding.

For example, Security Hub CSPM archives existing findings when you disable a control or standard, or you enable or disable consolidated control findings.

`PreviousComplianceStatus`

The previous compliance status (`Compliance.Status`) of the resource for the specified control, as of the most recent update to the finding. If the compliance status of the resource didn't change during the most recent update, this value is the same as the value for the `Compliance.Status` field of the finding. For a list of possible values, see Evaluating compliance status and control status.

`StandardsGuideArn` or `StandardsArn`

The ARN of the standard associated with the control.

For the CIS AWS Foundations Benchmark standard, the field is `StandardsGuideArn`. For the PCI DSS and AWS Foundational Security Best Practices standards, the field is `StandardsArn`.

These fields are removed in favor of `Compliance.AssociatedStandards` if you enable consolidated control findings.

`StandardsGuideSubscriptionArn` or `StandardsSubscriptionArn`

The ARN of the account's subscription to the standard.

For the CIS AWS Foundations Benchmark standard, the field is `StandardsGuideSubscriptionArn`. For the PCI DSS and AWS Foundational Security Best Practices standards, the field is `StandardsSubscriptionArn`.

These fields are removed if you enable consolidated control findings.

`RuleId` or `ControlId`

The identifier for the control.

For version 1.2.0 of the CIS AWS Foundations Benchmark standard, the field is `RuleId`. For other standards, including subsequent versions of the CIS AWS Foundations Benchmark standard, the field is `ControlId`.

These fields are removed in favor of `Compliance.SecurityControlId` if you enable consolidated control findings.

`RecommendationUrl`

The URL for remediation information for the control. This field is removed in favor of `Remediation.Recommendation.Url` if you enable consolidated control findings.

`RelatedAWSResources:0/name`

The name of the resource associated with the finding.

`RelatedAWSResource:0/type`

The type of resource associated with the control.

`StandardsControlArn`

The ARN of the control. This field is removed if you enable consolidated control findings.

`aws/securityhub/ProductName`

For control findings, the product name is `Security Hub`.

`aws/securityhub/CompanyName`

For control findings, the company name is `AWS`.

`aws/securityhub/annotation`

A description of the issue uncovered by the control.

`aws/securityhub/FindingId`

The identifier for the finding.

This field doesn't reference a standard if you enable consolidated control findings.

Severity levels for control findings

The severity assigned to a Security Hub CSPM control indicates the importance of the control. The severity of a control determines the severity label assigned to the control findings.

Severity criteria

The severity of a control is determined based on an assessment of the following criteria:

- **How difficult is it for a threat actor to take advantage of the configuration weakness associated with the control?** The difficulty is determined by the amount of sophistication or complexity that is required to use the weakness to carry out a threat scenario.
- **How likely is it that the weakness will lead to a compromise of your AWS accounts or resources?** A compromise of your AWS accounts or resources means that confidentiality, integrity, or availability of your data or AWS infrastructure is damaged in some way. The likelihood of compromise indicates how likely it is that the threat scenario will result in a disruption or breach of your AWS services or resources.

As an example, consider the following configuration weaknesses:

- User access keys are not rotated every 90 days.
- IAM root user key exists.

Both weaknesses are equally difficult for an adversary to take advantage of. In both cases, the adversary can use credential theft or some other method to acquire a user key. They can then use it to access your resources in an unauthorized way.

However, the likelihood of a compromise is much higher if the threat actor acquires the root user access key because this gives them greater access. As a result, the root user key weakness has a higher severity.

The severity does not take into account the criticality of the underlying resource. Criticality is the level of importance of the resources that are associated with the finding. For example, a resource that is associated with a mission critical application is more critical than one that is associated with non-production testing. To capture resource criticality information, use the `Criticality` field of the AWS Security Finding Format (ASFF).

The following table maps the difficulty to exploit and the likelihood of compromise to the security labels.

	Compromise highly likely	Compromise likely	Compromise unlikely	Compromise highly unlikely
Very easy to exploit	Critical	Critical	High	Medium
Somewhat easy to exploit	Critical	High	Medium	Medium
Somewhat difficult to exploit	High	Medium	Medium	Low
Very difficult to exploit	Medium	Medium	Low	Low

Severity definitions

The severity labels are defined as follows.

Critical – The issue should be remediated immediately to avoid it escalating.

For example, an open S3 bucket is considered a critical severity finding. Because so many threat actors scan for open S3 buckets, data in exposed S3 buckets is likely to be discovered and accessed by others.

In general, resources that are publicly accessible are considered critical security issues. You should treat critical findings with the utmost urgency. You also should consider the criticality of the resource.

High – The issue must be addressed as a near-term priority.

For example, if a default VPC security group is open to inbound and outbound traffic, it is considered high severity. It is somewhat easy for a threat actor to compromise a VPC using this method. It is also likely that the threat actor will be able to disrupt or exfiltrate resources once they are in the VPC.

Security Hub CSPM recommends that you treat a high severity finding as a near-term priority. You should take immediate remediation steps. You also should consider the criticality of the resource.

Medium – The issue should be addressed as a mid-term priority.

For example, lack of encryption for data in transit is considered a medium severity finding. It requires a sophisticated man-in-the-middle attack to take advantage of this weakness. In other words, it is somewhat difficult. It is likely that some data will be compromised if the threat scenario is successful.

Security Hub CSPM recommends that you investigate the implicated resource at your earliest convenience. You also should consider the criticality of the resource.

Low – The issue does not require action on its own.

For example, failure to collect forensics information is considered low severity. This control can help to prevent future compromises, but the absence of forensics does not lead directly to a compromise.

You do not need to take immediate action on low severity findings, but they can provide context when you correlate them with other issues.

Informational – No configuration weakness was found.

In other words, the status is `PASSED`, `WARNING`, or `NOT AVAILABLE`.

There is no recommended action. Informational findings help customers to demonstrate that they are in a compliant state.

Evaluating compliance status and control status

The `Compliance.Status` field of the AWS Security Finding Format describes the result of a control finding. AWS Security Hub CSPM uses the compliance status of control findings to determine an overall control status. The control status is displayed on the details page of a control on the Security Hub CSPM console.

Evaluating the compliance status of Security Hub CSPM findings

The compliance status for each finding is assigned one of the following values:

- `PASSED` – Indicates that the control passed the security check for the finding. This automatically sets the Security Hub CSPM `Workflow.Status` to `RESOLVED`.
- `FAILED` – Indicates that the control didn't pass the security check for the finding.

- WARNING – Indicates that Security Hub CSPM can't determine whether the resource is in a PASSED or FAILED state. For example, AWS Config resource recording isn't turned on for the corresponding resource type.
- NOT_AVAILABLE – Indicates that the check can't be completed because a server failed, the resource was deleted, or the result of the AWS Config evaluation was NOT_APPLICABLE. If the AWS Config evaluation result was NOT_APPLICABLE, Security Hub CSPM automatically archives the finding.

If the compliance status for a finding changes from PASSED to FAILED, WARNING, or NOT_AVAILABLE, and Workflow.Status was either NOTIFIED or RESOLVED, Security Hub CSPM automatically changes Workflow.Status to NEW.

If you don't have resources corresponding to a control, Security Hub CSPM produces a PASSED finding at the account level. If you have a resource corresponding to a control but then delete the resource, Security Hub CSPM creates a NOT_AVAILABLE finding and archives it immediately. After 18 hours, you receive a PASSED finding because you no longer have resources corresponding to the control.

Deriving control status from compliance status

Security Hub CSPM derives an overall control status from the compliance status of the control findings. When determining control status, Security Hub CSPM ignores findings that have a RecordState of ARCHIVED and findings that have a Workflow.Status of SUPPRESSED.

Control status is assigned one of the following values:

- **Passed** – Indicates that all findings have a compliance status of PASSED.
- **Failed** – Indicates that at least one finding has a compliance status of FAILED.
- **Unknown** – Indicates that at least one finding has a compliance status of WARNING or NOT_AVAILABLE. No findings have a compliance status of FAILED.
- **No data** – Indicates that there are no findings for the control. For example, a newly enabled control has this status until Security Hub CSPM starts to generate findings for it. A control also has this status if all of its findings are SUPPRESSED or it's unavailable in the current AWS Region.
- **Disabled** – Indicates that the control is disabled in the current account and Region. No security checks are currently being performed for this control in the current account and Region. However, the findings of a disabled control may have a value for compliance status for up to 24 hours after disablement.

For an administrator account, control status reflects the control status for the administrator account and the member accounts. Specifically, the overall status of a control appears as **Failed** if the control has one or more failed findings in the administrator account or any of the member accounts. If you have set an aggregation Region, the control status in the aggregation Region reflects the control status in the aggregation Region and the linked Regions. Specifically, the overall status of a control appears as **Failed** if the control has one or more failed findings in the aggregation Region or any of the linked Regions.

Security Hub CSPM typically generates the initial control status within 30 minutes after your first visit to the **Summary** page or the **Security standards** page on the Security Hub CSPM console. You must have AWS Config resource recording configured for the control status to appear. After control statuses are generated for the first time, Security Hub CSPM updates control statuses every 24 hours based on the findings from the previous 24 hours. A timestamp on the control details page indicates when control status was last updated.

> **Note**
>
> After enabling a control for first time, it can take up to 24 hours for control statuses to be generated in the China Regions and the AWS GovCloud (US) Region.

Calculating security scores

On the AWS Security Hub CSPM console, the **Summary** page and the **Controls** page display a summary security score across all of your enabled standards. On the **Security standards** page, Security Hub CSPM also displays a security score from 0–100 percent for each enabled standard.

When you first enable Security Hub CSPM, Security Hub CSPM calculates the summary security score and standard security scores within 30 minutes of your first visit to the **Summary** or **Security standards** page on the console. Scores are generated only for standards that are enabled when you visit those pages on the console. In addition, AWS Config resource recording must be configured for the scores to appear. The summary security score is the average of the standard security scores. To review a list of standards that are currently enabled, you can use the GetEnabledStandards operation of the Security Hub CSPM API.

After first-time score generation, Security Hub CSPM updates security scores every 24 hours. Security Hub CSPM displays a timestamp to indicate when a security score was last updated. Note that it can take up to 24 hours for first-time security scores to be generated in the China Regions and AWS GovCloud (US) Regions.

If you turn on consolidated control findings, it can take up to 24 hours for your security scores to update. In addition, enabling a new aggregation Region or updating linked Regions resets existing security scores. It can take up to 24 hours for Security Hub CSPM to generate new security scores that include data from the updated Regions.

Method of calculating security scores

Security scores represent the proportion of **Passed** controls to enabled controls. The score is displayed as a percentage rounded up or down to the nearest whole number.

Security Hub CSPM calculates a summary security score across all of your enabled standards. Security Hub CSPM also calculates a security score for each enabled standard. For purposes of score calculation, enabled controls include controls with a status of **Passed**, **Failed**, and **Unknown**. Controls with a status of **No data** are excluded from the score calculation.

Security Hub CSPM ignores archived and suppressed findings when calculating control status. This can impact security scores. For example, if you suppress all failed findings for a control, its status becomes **Passed**, which can in turn improve your security scores. For more information about control status, see Evaluating compliance status and control status.

Scoring example:

Standard	Passed controls	Failed controls	Unknown controls	Standard score
AWS Foundational Security Best Practices v1.0.0	168	22	0	88%
CIS AWS Foundations Benchmark v1.4.0	8	29	0	22%
CIS AWS Foundations Benchmark v1.2.0	6	35	0	15%

Standard	Passed controls	Failed controls	Unknown controls	Standard score
NIST Special Publication 800-53 Revision 5	159	56	0	74%
PCI DSS v3.2.1	28	17	0	62%

When calculating the summary security score, Security Hub CSPM counts each control only once across standards. For example, if you have enabled a control that applies to three enabled standards, it only counts as one enabled control for scoring purposes.

In this example, although the total number of enabled controls across enabled standards is 528, Security Hub CSPM counts each unique control only once for scoring purposes. The number of unique enabled controls is likely lower than 528. If we assume the number of unique enabled controls is 515, and the number of unique passed controls is 357, the summary score is 69%. This score is calculated by dividing the number of unique passed controls by the number of unique enabled controls.

You might have a summary score that differs from the standard security score, even if you've enabled only one standard in your account in the current Region. This can occur if you're signed in to an administrator account and member accounts have additional standards or different standards enabled. This can also occur if you're viewing the score from the aggregation Region and additional standards or different standards are enabled in linked Regions.

Security scores for administrator accounts

If you're signed in to an administrator account, the summary security score and standard scores account for control statuses in the administrator account and all of the member accounts.

If the status of a control is **Failed** in even one member account, its status is **Failed** in the administrator account and impacts the administrator account scores.

If you're signed in to an administrator account and are viewing scores in an aggregation Region, security scores account for control statuses in all member accounts *and* all linked Regions.

Security scores if you have set an aggregation Region

If you have set an aggregation AWS Region, the summary security score and standard scores account for control statuses in all
linked Regions.

If the status of a control is **Failed** in even one linked Region, its status is **Failed** in the aggregation Region and impacts the aggregation Region scores.

If you're signed in to an administrator account and are viewing scores in an aggregation Region, security scores account for control statuses in all member accounts *and* all linked Regions.

Control categories in Security Hub CSPM

Each control is assigned a category. The category for a control reflects the security function that the control applies to.

The category value contains the category, the subcategory within the category, and, optionally, a classifier within the subcategory. For example:

- Identify > Inventory
- Protect > Data protection > Encryption of data in transit

Here are the descriptions of the available categories, subcategories, and classifiers.

Identify

Develop the organizational understanding to manage cybersecurity risk to systems, assets, data, and capabilities.

Inventory

Has the service implemented the correct resource tagging strategies? Do the tagging strategies include the resource owner?

What resources does the service use? Are they approved resources for this service?

Do you have visibility into the approved inventory? For example, do you use services such as Amazon EC2 Systems Manager and Service Catalog?

Logging

Have you securely enabled all relevant logging for the service? Examples of log files include the following:

- Amazon VPC Flow Logs
- Elastic Load Balancing access logs
- Amazon CloudFront logs
- Amazon CloudWatch Logs
- Amazon Relational Database Service logging
- Amazon OpenSearch Service slow index logs
- X-Ray tracing
- AWS Directory Service logs
- AWS Config items
- Snapshots

Protect

Develop and implement the appropriate safeguards to ensure delivery of critical infrastructure services and secure coding practices.

Secure access management

Does the service use least privilege practices in its IAM or resource policies?

Are passwords and secrets sufficiently complex? Are they rotated appropriately?

Does the service use multi-factor authentication (MFA)?

Does the service avoid the root user?

Do resource-based policies allow public access?

Secure network configuration

Does the service avoid public and insecure remote network access?

Does the service use VPCs properly? For example, are jobs required to run in VPCs?

Does the service properly segment and isolate sensitive resources?

Data protection

Encryption of data at rest – Does the service encrypt data at rest?

Encryption of data in transit – Does the service encrypt data in transit?

Data integrity – Does the service validate data for integrity?

Data deletion protection – Does the service protect data from accidental deletion?

Data management / usage – Do you use services such as Amazon Macie to track the location of your sensitive data?

API protection

Does the service use AWS PrivateLink to protect the service API operations?

Protective services

Are the correct protective services in place? Do they provide the correct amount of coverage?

Protective services help you deflect attacks and compromises that are directed at the service. Examples of protective services in AWS include AWS Control Tower, AWS WAF, AWS Shield Advanced, Vanta, Secrets Manager, IAM Access Analyzer, and AWS Resource Access Manager.

Secure development

Do you use secure coding practices?

Do you avoid vulnerabilities such as the Open Web Application Security Project (OWASP) Top Ten?

Detect

Develop and implement the appropriate activities to identify the occurrence of a cybersecurity event.

Detection services

Are the correct detection services in place?

Do they provide the correct amount of coverage?

Examples of AWS detection services include Amazon GuardDuty, AWS Security Hub CSPM, Amazon Inspector, Amazon Detective, Amazon CloudWatch Alarms, AWS IoT Device Defender, and AWS Trusted Advisor.

Respond

Develop and implement the appropriate activities to take action regarding a detected cybersecurity event.

Response actions

Do you respond to security events swiftly?

Do you have any active critical or high severity findings?

Forensics

Can you securely acquire forensic data for the service? For example, do you acquire Amazon EBS snapshots associated with true positive findings?

Have you set up a forensic account?

Recover

Develop and implement the appropriate activities to maintain plans for resilience and to restore any capabilities or services that were impaired due to a cybersecurity event.

Resilience

Does the service configuration support graceful failovers, elastic scaling, and high availability?

Have you established backups?

Reviewing the details of controls in Security Hub CSPM

Selecting a control on the **Controls** page or standard details page of the Security Hub CSPM console takes you to a page of control details.

The top of the control details page indicates the control status. The control status summarizes the performance of a control based on the compliance status of the control findings. Security Hub

CSPM typically generates the initial control status within 30 minutes after your first visit to the **Summary** page or **Security standards** page on the Security Hub CSPM console. Statuses are only available for controls that are enabled when you visit those pages.

The control details page also provides a breakdown of the compliance status of the control findings for the past 24 hours. For more information about control status and compliance status, see Evaluating compliance status and control status.

AWS Config resource recording must be configured for the control status to appear. After control statuses are generated for the first time, Security Hub CSPM updates the control status every 24 hours based on findings from the previous 24 hours.

Administrator accounts see an aggregated control status across the administrator account and member accounts. If you have set an aggregation Region, the control status includes findings across all linked Regions. For more information about control status, see the section called "Compliance status and control status".

You can also enable or disable the control from the control details page.

> **Note**
>
> It can take up to 24 hours after enabling a control for first-time control statuses to be generated in the China Regions and AWS GovCloud (US) Regions.

The **Standards and Requirements** tab lists the standards that a control can be enabled for and the requirements related to the control from different compliance frameworks.

The **Checks** tab lists active findings for the control for the past 24 hours. Control findings are generated and updated when Security Hub CSPM runs security checks for the control. The list on this tab doesn't include archived findings.

For each finding, the list provides access to finding details such as the compliance status and related resource. You can also set the workflow status of each finding and send findings to custom actions. For more information, see Reviewing and managing control findings.

Viewing details for a control

Choose your preferred access method, and follow these steps to review details for a control. Details apply to the current account and Region and include the following:

- The title and description of the control.
- A link to remediation guidance for failed control findings.
- The severity of the control.
- The status of the control.

On the console, you can also review a list of recent findings for the control. To do this programmatically, you can use the GetFindings operation of the Security Hub CSPM API.

Security Hub CSPM console

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Choose **Controls** in the navigation pane.
3. Select a control.

Security Hub CSPM API

1. Run `ListSecurityControlDefinitions`, and provide one or more standard ARNs to get a list of control IDs for that standard. To obtain standard ARNs, run `DescribeStandards`. If you don't provide a standard ARN, this API returns all Security Hub CSPM control IDs. This API returns standard-agnostic security control IDs, not the standard-based control IDs that existed prior to these feature releases.

   Example request:

   ```
   {
       "StandardsArn": "arn:aws:securityhub:::standards/aws-foundational-security-best-practices/v/1.0.0"
   }
   ```

2. Run `BatchGetSecurityControls` to get details about one or more controls in the current AWS account and AWS Region.

   Example request:

   ```
   {
       "SecurityControlIds": ["Config.1", "IAM.1"]
   ```

```
}
```

AWS CLI

1. Run the `list-security-control-definitions` command, and provide one or more standard ARNs to get a list of control IDs. To obtain standard ARNs, run the `describe-standards` command. If you don't provide a standard ARN, this command returns all Security Hub CSPM control IDs. This command returns standard-agnostic security control IDs, not the standard-based control IDs that existed prior to these feature releases.

```
aws securityhub --region us-east-1 list-security-control-definitions --
standards-arn "arn:aws:securityhub:us-east-1::standards/aws-foundational-
security-best-practices/v/1.0.0"
```

2. Run the `batch-get-security-controls` command to get details about one or more controls in the current AWS account and AWS Region.

```
aws securityhub --region us-east-1 batch-get-security-controls --security-
control-ids '["Config.1", "IAM.1"]'
```

Filtering and sorting controls in Security Hub CSPM

On the AWS Security Hub CSPM console, you can use the **Controls** page to review a table of the controls that are available in the current AWS Region. The exception is an aggregation Region. If you configured an aggregation Region and sign in to that Region, the console shows controls that are available in the aggregation Region or one or more linked Regions.

To focus on a specific subset of controls, you can sort and filter the table of controls. The **Filter by** options next to the table can help you quickly focus on these specific subsets:

- All enabled controls, which are controls that are enabled in at least one enabled standard.
- All disabled controls, which are controls that are disabled in all standards.
- All enabled controls that have a specific control status, such as **Failed**. The **No data** option displays only those controls that don't currently have findings. For information about control status, see Evaluating compliance status and control status.

In addition to the **Filter by** options, you can filter the table by entering filter criteria in the **Filter controls** box above the table. For example, you can filter by control ID or severity.

By default, controls with a **Failed** status are listed first, in descending order by severity. You can change the sort order by choosing a different column heading.

> **Tip**
>
> If you have automated workflows based on control findings, we recommend using the `SecurityControlId` or `SecurityControlArn` ASFF fields as filters, rather than the `Title` or `Description` fields. The latter fields can change occasionally, whereas control ID and ARN are static identifiers.

If you're signed in to a Security Hub CSPM administrator account, **Enabled** controls include controls that are enabled in at least one member account. If you configured an aggregation Region, **Enabled** controls include controls that are enabled in at least one linked Region.

If you select the option next to an enabled a control, a panel appears and displays the standards in which the control is currently enabled. You can also see the standards in which the control is currently disabled. From this panel, you can disable a control in all standards. For more information, see Disabling controls in Security Hub CSPM. For administrator accounts, the information in the panel reflects settings for all of your member accounts.

To retrieve a list of controls programmatically, you can use the ListSecurityControlDefinitions operation of the Security Hub CSPM API. To retrieve the details of individual controls, use the BatchGetSecurityControls operation.

Understanding control parameters in Security Hub CSPM

Some controls in AWS Security Hub CSPM use parameters that affect how the control is evaluated. Typically, such controls are evaluated against the default parameter values that Security Hub CSPM defines. However, for a subset of these controls, you can modify the parameter values. When you modify a control parameter value, Security Hub CSPM starts evaluating the control against the value that you specify. If the resource underlying the control satisfies the custom value, Security Hub CSPM generates a `PASSED` finding. If the resource doesn't satisfy the custom value, Security Hub CSPM generates a `FAILED` finding.

By customizing control parameters, you can refine the security best practices recommended and monitored by Security Hub CSPM to align with your business requirements and security expectations. Instead of suppressing findings for a control, you can customize one or more of its parameters to get findings that suit your security needs.

Here are some sample use cases for modifying control parameters and setting custom values:

- **[CloudWatch.16] – CloudWatch log groups should be retained for a specified time period**

  You can specify the retention time period.
- **[IAM.7] – Password policies for IAM users should have strong configurations**

  You can specify parameters related to password strength.
- **[EC2.18] – Security groups should only allow unrestricted incoming traffic for authorized ports**

  You can specify which ports are authorized to permit unrestricted incoming traffic.
- **[Lambda.5] – VPC Lambda functions should operate in multiple Availability Zones**

  You can specify the minimum number of Availability Zones that produces a passed finding.

This section covers things to consider when you modify control parameters.

Effect of modifying control parameter values

When you change a parameter value, you also trigger a new security check that evaluates the control based on the new value. Security Hub CSPM then generates new control findings based on the new value. During periodic updates to control findings, Security Hub CSPM also uses the new parameter value. If you change parameter values for a control, but haven't enabled any standards that include the control, Security Hub CSPM doesn't conduct any security checks using the new values. You have to enable at least one relevant standard for Security Hub CSPM to evaluate the control based on the new parameter value.

A control can have one or more customizable parameters. Possible data types for each control parameter include the following:

- Boolean
- Double
- Enum

- EnumList
- Integer
- IntegerList
- String
- StringList

Custom parameter values apply across your enabled standards. You can't customize the parameters for a control that's not supported in your current Region. For a list of Regional limits for individual controls, see Regional limits on Security Hub CSPM controls.

For some controls, acceptable parameter values must fall into a specified range to be valid. In these cases, Security Hub CSPM provides the acceptable range.

Security Hub CSPM chooses default parameter values and might occasionally update them. After you customize a control parameter, its value continues to be the value that you specified for the parameter unless your change it. That is to say, the parameter stops tracking updates to the default Security Hub CSPM value, even if the custom value of the parameter matches the current, default value defined by Security Hub CSPM. Here's an example for the control **[ACM.1] – Imported and ACM-issued certificates should be renewed after a specified time period**:

```
{
    "SecurityControlId": "ACM.1",
    "Parameters": {
        "daysToExpiration": {
            "ValueType": "CUSTOM",
            "Value": {
                "Integer": 30
            }
        }
    }
}
```

In the preceding example, the `daysToExpiration` parameter has a custom value of `30`. The current default value for this parameter is also `30`. If Security Hub CSPM changes the default value to `14`, the parameter in this example won't track that change. It will retain a value of `30`.

If you want to track updates to the default Security Hub CSPM value for a parameter, set the `ValueType` field to `DEFAULT` instead of `CUSTOM`. For more information, see Reverting to default control parameters in a single account and Region.

Controls that support custom parameters

For a list of security controls that support custom parameters, see the **Controls** page of the Security Hub CSPM console or the Control reference for Security Hub CSPM. To retrieve this list programmatically, you can use the ListSecurityControlDefinitions operation. In the response, the `CustomizableProperties` object indicates which controls support customizable parameters.

Reviewing current control parameter values

It can be helpful to know the current value of a control parameter before you modify it.

You can review the current values for individual control parameters in your account. If you use central configuration, the delegated AWS Security Hub CSPM administrator can also review parameter values that are specified in a configuration policy.

Choose your preferred method, and follow the steps to review current control parameter values.

Security Hub CSPM console

To review current control parameter values (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Controls**. Choose a control.
3. Choose the **Parameters** tab. This tab shows the current parameter values for the control.

Security Hub CSPM API

To review current control parameter values (API)

Invoke the BatchGetSecurityControls API, and provide one or more security control IDs or ARNs. The `Parameters` object in the response shows the current parameter values for the specified controls.

For example, the following AWS CLI command shows the current parameter values for `APIGatway.1`, `CloudWatch.15`, and `IAM.7`. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub batch-get-security-controls \
```

```
--region us-east-1 \
--security-control-ids '["APIGateway.1", "CloudWatch.15", "IAM.7"]'
```

Choose your preferred method to view the current parameter values in a central configuration policy.

Security Hub CSPM console

To review current control parameter values in a configuration policy (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.

   Sign in using the credentials of the delegated Security Hub CSPM administrator account in the home Region.
2. In the navigation pane, choose **Settings** and **Configuration**.
3. On the **Policies** tab, select the configuration policy, and then choose **View details**. The policy details then appear, including current parameter values.

Security Hub CSPM API

To review current control parameter values in a configuration policy (API)

1. Invoke the GetConfigurationPolicy API from the delegated administrator account in the home Region.
2. Provide the ARN or ID of the configuration policy whose details you want to see. The response includes current parameter values.

For example, the following AWS CLI command retrieves the current control parameter values in the specified configuration policy. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub get-configuration-policy \
--region us-east-1 \
--identifier "arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Control findings also include the current values of control parameters. In the AWS Security Finding Format (ASFF), these values appear in the `Parameters` field of the `Compliance` object. To review findings on the Security Hub CSPM console, choose **Findings** in the navigation pane. To review findings programmatically, use the GetFindings operation of the Security Hub CSPM API.

Customizing control parameter values

The instructions for customizing control parameters vary based on whether you use central configuration in AWS Security Hub CSPM. Central configuration is a feature that the delegated Security Hub CSPM administrator can use to configure Security Hub CSPM capabilities across AWS Regions, accounts, and organizational units (OUs).

If your organization uses central configuration, the delegated administrator can create configuration policies that include custom control parameters. These policies can be associated with centrally managed member accounts and OUs, and they take effect in your home Region and all linked Regions. The delegated administrator can also designate one or more accounts as self-managed, which allows the account owner to configure its own parameters separately in each Region. If your organization doesn't use central configuration, you must customize control parameters separately in each account and Region.

We recommend using central configuration because it allows you to align control parameter values across different parts of your organization. For example, all of your test accounts might use certain parameter values, and all production accounts might use different values.

Customizing control parameters in multiple accounts and Regions

If you're the delegated Security Hub CSPM administrator for an organization that uses central configuration, choose your preferred method, and follow the steps to customize control parameters across multiple accounts and Regions.

Security Hub CSPM console

To customize control parameter values in multiple accounts and Regions (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.

   Ensure that you're signed in to the home Region.

2. In the navigation pane, choose **Settings** and **Configuration**.
3. Choose the **Policies** tab.
4. To create a new configuration policy that includes custom parameters, choose **Create policy**. To specify custom parameters in an existing configuration policy, select the policy, and then choose **Edit**.

   To create a new configuration policy with custom control parameter values

   1. In the **Custom policy** section, choose the security standards and controls that you want to enable.
   2. Select **Customize control parameters**.
   3. Select a control, and then specify custom values for one or more parameters.
   4. To customize parameters for more controls, choose **Customize additional control**.
   5. In the **Accounts** section, select the accounts or OUs that you want to apply the policy to.
   6. Choose **Next**.
   7. Choose **Create policy and apply**. In your home Region and all linked Regions, this action overrides the existing configuration settings of accounts and OUs that are associated with this configuration policy. Accounts and OUs can be associated with a configuration policy through direct application or inheritance from a parent.

   To customize control parameter values in an existing configuration policy

   1. In the **Controls** section, under **Custom policy**, specify the new custom parameter values that you want.
   2. If this is your first time customizing control parameters in this policy, select **Customize control parameters**, and then select a control to customize. To customize parameters for more controls, choose **Customize additional control**.
   3. In the **Accounts** section, verify the accounts or OUs that you want to apply the policy to.
   4. Choose **Next**.
   5. Review your changes, and verify that they're correct. When you finish, choose **Save policy and apply**. In your home Region and all linked Regions, this action overrides the existing configuration settings of accounts and OUs that are associated with this configuration policy. Accounts and OUs can be associated with a configuration policy through direct application or inheritance from a parent.

To customize control parameter values in multiple accounts and Regions (API)

To create a new configuration policy with custom control parameter values

1. Invoke the CreateConfigurationPolicy API from the delegated administrator account in the home Region.
2. For the `SecurityControlCustomParameters` object, provide the identifier of each control that you want to customize.
3. For the `Parameters` object, provide the name of each parameter that you want to customize. For each parameter that you customize, provide `CUSTOM` for `ValueType`. For `Value`, provide the data type of the parameter and the custom value. The `Value` field can't be empty when `ValueType` is `CUSTOM`. If your request omits a parameter that the control supports, that parameter retains its current value. You can find supported parameters, data types, and valid values for a control by invoking the GetSecurityControlDefinition API.

To customize control parameter values in an existing configuration policy

1. Invoke the UpdateConfigurationPolicy API from the delegated administrator account in the home Region.
2. For the `Identifier` field, provide the Amazon Resource Name (ARN) or ID of the configuration policy that you want to update.
3. For the `SecurityControlCustomParameters` object, provide the identifier of each control that you want to customize.
4. For the `Parameters` object, provide the name of each parameter that you want to customize. For each parameter that you customize, provide `CUSTOM` for `ValueType`. For `Value`, provide the data type of the parameter and the custom value. If your request omits a parameter that the control supports, that parameter retains its current value. You can find supported parameters, data types, and valid values for a control by invoking the GetSecurityControlDefinition API.

For example, the following AWS CLI command creates a new configuration policy with a custom value for the `daysToExpiration` parameter of `ACM.1`. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub create-configuration-policy \
--region us-east-1 \
--name "SampleConfigurationPolicy" \
--description "Configuration policy for production accounts" \
--configuration-policy '{"SecurityHub": {"ServiceEnabled": true,
 "EnabledStandardIdentifiers": ["arn:aws:securityhub:us-east-1::standards/aws-
foundational-security-best-practices/v/1.0.0","arn:aws:securityhub:::ruleset/
cis-aws-foundations-benchmark/v/1.2.0"],"SecurityControlsConfiguration":
{"DisabledSecurityControlIdentifiers": ["CloudTrail.2"],
 "SecurityControlCustomParameters": [{"SecurityControlId": "ACM.1", "Parameters":
 {"daysToExpiration": {"ValueType": "CUSTOM", "Value": "Integer": 15}}}]}}}'
```

Customizing control parameters in a single account and Region

If you don't use central configuration or have a self-managed account, you can customize control parameters for your account in one Region at a time only.

Choose your preferred method, and follow the steps to customize control parameters. Your changes apply only to your account in the current Region. To customize the control parameters in additional Regions, repeat the following steps in each additional account and Region in which you want to customize parameters. The same control can use different parameter values in different Regions.

Security Hub CSPM console

To customize control parameter values in one account and Region (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Controls**. In the table, choose a control that supports custom parameters and you want to change the parameters for. The **Custom parameters** column indicates which controls support custom parameters.
3. On the details page for the control, choose the **Parameters** tab, and then choose **Edit**.
4. Specify the parameter values that you want.
5. Optionally, in the **Reason for change** section, select a reason for customizing the parameters.
6. Choose **Save**.

Security Hub CSPM API

To customize control parameter values in one account and Region (API)

1. Invoke the UpdateSecurityControl API.
2. For `SecurityControlId`, provide the ID of the control that you want to customize.
3. For the `Parameters` object, provide the name of each parameter that you want to customize. For each parameter that you customize, provide `CUSTOM` for `ValueType`. For `Value`, provide the data type of the parameter and the custom value. If your request omits a parameter that the control supports, that parameter retains its current value. You can find supported parameters, data types, and valid values for a control by invoking the GetSecurityControlDefinition API.
4. Optionally, for `LastUpdateReason`, provide a reason for customizing the control parameters.

For example, the following AWS CLI command defines a custom value for the `daysToExpiration` parameter of `ACM.1`. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub update-security-control \
--region us-east-1 \
--security-control-id ACM.1 \
--parameters '{"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer":
 15}}}' \
--last-update-reason "Internal compliance requirement"
```

Reverting to default control parameter values

A control parameter can have a default value that AWS Security Hub CSPM defines. Occasionally, Security Hub CSPM updates the default value for a parameter to reflect evolving security best practices. If you haven't specified a custom value for a control parameter, the control automatically tracks those updates and uses the new default value.

You can revert to using default parameter values for a control. The instructions for reversion depend on whether you use central configuration in Security Hub CSPM. Central configuration is

a feature that the delegated Security Hub CSPM administrator can use to configure Security Hub CSPM capabilities across AWS Regions, accounts, and organizational units (OUs).

> **Note**
>
> Not all control parameters have a default Security Hub CSPM value. In such cases, when `ValueType` is set to `DEFAULT`, there isn't a specific default value that Security Hub CSPM uses. Rather, Security Hub CSPM ignores the parameter in the absence of a custom value.

Reverting to default control parameters in multiple accounts and Regions

If you use central configuration, you can revert control parameters for multiple, centrally managed accounts and OUs in the home Region and linked Regions.

Choose your preferred method, and follow the steps to revert to default parameter values across multiple accounts and Regions using central configuration.

Security Hub CSPM console

To revert to default control parameter values in multiple accounts and Regions (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.

   Sign in using the credentials of the delegated Security Hub CSPM administrator account in the home Region.
2. In the navigation pane, choose **Settings** and **Configuration**.
3. Choose the **Policies** tab.
4. Select a policy, and then choose **Edit**.
5. Under **Custom policy**, the **Controls** section shows a list of controls that you specified custom parameters for.
6. Find the control that has one or more parameter values to revert. Then, choose **Remove** to revert to the default values.
7. In the **Accounts** section, verify the accounts or OUs that you want to apply the policy to.
8. Choose **Next**.
9. Review your changes, and verify that they're correct. When you finish, choose **Save policy and apply**. In your home Region and all linked Regions, this action overrides the existing

configuration settings of accounts and OUs that are associated with this configuration policy. Accounts and OUs can be associated with a configuration policy through direct application or inheritance from a parent.

Security Hub CSPM API

To revert to default control parameter values in multiple accounts and Regions (API)

1. Invoke the UpdateConfigurationPolicy API from the delegated administrator account in the home Region.
2. For the `Identifier` field, provide the Amazon Resource Name (ARN) or ID of the policy that you want to update.
3. For the `SecurityControlCustomParameters` object, provide the identifier of each control for which you want to revert one or more parameters.
4. In the `Parameters` object, for each parameter that you want to revert, provide `DEFAULT` for the `ValueType` field. When `ValueType` is set to `DEFAULT`, you don't need to provide a value for the `Value` field. If a value is included in your request, Security Hub CSPM ignores it. If your request omits a parameter that the control supports, that parameter retains its current value.

> **Warning**
>
> If you omit a control object from the `SecurityControlCustomParameters` field, Security Hub CSPM reverts all custom parameters for the control to their default values. A completely empty list for `SecurityControlCustomParameters` reverts custom parameters for all controls to their default values.

For example, the following AWS CLI command reverts the `daysToExpiration` control parameter for `ACM.1` to its default value in the specified configuration policy. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub create-configuration-policy \
--region us-east-1 \
--identifier "arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
```

```
--name "TestConfigurationPolicy" \
--description "Updated configuration policy" \
--updated-reason "Revert ACM.1 parameter to default value"
--configuration-policy '{"SecurityHub": {"ServiceEnabled": true,
 "EnabledStandardIdentifiers": ["arn:aws:securityhub:us-east-1::standards/aws-
foundational-security-best-practices/v/1.0.0","arn:aws:securityhub:::ruleset/
cis-aws-foundations-benchmark/v/1.2.0"],"SecurityControlsConfiguration":
{"DisabledSecurityControlIdentifiers": ["CloudTrail.2"],
 "SecurityControlCustomParameters": [{"SecurityControlId": "ACM.1", "Parameters":
 {"daysToExpiration": {"ValueType": "DEFAULT"}}}]}}}'
```

Reverting to default control parameters in a single account and Region

If you don't use central configuration or have a self-managed account, you can revert to using default parameter values for your account in one Region at a time.

Choose your preferred method, and follow the steps to revert to default parameter values for your account in a single Region. To revert to default parameter values in additional Regions, repeat these steps in each additional Region.

> **Note**
>
> If you disable Security Hub CSPM, your custom control parameters are reset. If you enable Security Hub CSPM again in the future, all controls will use default parameter values to start.

Security Hub CSPM console

To revert to default control parameter values in one account and Region (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Controls**. Choose the control that you want to revert to default parameter values.
3. On the `Parameters` tab, choose **Customized** next to a control parameter. Then, choose **Remove customization**. This parameter now uses the default Security Hub CSPM value and tracks future updates to the default value.

4. Repeat the preceding step for each parameter value that you want to revert.

Security Hub CSPM API

To revert to default control parameter values in one account and Region (API)

1. Invoke the UpdateSecurityControl API.
2. For `SecurityControlId`, provide the ARN or ID of the control whose parameters you want to revert.
3. In the `Parameters` object, for each parameter that you want to revert, provide `DEFAULT` for the `ValueType` field. When `ValueType` is set to `DEFAULT`, you don't need to provide a value for the `Value` field. If a value is included in your request, Security Hub CSPM ignores it.
4. Optionally, for `LastUpdateReason`, provide a reason for reverting to default parameter values.

For example, the following AWS CLI command reverts the `daysToExpiration` control parameter for `ACM.1` to its default value. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub update-security-control \
--region us-east-1 \
--security-control-id ACM.1 \
--parameters '{"daysToExpiration": {"ValueType": "DEFAULT"}}' \
--last-update-reason "New internal requirement"
```

Checking the status of control parameter changes

When you attempt to customize a control parameter or revert to the default value, you can validate whether the desired changes were effective. This helps ensure that a control works as you expect and provides the intended security value. If a parameter update is unsuccessful, Security Hub CSPM retains the current value for the parameter.

To verify that a parameter update was successful, you can review the details of the control on the Security Hub CSPM console. On the console, choose **Controls** on the navigation pane. Then, choose a control to display its details. The **Parameters** tab shows the status of the parameter change.

Programmatically, if your request to update a parameter is valid, the value of the `UpdateStatus` field is `UPDATING` in a response to the BatchGetSecurityControls operation. This means that the update was valid, but all findings might not yet include the updated parameter values. When the value of `UpdateState` changes to `READY`, Security Hub CSPM uses the updated control parameter values when running security checks of the control. Findings include the updated parameter values.

The `UpdateSecurityControl` operation returns an `InvalidInputException` response for invalid parameter values. The response provides additional details about the reason for failure. For example, you might have specified a value that's outside the valid range for a parameter. Or, you might have specified a value that doesn't use the correct data type. Submit your request again with valid input.

If an internal failure occurs when you try to update a parameter value, Security Hub CSPM automatically retries if you have AWS Config enabled. For more information, see Considerations before enabling and configuring AWS Config.

Reviewing and managing control findings in Security Hub CSPM

The control details page displays a list of active findings for a control. The list does not include archived findings.

The control details page supports cross-Region aggregation. If you have set an aggregation Region, the control status and list of security checks on the control details page include checks from all linked AWS Regions.

The list provides tools to filter and sort the findings, so that you can focus on more urgent findings first. A finding may include links to resource details in the related service console. For controls that are based on AWS Config rules, you can view details about the rule.

You can also use the AWS Security Hub CSPM API to retrieve a list of findings and finding details.

For more information, see Reviewing finding details and history.

To reflect the current status of your investigation of a control finding, you set the workflow status. For more information, see the section called “Setting the workflow status of findings”.

You can also send selected Security Hub CSPM findings to a custom action in Amazon EventBridge. For more information, see the section called “Sending findings to a custom action”.

Topics

- Filtering and sorting control findings

- Samples of control findings

Filtering and sorting control findings

Selecting a control from the **Controls** page of the AWS Security Hub CSPM console or from the details page of a standard takes you to the control details page.

The control details page shows the title and description of the control, the overall control status, and a breakdown of security checks for the control in the last 24 hours.

Use the **Filter by** options next to the control checks list to quickly focus on findings with a specific workflow status or compliance status.

In addition to the **Filter by** options, you can use the **Add filter** box to filter the checks list by other fields, such as AWS account ID or resource ID.

By default, findings with a compliance status of **PASSED** are listed first. You can change the default sorting by choosing a different option in the column headers.

From the control details page, you can choose **Download** to download the current page of control findings to a .csv file.

If you filter the finding list, then the download only includes the controls that match the filter. If you select specific findings from the list, then the download only includes the selected findings.

For more information about filtering findings, see Filtering findings in Security Hub CSPM.

Samples of control findings

The following samples provide examples of AWS Security Hub CSPM control findings in the AWS Security Finding Format (ASFF). The contents of control findings vary depending on whether you enabled consolidated control findings.

If you enable consolidated control findings, Security Hub CSPM generates a single finding for a control, even if the control applies to multiple enabled standards. If you don't enable this feature, Security Hub CSPM generates a separate control finding for each enabled standard that a control applies to. For example, if you enable two standards and a control applies to both of them, you receive two separate findings for the control, one for each standard. If you enable consolidated control findings, you receive only one finding for the control. For more information, see Consolidated control findings.

The samples on this page provide examples for both scenarios. The samples include: control findings for individual Security Hub CSPM standards when consolidated control findings is disabled, and a control finding for multiple Security Hub CSPM standards when consolidated control findings is enabled.

Samples of control findings

- Sample finding for the AWS Foundational Security Best Practices standard
- Sample finding for CIS AWS Foundations Benchmark v5.0.0
- Sample finding for CIS AWS Foundations Benchmark v3.0.0
- Sample finding for CIS AWS Foundations Benchmark v1.4.0
- Sample finding for CIS AWS Foundations Benchmark v1.2.0
- Sample finding for the NIST SP 800-53 Revision 5 standard
- Sample finding for the NIST SP 800-171 Revision 2 standard
- Sample finding for Payment Card Industry Data Security Standard v3.2.1
- Sample finding for the AWS Resource Tagging standard
- Sample finding for the AWS Control Tower service-managed standard
- Sample consolidated finding for multiple standards

Note

Control findings reference different fields and values in the China Regions and the AWS GovCloud (US) Regions. For more information, see Impact of consolidation on ASFF fields and values.

Sample finding for the AWS Foundational Security Best Practices standard

The following sample provides an example of a finding for a control that applies to the AWS Foundational Security Best Practices (FSBP) standard. In this sample, consolidated control findings is disabled.

Understanding integrations in Security Hub CSPM

AWS Security Hub CSPM can ingest security findings from several AWS services and supported third-party AWS Partner Network security solutions. These integrations can help you get a comprehensive view of security and compliance across your AWS environment. Security Hub CSPM ingests findings from integrated solutions and converts them to the AWS Security Finding Format (ASFF).

> **Important**
>
> For supported AWS and third-party product integrations, Security Hub CSPM receives and consolidates findings that are generated only after you enable Security Hub CSPM for your AWS accounts. The service doesn't retroactively receive and consolidate security findings that were generated before you enabled Security Hub CSPM.

The **Integrations** page of the Security Hub CSPM console provides access to available AWS and third-party product integrations. The Security Hub CSPM API also has operations for managing integrations.

An integration might not be available in all AWS Regions. If an integration isn't supported in the Region that you are currently signed in to on the Security Hub CSPM console, it doesn't appear on the **Integrations** page of the console. For a list of integrations that are available in the China Regions and AWS GovCloud (US) Regions, see Availability of integrations by Region.

In addition to AWS service and built-in third-party integrations, you can integrate custom security products with Security Hub CSPM. You can then send findings from these products to Security Hub CSPM by using the Security Hub CSPM API. You can also use the API to update existing findings that Security Hub CSPM received from a custom security product.

Topics

- Reviewing a list of Security Hub CSPM integrations
- Enabling the flow of findings from a Security Hub CSPM integration
- Disabling the flow of findings from a Security Hub CSPM integration
- Viewing findings from a Security Hub CSPM integration
- AWS service integrations with Security Hub CSPM
- Third-party product integrations with Security Hub CSPM
- Integrating Security Hub CSPM with custom products

Reviewing a list of Security Hub CSPM integrations

Choose your preferred method, and follow the steps to review a list of integrations in AWS Security Hub CSPM or details about a specific integration.

Security Hub CSPM console

To review integration options and details (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the Security Hub CSPM navigation pane, choose **Integrations**.

On the **Integrations** page, integrations with other AWS services are listed first, followed by integrations with third-party products.

For each integration, the **Integrations** page provides the following information:

- The name of the company
- The name of the product
- A description of the integration
- The categories that the integration applies to
- How to enable the integration
- The current status of the integration

You can filter the list by entering text from the following fields:

- Company name
- Product name
- Integration description
- Categories

Security Hub CSPM API

To review integration options and details (API)

To get a list of integrations, use the DescribeProducts operation. If you're using the AWS CLI, run the describe-products command.

To retrieve details for a specific product integration, use the `ProductArn` parameter to specify the Amazon Resource Name (ARN) of the integration.

For example, the following AWS CLI command retrieves details about the Security Hub CSPM integration with 3CORESec.

```
$ aws securityhub describe-products --product-arn "arn:aws:securityhub:us-east-1::product/3coresec/3coresec"
```

Enabling the flow of findings from a Security Hub CSPM integration

On the **Integrations** page of the AWS Security Hub CSPM console, you can see the required steps to enable each integration.

For most of the integrations with other AWS services, the only required step to enable the integration is to enable the other service. The integration information includes a link to the other

service's home page. When you enable the other service, a resource-level permission that allows Security Hub CSPM to receive findings from the service is then automatically created and applied.

For third-party product integrations, you may need to purchase the integration from the AWS Marketplace, and then configure the integration. The integration information provides links to complete these tasks.

If more than one version of a product is available in AWS Marketplace, select the version that you wan to subscribe to, and then choose **Continue to Subscribe**. For example, some products offer a standard version and an AWS GovCloud (US) version.

When you enable a product integration, a resource policy is automatically attached to that product subscription. This resource policy defines the permissions that Security Hub CSPM needs to receive findings from that product.

After you complete any preliminary steps to enable an integration, you can then disable and re-enable the flow of findings from that integration. On the **Integrations** page, for integrations that send findings, the **Status** information indicates whether you are currently accepting findings.

Security Hub CSPM console

To enable the flow of findings from an integration (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the Security Hub CSPM navigation pane, choose **Integrations**.
3. For integrations that send findings, the **Status** information indicates whether Security Hub CSPM is currently accepting findings from that integration.
4. Choose **Accept findings**.

Security Hub CSPM API

Use the EnableImportFindingsForProduct operation. If you're using the AWS CLI, run the enable-import-findings-for-product command. To enable Security Hub to receive findings from an integration, you need the product ARN. To obtain the ARNs for the available integrations, use the DescribeProducts operation. If you're using the AWS CLI, run the describe-products.

For example, the following AWS CLI command enables Security Hub CSPM to receive findings from the CrowdStrike Falcon integration. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub enable-import-findings-for product --product-arn
 "arn:aws:securityhub:us-east-1:123456789333:product/crowdstrike/crowdstrike-falcon"
```

Disabling the flow of findings from a Security Hub CSPM integration

Choose your preferred method, and follow the steps to disable the flow of findings from an AWS Security Hub CSPM integration.

Security Hub CSPM console

To disable the flow of findings from an integration (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the Security Hub CSPM navigation pane, choose **Integrations**.
3. For integrations that send findings, the **Status** information indicates whether Security Hub CSPM is currently accepting findings from that integration.
4. Choose **Stop accepting findings**.

Security Hub CSPM API

Use the DisableImportFindingsForProduct operation. If you're using the AWS CLI, run the disable-import-findings-for-product command. To disable the flow of findings from an integration, you need the subscription ARN for the enabled integration. To obtain the subscription ARN, use the ListEnabledProductsForImport operation. If you're using the AWS CLI, run the list-enabled-products-for-import.

For example, the following AWS CLI command disables the flow of findings to Security Hub CSPM from the CrowdStrike Falcon integration. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub disable-import-findings-for-product --product-subscription-arn
 "arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/
crowdstrike-falcon"
```

Viewing findings from a Security Hub CSPM integration

When you start accepting findings from an AWS Security Hub CSPM integration, the **Integrations** page of the Security Hub CSPM console displays the **Status** of the integration as **Accepting findings**. To review a list of findings from the integration, choose **See findings**.

The findings list shows the active findings for the selected integration that have a workflow status of `NEW` or `NOTIFIED`.

If you enable cross-Region aggregation, then in the aggregation Region, the list includes findings from the aggregation Region and from linked Regions where the integration is enabled. Security Hub does not automatically enable integrations based on the cross-Region aggregation configuration.

In other Regions, the finding list for an integration only contains findings from the current Region.

For information on how to configure cross-Region aggregation, see the section called “Aggregating data across Regions”.

From the findings list, you can perform the following actions.

- Change the filters and grouping for the list
- View details for individual findings
- Update the workflow status of findings
- Send findings to custom actions

AWS service integrations with Security Hub CSPM

AWS Security Hub CSPM supports integrations with several other AWS services. These integrations can help you get a comprehensive view of security and compliance across your AWS environment.

Unless indicated otherwise below, AWS service integrations that send findings to Security Hub CSPM are activated automatically after you enable Security Hub CSPM and the other service.

Integrations that receive Security Hub CSPM findings might require additional steps for activation. Review the information about each integration to learn more.

Some integrations aren't available in all AWS Regions. On the Security Hub CSPM console, an integration doesn't appear on the **Integrations** page if it isn't supported in the current Region. For a list of integrations that are available in the China Regions and AWS GovCloud (US) Regions, see Availability of integrations by Region.

Overview of AWS service integrations with Security Hub CSPM

The following table provides an overview of AWS services that send findings to Security Hub CSPM or receive findings from Security Hub CSPM.

Integrated AWS service	Direction	
AWS Config	Sends findings	
AWS Firewall Manager	Sends findings	
Amazon GuardDuty	Sends findings	
AWS Health	Sends findings	
AWS Identity and Access Management Access Analyzer	Sends findings	
Amazon Inspector	Sends findings	
AWS IoT Device Defender	Sends findings	
Amazon Macie	Sends findings	
Amazon Route 53 Resolver DNS Firewall	Sends findings	
AWS Systems Manager Patch Manager	Sends findings	
AWS Audit Manager	Receives findings	

Integrated AWS service	Direction	
Amazon Q Developer in chat applications	Receives findings	
Amazon Detective	Receives findings	
Amazon Security Lake	Receives findings	
AWS Systems Manager Explorer and OpsCenter	Receives and updates findings	
AWS Trusted Advisor	Receives findings	

AWS services that send findings to Security Hub CSPM

The following AWS services integrate with and can send findings to Security Hub CSPM. Security Hub CSPM converts the findings to the AWS Security Finding Format.

AWS Config (Sends findings)

AWS Config is a service that allows you to assess, audit, and evaluate the configurations of your AWS resources. AWS Config continuously monitors and records your AWS resource configurations and allows you to automate the evaluation of recorded configurations against desired configurations.

By using the integration with AWS Config, you can see the results of AWS Config managed and custom rule evaluations as findings in Security Hub CSPM. These findings can be viewed alongside other Security Hub CSPM findings, providing a comprehensive overview of your security posture.

AWS Config uses Amazon EventBridge to send AWS Config rule evaluations to Security Hub CSPM. Security Hub CSPM transforms the rule evaluations into findings that follow the AWS Security Finding Format. Security Hub CSPM then enriches the findings on a best-effort basis by getting more information about the impacted resources, such as the Amazon Resource Name (ARN), resource tags, and creation date.

For more information about this integration, see the following sections.

How AWS Config sends findings to Security Hub CSPM

All findings in Security Hub CSPM use the standard JSON format of ASFF. ASFF includes details about the origin of the finding, the affected resource, and the current status of the finding. AWS Config sends managed and custom rule evaluations to Security Hub CSPM through EventBridge. Security Hub CSPM transforms the rule evaluations into findings that follow ASFF and enriches the findings on a best-effort basis.

Types of findings that AWS Config sends to Security Hub CSPM

After the integration is activated, AWS Config sends evaluations of all AWS Config managed rules and custom rules to Security Hub CSPM. Only evaluations that were performed after Security Hub CSPM was enabled are sent. For example, suppose that an AWS Config rule evaluation reveals five failed resources. If you enable Security Hub CSPM after that evaluation and the rule then reveals a sixth failed resource, AWS Config sends only the sixth resource evaluation to Security Hub CSPM.

Evaluations from service-linked AWS Config rules, such as those used to run checks for Security Hub CSPM controls, are excluded. The exception is findings generated by service-linked rules that AWS Control Tower creates and manages in AWS Config. Including findings for these rules helps ensure that your findings data includes the results of proactive checks performed by AWS Control Tower.

Sending AWS Config findings to Security Hub CSPM

When the integration is activated, Security Hub CSPM will automatically assign the permissions necessary to receive findings from AWS Config. Security Hub CSPM uses service-to-service level permissions that provide you with a safe way to activate this integration and import findings from AWS Config via Amazon EventBridge.

Latency for sending findings

When AWS Config creates a new finding, you can usually view the finding in Security Hub CSPM within five minutes.

Retrying when Security Hub CSPM is not available

AWS Config sends findings to Security Hub CSPM on a best-effort basis through EventBridge. When an event isn't successfully delivered to Security Hub CSPM, EventBridge retries delivery for up to 24 hours or 185 times, whichever comes first.

Updating existing AWS Config findings in Security Hub CSPM

After AWS Config sends a finding to Security Hub CSPM, it can send updates to the same finding to Security Hub CSPM to reflect additional observations of the finding activity. Updates are only sent for `ComplianceChangeNotification` events. If no compliance change occurs, updates aren't sent to Security Hub CSPM. Security Hub CSPM deletes findings 90 days after the most recent update or 90 days after creation if no update occurs.

Security Hub CSPM doesn't archive findings that are sent from AWS Config even if you delete the associated resource.

Regions in which AWS Config findings exist

AWS Config findings occur on a Regional basis. AWS Config sends findings to Security Hub CSPM in the same Region or Regions where the findings occur.

Viewing AWS Config findings in Security Hub CSPM

To view your AWS Config findings, choose **Findings** from the Security Hub CSPM navigation pane. To filter the findings to display only AWS Config findings, choose **Product name** in the search bar drop down. Enter **Config**, and choose **Apply**.

Interpreting AWS Config finding names in Security Hub CSPM

Security Hub CSPM transforms AWS Config rule evaluations into findings that follow the AWS Security Finding Format (ASFF). AWS Config rule evaluations use a different event pattern compared to ASFF. The following table maps the AWS Config rule evaluation fields with their ASFF counterpart as they appear in Security Hub CSPM.

Config rule evaluation finding type	ASFF finding type	Hardcoded value
detail.awsAccountId	AwsAccountId	
detail.newEvaluationResult.resultRecordedTime	CreatedAt	
detail.newEvaluationResult.resultRecordedTime	UpdatedAt	

Config rule evaluation finding type	ASFF finding type	Hardcoded value
	ProductArn	"arn:<partition>:securityhub:<region>::product/aws/config"
	ProductName	"Config"
	CompanyName	"AWS"
	Region	"eu-central-1"
configRuleArn	GeneratorId, ProductFields	
detail.ConfigRuleARN/finding/hash	Id	
detail.configRuleName	Title, ProductFields	
detail.configRuleName	Description	"This finding is created for a resource compliance change for config rule: `${detail.ConfigRuleName}` "
Configuration Item "ARN" or Security Hub CSPM computed ARN	Resources[i].id	
detail.resourceType	Resources[i].Type	"AwsS3Bucket"
	Resources[i].Partition	"aws"
	Resources[i].Region	"eu-central-1"
Configuration Item "configuration"	Resources[i].Details	
	SchemaVersion	"2018-10-08"

Config rule evaluation finding type	ASFF finding type	Hardcoded value
	Severity.Label	See "Interpreting Severity Label" below
	Types	["Software and Configuration Checks"]
detail.newEvaluationResult.complianceType	Compliance.Status	"FAILED", "NOT_AVAILABLE", "PASSED", or "WARNING"
	Workflow.Status	"RESOLVED" if an AWS Config finding is generated with a Compliance.Status of "PASSED," or if the Compliance.Status changes from "FAILED" to "PASSED." Otherwise, Workflow.Status will be "NEW." You can change this value with the BatchUpdateFindings API operation.

Interpreting severity label

All findings from AWS Config rule evaluations have a default severity label of **MEDIUM** in the ASFF. You can update the severity label of a finding with the `BatchUpdateFindings` API operation.

Typical finding from AWS Config

Security Hub CSPM transforms AWS Config rule evaluations into findings that follow the ASFF. The following is an example of a typical finding from AWS Config in the ASFF.

> **Note**
>
> If the description is more than 1,024 characters, it will be truncated to 1,024 characters and will say "(truncated)" at the end.

```

Enabling and configuring the integration

After you enable Security Hub CSPM, this integration is activated automatically. AWS Config immediately begins to send findings to Security Hub CSPM.

Stopping the publication of findings to Security Hub CSPM

To stop sending findings to Security Hub CSPM, you can use the Security Hub CSPM console or Security Hub CSPM API.

For instructions on stopping the flow of findings, see Enabling the flow of findings from a Security Hub CSPM integration.

AWS Firewall Manager (Sends findings)

Firewall Manager sends findings to Security Hub CSPM when a web application firewall (WAF) policy for resources or a web access control list (web ACL) rule is not in compliance. Firewall Manager also sends findings when AWS Shield Advanced is not protecting resources, or when an attack is identified.

After you enable Security Hub CSPM, this integration is automatically activated. Firewall Manager immediately begins to send findings to Security Hub CSPM.

To learn more about the integration, view the **Integrations** page in the Security Hub CSPM console.

To learn more about Firewall Manager, see the *AWS WAF Developer Guide*.

Amazon GuardDuty (Sends findings)

GuardDuty sends all of the finding types that it generates to Security Hub CSPM. Some finding types have prerequisites, enablement requirements, or Regional limitations. For more information, see GuardDuty finding types in the *Amazon GuardDuty User Guide*.

New findings from GuardDuty are sent to Security Hub CSPM within five minutes. Updates to findings are sent based on the **Updated findings** setting for Amazon EventBridge in GuardDuty settings.

When you generate GuardDuty sample findings using the GuardDuty **Settings** page, Security Hub CSPM receives the sample findings and omits the prefix `[Sample]` in the finding type. For example, the sample finding type in GuardDuty `[SAMPLE] Recon:IAMUser/ResourcePermissions` is displayed as `Recon:IAMUser/ResourcePermissions` in Security Hub CSPM.

After you enable Security Hub CSPM, this integration is automatically activated. GuardDuty immediately begins to send findings to Security Hub CSPM.

For more information about the GuardDuty integration, see Integrating with AWS Security Hub CSPM in the *Amazon GuardDuty User Guide*.

AWS Health (Sends findings)

AWS Health provides ongoing visibility into your resource performance and the availability of your AWS services and AWS accounts. You can use AWS Health events to learn how service and resource changes might affect your applications that run on AWS.

The integration with AWS Health does not use `BatchImportFindings`. Instead, AWS Health uses service-to-service event messaging to send findings to Security Hub CSPM.

For more information about the integration, see the following sections.

How AWS Health sends findings to Security Hub CSPM

In Security Hub CSPM, security issues are tracked as findings. Some findings come from issues that are detected by other AWS services or by third-party partners. Security Hub CSPM also has a set of rules that it uses to detect security issues and generate findings.

Security Hub CSPM provides tools to manage findings from across all of these sources. You can view and filter lists of findings and view details for a finding. See Reviewing finding details and history in Security Hub CSPM. You can also track the status of an investigation into a finding. See Setting the workflow status of findings in Security Hub CSPM.

All findings in Security Hub CSPM use a standard JSON format called the AWS Security Finding Format (ASFF). ASFF includes details about the source of the issue, the affected resources, and the current status of the finding.

AWS Health is one of the AWS services that sends findings to Security Hub CSPM.

Types of findings that AWS Health sends to Security Hub CSPM

After the integration is enabled, AWS Health sends findings that meet one or more of the listed specifications to Security Hub CSPM. Security Hub CSPM ingests the findings in the AWS Security Finding Format (ASFF).

- Findings that contain any of the following values for AWS service:
  - `RISK`
  - `ABUSE`
  - `ACM`
  - `CLOUDHSM`
  - `CLOUDTRAIL`
  - `CONFIG`
  - `CONTROLTOWER`
  - `DETECTIVE`
  - `EVENTS`
  - `GUARDDUTY`
  - `IAM`
  - `INSPECTOR`
  - `KMS`

- MACIE
- SES
- SECURITYHUB
- SHIELD
- SSO
- COGNITO
- IOTDEVICEDEFENDER
- NETWORKFIREWALL
- ROUTE53
- WAF
- FIREWALLMANAGER
- SECRETSMANAGER
- BACKUP
- AUDITMANAGER
- ARTIFACT
- CLOUDENDURE
- CODEGURU
- ORGANIZATIONS
- DIRECTORYSERVICE
- RESOURCEMANAGER
- CLOUDWATCH
- DRS
- INSPECTOR2
- RESILIENCEHUB

- Findings with the words `security`, `abuse`, or `certificate` in the AWS Health `typeCode` field
- Findings where the AWS Health service is `risk` or `abuse`

Sending AWS Health findings to Security Hub CSPM

When you choose to accept findings from AWS Health, Security Hub CSPM will automatically assign the permissions necessary to receive the findings from AWS Health. Security Hub CSPM

uses service-to-service level permissions that provide you with a safe, easy way to enable this integration and import findings from AWS Health via Amazon EventBridge on your behalf. Choosing **Accept Findings** grants Security Hub CSPM permission to consume findings from AWS Health.

Latency for sending findings

When AWS Health creates a new finding, it is usually sent to Security Hub CSPM within five minutes.

Retrying when Security Hub CSPM is not available

AWS Health sends findings to Security Hub CSPM on a best-effort basis through EventBridge. When an event isn't successfully delivered to Security Hub CSPM, EventBridge retries sending the event for 24 hours.

Updating existing findings in Security Hub CSPM

After AWS Health sends a finding to Security Hub CSPM, it can send updates to the same finding to reflect additional observations of the finding activity to Security Hub CSPM.

Regions in which findings exist

For global events, AWS Health sends findings to Security Hub CSPM in us-east-1 (AWS partition), cn-northwest-1 (China partition), and gov-us-west-1 (GovCloud partition). AWS Health sends Region-specific events to Security Hub CSPM in the same Region or Regions where the events occur.

Viewing AWS Health findings in Security Hub CSPM

To view your AWS Health findings in Security Hub CSPM, choose **Findings** from the navigation panel. To filter the findings to display only AWS Health findings, choose **Health** from the **Product name** field.

Interpreting AWS Health finding names in Security Hub CSPM

AWS Health sends the findings to Security Hub CSPM using the AWS Security Finding Format (ASFF). AWS Health finding uses a different event pattern compared to Security Hub CSPM ASFF format. The table below details all the AWS Health finding fields with their ASFF counterpart as they appear in Security Hub CSPM.

Health finding type	ASFF finding type	Hardcoded value
account	AwsAccountId	
detail.startTime	CreatedAt	
detail.eventDescription.latestDescription	Description	
detail.eventTypeCode	GeneratorId	
detail.eventArn (including account) + hash of detail.startTime	Id	
"arn:aws:securityhub:<region>::product/aws/health"	ProductArn	
account or resourceId	Resources[i].id	
	Resources[i].Type	"Other"
	SchemaVersion	"2018-10-08"
	Severity.Label	See "Interpreting Severity Label" below
“AWS Health -" detail.eventTypeCode	Title	
-	Types	["Software and Configuration Checks"]
event.time	UpdatedAt	
URL of the event on Health console	SourceUrl	

Interpreting severity label

The severity label in the ASFF finding is determined using the following logic:

- Severity **CRITICAL** if:
  - The `service` field in the AWS Health finding has the value `Risk`
  - The `typeCode` field in the AWS Health finding has the value `AWS_S3_OPEN_ACCESS_BUCKET_NOTIFICATION`
  - The `typeCode` field in the AWS Health finding has the value `AWS_SHIELD_INTERNET_TRAFFIC_LIMITATIONS_PLACED_IN_RESPONSE_TO_DDOS_ATTACK`
  - The `typeCode` field in the AWS Health finding has the value `AWS_SHIELD_IS_RESPONDING_TO_A_DDOS_ATTACK_AGAINST_YOUR_AWS_RESOURCES`

  Severity **HIGH** if:
  - The `service` field in the AWS Health finding has the value `Abuse`
  - The `typeCode` field in the AWS Health finding contains the value `SECURITY_NOTIFICATION`
  - The `typeCode` field in the AWS Health finding contains the value `ABUSE_DETECTION`

  Severity **MEDIUM** if:
  - The `service` field in the finding is any of the following: `ACM`, `ARTIFACT`, `AUDITMANAGER`, `BACKUP`,`CLOUDENDURE`, `CLOUDHSM`, `CLOUDTRAIL`, `CLOUDWATCH`, `CODEGURGU`, `COGNITO`, `CONFIG`, `CONTROLTOWER`, `DETECTIVE`, `DIRECTORYSERVICE`, `DRS`, `EVENTS`, `FIREWALLMANAGER`, `GUARDDUTY`, `IAM`, `INSPECTOR`, `INSPECTOR2`, `IOTDEVICEDEFENDER`, `KMS`, `MACIE`, `NETWORKFIREWALL`, `ORGANIZATIONS`, `RESILIENCEHUB`, `RESOURCEMANAGER`, `ROUTE53`, `SECURITYHUB`, `SECRETSMANAGER`, `SES`, `SHIELD`, `SSO`, or `WAF`
  - The **typeCode** field in the AWS Health finding contains the value `CERTIFICATE`
  - The **typeCode** field in the AWS Health finding contains the value `END_OF_SUPPORT`

Typical finding from AWS Health

AWS Health sends findings to Security Hub CSPM using the AWS Security Finding Format (ASFF). The following is an example of a typical finding from AWS Health.

Note

If the description is more than 1024 characters, it will be truncated to 1024 characters and will say *(truncated)* at the end.

```
{
            "SchemaVersion": "2018-10-08",

            }
        }
    ]
}
```

Enabling and configuring the integration

After you enable Security Hub CSPM, this integration is automatically activated. AWS Health immediately begins to send findings to Security Hub CSPM.

Stopping the publication of findings to Security Hub CSPM

To stop sending findings to Security Hub CSPM, you can use the Security Hub CSPM console or Security Hub CSPM API.

For instructions on stopping the flow of findings, see Enabling the flow of findings from a Security Hub CSPM integration.

AWS Identity and Access Management Access Analyzer (Sends findings)

With IAM Access Analyzer, all findings are sent to Security Hub CSPM.

IAM Access Analyzer uses logic-based reasoning to analyze resource-based policies that are applied to supported resources in your account. IAM Access Analyzer generates a finding when it detects a policy statement that lets an external principal access a resource in your account.

In IAM Access Analyzer, only the administrator account can see findings for analyzers that apply to an organization. For organization analyzers, the `AwsAccountId` ASFF field reflects the administrator account ID. Under `ProductFields`, the `ResourceOwnerAccount` field indicates the account in which the finding was discovered. If you enable analyzers individually for each account, Security Hub CSPM generates multiple findings, one that identifies the administrator account ID and one that identifies the resource account ID.

For more information, see Integration with AWS Security Hub CSPM in the *IAM User Guide*.

Amazon Inspector (Sends findings)

Amazon Inspector is a vulnerability management service that continuously scans your AWS workloads for vulnerabilities. Amazon Inspector automatically discovers and scans Amazon EC2 instances and container images that reside in the Amazon Elastic Container Registry. The scan looks for software vulnerabilities and unintended network exposure.

After you enable Security Hub CSPM, this integration is automatically activated. Amazon Inspector immediately begins to send all of the findings that it generates to Security Hub CSPM.

For more information about the integration, see Integration with AWS Security Hub CSPM in the *Amazon Inspector User Guide*.

Security Hub CSPM can also receive findings from Amazon Inspector Classic. Amazon Inspector Classic sends findings to Security Hub CSPM that are generated through assessment runs for all supported rules packages.

For more information about the integration, see Integration with AWS Security Hub CSPM in the *Amazon Inspector Classic User Guide*.

Findings for Amazon Inspector and Amazon Inspector Classic use the same product ARN. Amazon Inspector findings have the following entry in `ProductFields`:

```
"aws/inspector/ProductVersion": "2",
```

> **Note**
>
> Security findings generated by Amazon Inspector Code Security are not available for this integration. However, you can access these particular findings in the Amazon Inspector console and through the Amazon Inspector API.

AWS IoT Device Defender (Sends findings)

AWS IoT Device Defender is a security service that audits the configuration of your IoT devices, monitors connected devices to detect abnormal behavior, and helps mitigate security risks.

After enabling both AWS IoT Device Defender and Security Hub CSPM, visit the Integrations page of the Security Hub CSPM console, and choose **Accept findings** for Audit, Detect, or both. AWS IoT Device Defender Audit and Detect begin to send all findings to Security Hub CSPM.

AWS IoT Device Defender Audit sends check summaries to Security Hub CSPM, which contain general information for a specific audit check type and audit task. AWS IoT Device Defender Detect sends violation findings for machine learning (ML), statistical, and static behaviors to Security Hub CSPM. Audit also sends finding updates to Security Hub CSPM.

For more information about this integration, see Integration with AWS Security Hub CSPM in the *AWS IoT Developer Guide*.

Amazon Macie (Sends findings)

Amazon Macie is a data security service that discovers sensitive data by using machine learning and pattern matching, provides visibility into data security risks, and enables automated protection against those risks. A finding from Macie can indicate that a potential policy violation or sensitive data exists in your Amazon S3 data estate.

After you enable Security Hub CSPM, Macie automatically starts sending policy findings to Security Hub CSPM. You can configure the integration to also send sensitive data findings to Security Hub CSPM.

In Security Hub CSPM, the finding type for a policy or sensitive data finding is changed to a value that is compatible with ASFF. For example, the `Policy:IAMUser/S3BucketPublic` finding type in Macie is displayed as `Effects/Data Exposure/Policy:IAMUser-S3BucketPublic` in Security Hub CSPM.

Macie also sends generated sample findings to Security Hub CSPM. For sample findings, the name of the affected resource is `macie-sample-finding-bucket` and the value for the `Sample` field is `true`.

For more information, see Evaluating Macie findings with Security Hub in the *Amazon Macie User Guide*.

Amazon Route 53 Resolver DNS Firewall (Sends findings)

With Amazon Route 53 Resolver DNS Firewall, you can filter and regulate outbound DNS traffic for your virtual private cloud (VPC). You do this by creating reusable collections of filtering rules in DNS Firewall rule groups, associating the rule groups with your VPC, and then monitoring activity in DNS Firewall logs and metrics. Based on the activity, you can adjust DNS Firewall behavior. DNS Firewall is a feature of Route 53 Resolver.

Route 53 Resolver DNS Firewall can send several types of findings to Security Hub CSPM:

- Findings related to queries blocked or alerted on for domains associated with AWS Managed Domain Lists, which are domain lists that AWS manages.
- Findings related to queries blocked or alerted on for domains associated with a custom domain list that you define.
- Findings related to queries blocked or alerted on by DNS Firewall Advanced, which is a Route 53 Resolver feature that can detect queries associated with advanced DNS threats such as Domain Generation Algorithms (DGAs) and DNS Tunneling.

After you enable Security Hub CSPM and Route 53 Resolver DNS Firewall, DNS Firewall automatically starts sending findings for AWS Managed Domain Lists and DNS Firewall Advanced to Security Hub CSPM. To also send findings for a custom domain list to Security Hub CSPM, manually enable the integration in Security Hub CSPM.

In Security Hub CSPM, all findings from Route 53 Resolver DNS Firewall have the following type: `TTPs/Impact/Impact:Runtime-MaliciousDomainRequest.Reputation`.

For more information, see Sending findings from Route 53 Resolver DNS Firewall to Security Hub in the *Amazon Route 53 Developer Guide*.

AWS Systems Manager Patch Manager (Sends findings)

AWS Systems Manager Patch Manager sends findings to Security Hub CSPM when instances in a customer's fleet go out of compliance with their patch compliance standard.

Patch Manager automates the process of patching managed instances with both security related and other types of updates.

After you enable Security Hub CSPM, this integration is automatically activated. Systems Manager Patch Manager immediately begins to send findings to Security Hub CSPM.

For more information about using Patch Manager, see AWS Systems Manager Patch Manager in the *AWS Systems Manager User Guide*.

AWS services that receive findings from Security Hub CSPM

The following AWS services are integrated with Security Hub CSPM and receive findings from Security Hub CSPM. Where noted, the integrated service may also update findings. In this case, finding updates that you make in the integrated service will also be reflected in Security Hub CSPM.

AWS Audit Manager (Receives findings)

AWS Audit Manager receives findings from Security Hub CSPM. These findings help Audit Manager users to prepare for audits.

To learn more about Audit Manager, see the *AWS Audit Manager User Guide*. AWS Security Hub CSPM checks supported by AWS Audit Manager lists the controls for which Security Hub CSPM sends findings to Audit Manager.

Amazon Q Developer in chat applications (Receives findings)

Amazon Q Developer in chat applications is an interactive agent that helps you to monitor and interact with your AWS resources in your Slack channels and Amazon Chime chat rooms.

Amazon Q Developer in chat applications receives findings from Security Hub CSPM.

To learn more about the Amazon Q Developer in chat applications integration with Security Hub CSPM, see the Security Hub CSPM integration overview in the *Amazon Q Developer in chat applications Administrator Guide*.

Amazon Detective (Receives findings)

Detective automatically collects log data from your AWS resources and uses machine learning, statistical analysis, and graph theory to help you visualize and conduct faster and more efficient security investigations.

The Security Hub CSPM integration with Detective allows you to pivot from Amazon GuardDuty findings in Security Hub CSPM into Detective. You can then use the Detective tools and visualizations to investigate them. The integration does not require any additional configuration in Security Hub CSPM or Detective.

For findings received from other AWS services, the finding details panel on the Security Hub CSPM console includes an **Investigate in Detective** subsection. That subsection contains a link to Detective where you can further investigate the security issue that the finding flagged. You can also build a behavior graph in Detective based on Security Hub CSPM findings to conduct more effective investigations. For more information, see AWS security findings in the *Amazon Detective Administration Guide*.

If cross-Region aggregation is enabled, then when you pivot from the aggregation Region, Detective opens in the Region where the finding originated.

If a link does not work, then for troubleshooting advice, see Troubleshooting the pivot.

Amazon Security Lake (Receives findings)

Security Lake is a fully-managed security data lake service. You can use Security Lake to automatically centralize security data from cloud, on-premises, and custom sources into a data lake that's stored in your account. Subscribers can consume data from Security Lake for investigative and analytics use cases.

To activate this integration, you must enable both services and add Security Hub CSPM as a source in the Security Lake console, Security Lake API, or AWS CLI. Once you complete these steps, Security Hub CSPM begins to send all findings to Security Lake.

Security Lake automatically normalizes Security Hub CSPM findings and converts them to a standardized open-source schema called Open Cybersecurity Schema Framework (OCSF). In Security Lake, you can add one or more subscribers to consume Security Hub CSPM findings.

For more information about this integration, including instructions on adding Security Hub CSPM as a source and creating subscribers, see Integration with AWS Security Hub CSPM in the *Amazon Security Lake User Guide*.

AWS Systems Manager Explorer and OpsCenter (Receives and updates findings)

AWS Systems Manager Explorer and OpsCenter receive findings from Security Hub CSPM, and update those findings in Security Hub CSPM.

Explorer provides you with a customizable dashboard, providing key insights and analysis into the operational health and performance of your AWS environment.

OpsCenter provides you with a central location to view, investigate, and resolve operational work items.

For more information about Explorer and OpsCenter, see Operations management in the *AWS Systems Manager User Guide*.

AWS Trusted Advisor (Receives findings)

Trusted Advisor draws upon best practices learned from serving hundreds of thousands of AWS customers. Trusted Advisor inspects your AWS environment, and then makes recommendations when opportunities exist to save money, improve system availability and performance, or help close security gaps.

When you enable both Trusted Advisor and Security Hub CSPM, the integration is updated automatically.

Security Hub CSPM sends the results of its AWS Foundational Security Best Practices checks to Trusted Advisor.

For more information about the Security Hub CSPM integration with Trusted Advisor, see Viewing AWS Security Hub CSPM controls in AWS Trusted Advisor in the *AWS Support User Guide*.

Third-party product integrations with Security Hub CSPM

AWS Security Hub CSPM integrates with multiple third-party partner products. An integration can perform one or more of the following actions:

- Send findings that it generates to Security Hub CSPM
- Receive findings from Security Hub CSPM
- Update findings in Security Hub CSPM

Integrations that send findings to Security Hub CSPM have an Amazon Resource Name (ARN).

An integration might not be available in all AWS Regions. If an integration isn't supported in the Region that you are currently signed in to on the Security Hub CSPM console, it doesn't appear on the **Integrations** page of the console. For a list of integrations that are available in the China Regions and AWS GovCloud (US) Regions, see Availability of integrations by Region.

If you have a security solution and are interested in becoming a Security Hub CSPM partner, send email to <securityhub-partners@amazon.com>. For more information, see the Partner Integration Guide.

Overview of third-party integrations with Security Hub CSPM

The following table provides an overview of the third-party integrations that can send findings to Security Hub CSPM or receive findings from Security Hub CSPM.

Integration	Direction	ARN (if applicable)
3CORESec – 3CORESec NTA	Sends findings	arn:aws:securityhub: *<REGION>*::product/3coresec/3coresec
Alert Logic – SIEMless Threat Management	Sends findings	arn:aws:securityhub: *<REGION>*:733251395267:product/alertlogic/althreatmanagement
Aqua Security – Aqua Cloud Native Security Platform	Sends findings	arn:aws:securityhub: *<REGION>*::product/aquasecurity/aquasecurity
Aqua Security – Kube-bench	Sends findings	arn:aws:securityhub: *<REGION>*::product/aqua-security/kube-bench
Armor – Armor Anywhere	Sends findings	arn:aws:securityhub: *<REGION>*:679703615338:product/armordefense/armoranywhere
AttackIQ – AttackIQ	Sends findings	arn:aws:securityhub: *<REGION>*::product

Integration	Direction	ARN (if applicable)
		/attackiq/attackiq-platform
Barracuda Networks – Cloud Security Guardian	Sends findings	arn:aws:securityhub: *<REGION>*:151784055945:product/barracuda/cloudsecurityguardian
BigID – BigID Enterprise	Sends findings	arn:aws:securityhub: *<REGION>*::product/bigid/bigid-enterprise
Blue Hexagon – Blue Hexagon forAWS	Sends findings	arn:aws:securityhub: *<REGION>*::product/blue-hexagon/blue-hexagon-for-aws
Check Point – CloudGuard IaaS	Sends findings	arn:aws:securityhub: *<REGION>*:758245563457:product/checkpoint/cloudguard-iaas
Check Point – CloudGuard Posture Management	Sends findings	arn:aws:securityhub: *<REGION>*:634729597623:product/checkpoint/dome9-arc
Claroty – xDome	Sends findings	arn:aws:securityhub: *<REGION>*::product/claroty/xdome

Integration	Direction	ARN (if applicable)
Cloud Storage Security – Antivirus for Amazon S3	Sends findings	arn:aws:securityhub: *<REGION>*::product/cloud-storage-security/antivirus-for-amazon-s3
Contrast Security	Sends findings	arn:aws:securityhub: *<REGION>*::product/contrast-security/security-assess
CrowdStrike – CrowdStrike Falcon	Sends findings	arn:aws:securityhub: *<REGION>*:517716713836:product/crowdstrike/crowdstrike-falcon
CyberArk – Privileged Threat Analytics	Sends findings	arn:aws:securityhub: *<REGION>*:749430749651:product/cyberark/cyberark-pta
Data Theorem – Data Theorem	Sends findings	arn:aws:securityhub: *<REGION>*::product/data-theorem/api-cloud-web-secure
Drata	Sends findings	arn:aws:securityhub: *<REGION>*::product/drata/drata-integration

Integration	Direction	ARN (if applicable)
Forcepoint – Forcepoint CASB	Sends findings	arn:aws:securityhub: *<REGION>*:365761988620:product/forcepoint/forcepoint-casb
Forcepoint – Forcepoint Cloud Security Gateway	Sends findings	arn:aws:securityhub: *<REGION>*::product/forcepoint/forcepoint-cloud-security-gateway
Forcepoint – Forcepoint DLP	Sends findings	arn:aws:securityhub: *<REGION>*:365761988620:product/forcepoint/forcepoint-dlp
Forcepoint – Forcepoint NGFW	Sends findings	arn:aws:securityhub: *<REGION>*:365761988620:product/forcepoint/forcepoint-ngfw
Fugue – Fugue	Sends findings	arn:aws:securityhub: *<REGION>*::product/fugue/fugue
Guardicore – Centra 4.0	Sends findings	arn:aws:securityhub: *<REGION>*::product/guardicore/guardicore

Integration	Direction	ARN (if applicable)
HackerOne – Vulnerability Intelligence	Sends findings	arn:aws:securityhub: *<REGION>*::product/hackerone/vulnerability-intelligence
JFrog – Xray	Sends findings	arn:aws:securityhub: *<REGION>*::product/jfrog/jfrog-xray
Juniper Networks – vSRX Next Generation Firewall	Sends findings	arn:aws:securityhub: *<REGION>*::product/juniper-networks/vsrx-next-generation-firewall
k9 Security – Access Analyzer	Sends findings	arn:aws:securityhub: *<REGION>*::product/k9-security/access-analyzer
Lacework – Lacework	Sends findings	arn:aws:securityhub: *<REGION>*::product/lacework/lacework
McAfee – MVISION Cloud Native Application Protection Platform (CNAPP)	Sends findings	arn:aws:securityhub: *<REGION>*::product/mcafee-skyhigh/mcafee-mvision-cloud-aws
NETSCOUT – NETSCOUT Cyber Investigator	Sends findings	arn:aws:securityhub:us-east-1::product/netscout/netscout-cyber-investigator

Integration	Direction	ARN (if applicable)
Orca Cloud Security Platform	Sends findings	arn:aws:securityhub: *<REGION>*::product/orca-security/orca-security
Palo Alto Networks – Prisma Cloud Compute	Sends findings	arn:aws:securityhub: *<REGION>*:496947949261:product/twistlock/twistlock-enterprise
Palo Alto Networks – Prisma Cloud Enterprise	Sends findings	arn:aws:securityhub: *<REGION>*:188619942792:product/paloaltonetworks/redlock
Plerion – Cloud Security Platform	Sends findings	arn:aws:securityhub: *<REGION>*::product/plerion/cloud-security-platform
Prowler – Prowler	Sends findings	arn:aws:securityhub: *<REGION>*::product/prowler/prowler
Qualys – Vulnerability Management	Sends findings	arn:aws:securityhub: *<REGION>*:805950163170:product/qualys/qualys-vm
Rapid7 – InsightVM	Sends findings	arn:aws:securityhub: *<REGION>*:336818582268:product/rapid7/insightvm

Integration	Direction	ARN (if applicable)
SentinelOne – SentinelOne	Sends findings	arn:aws:securityhub: *<REGION>*::product/sentinelone/endpoint-protection
Snyk	Sends findings	arn:aws:securityhub: *<region>*::product/snyk/snyk
Sonrai Security – Sonrai Dig	Sends findings	arn:aws:securityhub: *<REGION>*::product/sonrai-security/sonrai-dig
Sophos – Server Protection	Sends findings	arn:aws:securityhub: *<REGION>*:062897671886:product/sophos/sophos-server-protection
StackRox – StackRox Kubernetes Security	Sends findings	arn:aws:securityhub: *<REGION>*::product/stackrox/kubernetes-security
Sumo Logic – Machine Data Analytics	Sends findings	arn:aws:securityhub: *<REGION>*:956882708938:product/sumologicinc/sumologic-mda
Symantec – Cloud Workload Protection	Sends findings	arn:aws:securityhub: *<REGION>*:754237914691:product/symantec-corp/symantec-cwp

Integration	Direction	ARN (if applicable)
Tenable – Tenable.io	Sends findings	`arn:aws:securityhub: <REGION>:422820575223:product/tenable/tenable-io`
Trend Micro – Cloud One	Sends findings	`arn:aws:securityhub: <REGION>::product/trend-micro/cloud-one`
Vectra – Cognito Detect	Sends findings	`arn:aws:securityhub: <REGION>:978576646331:product/vectra-ai/cognito-detect`
Wiz	Sends findings	`arn:aws:securityhub: <REGION>::product/wiz-security/wiz-security`
Atlassian - Jira Service Management	Receives and updates findings	Not applicable
Atlassian - Jira Service Management Cloud	Receives and updates findings	Not applicable
Atlassian – Opsgenie	Receives findings	Not applicable
Dynatrace	Receives findings	Not applicable
Elastic	Receives findings	Not applicable
Fortinet – FortiCNP	Receives findings	Not applicable
IBM – QRadar	Receives findings	Not applicable
Logz.io Cloud SIEM	Receives findings	Not applicable

Integration	Direction	ARN (if applicable)
MetricStream	Receives findings	Not applicable
MicroFocus – MicroFocus Arcsight	Receives findings	Not applicable
New Relic Vulnerability Management	Receives findings	Not applicable
PagerDuty – PagerDuty	Receives findings	Not applicable
Palo Alto Networks – Cortex XSOAR	Receives findings	Not applicable
Palo Alto Networks – VM-Series	Receives findings	Not applicable
Rackspace Technology – Cloud Native Security	Receives findings	Not applicable
Rapid7 – InsightConnect	Receives findings	Not applicable
RSA – RSA Archer	Receives findings	Not applicable
ServiceNow – ITSM	Receives and updates findings	Not applicable
Slack – Slack	Receives findings	Not applicable
Splunk – Splunk Enterprise	Receives findings	Not applicable
Splunk – Splunk Phantom	Receives findings	Not applicable
ThreatModeler	Receives findings	Not applicable
Trellix – Trellix Helix	Receives findings	Not applicable
Caveonix – Caveonix Cloud	Sends and receives findings	`arn:aws:securityhub: <REGION>::product/caveonix/caveonix-cloud`

Integration	Direction	ARN (if applicable)
Cloud Custodian – Cloud Custodian	Sends and receives findings	`arn:aws:securityhub: <REGION>::product/cloud-custodian/cloud-custodian`
DisruptOps, Inc. – DisruptOPS	Sends and receives findings	`arn:aws:securityhub: <REGION>::product/disruptops-inc/disruptops`
Kion	Sends and receives findings	`arn:aws:securityhub: <REGION>::product/cloudtamerio/cloudtamerio`
Turbot – Turbot	Sends and receives findings	`arn:aws:securityhub: <REGION>:453761072151:product/turbot/turbot`

Third-party integrations that send findings to Security Hub CSPM

The following third-party partner product integrations can send findings to Security Hub CSPM. Security Hub CSPM transforms the findings into the AWS Security Finding Format.

3CORESec – 3CORESec NTA

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/3coresec/3coresec`

3CORESec provides managed detection services for both on-premises and AWS systems. Their integration with Security Hub CSPM allows visibility into threats such as malware, privilege escalation, lateral movement, and improper network segmentation.

Product link

Partner documentation

Alert Logic – SIEMless Threat Management

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:733251395267:product/alertlogic/althreatmanagement`

Get the right level of coverage: vulnerability and asset visibility, threat detection and incident management, AWS WAF, and assigned SOC analyst options.

Product link

Partner documentation

Aqua Security – Aqua Cloud Native Security Platform

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/aquasecurity/aquasecurity`

Aqua Cloud Native Security Platform (CSP) provides full lifecycle security for container-based and serverless applications, from your CI/CD pipeline to runtime production environments.

Product link

Partner documentation

Aqua Security – Kube-bench

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/aqua-security/kube-bench`

Kube-bench is an open-source tool that runs the Center for Internet Security (CIS) Kubernetes Benchmark against your environment.

Product link

Partner documentation

Armor – Armor Anywhere

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:679703615338:product/armordefense/armoranywhere`

Armor Anywhere delivers managed security and compliance for AWS.

Product link

Partner documentation

AttackIQ – AttackIQ

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/attackiq/attackiq-platform`

AttackIQ Platform emulates real adversarial behavior aligned with the MITRE ATT&CK Framework to help validate and improve your overall security posture.

Product link

Partner documentation

Barracuda Networks – Cloud Security Guardian

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:151784055945:product/barracuda/cloudsecurityguardian`

Barracuda Cloud Security Sentry helps organizations stay secure while building applications in, and moving workloads to, the public cloud.

AWS Marketplace link

Product link

BigID – BigID Enterprise

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/bigid/bigid-enterprise`

The BigID Enterprise Privacy Management Platform helps companies manage and protect sensitive data (PII) across all their systems.

Product link

Partner documentation

Blue Hexagon – Blue Hexagon for AWS

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/blue-hexagon/blue-hexagon-for-aws`

Blue Hexagon is a real time threat detection platform. It uses deep learning principles to detect known and unknown threats, including malware and network anomalies.

AWS Marketplace link

Partner documentation

Check Point – CloudGuard IaaS

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:758245563457:product/checkpoint/cloudguard-iaas`

Check Point CloudGuard easily extends comprehensive threat prevention security to AWS while protecting assets in the cloud.

Product link

Partner documentation

Check Point – CloudGuard Posture Management

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:634729597623:product/checkpoint/dome9-arc`

A SaaS platform that delivers verifiable cloud network security, advanced IAM protection, and comprehensive compliance and governance.

Product link

Partner documentation

Claroty – xDome

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/claroty/xdome`

Claroty xDome helps organizations secure their cyber-physical systems across the Extended Internet of Things (XIoT) within industrial (OT), healthcare (IoMT), and enterprise (IoT) environments.

Product link

Partner documentation

Cloud Storage Security – Antivirus for Amazon S3

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/cloud-storage-security/antivirus-for-amazon-s3`

Cloud Storage Security provides cloud native anti-malware and antivirus scanning for Amazon S3 objects.

Antivirus for Amazon S3 offers real time and scheduled scans of objects and files in Amazon S3 for malware and threats. It provides visibility and remediation for problem and infected files.

Product link

Partner documentation

Contrast Security – Contrast Assess

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/contrast-security/security-assess`

Contrast Security Contrast Assess is an IAST tool that offers real-time vulnerability detection in web apps, APIs, and microservices. Contrast Assess integrates with Security Hub CSPM to help provide centralized visibility and response for all your workloads.

Product link

Partner documentation

CrowdStrike – CrowdStrike Falcon

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:517716713836:product/crowdstrike/crowdstrike-falcon`

The CrowdStrike Falcon single, lightweight sensor unifies next-generation antivirus, endpoint detection and response, and 24/7 managed hunting through the cloud.

AWS Marketplace link

Partner documentation

CyberArk – Privileged Threat Analytics

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:749430749651:product/cyberark/cyberark-pta`

Privileged Threat Analytics collect, detect, alert, and respond to high-risk activity and behavior of privileged accounts to contain in-progress attacks.

Product link

Partner documentation

Data Theorem – Data Theorem

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/data-theorem/api-cloud-web-secure`

Data Theorem continuously scans web applications, APIs, and cloud resources in search of security flaws and data privacy gaps to prevent AppSec data breaches.

Product link

Partner documentation

Drata

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/drata/drata-integration`

Drata is a compliance automation platform that helps you achieve and maintain compliance with various frameworks, such as SOC2, ISO, and GDPR. The integration between Drata and Security Hub CSPM helps you centralize your security findings in one location.

AWS Marketplace link

Partner documentation

Forcepoint – Forcepoint CASB

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:365761988620:product/forcepoint/forcepoint-casb`

Forcepoint CASB allows you to discover cloud application use, analyze risk, and enforce appropriate controls for SaaS and custom applications.

Product link

Partner documentation

Forcepoint – Forcepoint Cloud Security Gateway

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/forcepoint/forcepoint-cloud-security-gateway`

Forcepoint Cloud Security Gateway is a converged cloud security service that provides visibility, control, and threat protection for users and data, wherever they are.

Product link

Partner documentation

Forcepoint – Forcepoint DLP

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:365761988620:product/forcepoint/forcepoint-dlp`

Forcepoint DLP addresses human-centric risk with visibility and control everywhere your people work and everywhere your data resides.

Product link

Partner documentation

Forcepoint – Forcepoint NGFW

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:365761988620:product/forcepoint/forcepoint-ngfw`

Forcepoint NGFW lets you connect your AWS environment into your enterprise network with the scalability, protection, and insights needed to manage your network and respond to threats.

Product link

Partner documentation

Fugue – Fugue

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/fugue/fugue`

Fugue is an agent-less, scalable cloud-native platform that automates the continuous validation of infrastructure-as-code and cloud runtime environments using the same policies.

Product link

Partner documentation

Guardicore – Centra 4.0

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/guardicore/guardicore`

Guardicore Centra provides flow visualization, micro-segmentation, and breach detection for workloads in modern data centers and clouds.

Product link

Partner documentation

HackerOne – Vulnerability Intelligence

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/hackerone/vulnerability-intelligence`

The HackerOne platform partners with the global hacker community to uncover the most relevant security issues. Vulnerability Intelligence enables your organization to go beyond automated scanning. It shares vulnerabilities that HackerOne ethical hackers have validated and provided steps to reproduce.

AWS marketplace link

Partner documentation

JFrog – Xray

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/jfrog/jfrog-xray`

JFrog Xray is a universal application security Software Composition Analysis (SCA) tool that continuously scans binaries for license compliance and security vulnerabilities so that you can run a secure software supply chain.

AWS Marketplace link

Partner documentation

Juniper Networks – vSRX Next Generation Firewall

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/juniper-networks/vsrx-next-generation-firewall`

Juniper Networks' vSRX Virtual Next Generation Firewall delivers a complete cloud-based virtual firewall with advanced security, secure SD-WAN, robust networking, and built-in automation.

AWS Marketplace link

Partner documentation

Product link

k9 Security – Access Analyzer

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/k9-security/access-analyzer`

k9 Security notifies you when important access changes occur in your AWS Identity and Access Management account. With k9 Security, you can understand the access that users and IAM roles have to critical AWS services and your data.

k9 Security is built for continuous delivery, allowing you to operationalize IAM with actionable access audits and simple policy automation for AWS CDK and Terraform.

Product link

Partner documentation

Lacework – Lacework

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/lacework/lacework`

Lacework is the data-driven security platform for the cloud. The Lacework Cloud Security Platform automates cloud security at scale so you can innovate with speed and safety.

Product link

Partner documentation

McAfee – MVISION Cloud Native Application Protection Platform (CNAPP)

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/mcafee-skyhigh/mcafee-mvision-cloud-aws`

McAfee MVISION Cloud Native Application Protection Platform (CNAPP) offers Cloud Security Posture Management (CSPM) and Cloud Workload Protection Platform (CWPP) for your AWS environment.

Product link

Partner documentation

NETSCOUT – NETSCOUT Cyber Investigator

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/netscout/netscout-cyber-investigator`

NETSCOUT Cyber Investigator is an enterprise-wide network threat, risk investigation, and forensic analysis platform that helps to reduce the impact of cyber threats on businesses.

Product link

Partner documentation

Orca Cloud Security Platform

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/orca-security/orca-security`

The Orca Cloud Security Platform identifies, prioritizes, and remediates risks and compliance issues across your entire cloud estate. Orca's agentless-first, AI-driven platform offers comprehensive

coverage detecting vulnerabilities, misconfigurations, lateral movement, API risks, sensitive data, anomalous events and behaviors, and overly permissive identities.

Orca integrates with Security Hub CSPM to bring deep cloud security telemetry into Security Hub CSPM. Orca, using its SideScanning technology, prioritizes risk across cloud infrastructure, workloads, applications, data, APIs, identities, and more.

Product link

Partner documentation

Palo Alto Networks – Prisma Cloud Compute

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:496947949261:product/twistlock/twistlock-enterprise`

Prisma Cloud Compute is a cloud native cybersecurity platform that protects VMs, containers, and serverless platforms.

Product link

Partner documentation

Palo Alto Networks – Prisma Cloud Enterprise

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:188619942792:product/paloaltonetworks/redlock`

Protects your AWS deployment with cloud security analytics, advanced threat detection, and compliance monitoring.

Product link

Partner documentation

Plerion – Cloud Security Platform

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/plerion/cloud-security-platform`

Plerion is a Cloud Security Platform with a unique threat-led, risk-driven approach that offers preventative, detective, and corrective action across your workloads. The integration between Plerion and Security Hub CSPM allows customers to centralize and act upon their security findings in one place.

AWS Marketplace link

Partner documentation

Prowler – Prowler

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/prowler/prowler`

Prowler is an open source security tool to perform AWS checks related to security best practices, hardening, and continuous monitoring.

Product link

Partner documentation

Qualys – Vulnerability Management

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:805950163170:product/qualys/qualys-vm`

Qualys Vulnerability Management (VM) continuously scans and identifies vulnerabilities, protecting your assets.

Product link

Partner documentation

Rapid7 – InsightVM

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:336818582268:product/rapid7/insightvm`

Rapid7 InsightVM provides vulnerability management for modern environments, allowing you to efficiently find, prioritize, and remediate vulnerabilities.

Product link

Partner documentation

SentinelOne – SentinelOne

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/sentinelone/endpoint-protection`

SentinelOne is an autonomous extended detection and response (XDR) platform encompassing AI-powered prevention, detection, response, and hunting across endpoints, containers, cloud workloads, and IoT devices.

AWS Marketplace link

Product link

Snyk

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/snyk/snyk`

Snyk provides a security platform that scans app components for security risks in workloads running on AWS. These risks are sent to Security Hub CSPM as findings, helping developers and security teams visualize and prioritize them along with the rest of their AWS security findings.

AWS Marketplace link

Partner documentation

Sonrai Security – Sonrai Dig

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/sonrai-security/sonrai-dig`

Sonrai Dig monitors and remediates cloud misconfigurations and policy violations, so you can improve your security and compliance posture.

Product link

Partner documentation

Sophos – Server Protection

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:062897671886:product/sophos/sophos-server-protection`

Sophos Server Protection defends the critical applications and data at the core of your organization, using comprehensive defense-in-depth techniques.

Product link

StackRox – StackRox Kubernetes Security

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/stackrox/kubernetes-security`

StackRox helps enterprises secure their container and Kubernetes deployments at scale by enforcing their compliance and security policies across the entire container life cycle – build, deploy, and run.

Product link

Partner documentation

Sumo Logic – Machine Data Analytics

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:956882708938:product/sumologicinc/sumologic-mda`

Sumo Logic is a secure, machine data analytics platform that enables development and security operations teams to build, run, and secure their AWS applications.

Product link

Partner documentation

Symantec – Cloud Workload Protection

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:754237914691:product/symantec-corp/symantec-cwp`

Cloud Workload Protection provides complete protection for your Amazon EC2 instances with antimalware, intrusion prevention, and file integrity monitoring.

Product link

Partner documentation

Tenable – Tenable.io

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:422820575223:product/tenable/tenable-io`

Accurately identify, investigate, and prioritize vulnerabilities. Managed in the cloud.

Product link

Partner documentation

Trend Micro – Cloud One

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/trend-micro/cloud-one`

Trend Micro Cloud One provides the right security information to teams at the right time and place. This integration sends security findings to Security Hub CSPM in real time, enhancing visibility into your AWS resources and Trend Micro Cloud One event details in Security Hub CSPM.

AWS Marketplace link

Partner documentation

Vectra – Cognito Detect

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>:978576646331:product/vectra-ai/cognito-detect`

Vectra is transforming cybersecurity by applying advanced AI to detect and respond to hidden cyberattackers before they can steal or cause damage.

AWS Marketplace link

Partner documentation

Wiz – Wiz Security

Integration type: Send

Product ARN: `arn:aws:securityhub:<REGION>::product/wiz-security/wiz-security`

Wiz continuously analyzes configurations, vulnerabilities, networks, IAM settings, secrets, and more across your AWS accounts, users, and workloads to discover critical issues that represent actual risk. Integrate Wiz with Security Hub CSPM to visualize and respond to issues that Wiz detects from the Security Hub CSPM console.

AWS Marketplace link

Partner documentation

Third-party integrations that receive findings from Security Hub CSPM

The following third-party partner product integrations can receive findings from Security Hub CSPM. Where noted, the product might also update findings. In this case, updates that you make to findings in the partner product are also reflected in Security Hub CSPM.

Atlassian - Jira Service Management

Integration type: Receive and update

The AWS Service Management Connector for Jira sends findings from Security Hub CSPM to Jira. Jira issues are created based on the findings. When the Jira issues are updated, the corresponding findings are updated in Security Hub CSPM.

The integration only supports Jira Server and Jira Data Center.

For an overview of the integration and how it works, watch the video AWS Security Hub CSPM – Bidirectional integration with Atlassian Jira Service Management.

Product link

Partner documentation

Atlassian - Jira Service Management Cloud

Integration type: Receive and update

Jira Service Management Cloud is the cloud component of Jira Service Management.

The AWS Service Management Connector for Jira sends findings from Security Hub CSPM to Jira. The findings trigger the creation of issues in Jira Service Management Cloud. When you update those issues in Jira Service Management Cloud, the corresponding findings are also updated in Security Hub CSPM.

Product link

Partner documentation

Atlassian – Opsgenie

Integration type: Receive

Opsgenie is a modern incident management solution for operating always-on services, empowering development and operations teams to plan for service disruptions and stay in control during incidents.

Integrating with Security Hub CSPM ensures that mission critical security-related incidents are routed to the appropriate teams for immediate resolution.

Product link

Partner documentation

Dynatrace

Integration type: Receive

The Dynatrace integration with Security Hub CSPM helps to unify, visualize, and automate security findings across tools and environments. Adding Dynatrace runtime context to security findings allows smarter prioritization, helps reduce noise from alerts, and focuses your DevSecOps teams on efficiently remedying the critical issues that affect your production environments and applications.

Product link

Partner documentation

Elastic

Integration type: Receive

Elastic builds search-powered solutions for security, observability, and search. With the Security Hub CSPM integration, Elastic ingests findings and insights from Security Hub CSPM programmatically, normalizes them for correlation and analytics, and presents unified dashboards and detections in Elastic Security, enabling faster triage and investigation without deploying agents.

Product link

Partner documentation

Fortinet – FortiCNP

Integration type: Receive

FortiCNP is a Cloud Native Protection product that aggregates security findings into actionable insights and prioritizes security insights based on risk score to reduce alert fatigue and accelerate remediation.

AWS Marketplace link

Partner documentation

IBM – QRadar

Integration type: Receive

IBM QRadar SIEM provides security teams with the ability to quickly and accurately detect, prioritize, investigate, and respond to threats.

Product link

Partner documentation

Logz.io Cloud SIEM

Integration type: Receive

Logz.io is a provider of Cloud SIEM that provides advanced correlation of log and event data to help security teams to detect, analyze, and respond to security threats in real time.

Product link

Partner documentation

MetricStream – CyberGRC

Integration type: Receive

MetricStream CyberGRC helps you manage, measure, and mitigate cybersecurity risks. By receiving Security Hub CSPM findings, CyberGRC provides more visibility into these risks, so you can prioritize cybersecurity investments and comply with IT policies.

AWS Marketplace link

Product link

MicroFocus – MicroFocus Arcsight

Integration type: Receive

ArcSight accelerates effective threat detection and response in real time, integrating event correlation and supervised and unsupervised analytics with response automation and orchestration.

Product link

Partner documentation

New Relic Vulnerability Management

Integration type: Receive

New Relic Vulnerability Management receives security findings from Security Hub CSPM, so you can get a centralized view of security alongside performance telemetry in context across your stack.

AWS Marketplace link

Partner documentation

PagerDuty – PagerDuty

Integration type: Receive

The PagerDuty digital operations management platform empowers teams to proactively mitigate customer-impacting issues by automatically turning any signal into the right insight and action.

AWS users can use the PagerDuty set of AWS integrations to scale their AWS and hybrid environments with confidence.

When coupled with Security Hub CSPM aggregated and organized security alerts, PagerDuty allows teams to automate their threat response process and quickly set up custom actions to prevent potential issues.

PagerDuty users who are undertaking a cloud migration project can move quickly, while decreasing the impact of issues that occur throughout the migration lifecycle.

Product link

Partner documentation

Palo Alto Networks – Cortex XSOAR

Integration type: Receive

Cortex XSOAR is a Security Orchestration, Automation, and Response (SOAR) platform that integrates with your entire security product stack to accelerate incident response and security operations.

Product link

Partner documentation

Palo Alto Networks – VM-Series

Integration type: Receive

Palo Alto VM-Series integration with Security Hub CSPM collects threat intelligence and sends it to the VM-Series next-generation firewall as an automatic security policy update that blocks malicious IP address activity.

Product link

Partner documentation

Rackspace Technology – Cloud Native Security

Integration type: Receive

Rackspace Technology provides managed security services on top of native AWS security products for 24x7x365 monitoring by Rackspace SOC, advanced analysis, and threat remediation.

Product link

Rapid7 – InsightConnect

Integration type: Receive

Rapid7 InsightConnect is a security orchestration and automation solution that enables your team to optimize SOC operations with little to no code.

Product link

Partner documentation

RSA – RSA Archer

Integration type: Receive

RSA Archer IT and Security Risk Management allows you to determine which assets are critical to your business, establish and communicate security policies and standards, detect and respond to attacks, identify and remediate security deficiencies, and establish clear IT risk management best practices.

Product link

Partner documentation

ServiceNow – ITSM

Integration type: Receive and update

The ServiceNow integration with Security Hub CSPM allows security findings from Security Hub CSPM to be viewed within ServiceNow ITSM. You can also configure ServiceNow to automatically create an incident or problem when it receives a finding from Security Hub CSPM.

Any updates to these incidents and problems result in updates to the findings in Security Hub CSPM.

For an overview of the integration and how it works, watch the video AWS Security Hub CSPM - Bidirectional integration with ServiceNow ITSM.

Product link

Partner documentation

Slack – Slack

Integration type: Receive

Slack is a layer of the business technology stack that brings together people, data, and applications. It is a single place where people can effectively work together, find important information, and access hundreds of thousands of critical applications and services to do their best work.

Product link

Partner documentation

Splunk – Splunk Enterprise

Integration type: Receive

Splunk uses Amazon CloudWatch Events as a consumer of Security Hub CSPM findings. Send your data to Splunk for advanced security analytics and SIEM.

Product link

Partner documentation

Splunk – Splunk Phantom

Integration type: Receive

With the Splunk Phantom application for AWS Security Hub CSPM, findings are sent to Phantom for automated context enrichment with additional threat intelligence information or to perform automated response actions.

Product link

Partner documentation

ThreatModeler

Integration type: Receive

ThreatModeler is an automated threat modeling solution that secures and scales the enterprise software and cloud development life cycle.

Product link

Partner documentation

Trellix – Trellix Helix

Integration type: Receive

Trellix Helix is a cloud-hosted security operations platform that allows organizations to take control of any incident from alert to fix.

Product link

Partner documentation

Third-party integrations that send findings to and receive findings from Security Hub CSPM

The following third-party partner product integrations can send findings to and receive findings from Security Hub CSPM.

Caveonix – Caveonix Cloud

Integration type: Send and receive

Product ARN: `arn:aws:securityhub:<REGION>::product/caveonix/caveonix-cloud`

The Caveonix AI-powered platform automates visibility, assessment, and mitigation in hybrid clouds, covering cloud-native services, VMs, and containers. Integrated with AWS Security Hub CSPM, Caveonix merges AWS data and advanced analytics for insights into security alerts and compliance.

AWS Marketplace link

Partner documentation

Cloud Custodian – Cloud Custodian

Integration type: Send and receive

Product ARN: `arn:aws:securityhub:<REGION>::product/cloud-custodian/cloud-custodian`

Cloud Custodian enables users to be well managed in the cloud. The simple YAML DSL allows easily defined rules to enable a well-managed cloud infrastructure that's both secure and cost optimized.

Product link

Partner documentation

DisruptOps, Inc. – DisruptOPS

Integration type: Send and receive

Product ARN: `arn:aws:securityhub:<REGION>::product/disruptops-inc/disruptops`

The DisruptOps Security Operations Platform helps organizations maintain best security practices in your cloud through the use of automated guardrails.

Product link

Partner documentation

Kion

Integration type: Send and receive

Product ARN: `arn:aws:securityhub:<REGION>::product/cloudtamerio/cloudtamerio`

Kion (formerly cloudtamer.io) is a complete cloud governance solution for AWS. Kion gives stakeholders visibility into cloud operations and helps cloud users manage accounts, control budget and cost, and ensure continuous compliance.

Product link

Partner documentation

Turbot – Turbot

Integration type: Send and receive

Product ARN: `arn:aws:securityhub:<REGION>::product/turbot/turbot`

Turbot ensures that your cloud infrastructure is secure, compliant, scalable, and cost optimized.

Product link

Partner documentation

Integrating Security Hub CSPM with custom products

In addition to findings generated by integrated AWS services and third-party products, AWS Security Hub CSPM can consume findings that are generated by other custom security products.

You can send these findings to Security Hub CSPM by using the BatchImportFindings operation of the Security Hub CSPM API. You can use the same operation to update findings from custom products that you already sent to Security Hub CSPM.

When setting up the custom integration, use the guidelines and checklists provided in the *Security Hub CSPM Partner Integration Guide*.

Requirements and recommendations for custom product integrations

Before you can successfully invoke the `BatchImportFindings` API operation, you must enable Security Hub CSPM.

You must also provide finding details for the custom product using the the section called “Finding format: ASFF”. Review the following requirements and recommendations for custom product integrations:

Setting the product ARN

When you enable Security Hub CSPM, a default product Amazon Resource Name (ARN) for Security Hub CSPM is generated in your current account.

This product ARN has the following format: `arn:aws:securityhub:<region>:<account-id>:product/<account-id>/default`. For example, `arn:aws:securityhub:us-west-2:123456789012:product/123456789012/default`.

Use this product ARN as the value for the `ProductArn` attribute when invoking the `BatchImportFindings` API operation.

Setting the company and product names

You can use `BatchImportFindings` to set a preferred company name and product name for the custom integration that is sending findings to Security Hub CSPM.

Your specified names replace the preconfigured company name and product name, called personal name and default name respectively, and appear in the Security Hub CSPM console and the JSON of each finding. See BatchImportFindings for finding providers.

Setting the finding IDs

You must supply, manage, and increment your own finding IDs, using the `Id` attribute.

Each new finding should have a unique finding ID. If the custom product sends multiple findings with the same finding ID, Security Hub CSPM only processes the first finding.

Setting the account ID

You must specify your own account ID, using the `AwsAccountId` attribute.

Setting the created at and updated at dates

You must supply your own timestamps for the `CreatedAt` and `UpdatedAt` attributes.

Updating findings from custom products

In addition to sending new findings from custom products, you can also use the `BatchImportFindings` API operation to update existing findings from custom products.

To update existing findings, use the existing finding ID (via the `Id` attribute). Resend the full finding with the appropriate information updated in the request, including a modified `UpdatedAt` timestamp.

Example custom integrations

You can use the following example custom product integrations as a guide to create your own custom solutions:

Sending findings from Chef InSpec scans to Security Hub CSPM

You can create an CloudFormation template that runs a Chef InSpec compliance scan and then sends findings to Security Hub CSPM.

For more details, see Continuous compliance monitoring with Chef InSpec and AWS Security Hub CSPM.

Sending container vulnerabilities detected by Trivy to Security Hub CSPM

You can create an CloudFormation template that uses AquaSecurity Trivy to scan containers for vulnerabilities, and then sends those vulnerability findings to Security Hub CSPM.

For more details, see How to build a CI/CD pipeline for container vulnerability scanning with Trivy andAWS Security Hub CSPM.

Integrating Security Hub CSPM with Microsoft Azure

To monitor your Microsoft Azure resources, you can integrate Microsoft Azure with AWS Security Hub CSPM. Security Hub CSPM then automatically enables posture management checks for your Azure environment and generates findings about your environment. More specifically, the service provides you with the following:

> **Note**
>
> You can manage Azure standards and controls using the Security Hub CSPM console, APIs, and AWS CloudFormation. The Security Hub CSPM Central Configuration feature is not supported for Azure standards.

- **ASFF findings** – Security Hub CSPM generates findings in the AWS Security Finding Format (ASFF) format for posture checks that it performs for your Azure resources.
- **CIS Microsoft Azure Foundations Benchmark v4.0** – Automated compliance checks against the CIS Azure v4.0 standard. This standard includes identity, networking, storage, logging, and database controls.

- **Azure Foundational Best Practices** – Automated detection of Azure resource misconfigurations based on AWS-curated security best practices covering network security, identity management, data protection, and logging.
- **Posture management** – Continuous evaluation of Azure resource configurations against security best practices and compliance standards, with 122 controls across both standards.
- **Per-provider security scores** – Separate security scores for AWS and Azure, so you can track each environment independently.

To create the integration, you connect your Azure environment to Security Hub CSPM through the following process:

> **Note**
>
> Azure standards differ from AWS standards in the following ways:
>
> - Azure standards do not require manual AWS Config prerequisites. Unlike AWS, where CSPM-only customers need a customer managed recorder, Azure standards use an internal service-linked recorder automatically.
> - Azure standards always use internal service-linked config rules. AWS standards only use service-linked config rules when Security Hub is also enabled.

1. You configure your Azure environment with an application registration, federated identity credentials, Azure role assignments, and Event Hub infrastructure.
2. By using the Security Hub CSPM console, you create a connector for the integration. You specify your Azure tenant ID, application client ID, and monitoring scope.
3. AWS Config collects resource configuration data from your Azure environment.

   AWS Config is used internally to collect resource configuration data. Unlike AWS posture management, where you must explicitly enable AWS Config and pay for recording, Azure posture management handles AWS Config automatically. You don't need to enable AWS Config separately, configure a recorder, or pay separately for AWS Config usage. These costs are included in your Security Hub CSPM pricing.
4. Security Hub CSPM begins receiving resource configuration data and Activity Log events from your Azure environment.
5. Security Hub CSPM generates posture management findings about your Azure environment.

How AWS Config is used

AWS Config is used internally to collect resource configuration data and detect changes in your Azure environment. The connector handles this automatically. You do not need to enable AWS Config separately, configure a recorder, or pay for AWS Config usage. These costs are included in your Security Hub CSPM pricing for Azure resources.

Service-linked connectors and customer-managed connectors

Security Hub CSPM supports two types of connectors:

Service-linked connector (SLC)

Automatically created when you set up the Azure integration in Security Hub. The scope of a service-linked connector always matches the scope defined in your Security Hub connector. You cannot modify the scope of a service-linked connector directly; instead, modify the scope in Security Hub. Security Hub manages the lifecycle of service-linked connectors on your behalf.

Customer-managed connector (CMC)

Created directly in the Security Hub CSPM console on the Integrations page. Use a customer-managed connector when you want to use Security Hub CSPM independently of Security Hub, or when you need a different scope than your Security Hub connector. When both types exist, the service-linked connector scope must always be equal to or larger than your customer-managed connector scope.

> **Note**
>
> Unlike Security Hub, Security Hub CSPM does not offer per-capability selection for Azure connectors. When you create a connector in Security Hub CSPM, all posture management capabilities are enabled together.

For information about estimating and calculating costs for integrating Security Hub CSPM with Azure, see AWS Security Hub CSPM pricing.

Topics

- Prerequisites for integrating Security Hub CSPM with Microsoft Azure

- Configuring Microsoft Azure to integrate with Security Hub CSPM
- Configuring Security Hub CSPM to integrate with Microsoft Azure
- Deleting a Microsoft Azure connector in Security Hub CSPM

Prerequisites for integrating Security Hub CSPM with Microsoft Azure

Before you integrate Microsoft Azure with AWS Security Hub CSPM, complete the following tasks in your AWS and Azure environments. This helps ensure that you and Security Hub CSPM have the resources and permissions that you need to monitor your Azure resources.

Topics

- Prerequisites for AWS
- Prerequisites for Microsoft Azure

Prerequisites for AWS

Verify that you have the following in your AWS account:

AWS Security Hub CSPM enabled

Security Hub CSPM must be enabled in the AWS account and AWS Region where you want to create the connector.

Console IAM permissions

The IAM principal creating the connector must have the following permissions:

- `config:GetConnector`
- `config:ListConnectors`
- `config:PutConnector`

IAM Outbound Identity Federation enabled

You must enable IAM Outbound Identity Federation in your AWS account. This feature allows AWS services to authenticate to external identity providers (such as Microsoft Entra ID) using federated credentials rather than long-lived secrets.

After enabling Outbound Identity Federation, note the **Token Issuer URL**. This URL follows the format:

```
https://uuid.tokens.sts.global.api.aws
```

You will need this URL when configuring federated identity credentials in Azure.

Prerequisites for Microsoft Azure

Verify that you have the following in your Azure environment:

Azure tenant

You must have an Azure tenant in the Azure commercial cloud. Azure Government and Azure China are not supported.

Microsoft Entra ID log availability

Resource recording requires Microsoft Graph audit logs and sign-in logs from your Microsoft Entra ID tenant. Some Microsoft Entra ID logs require Microsoft Entra ID P1 or P2 licensing.

If the tenant lacks required logs, resource recording might report partial failures. The app registration and Azure role assignments do not supply missing log data.

Global Administrator role

The person configuring the Azure environment must have the **Global Administrator** role in Microsoft Entra ID. This role is required to register applications, grant admin consent for Microsoft Graph API permissions, assign RBAC roles at the tenant root management group scope, and configure diagnostic settings for Entra ID Audit Logs.

> **Note**
>
> In many organizations, the Azure Global Administrator and the AWS security administrator are different people. The Azure setup can be completed independently using the generated setup script.

Azure app registration

You must register an application in Microsoft Entra ID. This application serves as the identity that AWS uses to authenticate to your Azure environment using federated credentials. No client secrets are required.

Azure Event Hub

You must create an Azure Event Hub namespace and Event Hub instance to receive Activity Log and Entra ID Audit Log events. The setup script automates this creation.

Microsoft Graph API permissions

The registered application requires the following Microsoft Graph API permissions (Application type, requires admin consent):

- `Directory.Read.All` – Read directory data including users, groups, and service principals.
- `AuditLog.Read.All` – Read Entra ID audit log events.
- `Policy.Read.All` – Read organization policies and conditional access configurations.

Azure RBAC Reader role

The service principal must be assigned the **Reader** role at the **tenant root management group** scope. This grants read-only access to all Azure resources across all subscriptions in the tenant.

After you complete these tasks, you're ready to configure your Azure environment.

Configuring Microsoft Azure to integrate with Security Hub CSPM

After you complete the prerequisite tasks, you can configure your Microsoft Azure environment to support integration with AWS Security Hub CSPM. To help you do this, the Security Hub CSPM console generates a setup script that's customized for your configuration.

To generate the script, do the following:

1. Open the Security Hub CSPM console.
2. In the navigation pane, choose **Integrations**.
3. Choose **Create Azure connector**.
4. Complete the connector configuration (tenant ID, scope, and name), and then copy the generated setup script.

To run the script, use the Azure CLI and authenticate with a Global Administrator account (`az login`).

When you run the script, it performs a series of tasks. The following sections describe each task that the script performs. If your organization restricts script execution, you can perform these

tasks manually, using this topic as a guide. After you configure your Azure environment, you can configure Security Hub CSPM to integrate with Azure.

> **Note**
>
> A single Azure app registration is shared across AWS security services. If you also use Security Hub or Amazon Inspector for Azure, they use the same app registration. You do not need to create separate registrations for each AWS service.

Tasks

- Step 1: Register an Azure application
- Step 2: Create a service principal
- Step 3: Configure federated identity credentials
- Step 4: Assign the Reader role
- Step 5: Configure Microsoft Graph API permissions
- Step 6: Set up Azure Event Hub
- Step 7: Configure Activity Log and Entra ID Audit Log export

Step 1: Register an Azure application

Register a new application in Microsoft Entra ID. This application serves as the identity that AWS uses to authenticate to your Azure environment using federated credentials. No client secrets are required.

```
$ az ad app create --display-name "AWSSecurityHubIntegration"
```

Note the **Application (client) ID** from the output (the `appId` attribute). You will provide this value when creating the connector in the Security Hub CSPM console.

Step 2: Create a service principal

Create a service principal for the registered application. You use Azure role assignments to grant permissions to the service principal. The service principal performs actions in your Azure environment.

```
$ az ad sp create --id application-client-id
```

Where *application-client-id* is the Application (client) ID from the previous step.

Step 3: Configure federated identity credentials

Configure federated identity credentials on the application to enable AWS to authenticate without client secrets. This establishes an OIDC trust between AWS and Azure. No long-lived secrets or credentials are stored.

```
$ az ad app federated-credential create \
  --id application-client-id \
  --parameters '{
    "name": "AWSConfigFederation",
    "issuer": "token-issuer-url",
    "subject": "arn:aws:iam::account-id:role/aws-service-role/
thirdparty.config.amazonaws.com/AWSServiceRoleForConfigThirdParty",
    "audiences": ["api://AzureADTokenExchange"],
    "description": "Federation for AWS Config third-party cloud resource discovery"
  }'
```

Key values:

- **Issuer** – Your Token Issuer URL from IAM Outbound Identity Federation. This follows the format `https://uuid.tokens.sts.global.api.aws`.
- **Subject** – The ARN of the `AWSServiceRoleForConfigThirdParty` service-linked role in your AWS account. AWS creates this service-linked role automatically during connector setup.
- **Audience** – `api://AzureADTokenExchange` (standard value for workload identity federation).

Step 4: Assign the Reader role

Assign the **Reader** role to the service principal at the root scope (/). This grants read-only access to all Azure resources across all subscriptions in the tenant.

> **Assign Reader at the root scope**
>
> Make sure to assign the **Reader** role at the **root scope** (/), not the tenant root management group scope. Security Hub CSPM reads Azure role-assignment resources at every scope,

including assignments scoped at the tenant root. A Reader assignment at the root management group does not cover assignments whose scope is /, so without it those reads fail with an authorization error and the connector can enter a degraded state.

```
$ az role assignment create \
  --assignee application-client-id \
  --role "Reader" \
  --scope "/"
```

Root-scope assignment requires elevated access

Assigning a role at the root scope (/) requires elevated access. If a role assignment fails, verify that *Access management for Azure resources* is set to **Yes** in Microsoft Entra ID > Properties. Then sign out and sign back in to refresh your token.

Remove the temporary root elevation

Enabling *Access management for Azure resources* grants the signed-in administrator the User Access Administrator role at the root scope (/), which can manage access across every subscription and management group in the tenant. After onboarding is complete, set *Access management for Azure resources* back to **No** in Microsoft Entra ID > Properties, save, and sign out so that this elevation does not remain active.

Step 5: Configure Microsoft Graph API permissions

Grant the following Microsoft Graph API permissions (Application type) to the application, and then grant admin consent:

- `Application.Read.All`
- `AuditLog.Read.All`
- `DelegatedPermissionGrant.Read.All`
- `Device.Read.All`
- `Group.Read.All`

- `GroupMember.Read.All`
- `GroupSettings.Read.All`
- `Organization.Read.All`
- `Policy.Read.All`
- `RoleManagement.Read.Directory`
- `User.Read.All`
- `UserAuthenticationMethod.Read.All`

```
$ az ad app permission admin-consent --id application-client-id
```

Step 6: Set up Azure Event Hub

AWS Config uses an Azure Event Hub to receive near real-time notifications of resource configuration changes in your Azure environment. The setup script creates the Event Hub infrastructure and tags it for discovery.

```
$ az group create \
  --name "aws-securityhub-integration" \
  --location event-hub-region

$ az eventhubs namespace create \
  --resource-group "aws-securityhub-integration" \
  --name "aws-securityhub-account-id" \
  --location event-hub-region \
  --sku Standard

$ az eventhubs eventhub create \
  --resource-group "aws-securityhub-integration" \
  --namespace-name "aws-securityhub-account-id" \
  --name "activitylog" \
  --message-retention 1 \
  --partition-count 4

$ az eventhubs eventhub consumer-group create \
  --resource-group "aws-securityhub-integration" \
  --namespace-name "aws-securityhub-account-id" \
  --eventhub-name "activitylog" \
  --name "AWSConfig"
```

After creating the Event Hub, tag the namespace for discovery and assign the Data Receiver role:

```
$ az tag create \
  --resource-id namespace-resource-id \
  --tags "AWSConfig-account-id-region=activitylog"

$ az role assignment create \
  --assignee application-client-id \
  --role "Azure Event Hubs Data Receiver" \
  --scope namespace-resource-id
```

> **Note**
>
> In the tag format `AWSConfig-account-id-region`, *account-id* is your 12-digit AWS account ID and *region* is the AWS Region where you are creating the connector (for example, `us-east-1`). These values identify which AWS account and Region own this Event Hub integration.

Key configuration:

- **Namespace SKU** – Standard (required for consumer groups).
- **Event Hub name** – `activitylog`.
- **Consumer group** – `AWSConfig`.
- **Tag** – `AWSConfig-account-id-region` with value `activitylog`. This tag enables AWS Config to discover the Event Hub automatically.
- **Role assignment** – Azure Event Hubs Data Receiver on the namespace.

Step 7: Configure Activity Log and Entra ID Audit Log export

Configure Azure to export Activity Logs and Entra ID Audit Logs to the Event Hub.

Activity Log export:

Configure diagnostic settings on each subscription to export Activity Logs to the Event Hub. The setup script configures this automatically for all monitored subscriptions. Activity Logs capture subscription-level activity including role assignments and resource changes.

Entra ID Audit Log export:

Configure diagnostic settings on Microsoft Entra ID to export audit logs to the same Event Hub. Navigate to *Microsoft Entra ID > Monitoring > Diagnostic settings > Add diagnostic setting*. Enable **AuditLogs** and route them to your Event Hub.

Microsoft Defender for Cloud continuous export (optional):

To forward Defender for Cloud security alerts to Security Hub CSPM, configure continuous export to your Event Hub. In the Azure portal, navigate to *Microsoft Defender for Cloud > Environment settings > select subscription > Continuous export*. Select **Event Hub** as the export target and choose your Event Hub namespace. Enable **Security alerts** as the export data type.

Amazon Inspector data event configuration (optional):

If you plan to use Amazon Inspector for Azure VM scanning, additional data event configuration is required. For details about configuring Inspector-specific data events, see the Amazon Inspector documentation for Azure integration.

Configuring Security Hub CSPM to integrate with Microsoft Azure

After you complete the prerequisite tasks and configure your Microsoft Azure environment, you can configure AWS Security Hub CSPM to integrate with Azure. To configure Security Hub CSPM to integrate with Azure, you create a connector. After you create the connector, the following events occur:

1. Security Hub CSPM validates the Azure credentials and connectivity to your Azure environment. This process can take several minutes.
2. AWS Config begins discovering and recording configuration data for your Azure resources.
3. Security Hub CSPM begins generating posture management findings for your Azure resources after resource data collection completes.

> **Note**
>
> If you already created a connector in Security Hub, a service-linked connector was automatically created in Security Hub CSPM. You do not need to create a separate customer-managed connector unless you require a different scope.

Topics

- Create an Azure connector
- Enabling standards and controls
- Adjust the scope of an Azure connector
- Verify the health of an Azure connector
- Troubleshoot an Azure connector
- How Security Hub CSPM handles resource identifiers
- Available controls for Azure

Create an Azure connector

To create an Microsoft Azure connector for your environment, complete the following steps by using the AWS Security Hub CSPM console or the API.

1. Open the Security Hub CSPM console.
2. In the navigation pane, choose **Integrations**.
3. Choose **Create Azure connector**.
4. For **Azure Tenant ID**, enter your Azure Active Directory tenant identifier.
5. For **Application (client ID)**, enter the application ID for the Azure app registration that you created.
6. Configure additional settings and the scope of the connector by doing the following:

   - For **Name**, enter a unique name for the connector. The name can contain up to 50 alphanumeric characters and it can include hyphens (-).

     > **Important**
     >
     > Names and descriptions are used to identify your content, and we recommend you do not include sensitive, confidential, or personally identifiable information (PII) in them.

   - For **Description**, optionally enter a brief description of the connector. The description can contain up to 200 characters.
   - For **Subscriptions**, choose **All subscriptions** to monitor all current and future subscriptions in the tenant, or **Specific subscriptions** to monitor only the subscriptions that you specify. If you choose to monitor only specific subscriptions, enter the ID for each one.

- For **Regions**, choose the Azure regions where your resources are deployed.

> **Note**
>
> Controls that evaluate Microsoft Entra ID and Microsoft Graph resources require the global region scope to be included in your integration configuration. If you select specific Azure Regions only, these controls will not generate findings.

7. Review your configuration and choose **Create connector**.

After you create the connector, Security Hub CSPM validates your Azure credentials and begins resource discovery. The connector should show a status of Active within 2-5 minutes.

Enabling standards and controls

After creating the connector, you must enable Azure security standards to begin generating findings. For general information about enabling standards and managing controls, see Enabling standards and Enabling and disabling controls.

Available standards

- **CIS Microsoft Azure Foundations Benchmark v4.0** - A widely adopted security benchmark that defines best practices for securing Azure environments. Each control evaluates a specific aspect of your Azure configuration (for example, storage account encryption, network security group rules, identity and access settings).
- **Azure Foundational Best Practices** - Evaluates Azure resources for exposure risks by correlating network reachability, public access, and sensitive data indicators. Generates exposure-type findings that highlight resources at elevated risk.

Azure standards have their own set of controls, separate from AWS controls. There are no cross-cloud controls that evaluate both AWS and Azure resources in a single check.

Enabling a standard

You can enable Azure standards through the Security Hub CSPM console or through the API/CLI. Navigate to **Standards** in the Security Hub CSPM console and enable the desired standard. Alternatively, use the CLI:

```
$ aws securityhub batch-enable-standards \
```

```
  --standards-subscription-requests '[{"StandardsArn": "Standard-ARN"}]' \
  --region your-aws-region
```

> **Note**
>
> You can enable Azure standards before or after creating the connector - they are not coupled. However, findings will only be generated once both the connector and the standard are active and resource data has been collected.

Managing individual controls

Once a standard is enabled (typically within seconds), you can view and manage individual controls:

- **View controls:** Use the Security Hub CSPM console (Standards > select standard > Controls) or the `list-standards-control-associations` API.
- **Disable a control:** If a specific control is not applicable to your environment, you can disable it.
- **Configure custom parameters:** Some controls accept custom input parameters (for example, password length thresholds). These can be configured through the `update-security-control` API.

Important notes

- Azure standards apply uniformly across your entire connector scope. You cannot enable different standards or controls for different Azure subscriptions within the same connector.
- **Controls depend on resource data availability.** Each control evaluates a specific Azure resource type. If AWS Config has not yet collected configuration data for a particular resource type, the control will generate a default PASS finding for those resources. These default PASS findings will automatically update to accurate evaluations as resource data arrives. Do not treat initial compliance scores as accurate until resource data collection is complete.
- Custom input parameters for security controls can be configured even before creating a connector - they persist independently.
- Controls evaluating subscription-level settings (for example, Microsoft Defender plans, activity log alerts) produce one finding per Azure subscription rather than per individual resource.
- Multicloud standards cannot be included in Central Configuration policies. You must manage Azure standard enablement independently in each AWS account and AWS Region.

Adjust the scope of an Azure connector

After you create a Microsoft Azure connector, you can adjust the scope of the connector by changing the Azure Subscriptions or Azure Regions that it monitors. If you adjust the scope, most types of changes take effect within approximately 15 minutes.

Before you adjust the scope, note the following:

- The scope of a customer-managed connector cannot exceed the scope of any existing service-linked connector in the same account and Region.
- When you expand the scope, Security Hub CSPM begins generating findings for new resources after AWS Config collects their configuration data.
- When you reduce the scope, existing findings for removed resources transition to an archived state.

Verify the health of an Azure connector

You can check the health of an Microsoft Azure connector at any time. Navigate to **Integrations** in the Security Hub CSPM console and confirm your connector shows Active status.

Initial findings typically appear within 15-30 minutes of resource data collection completing.

> **Note**
>
> Connector health status is eventually consistent. When a permission or configuration issue occurs, the connector status changes to **Degraded** quickly with an actionable message. However, after you fix the issue, the status can take up to 24 hours to return to **Connected**.
>
> - A **Degraded** status after a recent fix does not necessarily indicate an ongoing problem.
> - For real-time visibility into recording failures, check the CloudWatch metrics in the namespace.

Troubleshoot an Azure connector

If you encounter issues with your connector, use the following information to diagnose and resolve common problems.

Connector status is Unhealthy

This issue typically occurs if federated credentials aren't configured correctly in Azure.

To address this issue, verify that the token issuer URL and subject ARN in your Azure federated credentials match your AWS account.

No findings after 30 minutes

This issue can occur if Event Hub isn't receiving Activity Logs or if no standard is enabled.

To address this issue, verify that the Event Hub namespace is tagged correctly (`AWSConfig-`*`account-id`*`-`*`region`*`=activitylog`), the `AWSConfig` consumer group exists, the Data Receiver role is assigned, and at least one Azure standard is enabled.

Unable to record some Azure resources

The error can occur for any of the following reasons:

- The Azure environment does not meet the prerequisites for resource recording.
- The app registration does not have admin consent for Microsoft Graph API permissions.
- The Reader role assignment does not cover all required scopes.
- The Microsoft Entra ID tenant does not have required log data.

To address the error, do the following:

1. To confirm that your environment meets all requirements, review Prerequisites for Microsoft Azure.
2. Confirm that the app registration has the required Microsoft Graph API permissions with admin consent.
3. Verify that the service principal has the Reader role at the tenant root management group scope.

Connector stays in Pending status

This issue can occur if the Azure app registration is misconfigured.

To address this issue, verify that the federated identity credential issuer URL and subject identifier match your AWS account. Also verify that admin consent has been granted for all required Microsoft Graph API permissions.

How Security Hub CSPM handles resource identifiers

By enabling your Azure integration for AWS Security Hub CSPM, resource identifiers from other cloud providers will be stored in AWS Config, AWS Security Hub CSPM, and other AWS services (as needed) as metadata related to the management of the corresponding resource configuration data collected from the other cloud providers. Such resource identifiers do not constitute Your Content, and we recommend you do not include sensitive, confidential, or personally identifiable information in them.

The following identifiers from your connected cloud environment are stored and used by AWS to provide multicloud security capabilities:

- **Resource identifiers:** Azure Tenant ID, Subscription ID, Location (region), Resource ID (Resource Group IDs or Names, Resource Provider, Resource Type)

Relationships among these identifiers - including how resources relate to one another and how findings relate to resources - are also stored as service metadata. AWS uses these identifiers for resource correlation, associating findings to resources, service operational logging, and de-duplication.

Available controls for Azure

After you enable Azure standards, the following 122 controls evaluate your Azure resources. Controls are distributed across two standards:

- **CIS Microsoft Azure Foundations Benchmark v4.0** – 96 controls mapped to specific CIS sections
- **Azure Foundational Best Practices** – 26 controls covering additional security best practices

> **Note**
>
> Controls that evaluate Microsoft Entra ID and Microsoft Graph resources require the global region scope to be included in your integration configuration.

Available Azure controls

Control title	Resource type	Standard
Azure Container Apps with managed identity enabled should follow least privilege	`microsoft.app/containerapps`	Azure Foundational Best Practices
Azure Container Apps should not pass Azure SDK credentials as environment variables	`microsoft.app/containerapps`	Azure Foundational Best Practices
Azure Container Apps should not have external ingress enabled	`microsoft.app/containerapps`	Azure Foundational Best Practices
Azure Container App environments should not have unrestricted NSG access	`microsoft.app/containerapps`	Azure Foundational Best Practices
Azure Container App managed environments should not have public IP enabled	`microsoft.app/managedenvironments`	Azure Foundational Best Practices
Azure role assignments should not grant broad admin access at subscription scope	`microsoft.authorization/roleassignments`	Azure Foundational Best Practices
Azure role assignments should not grant the User Access Administrator role	`microsoft.authorization/roleassignments`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure custom role definitions should not have wildcard administrative permissions	`microsoft.authorization/roledefinitions`	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Cloud Security Benchmark policy assignments should have enforcement mode enabled	`microsoft.authorization/policyassignments`	CIS Microsoft Azure Foundations Benchmark v4.0

Control title	Resource type	Standard
Azure Kubernetes Service (AKS) clusters should not have publicly accessible API servers without IP restrictions	`microsoft.containerservice/managedclusters`	Azure Foundational Best Practices
Azure Kubernetes Service (AKS) clusters should encrypt Kubernetes secrets at rest	`microsoft.containerservice/managedclusters`	Azure Foundational Best Practices
Azure Kubernetes Service (AKS) clusters should run a supported Kubernetes version	`microsoft.containerservice/managedclusters`	Azure Foundational Best Practices
Azure Cosmos DB accounts should have continuous backup enabled	`microsoft.documentdb/databaseaccounts`	Azure Foundational Best Practices
Azure Database for MySQL flexible servers should have public network access disabled	`microsoft.dbformysql/flexibleservers`	Azure Foundational Best Practices
Azure Databricks workspaces should be deployed in a customer-managed virtual network	`microsoft.databricks/workspaces`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Databricks workspaces should have diagnostic log delivery configured	`microsoft.databricks/workspaces`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Databricks workspaces should use customer-managed keys for managed disk encryption	`microsoft.databricks/workspaces`	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra ID authorization policies should prohibit default users from registering applications	`microsoft.graph/policies/authorizationpolicy`	CIS Microsoft Azure Foundations Benchmark v4.0

Control title	Resource type	Standard
Azure Entra ID should have security defaults enabled	microsoft.graph/policies/identitysecuritydefaultsenforcementpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra tenants should have a Conditional Access policy that blocks access from disallowed geographic locations	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra tenants should have a Conditional Access policy that blocks the device code authentication flow	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Azure conditional access policies should require MFA for all users	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra tenants should require multifactor authentication for risky sign-ins through a Conditional Access policy	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Azure tenants should require MFA via Conditional Access for the Azure Service Management API	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
At least one Conditional Access policy should require MFA for Microsoft Admin Portals	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra authorization policies should restrict non-admin users from creating tenants	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0

Control title	Resource type	Standard
Microsoft Entra ID authentication methods policies should set the reconfirmation period to a non-zero value	microsoft.graph/policies/authenticationmethodspolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra authorization policies should restrict user consent for applications	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Azure authorization policies should restrict user consent to verified publisher apps	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra authorization policies should restrict guest user access to their own directory objects	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Azure authorization policies should restrict guest invitations to admin roles only	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Azure authorization policies should restrict security group creation to administrators	microsoft.graph/policies/authorizationpolicy	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra tenants should require multi-factor authentication to register or join devices	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0
Microsoft Entra ID directory roles should have between 2 and 4 Global Administrators	microsoft.graph/directoryrole	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Entra ID group settings should restrict group creation to administrators	microsoft.graph/organization	CIS Microsoft Azure Foundations Benchmark v4.0

Control title	Resource type	Standard
Azure subscriptions should have a diagnostic setting configured for activity logs	`microsoft.insights/diagnosticsettings`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for create policy assignment	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for policy assignment deletion	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for create or update Network Security Group operations	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for Network Security Group deletion	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for create or update Security Solution	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for Security Solution deletion	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for create or update of SQL server firewall rules	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for deleting SQL server firewall rules	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0

Control title	Resource type	Standard
Azure subscriptions should have an activity log alert configured for Create or Update Public IP Address operations	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for Public IP address deletion	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have an activity log alert for Service Health incidents	`microsoft.insights/activitylogalerts`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure subscriptions should have at least one Application Insights component configured	`microsoft.insights/components`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vaults should have soft delete and purge protection enabled	`microsoft.keyvault/vaults`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vaults should have role-based access control enabled	`microsoft.keyvault/vaults`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vaults should have public network access disabled when using private endpoints	`microsoft.keyvault/vaults`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vaults should use private endpoints	`microsoft.keyvault/vaults`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vaults should have purge protection enabled	`microsoft.keyvault/vaults`	Azure Foundational Best Practices
Azure Key Vaults should restrict network access	`microsoft.keyvault/vaults`	Azure Foundational Best Practices

Control title	Resource type	Standard
Azure Key Vaults should have AuditEvent logging enabled	`microsoft.keyvault/vaults`	CIS Microsoft Azure Foundations Benchmark v4.0
Azure Key Vault keys in RBAC vaults should have an expiration date set	`microsoft.keyvault/vaults/keys`	CIS Microsoft Azure Foundations Benchmark v4.0

Azure Function apps on Premium or Dedicated plans should be integrated with a virtual network	`microsoft.web/sites`	Azure Foundational Best Practices
Azure App Service web apps should have HTTP logs enabled in diagnostic settings	`microsoft.web/sites`	CIS Microsoft Azure Foundations Benchmark v4.0

Deleting a Microsoft Azure connector in Security Hub CSPM

After you create a Microsoft Azure connector in AWS Security Hub CSPM, you can delete it at any time. If you delete a connector, Security Hub CSPM stops performing posture management checks and vulnerability monitoring for your Azure environment. Security Hub CSPM also stops generating new findings about your environment. Your existing findings are retained for 90 days. Resource inventory remains as it was when the connector was deleted and is removed after 90 days.

When you delete a connector, note the following:

- Security Hub CSPM doesn't delete the Azure application registration and Event Hub infrastructure in your Azure environment. You must delete these manually, directly in Microsoft Azure. To learn how, see Remove an application in the Microsoft Azure documentation.
- If the connector is a customer-managed connector and a service-linked connector also exists, deleting the customer-managed connector does not affect the service-linked connector. Security Hub CSPM continues to receive posture management findings through the service-linked connector.

- Existing findings transition to an archived state within 3-5 days and are deleted after the 90-day retention period.

To delete an Azure connector

1. Open the Security Hub CSPM console.
2. In the navigation pane, choose **Integrations**.
3. Select your connector.
4. Choose **Delete**.
5. When prompted, confirm that you want to delete the connector.

After deletion, you can optionally clean up the Azure resources that were created during setup:

- Delete the app registration in Microsoft Entra ID.
- Delete the Event Hub namespace and resource group.
- Remove the diagnostic settings that export Activity Logs and Entra ID Audit Logs.

Creating and updating findings in Security Hub CSPM

In AWS Security Hub CSPM, a *finding* is an observable record of a security check or security-related detection. A finding can originate from one of the following sources:

- A security check for a control in Security Hub CSPM.
- An integration with another AWS service.
- An integration with a third-party product.
- A custom integration.

Security Hub CSPM normalizes findings from all sources into a standard syntax and format called the *AWS Security Finding Format (ASFF)*. For detailed information about this format, including descriptions of individual ASFF fields, see AWS Security Finding Format (ASFF). If you enable cross-Region aggregation, Security Hub CSPM also aggregates new and updated findings automatically from all linked Regions to an aggregation Region that you specify. For more information, see Understanding cross-Region aggregation in Security Hub CSPM.

After a finding is created, it can be updated as follows:

- A finding provider can use the BatchImportFindings operation of the Security Hub CSPM API to update general information about the finding. Finding providers can only update findings that they created.
- A customer can use the Security Hub CSPM console or the BatchUpdateFindings operation of the Security Hub CSPM API to update the status of the investigation into the finding. The `BatchUpdateFindings` operation can also be used by a SIEM, ticketing, incident management, SOAR, or other type of tool on behalf of a customer.

To reduce finding noise and streamline tracking and analysis of individual findings, Security Hub CSPM automatically deletes findings that haven't been updated recently. The timing with which Security Hub CSPM does this depends on whether a finding is active or archived:

- An *active finding* is a finding whose record state (`RecordState`) is `ACTIVE`. Security Hub CSPM stores active findings for 90 days. If an active finding hasn't been updated for 90 days, it expires and Security Hub CSPM permanently deletes it.
- An *archived finding* is a finding whose record state (`RecordState`) is `ARCHIVED`. Security Hub CSPM stores archived findings for 30 days. If an archived finding hasn't been updated for 30 days, it expires and Security Hub CSPM permanently deletes it.

For control findings, which are findings that Security Hub CSPM generates from security checks for controls, Security Hub CSPM determines whether a finding has expired based on the value for the `UpdatedAt` field of the finding. If this value was more than 90 days ago for an active finding, Security Hub CSPM permanently deletes the finding. If this value was more than 30 days ago for an archived finding, Security Hub CSPM permanently deletes the finding.

For all other types of findings, Security Hub CSPM determines whether a finding has expired based on the values for the `ProcessedAt` and `UpdatedAt` fields of the finding. Security Hub CSPM compares the values for these fields and determines which is more recent. If the more recent value was more than 90 days ago for an active finding, Security Hub CSPM permanently deletes the finding. If the more recent value was more than 30 days ago for an archived finding, Security Hub CSPM permanently deletes the finding. Finding providers can change the value for the `UpdatedAt` field of one or more findings by using the BatchImportFindings operation of the Security Hub CSPM API.

For longer-term retention of findings, you can export findings to an S3 bucket. You can do this by using a custom action with an Amazon EventBridge rule. For more information, see Using EventBridge for automated response and remediation.

Topics

- BatchImportFindings for finding providers
- BatchUpdateFindings for customers
- Reviewing finding details and history in Security Hub CSPM
- Filtering findings in Security Hub CSPM
- Grouping findings in Security Hub CSPM
- Setting the workflow status of findings in Security Hub CSPM
- Sending findings to a custom Security Hub CSPM action
- AWS Security Finding Format (ASFF)

BatchImportFindings for finding providers

Finding providers can use the BatchImportFindings operation to create new findings in AWS Security Hub CSPM. They can also use this operation to update findings that they created. Finding providers can't update findings that they didn't create.

Customers, SIEMs, ticketing, SOAR, and other types of tools must use the BatchUpdateFindings operation to make updates related to their investigation of findings from finding providers. For more information, see the section called “BatchUpdateFindings for customers”.

When Security Hub CSPM receives a `BatchImportFindings` request to create or update a finding, it automatically generates a **Security Hub Findings - Imported** event in Amazon EventBridge. You can take automated action on that event. For more information, see the section called “Automated response and remediation”.

Prerequisites for using `BatchImportFindings`

`BatchImportFindings` must be called by one of the following:

- The account that is associated with the findings. The identifier of the associated account must match the value of the `AwsAccountId` attribute for the finding.
- An account that is allow-listed as an official Security Hub CSPM partner integration.

Security Hub CSPM can only accept finding updates for accounts that have Security Hub CSPM enabled. The finding provider also must be enabled. If Security Hub CSPM is disabled, or the

finding provider integration is not enabled, then the findings are returned in the `FailedFindings` list, with an `InvalidAccess` error.

Determining whether to create or update a finding

To determine whether to create or update a finding, Security Hub CSPM checks the `ID` field. If the value of `ID` doesn't match an existing finding, Security Hub CSPM creates a new finding.

If `ID` matches an existing finding, Security Hub CSPM checks the `UpdatedAt` field for the update, and proceeds as follows:

- If `UpdatedAt` on the update matches or occurs before `UpdatedAt` on the existing finding, Security Hub CSPM ignores the update request.
- If `UpdatedAt` on the update occurs after `UpdatedAt` on the existing finding, Security Hub CSPM updates the existing finding.

Restrictions on finding updates with `BatchImportFindings`

Finding providers can't use `BatchImportFindings` to update the following attributes of an existing finding:

- `Note`
- `UserDefinedFields`
- `VerificationState`
- `Workflow`

Security Hub CSPM ignores any content provided in a `BatchImportFindings` request for these attributes. Customers, or entities acting on their behalf (such as ticketing tools), can use `BatchUpdateFindings` to update these attributes.

Updating findings with FindingProviderFields

Finding providers also shouldn't use `BatchImportFindings` to update the following top-level attributes in the AWS Security Finding Format (ASFF):

- `Confidence`
- `Criticality`

- `RelatedFindings`
- `Severity`
- `Types`

Instead, finding providers should use the `FindingProviderFields` object to provide values for these attributes.

Example

```
"FindingProviderFields": {
    "Confidence": 42,
    "Criticality": 99,
    "RelatedFindings":[
      {
        "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/guardduty",
        "Id": "123e4567-e89b-12d3-a456-426655440000"
      }
    ],
    "Severity": {
        "Label": "MEDIUM",
        "Original": "MEDIUM"
    },
    "Types": [ "Software and Configuration Checks/Vulnerabilities/CVE" ]
}
```

For `BatchImportFindings` requests, Security Hub CSPM handles values in the top-level attributes and in `FindingProviderFields` as follows.

(Preferred) `BatchImportFindings` provides a value for an attribute in `FindingProviderFields`, but does not provide a value for the corresponding top-level attribute.

For example, `BatchImportFindings` provides `FindingProviderFields.Confidence`, but does not provide `Confidence`. This is the preferred option for `BatchImportFindings` requests.

Security Hub CSPM updates the value of the attribute in `FindingProviderFields`.

It replicates the value to the top-level attribute only if the attribute wasn't already updated by `BatchUpdateFindings`.

`BatchImportFindings` provides a value for a top-level attribute, but does not provide a value for the corresponding attribute in `FindingProviderFields`.

For example, `BatchImportFindings` provides `Confidence`, but does not provide `FindingProviderFields.Confidence`.

Security Hub CSPM uses the value to update the attribute in `FindingProviderFields`. It overwrites any existing value.

Security Hub CSPM updates the top-level attribute only if the attribute was not already updated by `BatchUpdateFindings`.

`BatchImportFindings` provides a value for both a top-level attribute and the corresponding attribute in `FindingProviderFields`.

For example, `BatchImportFindings` provides both `Confidence` and `FindingProviderFields.Confidence`.

For a new finding, Security Hub CSPM uses the value in `FindingProviderFields` to populate both the top-level attribute and the corresponding attribute in `FindingProviderFields`. It doesn't use the provided top-level attribute value.

For an existing finding, Security Hub CSPM uses both values. However, it updates the top-level attribute value only if the attribute was not already updated by `BatchUpdateFindings`.

BatchUpdateFindings for customers

AWS Security Hub CSPM customers, and entities acting on their behalf, can use the BatchUpdateFindings operation to update information related to the processing of Security Hub CSPM findings from finding providers. As a customer, you can use this operation directly. SIEM, ticketing, incident management, and SOAR tools can also use this operation on behalf of a customer.

You can't use the `BatchUpdateFindings` operation to create new findings. However, you can use it to update up to 100 existing findings at a time. In a `BatchUpdateFindings` request, you specify which findings to update, which AWS Security Finding Format (ASFF) fields to update for the findings, and the new values for the fields. Security Hub CSPM then updates the findings as specified in your request. This process can take several minutes. If you update findings by using the `BatchUpdateFindings` operation, your updates don't affect existing values for the `UpdatedAt` field of the findings.

When Security Hub CSPM receives a `BatchUpdateFindings` request to update a finding, it automatically generates a **Security Hub Findings – Imported** event in Amazon EventBridge. You can optionally use this event to take automated action on the specified finding. For more information, see the section called "Automated response and remediation".

Available fields for BatchUpdateFindings

If you are signed in to a Security Hub CSPM administrator account, you can use `BatchUpdateFindings` to update findings that were generated by the administrator account or member accounts. Member accounts can use `BatchUpdateFindings` to update findings for their account only.

Customers can use `BatchUpdateFindings` to update the following fields and objects:

- `Confidence`
- `Criticality`
- `Note`
- `RelatedFindings`
- `Severity`
- `Types`
- `UserDefinedFields`
- `VerificationState`
- `Workflow`

Configuring access to BatchUpdateFindings

You can configure AWS Identity and Access Management (IAM) policies to restrict access to using `BatchUpdateFindings` to update finding fields and field values.

In a statement to restrict access to `BatchUpdateFindings`, use the following values:

- `Action` is `securityhub:BatchUpdateFindings`
- `Effect` is `Deny`
- For `Condition`, you can deny a `BatchUpdateFindings` request based on the following:
  - The finding includes a specific field.
  - The finding includes a specific field value.

Condition keys

These are the condition keys for restricting access to `BatchUpdateFindings`.

ASFF field

The condition key for an ASFF field is as follows:

```
securityhub:ASFFSyntaxPath/<fieldName>
```

Replace *<fieldName>* with the ASFF field. When configuring access to `BatchUpdateFindings`, include one or more specific ASFF fields in your IAM policy rather than a parent-level field. For example, to restrict access to the `Workflow.Status` field, you must include `securityhub:ASFFSyntaxPath/Workflow.Status` in your policy instead of the `Workflow` parent-level field.

Disallowing all updates to a field

To prevent a user from making any update to a specific field, use a condition like this:

```
 "Condition": {
                "Null": {
                    "securityhub:ASFFSyntaxPath/<fieldName>": "false"
               }
}
```

For example, the following statement indicates that `BatchUpdateFindings` can't be used to update the `Workflow.Status` field of findings.

```
{
    "Sid": "VisualEditor0",
    "Effect": "Deny",
    "Action": "securityhub:BatchUpdateFindings",
    "Resource": "*",
    "Condition": {
        "Null": {
            "securityhub:ASFFSyntaxPath/Workflow.Status": "false"
        }
    }
}
```

Disallowing specific field values

To prevent a user from setting a field to a specific value, use a condition like this:

```
"Condition": {
                "StringEquals": {
                    "securityhub:ASFFSyntaxPath/<fieldName>": "<fieldValue>"
                }
}
```

For example, the following statement indicates that `BatchUpdateFindings` can't be used to set `Workflow.Status` to `SUPPRESSED`.

```
{
    "Sid": "VisualEditor0",
    "Effect": "Deny",
    "Action": "securityhub:BatchUpdateFindings",
    "Resource": "*",
    "Condition": {
    "StringEquals": {
        "securityhub:ASFFSyntaxPath/Workflow.Status": "SUPPRESSED"
    }
}
```

You can also provide a list of values that are not permitted.

```
 "Condition": {
                "StringEquals": {
                    "securityhub:ASFFSyntaxPath/<fieldName>": [ "<fieldValue1>",
 "<fieldValue2>", "<fieldValuen>" ]
                }
}
```

For example, the following statement indicates that `BatchUpdateFindings` can't be used to set `Workflow.Status` to either `RESOLVED` or `SUPPRESSED`.

```
{
    "Sid": "VisualEditor0",
    "Effect": "Deny",
    "Action": "securityhub:BatchUpdateFindings",
    "Resource": "*",
```

```
    "Condition": {
    "StringEquals": {
        "securityhub:ASFFSyntaxPath/Workflow.Status": [
            "RESOLVED",
            "NOTIFIED"
        ]
    }
}
```

Reviewing finding details and history in Security Hub CSPM

In AWS Security Hub CSPM, a *finding* is an observable record of a security check or security-related detection. Security Hub CSPM generates a finding when it completes a security check of a control and when it ingests a finding from an integrated AWS service or third-party product. Each finding includes a history of changes and other details, such as a severity rating and information about the affected resources.

You can review the history and other details of individual findings on the Security Hub CSPM console or programmatically with the Security Hub CSPM API or the AWS CLI.

To help you streamline your analysis, the Security Hub CSPM console displays a finding panel when you choose a specific finding. The panel includes different menus and tabs for reviewing specific details of a finding.

Actions menu

From this menu, you can review the complete JSON of a finding or add notes. A finding can have only one note attached to it at a time. This menu also provides options to set the workflow status of a finding or send a finding to a custom action in Amazon EventBridge.

Investigate menu

From this menu, you can investigate a finding in Amazon Detective. Detective extracts entities, such as IP addresses and AWS users, from a finding and visualizes their activity. You can use the entity activity as a starting point to investigate the cause and impact of a finding.

Overview tab

This tab provides a summary of a finding. For example, you can determine when a finding was created and last updated, in which account it exists, and the source of the finding. For control findings, this tab also shows the name of the associated AWS Config rule and a link to remediation guidance in the Security Hub CSPM documentation.

In the **Resources** snapshot on the **Overview** tab, you can get a brief overview of the resources involved in a finding. For some resources, this includes an **Open resource** option, which links directly to an impacted resource on the relevant AWS service console. The **History** snapshot shows up to two changes made to the finding on the most recent date for which history is being tracked. For example, if you made one change yesterday and another one today, the snapshot shows today's change. To review earlier entries, switch to the **History** tab.

The **Compliance** row expands to show more details. For example, if a control includes parameters, you can review the parameter values that Security Hub CSPM currently uses when conducting security checks for the control.

Resources tab

This tab provides details about the resources involved in a finding. If you're signed in to the account that owns a resource, you can review the resource in the applicable AWS service console. If you're not the owner of a resource, this tab displays the AWS account ID for the owner.

The **Details** row shows resource-specific details in a finding. It shows the ResourceDetails section of the finding in JSON format.

The **Tags** row shows tag keys and values that are assigned to the resources involved in a finding. Resources that are supported by the GetResources operation of the AWS Resource Groups Tagging API can be tagged. Security Hub CSPM calls this operation by using a service-linked role when processing new or updated findings, and retrieves the resource tags if the AWS Security Finding Format (ASFF) `Resource.Id` field is populated with the ARN of a resource. Security Hub CSPM ignores invalid resource IDs. For more information about the inclusion of resource tags in findings, see Tags.

History tab

This tab tracks the history of a finding. Finding history is available for active and archived findings. It provides an immutable trail of changes made to a finding over time, including what ASFF field changed, when the change occurred, and by which user. Each page on the tab displays up to 20 changes. More recent changes are displayed first.

For active findings, finding history is available for up to 90 days. For archived findings, finding history is available for up to 30 days. Finding history includes changes that were made manually, or automatically by Security Hub CSPM automation rules. It doesn't include changes to top-level timestamp fields, such as the `CreatedAt` and `UpdatedAt` fields.

If you're signed in to a Security Hub CSPM administrator account, finding history is for the administrator account and all member accounts.

Threat tab

This tab includes data from the Action, Malware, and ProcessDetails objects of the ASFF, including the type of threat and whether a resource is the target or actor. These details typically apply to findings that originate in Amazon GuardDuty.

Vulnerabilities tab

This tab displays data from the Vulnerability object of the ASFF, including whether there are exploits or available fixes associated with a finding. These details typically apply to findings that originate in Amazon Inspector.

The rows on each tab include a copy or filter option. For example, if you open the panel for a finding that has a workflow status of **Notified**, you can choose the filter option next to the **Workflow status** row. If you choose **Show all findings with this value**, Security Hub CSPM filters the findings table and displays only findings with the same workflow status.

Reviewing finding details and history

Choose your preferred method, and follow the steps to review finding details in Security Hub CSPM.

If you enable cross-Region aggregation and sign in to the aggregation Region, finding data includes data from the aggregation Region and linked Regions. In other Regions, finding data is specific to that Region only. For more information about cross-Region aggregation, see the section called “Aggregating data across Regions”.

Security Hub CSPM console

Reviewing finding details and history

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. To display a finding list, do one of the following:
   - In the navigation pane, choose **Findings**. Add search filters as necessary to narrow the finding list.

- In the navigation pane, choose **Insights**. Choose an insight. Then, in the results list, choose an insight result.
- In the navigation pane, choose **Integrations**. Choose **See findings** for an integration.
- In the navigation pane, choose **Controls**.

3. Choose a finding. The finding panel displays the details of the finding.
4. In the finding panel, do any of the following:

- To review specific details for the finding, choose a tab.
- To take action on the finding, choose an option from the **Actions** menu.
- To investigate the finding in Amazon Detective, choose an **Investigate** option.

> **Note**
>
> If you integrate with AWS Organizations and you're signed in to a member account, the finding panel includes the account name. For member accounts that are invited manually, instead of through Organizations, the finding panel includes only the account ID.

Security Hub CSPM API

Use the GetFindings operation of the Security Hub CSPM API, or if you're using the AWS CLI, run the get-findings command. You can provide one or more values for the `Filters` parameter to narrow the findings to retrieve.

If the volume of results is too large, you can use the `MaxResults` parameter to limit the findings to a specified number and the `NextToken` parameter to paginate findings. Use the `SortCriteria` parameter to sort the findings by a specific field.

For example, the following AWS CLI command retrieves the findings that match the specified filter criteria, and sorts the results in descending order by the `LastObservedAt` field. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub get-findings \
--filters '{"GeneratorId":[{"Value": "aws-
foundational","Comparison":"PREFIX"}],"WorkflowStatus": [{"Value":
```

```
"NEW","Comparison":"EQUALS"}],"Confidence": [{"Gte": 85}]}' --sort-criteria
'{"Field": "LastObservedAt","SortOrder": "desc"}' --page-size 5 --max-items 100
```

To review finding history, use the GetFindingHistory operation. If you're using the AWS CLI, run the get-finding-history command. Identify the finding that you want to get history for with the `ProductArn` and `Id` fields. For information about these fields, see AwsSecurityFindingIdentifier. Each request can retrieve the history for only one finding.

For example, the following AWS CLI command retrieves the history for the specified finding. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub get-finding-history \
--region us-west-2 \
--finding-identifier Id="a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",ProductArn="arn:aws:securityhub:us-
west-2:123456789012:product/123456789012/default" \
--max-results 2 \
--start-time "2021-09-30T15:53:35.573Z" \
--end-time "2021-09-31T15:53:35.573Z"
```

PowerShell

Use the `Get-SHUBFinding` cmdlet. Optionally populate the `Filter` parameter to narrow the findings to retrieve.

For example, the following cmdlet retrieves the findings that match the specified filters.

```
Get-SHUBFinding -Filter @{AwsAccountId =
 [Amazon.SecurityHub.Model.StringFilter]@{Comparison = "EQUALS"; Value =
 "XXX"};ComplianceStatus = [Amazon.SecurityHub.Model.StringFilter]@{Comparison =
 "EQUALS"; Value = 'FAILED'}}
```

Note

If you filter findings by `CompanyName` or `ProductName`, Security Hub CSPM uses the values that are part of the `ProductFields` ASFF object. Security Hub CSPM doesn't use the top-level `CompanyName` and `ProductName` fields.

Filtering findings in Security Hub CSPM

AWS Security Hub CSPM generates its own findings from security checks and receives findings from integrated products. You can display a list of findings on the **Findings**, **Integrations**, and **Insights** pages of the Security Hub CSPM console. You can add filters to narrow a finding list so that the list is relevant to your organization or use case.

For information about filtering findings for a specific security control, see the section called "Filtering and sorting control findings". The information on this page applies to the **Findings**, **Insights**, and **Integrations** pages.

Default filters on finding lists

By default, finding lists on the Security Hub CSPM console are filtered based on the `RecordState` and `Workflow.Status` fields of the AWS Security Finding Format (ASFF). This is in addition to the filters for a specific insight or integration.

Record state indicates whether a finding is active or archived. By default, a finding list only shows active findings. A finding provider can archive a finding if it's no longer active or important. Security Hub CSPM also automatically archives control findings if the associated resource is deleted.

Workflow status indicates the status of an investigation into a finding. By default, a finding list only shows findings with a workflow status of `NEW` or `NOTIFIED`. You can update the workflow status of a finding.

Instructions for adding filters

You can filter a finding list by up to ten attributes. For each attribute, you can provide up to 20 filter values.

When filtering the finding list, Security Hub CSPM applies `AND` logic to the set of filters. A finding matches only if it matches all of the provided filters. For example, if you add GuardDuty as a filter for **Product name**, and `AwsS3Bucket` as a filter for **Resource type**, Security Hub CSPM displays findings that match both of these criteria.

Security Hub CSPM applies `OR` logic to filters that use the same attribute but different values. For example, if you add both GuardDuty and Amazon Inspector as filter values for **Product name**, Security Hub CSPM displays findings that were generated by either GuardDuty or Amazon Inspector.

To add filters to a findings list (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. To display a findings list, take one of the following actions from the navigation pane:
   - Choose **Findings**.
   - Choose **Insights**. Choose an insight. Then, on the results list, choose an insight result.
   - Choose **Integrations**. Choose **See findings** for an integration.
3. In the **Add filters** box, select one or more fileds to filter by.

   When you filter by **Company name** or **Product name**, the console uses the top-level `CompanyName` and `ProductName` fields of the AWS Security Finding Format (ASFF). The API uses the values that are nested under `ProductFields`.
4. Choose the filter match type.

   For a string filter, you can choose from the following options:
   - **is** – Find a value that exactly matches the filter value.
   - **starts with** – Find a value that starts with the filter value.
   - **is not** – Find a value that does not match the filter value.
   - **does not start with** – Find a value that does not start with the filter value.

   For the **Resource tags** field, you can filter based on specific keys or values.

   For a numeric filter, you can choose whether to provide a single number (**Simple**) or a range of numbers (**Range**).

   For a date or time filter, you can choose whether to provide a length of time from the current date and time (**Rolling window**) or a specific date range (**Fixed range**).

   Adding multiple filters has the following interactions:
   - **is** and **starts with** filters are joined by OR. A value matches if it contains any of the filter values. For example, if you specify **Severity label is CRITICAL** and **Severity label is HIGH**, the results include both critical and high severity findings.

- **is not** and **does not start with** filters are joined by AND. A value matches only if it does not contain any of those filter values. For example, if you specify **Severity label is not LOW** and **Severity label is not MEDIUM**, the results don't include low or medium severity findings.

If you have an **is** filter on a field, you can't have an **is not** or a **does not start with** filter on the same field.

5. Specify the filter value. For string filters, the filter value is case sensitive.
6. Choose **Apply**.

For an existing filter, you can change the filter match type or value. On a filtered finding list, choose the filter. In the **Edit filter** box, choose the new match type or value, and then choose **Apply**.

To remove a filter, choose the **x** icon. The list is updated automatically to reflect the change.

Grouping findings in Security Hub CSPM

You can group findings in AWS Security Hub CSPM based on the values of a selected attribute.

When you group the findings, the list of findings is replaced with a list of values for the selected attribute in the matching findings. For each value, the list displays the number of matching findings.

For example, if you group the findings by AWS account ID, you see a list of account identifiers, with the number of matching findings for each account.

Security Hub CSPM can display up to 100 values for a selected attribute. If there are more than 100 values, you only see the first 100.

When you choose an attribute value, Security Hub CSPM displays the list of matching findings for that value.

To group the findings in a findings list (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. To display a findings list, take one of the following actions from the navigation pane:

   - Choose **Findings**.

- Choose **Insights**. Choose an insight. Then, on the results list, choose an insight result.
- Choose **Integrations**. Choose **See findings** for an integration.

3. In the **Group by** drop down, choose the attribute to use for the grouping.

   To remove a grouping attribute, choose the **x** icon. When you remove the grouping attribute, the list changes from the list of attribute values to a list of findings.

Setting the workflow status of findings in Security Hub CSPM

Workflow status tracks the progress of your investigation into a finding. Workflow status is specific to an individual finding and doesn't affect generation of new findings. For example, if you change the workflow status of a finding to `SUPPRESSED` or `RESOLVED`, your change doesn't prevent Security Hub CSPM from generating a new finding for the same issue.

The workflow status of a finding can be one of the following values.

NEW

The initial state of a finding before you review it.

Findings that are ingested from integrated AWS services, such as AWS Config, have `NEW` as their initial status.

Security Hub CSPM also resets the workflow status from either `NOTIFIED` or `RESOLVED` to `NEW` in the following cases:

- `RecordState` changes from `ARCHIVED` to `ACTIVE`.
- `Compliance.Status` changes from `PASSED` to `FAILED`, `WARNING`, or `NOT_AVAILABLE`.

These changes imply that additional investigation is required.

NOTIFIED

Indicates that you notified the resource owner about the security issue. You can use this status when you are not the resource owner, and you need intervention from the resource owner in order to resolve a security issue.

If one of the following occurs, the workflow status is changed automatically from `NOTIFIED` to `NEW`:

- `RecordState` changes from `ARCHIVED` to `ACTIVE`.
- `Compliance.Status` changes from `PASSED` to `FAILED`, `WARNING`, or `NOT_AVAILABLE`.

SUPPRESSED

Indicates that you reviewed the finding and do not believe that any action is needed.

The workflow status of a `SUPPRESSED` finding does not change if `RecordState` changes from `ARCHIVED` to `ACTIVE`.

RESOLVED

The finding was reviewed and remediated and is now considered resolved.

The finding remains `RESOLVED` unless one of the following occurs:

- `RecordState` changes from `ARCHIVED` to `ACTIVE`.
- `Compliance.Status` changes from `PASSED` to `FAILED`, `WARNING`, or `NOT_AVAILABLE`.

In those cases, the workflow status is automatically reset to `NEW`.

For findings from controls, if `Compliance.Status` is `PASSED`, Security Hub CSPM automatically sets the workflow status to `RESOLVED`.

Setting the workflow status of findings

To change the workflow status of one or more findings, you can use the Security Hub CSPM console or the Security Hub CSPM API. If you change the workflow status of a finding, note that it can take several minutes for Security Hub CSPM to process your request and update the finding.

> **Tip**
>
> You can also change the workflow status of findings automatically by using automation rules. With automation rules, you configure Security Hub CSPM to automatically update the workflow status of findings based on criteria that you specify. For more information, see Understanding automation rules in Security Hub CSPM.

To change the workflow status of one or more findings, choose your preferred method and follow the steps.

Security Hub CSPM console

To change the workflow status of findings

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, do one of the following to display a table of findings:
   - Choose **Findings**.
   - Choose **Insights**. Then choose an insight. In the insight results, choose a result.
   - Choose **Integrations**. Then, in the section for the integration, choose **See findings**.
   - Choose **Security standards**. Then, in the section for the standard, choose **View results**. In the table of controls, choose a control to display findings for the control.
3. In the findings table, select the check box for each finding whose workflow status you want to change.
4. At the top of the page, choose **Workflow status**, and then choose the new workflow status for the selected findings.
5. In the **Set workflow status** dialog box, optionally enter a note that details the reason for changing the workflow status. Then choose **Set status**.

Security Hub CSPM API

Use the BatchUpdateFindings operation. Provide both the finding ID and the ARN of the product that generated the finding. You can get these details by using the GetFindings operation.

AWS CLI

Run the batch-update-findings command. Provide both the finding ID and the ARN of the product that generated the finding. You can get these details by running the get-findings command.

```
batch-update-findings --finding-identifiers
 Id="<findingID>",ProductArn="<productARN>" --workflow Status="<workflowStatus>"
```

Example

```
aws securityhub batch-update-findings --finding-identifiers
 Id="arn:aws:securityhub:us-west-1:123456789012:subscription/
pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",ProductArn="arn:aws:securityhub:us-west-1::product/aws/securityhub" --
workflow Status="RESOLVED"
```

Sending findings to a custom Security Hub CSPM action

You can create AWS Security Hub CSPM custom actions to automate Security Hub CSPM with Amazon EventBridge. For custom actions, the event type is **Security Hub Findings - Custom Action**. After you set up a custom action, you can send findings to it. For more information and detailed steps on creating custom actions, see the section called “Automated response and remediation”.

To send findings to a custom action (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. To display a finding list, do one of the following:
   - In the Security Hub CSPM navigation pane, choose **Findings**.
   - In the Security Hub CSPM navigation pane, choose **Insights**. Choose an insight. Then on the results list, choose an insight result.
   - In the Security Hub CSPM navigation pane, choose **Integrations**. Choose **See findings** for an integration.
   - In the Security Hub CSPM navigation pane, choose **Security standards**. Choose **View results** to display a list of controls. Then choose the control name.
3. In the finding list, select the check box for each finding to send to the custom action.

   You can send up to 20 findings at a time.
4. For **Actions**, choose the custom action.

AWS Security Finding Format (ASFF)

AWS Security Hub CSPM consumes and aggregates findings from integrated AWS services and third-party products. Security Hub CSPM processes these findings using a standard findings format

called the *AWS Security Finding Format (ASFF)*, which eliminates the need for time-consuming data conversion efforts.

This page provides a complete outline of the JSON for a finding in the AWS Security Finding Format (ASFF). The format derives from JSON Schema. Choose the name of a linked object to review an example of a finding for that object. Comparing your Security Hub CSPM findings with the resources and examples shown here can help you interpret your findings.

For descriptions of individual ASFF attributes, see the section called "Required top-level ASFF attributes" and the section called "Optional top-level ASFF attributes".

Impact of consolidation on ASFF fields and values

AWS Security Hub CSPM offers two types of consolidation for controls:

- **Consolidated controls view** – With this type of consolidation, each control has a single identifier across all standards. In addition, on the Security Hub CSPM console, the **Controls** page displays all controls across all standards.
- **Consolidated control findings** – With this type of consolidation, Security Hub CSPM produces a single finding for a control, even if the control applies to multiple enabled standards. This can reduce finding noise.

You can't enable or disable consolidated controls view. Consolidated control findings is enabled by default if you enable Security Hub CSPM on or after February 23, 2023. Otherwise, it's disabled by default. However, for organizations, consolidated control findings is enabled for Security Hub CSPM member accounts only if it's enabled for the administrator account. To learn more about consolidated control findings, see Generating and updating control findings.

Both types of consolidation affect fields and values for control findings in the AWS Security Finding Format (ASFF).

Topics

- Consolidated controls view – ASFF changes
- Consolidated control findings – ASFF changes

- Generator IDs before and after enabling consolidated control findings
- How consolidation impacts control IDs and titles
- Updating workflows for consolidation

Consolidated controls view – ASFF changes

The consolidated controls view feature introduced the following changes to fields and values for control findings in the ASFF. If your workflows don't rely on values for these ASFF fields, no action is required. If you have workflows that rely on specific values for these fields, update your workflows to use the current values.

ASFF field	Sample value before consolidated controls view	Sample value after consolidated controls view, and a description of the change
Compliance.SecurityControlId	Not applicable (new field)	EC2.2 Introduces a single control ID across standards. `ProductFields.RuleId` still provides the standard-based control ID for CIS v1.2.0 controls. `ProductFields.ControlId` still provides the standard-based control ID for controls in other standards.
Compliance.AssociatedStandards	Not applicable (new field)	[{"StandardsId": "standards/aws-foundational-security-best-practices/v/1.0.0"}] Shows which standards a control is enabled in.
ProductFields.ArchivalReasons:0/Description	Not applicable (new field)	"The finding is in an ARCHIVED state because consolidated control findings

ASFF field	Sample value before consolidated controls view	Sample value after consolidated controls view, and a description of the change
		has been turned on or off. This causes findings in the previous state to be archived when new findings are being generated." Describes why Security Hub CSPM has archived existing findings.
ProductFields.ArchivalReasons:0/ReasonCode	Not applicable (new field)	"CONSOLIDATED_CONTROL_FINDINGS_UPDATE" Provides the reason why Security Hub CSPM has archived existing findings.
ProductFields.RecommendationUrl	https://docs.aws.amazon.com/console/securityhub/PCI.EC2.2/remediation	https://docs.aws.amazon.com/console/securityhub/EC2.2/remediation This field no longer references a standard.
Remediation.Recommendation.Text	"For directions on how to fix this issue, consult the AWS Security Hub CSPM PCI DSS documentation."	"For directions on how to correct this issue, consult the AWS Security Hub CSPM controls documentation." This field no longer references a standard.

ASFF field	Sample value before consolidated controls view	Sample value after consolidated controls view, and a description of the change
Remediation.Recommendation.Url	https://docs.aws.amazon.com/console/securityhub/PCI.EC2.2/remediation	https://docs.aws.amazon.com/console/securityhub/EC2.2/remediation This field no longer references a standard.

Consolidated control findings – ASFF changes

If you enable consolidated control findings, you might be affected by the following changes to fields and values for control findings in the ASFF. These changes are in addition to the changes introduced by the consolidated controls view feature. If your workflows don't rely on values for these ASFF fields, no action is required. If you have workflows that rely on specific values for these fields, update your workflows to use the current values.

> **Tip**
>
> If you use the Automated Security Response on AWS v2.0.0 solution, note that it supports consolidated control findings. This means that you can maintain your current workflows if you enable consolidated control findings.

ASFF field	Example value before enabling consolidated control findings	Example value after enabling consolidated control findings, and a description of the change
GeneratorId	aws-foundational-security-best-practices/v/1.0.0/Config.1	security-control/Config.1 This field no longer references a standard.
Title	PCI.Config.1 AWS Config should be enabled	AWS Config should be enabled

ASFF field	Example value before enabling consolidated control findings	Example value after enabling consolidated control findings, and a description of the change
		This field no longer references standard-specific information.
Id	arn:aws:securityhub:eu-central-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.IAM.5/finding/ab6d6a26-a156-48f0-9403-115983e5a956	arn:aws:securityhub:eu-central-1:123456789012:security-control/iam.9/finding/ab6d6a26-a156-48f0-9403-115983e5a956 This field no longer references a standard.
ProductFields.ControlId	PCI.EC2.2	Removed. See `Compliance.SecurityControlId` instead. This field is removed in favor of a single, standard-agnostic control ID.
ProductFields.RuleId	1.3	Removed. See `Compliance.SecurityControlId` instead. This field is removed in favor of a single, standard-agnostic control ID.
Description	This PCI DSS control checks whether AWS Config is enabled in the current account and region.	This AWS control checks whether AWS Config is enabled in the current account and region. This field no longer references a standard.

Values for customer-provided ASFF fields after turning on consolidated control findings

If you enable consolidated control findings, Security Hub CSPM generates one finding across standards and archives the original findings (separate findings for each standard).

Updates that you made to the original findings by using the Security Hub CSPM console or the BatchUpdateFindings operation won't be preserved in the new findings. If necessary, you can recover this data by referring to the archived findings. To review archived findings, you can use the **Findings** page on the Security Hub CSPM console and set the **Record state** filter to **ARCHIVED**. Alternatively, you can use the GetFindings operation of the Security Hub CSPM API.

Customer-provided ASFF field	Description of change after enabling consolidated control findings
Confidence	Resets to empty state.
Criticality	Resets to empty state.

Customer-provided ASFF field	Description of change after enabling consolidated control findings
Note	Resets to empty state.
RelatedFindings	Resets to empty state.
Severity	Default severity of the finding (matches the severity of the control).
Types	Resets to standard-agnostic value.
UserDefinedFields	Resets to empty state.
VerificationState	Resets to empty state.
Workflow	New failed findings have a default value of `NEW`. New passed findings have a default value of `RESOLVED`.

Generator IDs before and after enabling consolidated control findings

The following table lists changes to generator ID values for controls when you enable consolidated control findings. These changes apply to controls that Security Hub CSPM supported as of February 15, 2023.

GeneratorID before enabling consolidated control findings	GeneratorID after enabling consolidated control findings
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.1	security-control/CloudWatch.1
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.10	security-control/IAM.16
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.11	security-control/IAM.17

GeneratorID before enabling consolidated control findings	GeneratorID after enabling consolidated control findings
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.12	security-control/IAM.4
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.13	security-control/IAM.9
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.14	security-control/IAM.6
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.16	security-control/IAM.2
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.2	security-control/IAM.5
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.20	security-control/IAM.18
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.22	security-control/IAM.1
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.3	security-control/IAM.8
arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule/1.4	security-control/IAM.3

How consolidation impacts control IDs and titles

Consolidated controls view and consolidated control findings standardize control IDs and titles across standards. The terms *security control ID* and *security control title* refer to these standard-agnostic values.

The Security Hub CSPM console displays standard-agnostic security control IDs and security control titles, regardless of whether consolidated control findings is enabled or disabled for your account. However, Security Hub CSPM findings contain standard-specific control titles, for PCI DSS and CIS v1.2.0, if consolidated control findings is disabled for your account. In addition, Security Hub CSPM findings contain the standard-specific control ID and security control ID. For examples of how consolidation impacts control findings, see Samples of control findings.

For controls that are part of the AWS Control Tower service-managed standard, the prefix `CT.` is removed from the control ID and title in findings when consolidated control findings is enabled.

To disable a security control in Security Hub CSPM, you must disable all standard controls that correspond to the security control. The following table shows the mapping of security control IDs and titles to standard-specific control IDs and titles. IDs and titles for controls that belong to the AWS Foundational Security Best Practices (FSBP) standard are already standard-agnostic. For a mapping of controls to the requirements of Center for Internet Security (CIS) v3.0.0, see Mapping of controls to CIS requirements in each version. To run your own scripts on this table, you can download it as a .csv file.

Standard	Standard control ID and title	Security control ID and title
CIS v1.2.0	1.1 Avoid the use of the root user	[CloudWatch.1] A log metric filter and alarm should exist for usage of the "root" user
CIS v1.2.0	1.10 Ensure IAM password policy prevents password reuse	[IAM.16] Ensure IAM password policy prevents password reuse
CIS v1.2.0	1.11 Ensure IAM password policy expires passwords within 90 days or less	[IAM.17] Ensure IAM password policy expires passwords within 90 days or less
CIS v1.2.0	1.12 Ensure no root user access key exists	[IAM.4] IAM root user access key should not exist
CIS v1.2.0	1.13 Ensure MFA is enabled for the root user	[IAM.9] MFA should be enabled for the root user
CIS v1.2.0	1.14 Ensure hardware MFA is enabled for the root user	[IAM.6] Hardware MFA should be enabled for the root user

Standard	Standard control ID and title	Security control ID and title
CIS v1.2.0	1.16 Ensure IAM policies are attached only to groups or roles	[IAM.2] IAM users should not have IAM policies attached
CIS v1.2.0	1.2 Ensure multi-factor authentic ation (MFA) is enabled for all IAM users that have a console password	[IAM.5] MFA should be enabled for all IAM users that have a console password
CIS v1.2.0	1.20 Ensure a support role has been created to manage incidents with Support	[IAM.18] Ensure a support role has been created to manage incidents with AWS Support
CIS v1.2.0	1.22 Ensure IAM policies that allow full "*:*" administrative privileges are not created	[IAM.1] IAM policies should not allow full "*" administrative privilege s
CIS v1.2.0	1.3 Ensure credentials unused for 90 days or greater are disabled	[IAM.8] Unused IAM user credentials should be removed
CIS v1.2.0	1.4 Ensure access keys are rotated every 90 days or less	[IAM.3] IAM users' access keys should be rotated every 90 days or less
CIS v1.2.0	1.5 Ensure IAM password policy requires at least one uppercase letter	[IAM.11] Ensure IAM password policy requires at least one uppercase letter
CIS v1.2.0	1.6 Ensure IAM password policy requires at least one lowercase letter	[IAM.12] Ensure IAM password policy requires at least one lowercase letter
CIS v1.2.0	1.7 Ensure IAM password policy requires at least one symbol	[IAM.13] Ensure IAM password policy requires at least one symbol
CIS v1.2.0	1.8 Ensure IAM password policy requires at least one number	[IAM.14] Ensure IAM password policy requires at least one number

Standard	Standard control ID and title	Security control ID and title
CIS v1.2.0	1.9 Ensure IAM password policy requires minimum password length of 14 or greater	[IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
CIS v1.2.0	2.1 Ensure CloudTrail is enabled in all regions	[CloudTrail.1] CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events
CIS v1.2.0	2.2 Ensure CloudTrail log file validation is enabled	[CloudTrail.4] CloudTrail log file validation should be enabled
CIS v1.2.0	2.3 Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible	[CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
CIS v1.2.0	2.4 Ensure CloudTrail trails are integrated with CloudWatch Logs	[CloudTrail.5] CloudTrail trails should be integrated with Amazon CloudWatch Logs
CIS v1.2.0	2.5 Ensure AWS Config is enabled	[Config.1] AWS Config should be enabled and use the service-linked role for resource recording
CIS v1.2.0	2.6 Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket	[CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
CIS v1.2.0	2.7 Ensure CloudTrail logs are encrypted at rest using KMS CMKs	[CloudTrail.2] CloudTrail should have encryption at-rest enabled
CIS v1.2.0	2.8 Ensure rotation for customer created CMKs is enabled	[KMS.4] AWS KMS key rotation should be enabled
CIS v1.2.0	2.9 Ensure VPC flow logging is enabled in all VPCs	[EC2.6] VPC flow logging should be enabled in all VPCs

Standard	Standard control ID and title	Security control ID and title
CIS v1.2.0	3.1 Ensure a log metric filter and alarm exist for unauthorized API calls	[CloudWatch.2] Ensure a log metric filter and alarm exist for unauthorized API calls
CIS v1.2.0	3.10 Ensure a log metric filter and alarm exist for security group changes	[CloudWatch.10] Ensure a log metric filter and alarm exist for security group changes
CIS v1.2.0	3.11 Ensure a log metric filter and alarm exist for changes to Network Access Control Lists (NACL)	[CloudWatch.11] Ensure a log metric filter and alarm exist for changes to Network Access Control Lists (NACL)
CIS v1.2.0	3.12 Ensure a log metric filter and alarm exist for changes to network gateways	[CloudWatch.12] Ensure a log metric filter and alarm exist for changes to network gateways
CIS v1.2.0	3.13 Ensure a log metric filter and alarm exist for route table changes	[CloudWatch.13] Ensure a log metric filter and alarm exist for route table changes
CIS v1.2.0	3.14 Ensure a log metric filter and alarm exist for VPC changes	[CloudWatch.14] Ensure a log metric filter and alarm exist for VPC changes
CIS v1.2.0	3.2 Ensure a log metric filter and alarm exist for Management Console sign-in without MFA	[CloudWatch.3] Ensure a log metric filter and alarm exist for Management Console sign-in without MFA
CIS v1.2.0	3.3 Ensure a log metric filter and alarm exist for usage of root user	[CloudWatch.1] A log metric filter and alarm should exist for usage of the "root" user
CIS v1.2.0	3.4 Ensure a log metric filter and alarm exist for IAM policy changes	[CloudWatch.4] Ensure a log metric filter and alarm exist for IAM policy changes

Standard	Standard control ID and title	Security control ID and title
CIS v1.2.0	3.5 Ensure a log metric filter and alarm exist for CloudTrail configuration changes	[CloudWatch.5] Ensure a log metric filter and alarm exist for CloudTrail configuration changes
CIS v1.2.0	3.6 Ensure a log metric filter and alarm exist for AWS Management Console authentication failures	[CloudWatch.6] Ensure a log metric filter and alarm exist for AWS Management Console authentication failures
CIS v1.2.0	3.7 Ensure a log metric filter and alarm exist for disabling or scheduled deletion of customer created CMKs	[CloudWatch.7] Ensure a log metric filter and alarm exist for disabling or scheduled deletion of customer managed keys
CIS v1.2.0	3.8 Ensure a log metric filter and alarm exist for S3 bucket policy changes	[CloudWatch.8] Ensure a log metric filter and alarm exist for S3 bucket policy changes
CIS v1.2.0	3.9 Ensure a log metric filter and alarm exist for AWS Config configuration changes	[CloudWatch.9] Ensure a log metric filter and alarm exist for AWS Config configuration changes
CIS v1.2.0	4.1 Ensure no security groups allow ingress from 0.0.0.0/0 to port 22	[EC2.13] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 22
CIS v1.2.0	4.2 Ensure no security groups allow ingress from 0.0.0.0/0 to port 3389	[EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
CIS v1.2.0	4.3 Ensure the default security group of every VPC restricts all traffic	[EC2.2] VPC default security groups should not allow inbound or outbound traffic
CIS v1.4.0	1.10 Ensure multi-factor authentication (MFA) is enabled for all IAM users that have a console password	[IAM.5] MFA should be enabled for all IAM users that have a console password

Standard	Standard control ID and title	Security control ID and title
CIS v1.4.0	1.14 Ensure access keys are rotated every 90 days or less	[IAM.3] IAM users' access keys should be rotated every 90 days or less
CIS v1.4.0	1.16 Ensure IAM policies that allow full "*:*" administrative privileges are not attached	[IAM.1] IAM policies should not allow full "*" administrative privileges
CIS v1.4.0	1.17 Ensure a support role has been created to manage incidents with Support	[IAM.18] Ensure a support role has been created to manage incidents with AWS Support
CIS v1.4.0	1.4 Ensure no root user account access key exists	[IAM.4] IAM root user access key should not exist
CIS v1.4.0	1.5 Ensure MFA is enabled for the root user account	[IAM.9] MFA should be enabled for the root user
CIS v1.4.0	1.6 Ensure hardware MFA is enabled for the root user account	[IAM.6] Hardware MFA should be enabled for the root user
CIS v1.4.0	1.7 Eliminate use of the root user for administrative and daily tasks	[CloudWatch.1] A log metric filter and alarm should exist for usage of the "root" user
CIS v1.4.0	1.8 Ensure IAM password policy requires minimum length of 14 or greater	[IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
CIS v1.4.0	1.9 Ensure IAM password policy prevents password reuse	[IAM.16] Ensure IAM password policy prevents password reuse
CIS v1.4.0	2.1.2 Ensure S3 Bucket Policy is set to deny HTTP requests	[S3.5] S3 general purpose buckets should require requests to use TLS

Standard	Standard control ID and title	Security control ID and title
CIS v1.4.0	2.1.5.1 S3 Block Public Access setting should be enabled	[S3.1] S3 general purpose buckets should have block public access settings enabled
CIS v1.4.0	2.1.5.2 S3 Block Public Access setting should be enabled at the bucket level	[S3.8] S3 general purpose buckets should block public access
CIS v1.4.0	2.2.1 Ensure EBS volume encryption is enabled	[EC2.7] EBS default encryption should be enabled
CIS v1.4.0	2.3.1 Ensure that encryption is enabled for RDS Instances	[RDS.3] RDS DB instances should have encryption at-rest enabled
CIS v1.4.0	3.1 Ensure CloudTrail is enabled in all regions	[CloudTrail.1] CloudTrail should be enabled and configured with at least one multi-Region trail that includes read and write management events
CIS v1.4.0	3.2 Ensure CloudTrail log file validation is enabled	[CloudTrail.4] CloudTrail log file validation should be enabled
CIS v1.4.0	3.4 Ensure CloudTrail trails are integrated with CloudWatch Logs	[CloudTrail.5] CloudTrail trails should be integrated with Amazon CloudWatch Logs
CIS v1.4.0	3.5 Ensure AWS Config is enabled in all regions	[Config.1] AWS Config should be enabled and use the service-linked role for resource recording
CIS v1.4.0	3.6 Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket	[CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
CIS v1.4.0	3.7 Ensure CloudTrail logs are encrypted at rest using KMS CMKs	[CloudTrail.2] CloudTrail should have encryption at-rest enabled

Standard	Standard control ID and title	Security control ID and title
CIS v1.4.0	3.8 Ensure rotation for customer created CMKs is enabled	[KMS.4] AWS KMS key rotation should be enabled
CIS v1.4.0	3.9 Ensure VPC flow logging is enabled in all VPCs	[EC2.6] VPC flow logging should be enabled in all VPCs
CIS v1.4.0	4.4 Ensure a log metric filter and alarm exist for IAM policy changes	[CloudWatch.4] Ensure a log metric filter and alarm exist for IAM policy changes
CIS v1.4.0	4.5 Ensure a log metric filter and alarm exist for CloudTrail configura tion changes	[CloudWatch.5] Ensure a log metric filter and alarm exist for CloudTrail configuration changes
CIS v1.4.0	4.6 Ensure a log metric filter and alarm exist for AWS Management Console authentication failures	[CloudWatch.6] Ensure a log metric filter and alarm exist for AWS Management Console authentic ation failures
CIS v1.4.0	4.7 Ensure a log metric filter and alarm exist for disabling or scheduled deletion of customer created CMKs	[CloudWatch.7] Ensure a log metric filter and alarm exist for disabling or scheduled deletion of customer managed keys
CIS v1.4.0	4.8 Ensure a log metric filter and alarm exist for S3 bucket policy changes	[CloudWatch.8] Ensure a log metric filter and alarm exist for S3 bucket policy changes
CIS v1.4.0	4.9 Ensure a log metric filter and alarm exist for AWS Config configura tion changes	[CloudWatch.9] Ensure a log metric filter and alarm exist for AWS Config configuration changes
CIS v1.4.0	4.10 Ensure a log metric filter and alarm exist for security group changes	[CloudWatch.10] Ensure a log metric filter and alarm exist for security group changes

Standard	Standard control ID and title	Security control ID and title
CIS v1.4.0	4.11 Ensure a log metric filter and alarm exist for changes to Network Access Control Lists (NACL)	[CloudWatch.11] Ensure a log metric filter and alarm exist for changes to Network Access Control Lists (NACL)
CIS v1.4.0	4.12 Ensure a log metric filter and alarm exist for changes to network gateways	[CloudWatch.12] Ensure a log metric filter and alarm exist for changes to network gateways
CIS v1.4.0	4.13 Ensure a log metric filter and alarm exist for route table changes	[CloudWatch.13] Ensure a log metric filter and alarm exist for route table changes
CIS v1.4.0	4.14 Ensure a log metric filter and alarm exist for VPC changes	[CloudWatch.14] Ensure a log metric filter and alarm exist for VPC changes
CIS v1.4.0	5.1 Ensure no Network ACLs allow ingress from 0.0.0.0/0 to remote server administration ports	[EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
CIS v1.4.0	5.3 Ensure the default security group of every VPC restricts all traffic	[EC2.2] VPC default security groups should not allow inbound or outbound traffic
PCI DSS v3.2.1	PCI.AutoScaling.1 Auto scaling groups associated with a load balancer should use load balancer health checks	[AutoScaling.1] Auto Scaling groups associated with a load balancer should use ELB health checks
PCI DSS v3.2.1	PCI.CloudTrail.1 CloudTrail logs should be encrypted at rest using AWS KMS CMKs	[CloudTrail.2] CloudTrail should have encryption at-rest enabled
PCI DSS v3.2.1	PCI.CloudTrail.2 CloudTrail should be enabled	[CloudTrail.3] At least one CloudTrail trail should be enabled

Standard	Standard control ID and title	Security control ID and title
PCI DSS v3.2.1	PCI.CloudTrail.3 CloudTrail log file validation should be enabled	[CloudTrail.4] CloudTrail log file validation should be enabled
PCI DSS v3.2.1	PCI.CloudTrail.4 CloudTrail trails should be integrated with Amazon CloudWatch Logs	[CloudTrail.5] CloudTrail trails should be integrated with Amazon CloudWatch Logs
PCI DSS v3.2.1	PCI.CodeBuild.1 CodeBuild GitHub or Bitbucket source repository URLs should use OAuth	[CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
PCI DSS v3.2.1	PCI.CodeBuild.2 CodeBuild project environment variables should not contain clear text credentials	[CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
PCI DSS v3.2.1	PCI.Config.1 AWS Config should be enabled	[Config.1] AWS Config should be enabled and use the service-linked role for resource recording
PCI DSS v3.2.1	PCI.CW.1 A log metric filter and alarm should exist for usage of the "root" user	[CloudWatch.1] A log metric filter and alarm should exist for usage of the "root" user
PCI DSS v3.2.1	PCI.DMS.1 Database Migration Service replication instances should not be public	[DMS.1] Database Migration Service replication instances should not be public
PCI DSS v3.2.1	PCI.EC2.1 EBS snapshots should not be publicly restorable	[EC2.1] Amazon EBS snapshots should not be configured to be publicly restorable
PCI DSS v3.2.1	PCI.EC2.2 VPC default security group should prohibit inbound and outbound traffic	[EC2.2] VPC default security groups should not allow inbound or outbound traffic
PCI DSS v3.2.1	PCI.EC2.4 Unused EC2 EIPs should be removed	[EC2.12] Unused Amazon EC2 EIPs should be removed

Standard	Standard control ID and title	Security control ID and title
PCI DSS v3.2.1	PCI.EC2.5 Security groups should not allow ingress from 0.0.0.0/0 to port 22	[EC2.13] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 22
PCI DSS v3.2.1	PCI.EC2.6 VPC flow logging should be enabled in all VPCs	[EC2.6] VPC flow logging should be enabled in all VPCs
PCI DSS v3.2.1	PCI.ELBv2.1 Application Load Balancer should be configured to redirect all HTTP requests to HTTPS	[ELB.1] Application Load Balancer should be configured to redirect all HTTP requests to HTTPS
PCI DSS v3.2.1	PCI.ES.1 Elasticsearch domains should be in a VPC	[ES.2] Elasticsearch domains should not be publicly accessible
PCI DSS v3.2.1	PCI.ES.2 Elasticsearch domains should have encryption at-rest enabled	[ES.1] Elasticsearch domains should have encryption at-rest enabled
PCI DSS v3.2.1	PCI.GuardDuty.1 GuardDuty should be enabled	[GuardDuty.1] GuardDuty should be enabled
PCI DSS v3.2.1	PCI.IAM.1 IAM root user access key should not exist	[IAM.4] IAM root user access key should not exist
PCI DSS v3.2.1	PCI.IAM.2 IAM users should not have IAM policies attached	[IAM.2] IAM users should not have IAM policies attached
PCI DSS v3.2.1	PCI.IAM.3 IAM policies should not allow full "*" administrative privilege s	[IAM.1] IAM policies should not allow full "*" administrative privilege s
PCI DSS v3.2.1	PCI.IAM.4 Hardware MFA should be enabled for the root user	[IAM.6] Hardware MFA should be enabled for the root user
PCI DSS v3.2.1	PCI.IAM.5 Virtual MFA should be enabled for the root user	[IAM.9] MFA should be enabled for the root user

Standard	Standard control ID and title	Security control ID and title
PCI DSS v3.2.1	PCI.IAM.6 MFA should be enabled for all IAM users	[IAM.19] MFA should be enabled for all IAM users
PCI DSS v3.2.1	PCI.IAM.7 IAM user credentials should be disabled if not used within a pre-defined number days	[IAM.8] Unused IAM user credentials should be removed
PCI DSS v3.2.1	PCI.IAM.8 Password policies for IAM users should have strong configura tions	[IAM.10] Password policies for IAM users should have strong configura tions
PCI DSS v3.2.1	PCI.KMS.1 Customer master key (CMK) rotation should be enabled	[KMS.4] AWS KMS key rotation should be enabled
PCI DSS v3.2.1	PCI.Lambda.1 Lambda functions should prohibit public access	[Lambda.1] Lambda function policies should prohibit public access
PCI DSS v3.2.1	PCI.Lambda.2 Lambda functions should be in a VPC	[Lambda.3] Lambda functions should be in a VPC
PCI DSS v3.2.1	PCI.Opensearch.1 OpenSearch domains should be in a VPC	[Opensearch.2] OpenSearch domains should not be publicly accessible
PCI DSS v3.2.1	PCI.Opensearch.2 EBS snapshots should not be publicly restorable	[Opensearch.1] OpenSearch domains should have encryption at rest enabled
PCI DSS v3.2.1	PCI.RDS.1 RDS snapshot should be private	[RDS.1] RDS snapshot should be private
PCI DSS v3.2.1	PCI.RDS.2 RDS DB Instances should prohibit public access	[RDS.2] RDS DB Instances should prohibit public access, as determine d by the PubliclyAccessible configura tion

Standard	Standard control ID and title	Security control ID and title
PCI DSS v3.2.1	PCI.Redshift.1 Amazon Redshift clusters should prohibit public access	[Redshift.1] Amazon Redshift clusters should prohibit public access
PCI DSS v3.2.1	PCI.S3.1 S3 buckets should prohibit public write access	[S3.3] S3 general purpose buckets should block public write access
PCI DSS v3.2.1	PCI.S3.2 S3 buckets should prohibit public read access	[S3.2] S3 general purpose buckets should block public read access
PCI DSS v3.2.1	PCI.S3.3 S3 buckets should have cross-region replication enabled	[S3.7] S3 general purpose buckets should use cross-Region replication
PCI DSS v3.2.1	PCI.S3.5 S3 buckets should require requests to use Secure Socket Layer	[S3.5] S3 general purpose buckets should require requests to use TLS
PCI DSS v3.2.1	PCI.S3.6 S3 Block Public Access setting should be enabled	[S3.1] S3 general purpose buckets should have block public access settings enabled
PCI DSS v3.2.1	PCI.SageMaker.1 Amazon SageMaker notebook instances should not have direct internet access	[SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
PCI DSS v3.2.1	PCI.SSM.1 EC2 instances managed by Systems Manager should have a patch compliance status of COMPLIANT after a patch installat ion	[SSM.2] Amazon EC2 instances managed by Systems Manager should have a patch compliance status of COMPLIANT after a patch installation
PCI DSS v3.2.1	PCI.SSM.2 EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT	[SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT

Standard	Standard control ID and title	Security control ID and title
PCI DSS v3.2.1	PCI.SSM.3 EC2 instances should be managed by AWS Systems Manager	[SSM.1] Amazon EC2 instances should be managed by AWS Systems Manager

Updating workflows for consolidation

If your workflows don't rely on the specific format of any fields in control findings, no action is required.

If your workflows rely on the specific format of one or more fields in control findings, as noted in the preceding tables, you should update your workflows. For example, If you created an Amazon EventBridge rule that triggered an action for a specific control ID, such as invoking an AWS Lambda function if the control ID equals CIS 2.7, update the rule to use CloudTrail.2, which is the value for the `Compliance.SecurityControlId` field for that control.

If you created custom insights that use any of the fields or values that changed, update those insights to use the new fields or values.

Required top-level ASFF attributes

The following top-level attributes in the AWS Security Finding Format (ASFF) are required for all findings in Security Hub CSPM. For more information about these attributes, see AwsSecurityFinding in the *AWS Security Hub API Reference*.

AwsAccountId

The AWS account ID that the finding applies to.

Example

```
"AwsAccountId": "111111111111"
```

CreatedAt

Indicates when the potential security issue or event captured by a finding was created.

Example

```
"CreatedAt": "2017-03-22T13:22:13.933Z"
```

Description

A finding's description. This field can be nonspecific boilerplate text or details that are specific to the instance of the finding.

For control findings that Security Hub CSPM generates, this field provides a description of the control.

This field doesn't reference a standard if you turn on consolidated control findings.

Example

```
"Description": "This AWS control checks whether AWS Config is enabled in the current
 account and Region."
```

GeneratorId

The identifier for the solution-specific component (a discrete unit of logic) that generated a finding.

For control findings that Security Hub CSPM generates, this field doesn't reference a standard if you turn on consolidated control findings.

Example

```
"GeneratorId": "security-control/Config.1"
```

Id

The product-specific identifier for a finding. For control findings that Security Hub CSPM generates, this field provides the Amazon Resource Name (ARN) of the finding.

This field doesn't reference a standard if you turn on consolidated control findings.

Example

```
"Id": "arn:aws:securityhub:eu-central-1:123456789012:security-control/iam.9/finding/
ab6d6a26-a156-48f0-9403-115983e5a956"
```

ProductArn

The Amazon Resource Name (ARN) generated by Security Hub CSPM that uniquely identifies a third-party findings product after the product is registered with Security Hub CSPM.

The format of this field is `arn:`*`partition`*`:securityhub:`*`region`*`:`*`account-id`*`:product/`*`company-id`*`/`*`product-id`*.

- For AWS services that are integrated with Security Hub CSPM, the `company-id` must be "`aws`", and the `product-id` must be the AWS public service name. Because AWS products and services aren't associated with an account, the `account-id` section of the ARN is empty. AWS services that are not yet integrated with Security Hub CSPM are considered third-party products.
- For public products, the `company-id` and `product-id` must be the ID values specified at the time of registration.
- For private products, the `company-id` must be the account ID. The `product-id` must be the reserved word "default" or the ID that was specified at the time of registration.

Example

```
// Private ARN
    "ProductArn": "arn:aws:securityhub:us-east-1:111111111111:product/111111111111/
default"

// Public ARN
    "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/guardduty"
    "ProductArn": "arn:aws:securityhub:us-west-2:222222222222:product/generico/secure-
pro"
```

Resources

The `Resources` array of objects provides a set of resource data types that describe the AWS resources that the finding refers to. For details about the fields that a `Resources` object might contain, including which fields are required, see Resource in the *AWS Security Hub API Reference*. For examples of `Resources` objects for specific AWS services, see Resources ASFF object.

Example

```
"Resources": [
  {
```

```
    "ApplicationArn": "arn:aws:resource-groups:us-west-2:123456789012:group/
SampleApp/1234567890abcdef0",
    "ApplicationName": "SampleApp",
    "DataClassification": {
    "DetailedResultsLocation": "Path_to_Folder_Or_File",
    "Result": {
        "MimeType": "text/plain",
        "SizeClassified": 2966026,
        "AdditionalOccurrences": false,
        "Status": {
            "Code": "COMPLETE",
            "Reason": "Unsupportedfield"
        },
       "SensitiveData": [
            {
                "Category": "PERSONAL_INFORMATION",
                "Detections": [
                    {
                        "Count": 34,
                        "Type": "GE_PERSONAL_ID",
                        "Occurrences": {
                            "LineRanges": [
                                {
                                    "Start": 1,
                                    "End": 10,
                                    "StartColumn": 20
                                }
                            ],
                            "Pages": [],
                            "Records": [],
                            "Cells": []
                        }
                    },
                    {
                        "Count": 59,
                        "Type": "EMAIL_ADDRESS",
                        "Occurrences": {
                            "Pages": [
                                {
                                    "PageNumber": 1,
                                    "OffsetRange": {
                                        "Start": 1,
                                        "End": 100,
                                        "StartColumn": 10
```

```
                                },
                                "LineRange": {
                                    "Start": 1,
                                    "End": 100,
                                    "StartColumn": 10
                                }
                            }
                        ]
                    }
                },
                {
                    "Count": 2229,
                    "Type": "URL",
                    "Occurrences": {
                       "LineRanges": [
                           {
                               "Start": 1,
                               "End": 13
                           }
                       ]
                    }
                },
                {
                    "Count": 13826,
                    "Type": "NameDetection",
                    "Occurrences": {
                        "Records": [
                            {
                                "RecordIndex": 1,
                                "JsonPath": "$.ssn.value"
                            }
                        ]
                    }
                },
                {
                    "Count": 32,

```
]
```

SchemaVersion

The schema version that a finding is formatted for. The value of this field must be one of the officially published versions identified by AWS. In the current release, the AWS Security Finding Format schema version is `2018-10-08`.

Example

```
"SchemaVersion": "2018-10-08"
```

Severity

Defines the importance of a finding. For details about this object, see `Severity` in the *AWS Security Hub API Reference*.

`Severity` is both a top-level object in a finding and nested under the `FindingProviderFields` object.

The value of the top-level `Severity` object for a finding should be updated only by using the `BatchUpdateFindings` API.

To provide severity information, finding providers should update the `Severity` object under `FindingProviderFields` when making a `BatchImportFindings` API request.
If a `BatchImportFindings` request for a new finding only provides `Label` or only provides `Normalized`, Security Hub CSPM automatically populates the value of the other field.
The `Product` and `Original` fields may also be populated.

If the top-level `Finding.Severity` object is present but `Finding.FindingProviderFields` is not present, Security Hub CSPM creates the `FindingProviderFields.Severity` object and copies the entire `Finding.Severity object` into it. This ensures that the original, provider-supplied details are retained within the `FindingProviderFields.Severity` structure, even if the top-level `Severity` object is overwritten.

The finding severity does not consider the criticality of the involved assets or the underlying resource. Criticality is defined as the level of importance of the resources that are associated with the finding. For example, a resource that is associated with a mission critical application has higher criticality than one that is associated with nonproduction testing. To capture information about resource criticality, use the `Criticality` field.

We recommend using the following guidance when translating findings' native severity scores to the value of `Severity.Label` in the ASFF.

- `INFORMATIONAL` – This category may include a finding for a `PASSED`, `WARNING`, or `NOT AVAILABLE` check or a sensitive data identification.
- `LOW` – Findings that could result in future compromises. For example, this category may include vulnerabilities, configuration weaknesses, and exposed passwords.
- `MEDIUM` – Findings that indicate an active compromise, but no indication that an adversary completed their objectives. For example, this category may include malware activity, hacking activity, and unusual behavior detection.
- `HIGH` or `CRITICAL` – Findings that indicate that an adversary completed their objectives, such as active data loss or compromise or a denial of service.

Example

```
"Severity": {
    "Label": "CRITICAL",
    "Normalized": 90,
    "Original": "CRITICAL"
}
```

Title

A finding's title. This field can contain nonspecific boilerplate text or details that are specific to this instance of the finding.

For control findings, this field provides the title of the control. This field doesn't reference a standard if you turn on consolidated control findings.

Example

```
"Title": "AWS Config should be enabled"
```

Types

One or more finding types in the format of *namespace*/*category*/*classifier* that classify a finding. This field doesn't reference a standard if you turn on consolidated control findings.

`Types` should be updated only by using the `BatchUpdateFindings` API.

Finding providers who want to provide a value for `Types` should use the `Types` attribute under `FindingProviderFields`.

In the following list, the top-level bullets are namespaces, the second-level bullets are categories, and the third-level bullets are classifiers. We recommend that finding providers use defined namespaces to help sort and group findings. The defined categories and classifiers may also be used, but are not required. Only the Software and Configuration Checks namespace has defined classifiers.

You may define a partial path for namespace/category/classifier. For example, the following finding types are all valid:

- TTPs
- TTPs/Defense Evasion
- TTPs/Defense Evasion/CloudTrailStopped

The tactics, techniques, and procedures (TTPs) categories in the following list align to the MITRE ATT&CK MatrixTM. The Unusual Behaviors namespace reflects general unusual behavior, such as general statistical anomalies, and are not aligned with a specific TTP. However, you could classify a finding with both Unusual Behaviors and TTPs finding types.

List of namespaces, categories, and classifiers:

- Software and Configuration Checks
  - Vulnerabilities
    - CVE
  - AWS Security Best Practices
    - Network Reachability
    - Runtime Behavior Analysis
  - Industry and Regulatory Standards
    - AWS Foundational Security Best Practices
    - CIS Host Hardening Benchmarks
    - CIS AWS Foundations Benchmark
    - PCI-DSS

    - Cloud Security Alliance Controls
    - ISO 90001 Controls
    - ISO 27001 Controls
    - ISO 27017 Controls
    - ISO 27018 Controls
    - SOC 1
    - SOC 2
    - HIPAA Controls (USA)
    - NIST 800-53 Controls (USA)
    - NIST CSF Controls (USA)
    - IRAP Controls (Australia)
    - K-ISMS Controls (Korea)
    - MTCS Controls (Singapore)
    - FISC Controls (Japan)
    - My Number Act Controls (Japan)
    - ENS Controls (Spain)
    - Cyber Essentials Plus Controls (UK)
    - G-Cloud Controls (UK)
    - C5 Controls (Germany)
    - IT-Grundschutz Controls (Germany)
    - GDPR Controls (Europe)
    - TISAX Controls (Europe)
  - Patch Management
- TTPs
  - Initial Access
  - Execution
  - Persistence
  - Privilege Escalation
  - Defense Evasion
  - Credential Access

  - Discovery
  - Lateral Movement
  - Collection
  - Command and Control
- Effects
  - Data Exposure
  - Data Exfiltration
  - Data Destruction
  - Denial of Service
  - Resource Consumption
- Unusual Behaviors
  - Application
  - Network Flow
  - IP address
  - User
  - VM
  - Container
  - Serverless
  - Process
  - Database
  - Data
- Sensitive Data Identifications
  - PII
  - Passwords
  - Legal
  - Financial
  - Security
  - Business

Example

```
"Types": [
    "Software and Configuration Checks/Vulnerabilities/CVE"
]
```

UpdatedAt

Indicates when the finding provider last updated the finding record.

This timestamp reflects the time when the finding record was last or most recently updated. Consequently, it can differ from the `LastObservedAt` timestamp, which reflects when the event or vulnerability was last or most recently observed.

When you update the finding record, you must update this timestamp to the current timestamp. Upon creation of a finding record, the `CreatedAt` and `UpdatedAt` timestamps must be the same. After an update to the finding record, the value of this field must be more recent than all of the previous values that it contained.

Note that `UpdatedAt` cannot be updated by using the `BatchUpdateFindings` operation. You can update it only by using `BatchImportFindings` operation.

Example

```
"UpdatedAt": "2017-04-22T13:22:13.933Z"
```

Optional top-level ASFF attributes

The following top-level attributes in the AWS Security Finding Format (ASFF) are optional for findings in Security Hub CSPM. For more information about these attributes, see AwsSecurityFinding in the *AWS Security Hub API Reference*.

Action

The `Action` object provides details about an action that affects or was taken on a resource.

Example

```
"Action": {
    "ActionType": "PORT_PROBE",
    "PortProbeAction": {
        "PortProbeDetails": [
            {
```

```
                "LocalPortDetails": {
                    "Port": 80,
                    "PortName": "HTTP"
                  },
                "LocalIpDetails": {
                     "IpAddressV4": "192.0.2.0"
                 },
                "RemoteIpDetails": {
                    "Country": {
                        "CountryName": "Example Country"
                    },
                    "City": {
                        "CityName": "Example City"
                    },
                   "GeoLocation": {
                       "Lon": 0,
                       "Lat": 0
                   },
                   "Organization": {
                       "AsnOrg": "ExampleASO",
                       "Org": "ExampleOrg",
                       "Isp": "ExampleISP",
                       "Asn": 64496
                   }
                }
            }
        ],
        "Blocked": false
    }
}
```

AwsAccountName

The AWS account name that the finding applies to.

Example

```
"AwsAccountName": "jane-doe-testaccount"
```

CompanyName

The name of the company for the product that generated the finding. For control-based findings, the company is AWS.

Security Hub CSPM populates this attribute automatically for each finding. You cannot update it using `BatchImportFindings` or `BatchUpdateFindings`. The exception to this is when you use a custom integration. See the section called "Custom product integrations".

When you use the Security Hub CSPM console to filter findings by company name, you use this attribute. When you use the Security Hub CSPM API to filter findings by company name, you use the `aws/securityhub/CompanyName` attribute under `ProductFields`. Security Hub CSPM does not synchronize those two attributes.

Example

```
"CompanyName": "AWS"
```

Compliance

The `Compliance` object typically provides details about a control finding, such as applicable standards and the status of the control check.

Example

```
"Compliance": {
    "AssociatedStandards": [
        {"StandardsId": "standards/aws-foundational-security-best-practices/v/1.0.0"},
        {"StandardsId": "standards/service-managed-aws-control-tower/v/1.0.0"},
        {"StandardsId": "standards/nist-800-53/v/5.0.0"}
    ],
    "RelatedRequirements": [
        "NIST.800-53.r5 AC-4",
        "NIST.800-53.r5 AC-4(21)",
        "NIST.800-53.r5 SC-7",
        "NIST.800-53.r5 SC-7(11)",
        "NIST.800-53.r5 SC-7(16)",
        "NIST.800-53.r5 SC-7(21)",
        "NIST.800-53.r5 SC-7(4)",
        "NIST.800-53.r5 SC-7(5)"
    ],
    "SecurityControlId": "EC2.18",
    "SecurityControlParameters":[
        {
            "Name": "authorizedTcpPorts",
            "Value": ["80", "443"]
        },
```

```
        {
            "Name": "authorizedUdpPorts",
            "Value": ["427"]
        }
    ],
    "Status": "NOT_AVAILABLE",
    "StatusReasons": [
        {
            "ReasonCode": "CONFIG_RETURNS_NOT_APPLICABLE",
            "Description": "This finding has a compliance status of NOT AVAILABLE
 because AWS Config sent Security Hub CSPM a finding with a compliance state of Not
 Applicable. The potential reasons for a Not Applicable finding from Config are that
 (1) a resource has been moved out of scope of the Config rule; (2) the Config rule has
 been deleted; (3) the resource has been deleted; or (4) the logic of the Config rule
 itself includes scenarios where Not Applicable is returned. The specific reason why
 Not Applicable is returned is not available in the Config rule evaluation."
        }
    ]
}
```

Confidence

The likelihood that a finding accurately identifies the behavior or issue that it was intended to identify.

`Confidence` should only be updated using `BatchUpdateFindings`.

Finding providers who want to provide a value for `Confidence` should use the `Confidence` attribute under `FindingProviderFields`. See the section called "Updating findings with FindingProviderFields".

`Confidence` is scored on a 0–100 basis using a ratio scale. 0 means 0 percent confidence, and 100 means 100 percent confidence. For example, a data exfiltration detection based on a statistical deviation of network traffic has low confidence because an actual exfiltration hasn't been verified.

Example

```
"Confidence": 42
```

Criticality

The level of importance that is assigned to the resources that are associated with a finding.

`Criticality` should only be updated by calling the `BatchUpdateFindings` API operation. Don't update this object with `BatchImportFindings`.

Finding providers who want to provide a value for `Criticality` should use the `Criticality` attribute under `FindingProviderFields`. See the section called "Updating findings with FindingProviderFields".

`Criticality` is scored on a 0–100 basis, using a ratio scale that supports only full integers. A score of 0 means that the underlying resources have no criticality, and a score of 100 is reserved for the most critical resources.

For each resource, consider the following when assigning `Criticality`:

- Does the affected resource contain sensitive data (for example, an S3 bucket with PII)?
- Does the affected resource enable an adversary to deepen their access or extend their capabilities to carry out additional malicious activity (for example, a compromised sysadmin account)?
- Is the resource a business-critical asset (for example, a key business system that if compromised could have significant revenue impact)?

You can use the following guidelines:

- A resource powering mission-critical systems or containing highly sensitive data can be scored in the 75–100 range.
- A resource powering important (but not critical systems) or containing moderately important data can be scored in the 25–74 range.
- A resource powering unimportant systems or containing nonsensitive data should be scored in the 0–24 range.

Example

```
"Criticality": 99
```

Detection

The `Detection` object provides details about an attack sequence finding from Amazon GuardDuty Extended Threat Detection. GuardDuty generates an attack sequence finding when multiple events align to a potentially suspicious activity. To receive GuardDuty attack sequence findings in AWS

Security Hub CSPM, you must have GuardDuty enabled in your account. For more information, see Amazon GuardDuty Extended Threat Detection in the *Amazon GuardDuty User Guide*.

Example

```
"Detection": {
    "Sequence": {
     "Uid": "1111111111111-184ec3b9-cf8d-452d-9aad-f5bdb7afb010",
     "Actors": [{
      "Id": "USER:AROA987654321EXAMPLE:i-b188560f:1234567891",
      "Session": {

        "Data Destruction"
       ]
      }
     ]
    }
}
```

FindingProviderFields

`FindingProviderFields` includes the following attributes:

- `Confidence`
- `Criticality`
- `RelatedFindings`
- `Severity`
- `Types`

The preceding fields are nested under the `FindingProviderFields` object, but have analogues of the same name as top-level ASFF fields. When a new finding is sent to Security Hub CSPM

by a finding provider, Security Hub CSPM populates the `FindingProviderFields` object automatically if it is empty based on the corresponding top-level fields.

Finding providers can update `FindingProviderFields` by using the`BatchImportFindings` operation of the Security Hub CSPM API. Finding providers cannot update this object with `BatchUpdateFindings`.

For details on how Security Hub CSPM handles updates from `BatchImportFindings` to `FindingProviderFields` and to the corresponding top-level attributes, see the section called "Updating findings with FindingProviderFields".

Customers can update the top-level fields by using the `BatchUpdateFindings` operation. Customers can't update `FindingProviderFields`.

Example

```
"FindingProviderFields": {
    "Confidence": 42,
    "Criticality": 99,
    "RelatedFindings":[
      {
        "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/guardduty",
        "Id": "123e4567-e89b-12d3-a456-426655440000"
      }
    ],
    "Severity": {
        "Label": "MEDIUM",
        "Original": "MEDIUM"
    },
    "Types": [ "Software and Configuration Checks/Vulnerabilities/CVE" ]
}
```

FirstObservedAt

Indicates when the potential security issue or event captured by a finding was first observed.

This timestamp specifies when the event or vulnerability was first observed. Consequently, it can differ from the `CreatedAt` timestamp, which reflects when this finding record was created.

For control findings that Security Hub CSPM generates and updates, this timestamp can also indicate when the compliance status of a resource most recently changed. For other types of

findings, this timestamp should be immutable between updates of the finding record, but can be updated if a more accurate timestamp is determined.

Example

```
"FirstObservedAt": "2017-03-22T13:22:13.933Z"
```

LastObservedAt

Indicates when the potential security issue or event captured by a finding was most recently observed by the security findings product.

This timestamp specifies when the event or vulnerability was last or most recently observed. Consequently, it can differ from the `UpdatedAt` timestamp, which reflects when this finding record was last or most recently updated.

You can provide this timestamp, but it isn't required upon first observation. If you populate this field upon first observation, the timestamp should be the same as the `FirstObservedAt` timestamp. You should update this field to reflect the last or most recently observed timestamp each time a finding is observed.

Example

```
"LastObservedAt": "2017-03-23T13:22:13.933Z"
```

Malware

The `Malware` object provides a list of malware related to a finding.

Example

```
"Malware": [
    {
        "Name": "Stringler",
        "Type": "COIN_MINER",
        "Path": "/usr/sbin/stringler",
        "State": "OBSERVED"
    }
]
```

Network (Retired)

The `Network` object provides network-related information about a finding.

This object is retired. To provide this data, you can either map the data to a resource in `Resources`, or use the `Action` object.

Example

```
"Network": {
    "Direction": "IN",
    "OpenPortRange": {
        "Begin": 443,
        "End": 443
    },
    "Protocol": "TCP",
    "SourceIpV4": "1.2.3.4",
    "SourceIpV6": "FE80:CD00:0000:0CDE:1257:0000:211E:729C",
    "SourcePort": "42",
    "SourceDomain": "example1.com",
    "SourceMac": "00:0d:83:b1:c0:8e",
    "DestinationIpV4": "2.3.4.5",
    "DestinationIpV6": "FE80:CD00:0000:0CDE:1257:0000:211E:729C",
    "DestinationPort": "80",
    "DestinationDomain": "example2.com"
}
```

NetworkPath

The `NetworkPath` object provides information about a network path that is related to a finding. Each entry in `NetworkPath` represents a component of the path.

Example

```
"NetworkPath" : [
    {
        "ComponentId": "abc-01a234bc56d8901ee",
        "ComponentType": "AWS::EC2::InternetGateway",
        "Egress": {
            "Destination": {
                "Address": [ "192.0.2.0/24" ],
                "PortRanges": [
```

```
                    {
                        "Begin": 443,
                        "End": 443
                    }
                ]
            },
            "Protocol": "TCP",
            "Source": {
                "Address": ["203.0.113.0/24"]
            }
        },
        "Ingress": {
            "Destination": {
                "Address": [ "198.51.100.0/24" ],
                "PortRanges": [
                    {
                        "Begin": 443,
                        "End": 443
                    }
                 ]
            },
            "Protocol": "TCP",
            "Source": {
                "Address": [ "203.0.113.0/24" ]
            }
        }
    }
]
```

Note

The `Note` object specifies a user-defined note that you can add to a finding.

A finding provider can provide an initial note for a finding, but cannot add notes after that. You can only update a note using `BatchUpdateFindings`.

Example

```
"Note": {
    "Text": "Don't forget to check under the mat.",
    "UpdatedBy": "jsmith",
    "UpdatedAt": "2018-08-31T00:15:09Z"
}
```

PatchSummary

The `PatchSummary` object provides a summary of the patch compliance status for an instance against a selected compliance standard.

Example

```
"PatchSummary" : {
    "FailedCount" : 0,
    "Id" : "pb-123456789098",
    "InstalledCount" : 100,
    "InstalledOtherCount" : 1023,
    "InstalledPendingReboot" : 0,
    "InstalledRejectedCount" : 0,
    "MissingCount" : 100,
    "Operation" : "Install",
    "OperationEndTime" : "2018-09-27T23:39:31Z",
    "OperationStartTime" : "2018-09-27T23:37:31Z",
    "RebootOption" : "RebootIfNeeded"
}
```

Process

The `Process` object provides process-related details about a finding.

Example:

```
"Process": {
    "LaunchedAt": "2018-09-27T22:37:31Z",
    "Name": "syslogd",
    "ParentPid": 56789,
    "Path": "/usr/sbin/syslogd",
    "Pid": 12345,
    "TerminatedAt": "2018-09-27T23:37:31Z"
}
```

ProcessedAt

Indicates when Security Hub CSPM received a finding and began to process it.

This differs from `CreatedAt` and `UpdatedAt`, which are required timestamps that relate to the finding provider's interaction with the security issue and finding. The `ProcessedAt` timestamp

indicates when Security Hub CSPM starts to process a finding. A finding appears in a user's account after processing is complete.

```
"ProcessedAt": "2023-03-23T13:22:13.933Z"
```

ProductFields

A data type where security findings products can include additional solution-specific details that are not part of the defined AWS Security Finding Format.

For findings generated by Security Hub CSPM controls, `ProductFields` includes information about the control. See the section called “Generating and updating control findings”.

This field should not contain redundant data and must not contain data that conflicts with AWS Security Finding Format fields.

The "`aws/`" prefix represents a reserved namespace for AWS products and services only and must not be submitted with findings from third-party integrations.

Although not required, products should format field names as `company-id/product-id/field-name`, where the `company-id` and `product-id` match those supplied in the `ProductArn` of the finding.

The fields referencing `Archival` are used when Security Hub CSPM archives an existing finding. For example, Security Hub CSPM archives existing findings when you disable a control or standard and when you turn consolidated control findings on or off.

This field may also include information about the standard that includes the control that produced the finding.

Example

```
"ProductFields": {
    "API", "DeleteTrail",
    "ArchivalReasons:0/Description": "The finding is in an ARCHIVED state because
 consolidated control findings has been turned on or off. This causes findings in the
 previous state to be archived when new findings are being generated.",
    "ArchivalReasons:0/ReasonCode": "CONSOLIDATED_CONTROL_FINDINGS_UPDATE",
    "aws/inspector/AssessmentTargetName": "My prod env",
    "aws/inspector/AssessmentTemplateName": "My daily CVE assessment",
    "aws/inspector/RulesPackageName": "Common Vulnerabilities and Exposures",
    "generico/secure-pro/Action.Type", "AWS_API_CALL",
```

```
    "generico/secure-pro/Count": "6",
    "Service_Name": "cloudtrail.amazonaws.com"
}
```

ProductName

Provides the name of the product that generated the finding. For control-based findings, the product name is Security Hub CSPM.

Security Hub CSPM populates this attribute automatically for each finding. You cannot update it using `BatchImportFindings` or `BatchUpdateFindings`. The exception to this is when you use a custom integration. See the section called “Custom product integrations”.

When you use the Security Hub CSPM console to filter findings by product name, you use this attribute.

When you use the Security Hub CSPM API to filter findings by product name, you use the `aws/securityhub/ProductName` attribute under `ProductFields`.

Security Hub CSPM does not synchronize those two attributes.

RecordState

Provides the record state of a finding.

By default, when initially generated by a service, findings are considered `ACTIVE`.

The `ARCHIVED` state indicates that a finding should be hidden from view. Archived findings are not deleted immediately. You can search, review, and report on them. Security Hub CSPM automatically archives control-based findings if the associated resource is deleted, the resource does not exist, or the control is disabled.

`RecordState` is intended for finding providers, and can be updated only by using the `BatchImportFindings` operation. You cannot update it by using the `BatchUpdateFindings` operation.

To track the status of your investigation into a finding, use `Workflow` instead of `RecordState`.

If the record state changes from `ARCHIVED` to `ACTIVE`, and the workflow status of the finding is `NOTIFIED` or `RESOLVED`, Security Hub CSPM automatically changes the workflow status to `NEW`.

Example

```
"RecordState": "ACTIVE"
```

Region

Specifies the AWS Region from which the finding was generated.

Security Hub CSPM populates this attribute automatically for each finding. You cannot update it using `BatchImportFindings` or `BatchUpdateFindings`.

Example

```
"Region": "us-west-2"
```

RelatedFindings

Provides a list of findings that are related to the current finding.

`RelatedFindings` should only be updated with the `BatchUpdateFindings` API operation. You should not update this object with `BatchImportFindings`.

For `BatchImportFindings` requests, finding providers should use the `RelatedFindings` object under `FindingProviderFields`.

To view descriptions of `RelatedFindings` attributes, see `RelatedFinding` in the *AWS Security Hub API Reference*.

Example

```
"RelatedFindings": [
    { "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/guardduty",
      "Id": "123e4567-e89b-12d3-a456-426655440000" },
    { "ProductArn": "arn:aws:securityhub:us-west-2::product/aws/guardduty",
      "Id": "AcmeNerfHerder-111111111111-x189dx7824" }
]
```

RiskAssessment

Example

```
"RiskAssessment": {
    "Posture": {
        "FindingTotal": 4,
```

```
        "Indicators": [
            {
                "Type": "Reachability",
                "Findings": [
                    {
                        "Id": "arn:aws:inspector2:us-
east-2:123456789012:finding/1234567890abcdef0",
                        "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
inspector",
                        "Title": "Finding title"
                    },
                    {
                        "Id": "arn:aws:inspector2:us-east-2:123456789012:finding/
abcdef01234567890",
                        "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
inspector",
                        "Title": "Finding title"
                    }
                ]
            },
            {
                "Type": "Vulnerability",
                "Findings": [
                    {
                        "Id": "arn:aws:inspector2:us-
east-2:123456789012:finding/021345abcdef6789",
                        "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
inspector",
                        "Title": "Finding title"
                    },
                    {
                        "Id": "arn:aws:inspector2:us-
east-2:123456789012:finding/021345ghijkl6789",
                        "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
inspector",
                        "Title": "Finding title"
                    }
                ]
            }
        ]
    }
}
```

Remediation

The Remediation object provides information about recommended remediation steps to address the finding.

Example

```
"Remediation": {
    "Recommendation": {
        "Text": "For instructions on how to fix this issue, see the AWS Security Hub
 CSPM documentation for EC2.2.",
        "Url": "https://docs.aws.amazon.com/console/securityhub/EC2.2/remediation"
    }
}
```

Sample

Specifies whether the finding is a sample finding.

```
"Sample": true
```

SourceUrl

The SourceUrl object provides a URL that links to a page about the current finding in the finding product.

```
"SourceUrl": "http://sourceurl.com"
```

ThreatIntelIndicators

The ThreatIntelIndicator object provides threat intelligence details that are related to a finding.

Example

```
"ThreatIntelIndicators": [
  {
    "Category": "BACKDOOR",
    "LastObservedAt": "2018-09-27T23:37:31Z",
    "Source": "Threat Intel Weekly",
```

```
    "SourceUrl": "http://threatintelweekly.org/backdoors/8888",
    "Type": "IPV4_ADDRESS",
    "Value": "8.8.8.8",
  }
]
```

Threats

The Threats object provides details about the threat detected by a finding.

Example

```
"Threats": [{
    "FilePaths": [{
        "FileName": "b.txt",
        "FilePath": "/tmp/b.txt",
        "Hash": "sha256",
        "ResourceId": "arn:aws:ec2:us-west-2:123456789012:volume/vol-032f3bdd89aee112f"
    }],
    "ItemCount": 3,
    "Name": "Iot.linux.mirai.vwisi",
    "Severity": "HIGH"
}]
```

UserDefinedFields

Provides a list of name-value string pairs that are associated with the finding. These are custom, user-defined fields that are added to a finding. These fields can be generated automatically through your specific configuration.

Finding providers should not use this field for data that the product generates. Instead, finding providers can use the `ProductFields` field for data that does not map to any standard AWS Security Finding Format field.

These fields can only be updated using `BatchUpdateFindings`.

Example

```
"UserDefinedFields": {
    "reviewedByCio": "true",
    "comeBackToLater": "Check this again on Monday"
```

```
}
```

VerificationState

Provides the veracity of a finding. Findings products can provide a value of `UNKNOWN` for this field. A findings product should provide a value for this field if there is a meaningful analog in the findings product's system. This field is typically populated by a user determination or action after investigating a finding.

A finding provider can provide an initial value for this attribute, but cannot update it after that. You can only update this attribute by using `BatchUpdateFindings`.

```
"VerificationState": "Confirmed"
```

Vulnerabilities

The Vulnerabilities object provides a list of vulnerabilities that are associated with a finding.

Example

```
"Vulnerabilities" : [
    {
        "CodeVulnerabilities": [{
            "Cwes": [
                "CWE-798",
                "CWE-799"
            ],
            "FilePath": {
                "EndLine": 421,
                "FileName": "package-lock.json",
                "FilePath": "package-lock.json",
                "StartLine": 420
            },
                "SourceArn":"arn:aws:lambda:us-east-1:123456789012:layer:AWS-AppConfig-
Extension:114"
        }],
        "Cvss": [
            {

                "Version": "1.0.2k"
            }
        ]
    }
]
```

Workflow

The `Workflow` object provides information about the status of the investigation into a finding.

This field is intended for customers to use with remediation, orchestration, and ticketing tools. It is not intended for finding providers.

You can only update the `Workflow` field with `BatchUpdateFindings`. Customers can also update it from the console. See the section called “Setting the workflow status of findings”.

Example

```
"Workflow": {
    "Status": "NEW"
}
```

WorkflowState (Retired)

This object is retired and has been replaced by the `Status` field of the `Workflow` object.

This field provides the workflow state of a finding. Findings products can provide the value of `NEW` for this field. A findings product can provide a value for this field if there is a meaningful analog in the findings product's system.

Example

```
"WorkflowState": "NEW"
```

Resources ASFF object

In the AWS Security Finding Format (ASFF), the `Resources` object provides information about the resources involved in a finding. It contains an array of up to 32 resource objects. To determine how resource names are formatted, see AWS Security Finding Format (ASFF). For examples of each resource object, select a resource from the following list.

Topics

- Resource attributes in the ASFF
- AwsAmazonMQ resources in ASFF
- AwsApiGateway resources in ASFF
- AwsAppSync resources in ASFF
- AwsAthena resources in ASFF
- AwsAutoScaling resources in ASFF

- AwsBackup resources in ASFF
- AwsCertificateManager resources in ASFF
- AwsCloudFormation resources in ASFF
- AwsCloudFront resources in ASFF
- AwsCloudTrail resources in ASFF
- AwsCloudWatch resources in ASFF
- AwsCodeBuild resources in ASFF
- AwsDms resources in ASFF
- AwsDynamoDB resources in ASFF
- AwsEc2 resources in ASFF
- AwsEcr resources in ASFF
- AwsEcs resources in ASFF
- AwsEfs resources in ASFF
- AwsEks resources in ASFF
- AwsElasticBeanstalk resources in ASFF
- AwsElasticSearch resources in ASFF
- AwsElb resources in ASFF
- AwsEventBridge resources in ASFF
- AwsGuardDuty resources in ASFF
- AwsIam resources in ASFF
- AwsKinesis resources in ASFF
- AwsKms resources in ASFF
- AwsLambda
- AwsMsk resources in ASFF
- AwsNetworkFirewall resources in ASFF
- AwsOpenSearchService resources in ASFF
- AwsRds resources in ASFF
- AwsRedshift resources in ASFF
- AwsRoute53 resources in ASFF
- AwsS3 resources in ASFF

- AwsSageMaker resources in ASFF
- AwsSecretsManager resources in ASFF
- AwsSns resources in ASFF
- AwsSqs resources in ASFF
- AwsSsm resources in ASFF
- AwsStepFunctions resources in ASFF
- AwsWaf resources in ASFF
- AwsXray resources in ASFF
- CodeRepository object in ASFF
- Container object in ASFF
- Other object in ASFF

Resource attributes in the ASFF

Here are descriptions and examples for the `Resources` object in the AWS Security Finding Format (ASFF). For more information about these fields, see Resources.

ApplicationArn

Identifies the Amazon Resource Name (ARN) of the application involved in the finding.

Example

```
"ApplicationArn": "arn:aws:resource-groups:us-west-2:123456789012:group/
SampleApp/1234567890abcdef0"
```

ApplicationName

Identifies the name of the application involved in the finding.

Example

```
"ApplicationName": "SampleApp"
```

DataClassification

The DataClassification field provides information about sensitive data that was detected on the resource.

Example

```
"DataClassification": {
    "DetailedResultsLocation": "Path_to_Folder_Or_File",
    "Result": {
        "MimeType": "text/plain",
        "SizeClassified": 2966026,
        "AdditionalOccurrences": false,
        "Status": {
            "Code": "COMPLETE",
            "Reason": "Unsupportedfield"
        },
       "SensitiveData": [
            {
                "Category": "PERSONAL_INFORMATION",
                "Detections": [
                    {
                        "Count": 34,
                        "Type": "GE_PERSONAL_ID",
                        "Occurrences": {
                            "LineRanges": [
                                {
                                    "Start": 1,
                                    "End": 10,
                                    "StartColumn": 20
                                }
                            ],
                            "Pages": [],
                            "Records": [],
                            "Cells": []
                        }
                    },
                    {
                        "Count": 59,
                        "Type": "EMAIL_ADDRESS",
                        "Occurrences": {
                            "Pages": [
                                {
                                    "PageNumber": 1,
                                    "OffsetRange": {
                                        "Start": 1,
                                        "End": 100,
                                        "StartColumn": 10
                                     },
```

```
                                "LineRange": {
                                    "Start": 1,
                                    "End": 100,
                                    "StartColumn": 10
                                }
                            }
                        ]
                    }
                },
                {
                    "Count": 2229,
                    "Type": "URL",
                    "Occurrences": {
                       "LineRanges": [
                           {
                               "Start": 1,
                               "End": 13
                           }
                       ]
                    }
                },
                {
                    "Count": 13826,
                    "Type": "NameDetection",
                    "Occurrences": {
                        "Records": [
                            {
                                "RecordIndex": 1,
                                "JsonPath": "$.ssn.value"
                            }
                        ]
                    }
                },
                {
                    "Count": 32,
                    "Type": "AddressDetection"
                }
            ],
            "TotalCount": 32
        }
    ],
    "CustomDataIdentifiers": {
        "Detections": [
            {
```

```
                    "Arn": "1712be25e7c7f53c731fe464f1c869b8",
                    "Name": "1712be25e7c7f53c731fe464f1c869b8",
                    "Count": 2,
                }
            ],
            "TotalCount": 2
        }
    }
}
```

Details

The Details field provides additional information about a single resource using the appropriate objects. Each resource must be provided in a separate resource object in the `Resources` object.

Note that if the finding size exceeds the maximum of 240 KB, then the `Details` object is removed from the finding. For control findings that use AWS Config rules, you can view the resource details on the AWS Config console.

Security Hub CSPM provides a set of available resource details for its supported resource types. These details correspond to values of the `Type` object. Use the provided types whenever possible.

For example, if the resource is an S3 bucket, then set the resource `Type` to `AwsS3Bucket` and provide the resource details in the `AwsS3Bucket` object.

The `Other` object allows you to provide custom fields and values. You use the `Other` object in the following cases:

- The resource type (the value of the resource `Type`) does not have a corresponding details object. To provide details for the resource, you use the `Other` object.
- The object for the resource type does not include all of the fields that you want to populate. In this case, use the details object for the resource type to populate the available fields. Use the `Other` object to populate the fields that are not in the type-specific object.
- The resource type is not one of the provided types. In this case, set `Resource.Type` to `Other`, and use the `Other` object to populate the details.

Example

```
"Details": {
```

```
  "AwsEc2Instance": {
    "IamInstanceProfileArn": "arn:aws:iam::123456789012:role/IamInstanceProfileArn",
    "ImageId": "ami-79fd7eee",
    "IpV4Addresses": ["1.1.1.1"],
    "IpV6Addresses": ["2001:db8:1234:1a2b::123"],
    "KeyName": "testkey",
    "LaunchedAt": "2018-09-29T01:25:54Z",
    "MetadataOptions": {
      "HttpEndpoint": "enabled",
      "HttpProtocolIpv6": "enabled",
      "HttpPutResponseHopLimit": 1,
      "HttpTokens": "optional",
      "InstanceMetadataTags": "disabled"
    },
    "NetworkInterfaces": [
    {
      "NetworkInterfaceId": "eni-e5aa89a3"
    }
    ],
    "SubnetId": "PublicSubnet",
    "Type": "i3.xlarge",
    "VirtualizationType": "hvm",
    "VpcId": "TestVPCIpv6"
  },
  "AwsS3Bucket": {
    "OwnerId": "da4d66eac431652a4d44d490a00500bded52c97d235b7b4752f9f688566fe6de",
    "OwnerName": "acmes3bucketowner"
  },
  "Other": { "LightPen": "blinky", "SerialNo": "1234abcd"}
}
```

Id

The identifier for the given resource type.

For AWS resources that are identified by Amazon Resource Names (ARNs), this is the ARN.

For AWS resources that lack ARNs, this is the identifier as defined by the AWS service that created the resource.

For non-AWS resources, this is a unique identifier that is associated with the resource.

Example

```
"Id": "arn:aws:s3:::amzn-s3-demo-bucket"
```

Partition

The partition in which the resource is located. A partition is a group of AWS Regions. Each AWS account is scoped to one partition.

The following partitions are supported:

- `aws` – AWS Regions
- `aws-cn` – China Regions
- `aws-us-gov` – AWS GovCloud (US) Region

Example

```
"Partition": "aws"
```

Region

The code for the AWS Region where this resource is located. For a list of Region codes, see Regional endpoints.

Example

```
"Region": "us-west-2"
```

ResourceRole

Identifies the role of the resource in the finding. A resource is either the target of the finding activity or the actor that performed the activity.

Example

```
"ResourceRole": "target"
```

Tags

This field provides tag key and value information for the resource involved in a finding. You can tag resources that are supported by the `GetResources` operation of the AWS Resource Groups

Tagging API. Security Hub CSPM calls this operation though the service-linked role and retrieves the resource tags if the AWS Security Finding Format (ASFF) `Resource.Id` field is populated with the AWS resource ARN. Invalid resource IDs are ignored.

You can add resource tags to findings that Security Hub CSPM ingests, including findings from integrated AWS services and third-party products.

Adding tags tells you the tags that were associated with a resource at the time the finding was processed. You can include the `Tags` attribute only for resources that have an associated tag. If a resource has no associated tag, don't include a `Tags` attribute in the finding.

The inclusion of resource tags in findings eliminates the need to build data enrichment pipelines or manually enrich the metadata of security findings. You can also use tags to search or filter findings and insights and create automation rules.

For information about restrictions that apply to tags, see Tag naming limits and requirements.

You can only provide tags that exist on an AWS resource in this field. To provide data that isn't defined in the AWS Security Finding Format, use the `Other` details subfield.

Example

```
"Tags": {
    "billingCode": "Lotus-1-2-3",
    "needsPatching": "true"
}
```

Type

The type of resource that you are providing details for.

Whenever possible, use one of the provided resource types, such as `AwsEc2Instance` or `AwsS3Bucket`.

If the resource type does not match any of the provided resource types, then set the resource `Type` to `Other`, and use the `Other` details subfield to populate the details.

Supported values are listed under Resources.

Example

```
"Type": "AwsS3Bucket"
```

AwsAmazonMQ resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsAmazonMQ` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsAmazonMQBroker

`AwsAmazonMQBroker` provides information about an Amazon MQ broker, which is a message broker environment running on Amazon MQ.

The following example shows the ASFF for the `AwsAmazonMQBroker` object. To view descriptions of `AwsAmazonMQBroker` attributes, see AwsAmazonMQBroker in the *AWS Security Hub API Reference*.

Example

```
"AwsAmazonMQBroker": {
    "AutoMinorVersionUpgrade": true,
    "BrokerArn": "arn:aws:mq:us-east-1:123456789012:broker:TestBroker:b-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BrokerId": "b-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BrokerName": "TestBroker",
    "Configuration": {
        "Id": "c-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Revision": 1
    },
    "DeploymentMode": "ACTIVE_STANDBY_MULTI_AZ",
    "EncryptionOptions": {
        "UseAwsOwnedKey": true
    },
    "EngineType": "ActiveMQ",
    "EngineVersion": "5.17.2",
    "HostInstanceType": "mq.t2.micro",
    "Logs": {
        "Audit": false,
        "AuditLogGroup": "/aws/amazonmq/broker/b-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/
audit",
        "General": false,
        "GeneralLogGroup": "/aws/amazonmq/broker/b-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/general"
```

```
    },
    "MaintenanceWindowStartTime": {
        "DayOfWeek": "MONDAY",
        "TimeOfDay": "22:00",
        "TimeZone": "UTC"
    },
    "PubliclyAccessible": true,
    "SecurityGroups": [
        "sg-021345abcdef6789"
    ],
    "StorageType": "efs",
    "SubnetIds": [
        "subnet-1234567890abcdef0",
        "subnet-abcdef01234567890"
    ],
    "Users": [
        {
            "Username": "admin"
        }
    ]
}
```

AwsApiGateway resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsApiGateway` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsApiGatewayRestApi

The `AwsApiGatewayRestApi` object contains information about a REST API in version 1 of Amazon API Gateway.

The following is an example `AwsApiGatewayRestApi` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayRestApi` attributes, see AwsApiGatewayRestApiDetails in the *AWS Security Hub API Reference*.

Example

```
AwsApiGatewayRestApi: {
    "Id": "exampleapi",
```

```
    "Name": "Security Hub",
    "Description": "AWS Security Hub",

}
```

AwsApiGatewayStage

The `AwsApiGatewayStage` object provides information about a version 1 Amazon API Gateway stage.

The following is an example `AwsApiGatewayStage` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayStage` attributes, see AwsApiGatewayStageDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsApiGatewayStage": {
    "DeploymentId": "n7hlmf",
    "ClientCertificateId": "a1b2c3",
    "StageName": "Prod",
    "Description" : "Stage Description",
    "CacheClusterEnabled": false,
    "CacheClusterSize" : "1.6",
    "CacheClusterStatus": "NOT_AVAILABLE",
    "MethodSettings": [
        {
            "MetricsEnabled": true,
            "LoggingLevel": "INFO",
            "DataTraceEnabled": false,
            "ThrottlingBurstLimit": 100,
            "ThrottlingRateLimit": 5.0,
            "CachingEnabled": false,
            "CacheTtlInSeconds": 300,
            "CacheDataEncrypted": false,
```

```
            "RequireAuthorizationForCacheControl": true,
            "UnauthorizedCacheControlHeaderStrategy": "SUCCEED_WITH_RESPONSE_HEADER",
            "HttpMethod": "POST",
            "ResourcePath": "/echo"
        }
    ],
    "Variables": {"test": "value"},
    "DocumentationVersion": "2.0",
    "AccessLogSettings": {
        "Format": "{\"requestId\": \"$context.requestId\", \"extendedRequestId
\": \"$context.extendedRequestId\", \"ownerAccountId\": \"$context.accountId\",

}
```

AwsApiGatewayV2Api

The `AwsApiGatewayV2Api` object contains information about a version 2 API in Amazon API Gateway.

The following is an example `AwsApiGatewayV2Api` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayV2Api` attributes, see AwsApiGatewayV2ApiDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsApiGatewayV2Api": {
    "ApiEndpoint": "https://example.us-west-2.amazonaws.com",
    "ApiId": "a1b2c3d4",
    "ApiKeySelectionExpression": "$request.header.x-api-key",
    "CreatedDate": "2020-03-28T00:32:37Z",
   "Description": "ApiGatewayV2 Api",
   "Version": "string",
    "Name": "my-api",
    "ProtocolType": "HTTP",
    "RouteSelectionExpression": "$request.method $request.path",
   "CorsConfiguration": {
        "AllowOrigins": [ "*" ],
        "AllowCredentials": true,
        "ExposeHeaders": [ "string" ],
        "MaxAge": 3000,
        "AllowMethods": [
          "GET",
          "PUT",
          "POST",
          "DELETE",
          "HEAD"
        ],
        "AllowHeaders": [ "*" ]
    }
}
```

AwsApiGatewayV2Stage

`AwsApiGatewayV2Stage` contains information about a version 2 stage for Amazon API Gateway.

The following is an example `AwsApiGatewayV2Stage` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayV2Stage` attributes, see AwsApiGatewayV2StageDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsApiGatewayV2Stage": {
    "CreatedDate": "2020-04-08T00:36:05Z",
    "Description" : "ApiGatewayV2",
    "DefaultRouteSettings": {
        "DetailedMetricsEnabled": false,
        "LoggingLevel": "INFO",
        "DataTraceEnabled": true,
        "ThrottlingBurstLimit": 100,
        "ThrottlingRateLimit": 50
    },
    "DeploymentId": "x1zwyv",
    "LastUpdatedDate": "2020-04-08T00:36:13Z",
    "RouteSettings": {
        "DetailedMetricsEnabled": false,
        "LoggingLevel": "INFO",
        "DataTraceEnabled": true,
        "ThrottlingBurstLimit": 100,
        "ThrottlingRateLimit": 50
    },
    "StageName": "prod",
    "StageVariables": [
        "function": "my-prod-function"
    ],
    "AccessLogSettings": {
        "Format": "{\"requestId\": \"$context.requestId\", \"extendedRequestId
\": \"$context.extendedRequestId\", \"ownerAccountId\": \"$context.accountId\",
 \"requestAccountId\": \"$context.identity.accountId\", \"callerPrincipal\":

        "DestinationArn": "arn:aws:logs:us-west-2:111122223333:log-
group:SecurityHubAPIAccessLog/Prod"
    },
    "AutoDeploy": false,
    "LastDeploymentStatusMessage": "Message",
    "ApiGatewayManaged": true,
}
```

AwsAppSync resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for AwsAppSync resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsAppSyncGraphQLApi

AwsAppSyncGraphQLApi provides information about an AWS AppSync GraphQL API, which is a top-level construct for your application.

The following example shows the ASFF for the AwsAppSyncGraphQLApi object. To view descriptions of AwsAppSyncGraphQLApi attributes, see AwsAppSyncGraphQLApi in the *AWS Security Hub API Reference*.

Example

```
"AwsAppSyncGraphQLApi": {
    "AdditionalAuthenticationProviders": [
    {
     "AuthenticationType": "AWS_LAMBDA",
     "LambdaAuthorizerConfig": {
      "AuthorizerResultTtlInSeconds": 300,
      "AuthorizerUri": "arn:aws:lambda:us-east-1:123456789012:function:mylambdafunc"
     }
    },
    {
     "AuthenticationType": "AWS_IAM"
    }
    ],
    "ApiId": "021345abcdef6789",
```

```
    "Arn": "arn:aws:appsync:eu-central-1:123456789012:apis/021345abcdef6789",
    "AuthenticationType": "API_KEY",
    "Id": "021345abcdef6789",
    "LogConfig": {
     "CloudWatchLogsRoleArn": "arn:aws:iam::123456789012:role/service-role/appsync-
graphqlapi-logs-eu-central-1",
     "ExcludeVerboseContent": true,
     "FieldLogLevel": "ALL"
    },
    "Name": "My AppSync App",
    "XrayEnabled": true,
}
```

AwsAthena resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsAthena` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsAthenaWorkGroup

`AwsAthenaWorkGroup` provides information about an Amazon Athena workgroup. A workgroup helps you separate users, teams, applications, or workloads. It also helps you set limits on data processing and track costs.

The following example shows the ASFF for the `AwsAthenaWorkGroup` object. To view descriptions of `AwsAthenaWorkGroup` attributes, see AwsAthenaWorkGroup in the *AWS Security Hub API Reference*.

Example

```
"AwsAthenaWorkGroup": {
    "Description": "My workgroup for prod workloads",
    "Name": "MyWorkgroup",
    "WorkgroupConfiguration" {
        "ResultConfiguration": {
            "EncryptionConfiguration": {
                "EncryptionOption": "SSE_KMS",
                "KmsKey": "arn:aws:kms:us-east-1:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
            }
```

```
        }
    },
        "State": "ENABLED"
}
```

AwsAutoScaling resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsAutoScaling` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsAutoScalingAutoScalingGroup

The `AwsAutoScalingAutoScalingGroup` object provides details about an automatic scaling group.

The following is an example `AwsAutoScalingAutoScalingGroup` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsAutoScalingAutoScalingGroup` attributes, see AwsAutoScalingAutoScalingGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsAutoScalingAutoScalingGroup": {
        "CreatedTime": "2017-10-17T14:47:11Z",
        "HealthCheckGracePeriod": 300,
        "HealthCheckType": "EC2",
        "LaunchConfigurationName": "mylaunchconf",
        "LoadBalancerNames": [],
        "LaunchTemplate": {
            "LaunchTemplateId": "string",
            "LaunchTemplateName": "string",
            "Version": "string"
        },
        "MixedInstancesPolicy": {
            "InstancesDistribution": {
                "OnDemandAllocationStrategy": "prioritized",
                "OnDemandBaseCapacity": number,
                "OnDemandPercentageAboveBaseCapacity": number,
                "SpotAllocationStrategy": "lowest-price",
                "SpotInstancePools": number,
```

```
                "SpotMaxPrice": "string"
            },
            "LaunchTemplate": {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateId": "string",
                    "LaunchTemplateName": "string",
                    "Version": "string"
                 },
                "CapacityRebalance": true,
                "Overrides": [
                    {
                       "InstanceType": "string",
                       "WeightedCapacity": "string"
                    }
                ]
            }
        }
    }
}
```

AwsAutoScalingLaunchConfiguration

The `AwsAutoScalingLaunchConfiguration` object provides details about a launch configuration.

The following is an example `AwsAutoScalingLaunchConfiguration` finding in the AWS Security Finding Format (ASFF).

To view descriptions of `AwsAutoScalingLaunchConfiguration` attributes, see AwsAutoScalingLaunchConfigurationDetails in the *AWS Security Hub API Reference*.

Example

```
AwsAutoScalingLaunchConfiguration: {
    "LaunchConfigurationName": "newtest",
    "ImageId": "ami-058a3739b02263842",
    "KeyName": "55hundredinstance",
    "SecurityGroups": [ "sg-01fce87ad6e019725" ],
    "ClassicLinkVpcSecurityGroups": [],
    "UserData": "...Base64-Encoded user data..."
    "InstanceType": "a1.metal",
    "KernelId": "",
    "RamdiskId": "ari-a51cf9cc",
```

```
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/sdh",
            "Ebs": {
                "VolumeSize": 30,
                "VolumeType": "gp2",
                "DeleteOnTermination": false,
                "Encrypted": true,
                "SnapshotId": "snap-ffaa1e69",
                "VirtualName": "ephemeral1"
            }
        },
        {
            "DeviceName": "/dev/sdb",
            "NoDevice": true
        },
        {
            "DeviceName": "/dev/sda1",
            "Ebs": {
                "SnapshotId": "snap-02420cd3d2dea1bc0",
                "VolumeSize": 8,
                "VolumeType": "gp2",
                "DeleteOnTermination": true,
                "Encrypted": false
            }
        },
        {
            "DeviceName": "/dev/sdi",
            "Ebs": {
                "VolumeSize": 20,
                "VolumeType": "gp2",
                "DeleteOnTermination": false,
                "Encrypted": true
            }
        },
        {
            "DeviceName": "/dev/sdc",
            "NoDevice": true
        }
    ],
    "InstanceMonitoring": {
        "Enabled": false
    },
    "CreatedTime": 1620842933453,
```

```
    "EbsOptimized": false,
    "AssociatePublicIpAddress": true,
    "SpotPrice": "0.045"
}
```

AwsBackup resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsBackup` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsBackupBackupPlan

The `AwsBackupBackupPlan` object provides information about an AWS Backup backup plan. An AWS Backup backup plan is a policy expression that defines when and how you want to back up your AWS resources.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsBackupBackupPlan` object. To view descriptions of `AwsBackupBackupPlan` attributes, see AwsBackupBackupPlan in the *AWS Security Hub API Reference*.

Example

```
"AwsBackupBackupPlan": {
    "BackupPlan": {
     "AdvancedBackupSettings": [{
      "BackupOptions": {
       "WindowsVSS":"enabled"
      },
      "ResourceType":"EC2"
     }],
     "BackupPlanName": "test",
     "BackupPlanRule": [{
      "CompletionWindowMinutes": 10080,
      "CopyActions": [{
       "DestinationBackupVaultArn": "arn:aws:backup:us-east-1:858726136373:backup-
vault:aws/efs/automatic-backup-vault",
       "Lifecycle": {
        "DeleteAfterDays": 365,
        "MoveToColdStorageAfterDays": 30
```

```
       }
      }],
      "Lifecycle": {
       "DeleteAfterDays": 35
      },
      "RuleName": "DailyBackups",
      "ScheduleExpression": "cron(0 5 ? * * *)",
      "StartWindowMinutes": 480,
      "TargetBackupVault": "Default"
      },
      {
      "CompletionWindowMinutes": 10080,
      "CopyActions": [{
       "DestinationBackupVaultArn": "arn:aws:backup:us-east-1:858726136373:backup-
vault:aws/efs/automatic-backup-vault",
       "Lifecycle": {
        "DeleteAfterDays": 365,
        "MoveToColdStorageAfterDays": 30
       }
      }],
      "Lifecycle": {
       "DeleteAfterDays": 35
      },
      "RuleName": "Monthly",
      "ScheduleExpression": "cron(0 5 1 * ? *)",
      "StartWindowMinutes": 480,
      "TargetBackupVault": "Default"
     }]
    },
    "BackupPlanArn": "arn:aws:backup:us-east-1:858726136373:backup-
plan:b6d6b896-590d-4ee1-bf29-c5ccae63f4e7",
    "BackupPlanId": "b6d6b896-590d-4ee1-bf29-c5ccae63f4e7",
    "VersionId": "ZDVjNDIzMjItYTZiNS00NzczLTg4YzctNmExMWM2NjZhY2E1"
}
```

AwsBackupBackupVault

The `AwsBackupBackupVault` object provides information about an AWS Backup backup vault. A AWS Backup backup vault is a container that stores and organizes your backups.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsBackupBackupVault` object. To view descriptions of `AwsBackupBackupVault` attributes, see AwsBackupBackupVault in the *AWS Security Hub API Reference*.

Example

```
"AwsBackupBackupVault": {
    "AccessPolicy": {
     "Statement": [{
      "Action": [
       "backup:DeleteBackupVault",
       "backup:DeleteBackupVaultAccessPolicy",
       "backup:DeleteRecoveryPoint",
       "backup:StartCopyJob",
       "backup:StartRestoreJob",
       "backup:UpdateRecoveryPointLifecycle"
      ],
      "Effect": "Deny",
      "Principal": {
       "AWS": "*"
      },
      "Resource": "*"
     }],
     "Version": "2012-10-17"
    },
    "BackupVaultArn": "arn:aws:backup:us-east-1:123456789012:backup-vault:aws/efs/
automatic-backup-vault",
    "BackupVaultName": "aws/efs/automatic-backup-vault",
    "EncrytionKeyArn": "arn:aws:kms:us-east-1:444455556666:key/72ba68d4-5e43-40b0-
ba38-838bf8d06ca0",
    "Notifications": {
     "BackupVaultEvents": ["BACKUP_JOB_STARTED", "BACKUP_JOB_COMPLETED",
 "COPY_JOB_STARTED"],
     "SNSTopicArn": "arn:aws:sns:us-west-2:111122223333:MyVaultTopic"
    }
}
```

AwsBackupRecoveryPoint

The `AwsBackupRecoveryPoint` object provides information about an AWS Backup backup, also referred to as a recovery point. An AWS Backup recovery point represents the content of a resource at a specified time.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsBackupRecoveryPoint` object. To view descriptions of `AwsBackupBackupVault` attributes, see AwsBackupRecoveryPoint in the *AWS Security Hub API Reference*.

Example

```
"AwsBackupRecoveryPoint": {
    "BackupSizeInBytes": 0,
    "BackupVaultName": "aws/efs/automatic-backup-vault",
    "BackupVaultArn": "arn:aws:backup:us-east-1:111122223333:backup-vault:aws/efs/
automatic-backup-vault",
    "CalculatedLifecycle": {
     "DeleteAt": "2021-08-30T06:51:58.271Z",
     "MoveToColdStorageAt": "2020-08-10T06:51:58.271Z"
    },
    "CompletionDate": "2021-07-26T07:21:40.361Z",
    "CreatedBy": {
     "BackupPlanArn": "arn:aws:backup:us-east-1:111122223333:backup-plan:aws/
efs/73d922fb-9312-3a70-99c3-e69367f9fdad",
     "BackupPlanId": "aws/efs/73d922fb-9312-3a70-99c3-e69367f9fdad",
     "BackupPlanVersion": "ZGM4YzY5YjktMWYxNC00ZTBmLWE5MjYtZmU5OWNiZmM5ZjIz",
     "BackupRuleId": "2a600c2-42ad-4196-808e-084923ebfd25"
    },
    "CreationDate": "2021-07-26T06:51:58.271Z",
    "EncryptionKeyArn": "arn:aws:kms:us-east-1:111122223333:key/72ba68d4-5e43-40b0-
ba38-838bf8d06ca0",
    "IamRoleArn": "arn:aws:iam::111122223333:role/aws-service-role/
backup.amazonaws.com/AWSServiceRoleForBackup",
    "IsEncrypted": true,
    "LastRestoreTime": "2021-07-26T06:51:58.271Z",
    "Lifecycle": {
     "DeleteAfterDays": 35,
     "MoveToColdStorageAfterDays": 15
    },

AwsCertificateManager resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCertificateManager` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCertificateManagerCertificate

The `AwsCertificateManagerCertificate` object provides details about an AWS Certificate Manager (ACM) certificate.

The following is an example `AwsCertificateManagerCertificate` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsCertificateManagerCertificate` attributes, see AwsCertificateManagerCertificateDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCertificateManagerCertificate": {
    "CertificateAuthorityArn": "arn:aws:acm:us-west-2:444455556666:certificate-
authority/example",
    "CreatedAt": "2019-05-24T18:12:02.000Z",
    "DomainName": "example.amazondomains.com",
    "DomainValidationOptions": [
        {
            "DomainName": "example.amazondomains.com",
            "ResourceRecord": {
                "Name": "_1bacb61828d3a1020c40a560ceed08f7.example.amazondomains.com",
                "Type": "CNAME",
                "Value": "_example.acm-validations.aws."
             },
             "ValidationDomain": "example.amazondomains.com",
             "ValidationEmails": [sample_email@sample.com],
             "ValidationMethod": "DNS",
             "ValidationStatus": "SUCCESS"
        }
    ],
    "ExtendedKeyUsages": [

AwsCloudFormation resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCloudFormation` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCloudFormationStack

The `AwsCloudFormationStack` object provides details about an AWS CloudFormation stack that is nested as a resource in a top-level template.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsCloudFormationStack` object. To view descriptions of `AwsCloudFormationStack` attributes, see AwsCloudFormationStackDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCloudFormationStack": {
 "Capabilities": [
  "CAPABILITY_IAM",
  "CAPABILITY_NAMED_IAM"
 ],
 "CreationTime": "2022-02-18T15:31:53.161Z",
 "Description": "AWS CloudFormation Sample",
 "DisableRollback": true,
 "DriftInformation": {
  "StackDriftStatus": "DRIFTED"
 },
 "EnableTerminationProtection": false,
 "LastUpdatedTime": "2022-02-18T15:31:53.161Z",
 "NotificationArns": [
  "arn:aws:sns:us-east-1:978084797471:sample-sns-cfn"
```

```
 ],
 "Outputs": [{
  "Description": "URL for newly created LAMP stack",
  "OutputKey": "WebsiteUrl",
  "OutputValue": "http://ec2-44-193-18-241.compute-1.amazonaws.com"
 }],
 "RoleArn": "arn:aws:iam::012345678910:role/exampleRole",

 "StackName": "sample-stack",
 "StackStatus": "CREATE_COMPLETE",
 "StackStatusReason": "Success",
 "TimeoutInMinutes": 1
}
```

AwsCloudFront resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCloudFront` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCloudFrontDistribution

The `AwsCloudFrontDistribution` object provides details about a Amazon CloudFront distribution configuration.

The following is an example `AwsCloudFrontDistribution` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsCloudFrontDistribution` attributes, see AwsCloudFrontDistributionDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCloudFrontDistribution": {
    "CacheBehaviors": {
        "Items": [
            {
               "ViewerProtocolPolicy": "https-only"
            }
         ]
    },
    "DefaultCacheBehavior": {
```

```
          "ViewerProtocolPolicy": "https-only"
      },
      "DefaultRootObject": "index.html",
      "DomainName": "d2wkuj2w9l34gt.cloudfront.net",
      "Etag": "E37HOT42DHPVYH",
      "LastModifiedTime": "2015-08-31T21:11:29.093Z",
      "Logging": {
          "Bucket": "myawslogbucket.s3.amazonaws.com",
          "Enabled": false,
          "IncludeCookies": false,
          "Prefix": "myawslog/"
       },
       "OriginGroups": {
            "Items": [
               {
                  "FailoverCriteria": {
                      "StatusCodes": {
                          "Items": [
                              200,
                              301,
                              404
                          ]
                          "Quantity": 3
                       }
                  }
               }
            ]
       },
       "Origins": {
            "Items": [
                {
                   "CustomOriginConfig": {
                       "HttpPort": 80,
                       "HttpsPort": 443,
                       "OriginKeepaliveTimeout": 60,
                       "OriginProtocolPolicy": "match-viewer",

            "SslSupportMethod": "sni-only"
      },
      "WebAclId": "waf-1234567890"
}
```

AwsCloudTrail resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCloudTrail` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCloudTrailTrail

The `AwsCloudTrailTrail` object provides details about a AWS CloudTrail trail.

The following is an example `AwsCloudTrailTrail` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsCloudTrailTrail` attributes, see AwsCloudTrailTrailDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCloudTrailTrail": {
```

```
    "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-west-2:123456789012:log-
group:CloudTrail/regression:*",
    "CloudWatchLogsRoleArn": "arn:aws:iam::866482105055:role/
CloudTrail_CloudWatchLogs",
    "HasCustomEventSelectors": true,
    "HomeRegion": "us-west-2",
    "IncludeGlobalServiceEvents": true,
    "IsMultiRegionTrail": true,
    "IsOrganizationTrail": false,
    "KmsKeyId": "kmsKeyId",
    "LogFileValidationEnabled": true,
    "Name": "regression-trail",
    "S3BucketName": "cloudtrail-bucket",
    "S3KeyPrefix": "s3KeyPrefix",
    "SnsTopicArn": "arn:aws:sns:us-east-2:123456789012:MyTopic",
    "SnsTopicName": "snsTopicName",
    "TrailArn": "arn:aws:cloudtrail:us-west-2:123456789012:trail"
}
```

AwsCloudWatch resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCloudWatch` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCloudWatchAlarm

The `AwsCloudWatchAlarm` object provides details about Amazon CloudWatch alarms that watch a metric or perform an action when an alarm changes state.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsCloudWatchAlarm` object. To view descriptions of `AwsCloudWatchAlarm` attributes, see AwsCloudWatchAlarmDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCloudWatchAlarm": {
 "ActionsEnabled": true,
 "AlarmActions": [
  "arn:aws:automate:region:ec2:stop",
```

```
  "arn:aws:automate:region:ec2:terminate"
 ],
 "AlarmArn": "arn:aws:cloudwatch:us-west-2:012345678910:alarm:sampleAlarm",
 "AlarmConfigurationUpdatedTimestamp": "2022-02-18T15:31:53.161Z",
 "AlarmDescription": "Alarm Example",
 "AlarmName": "Example",
 "ComparisonOperator": "GreaterThanOrEqualToThreshold",
 "DatapointsToAlarm": 1,
 "Dimensions": [{
  "Name": "InstanceId",
  "Value": "i-1234567890abcdef0"
 }],
 "EvaluateLowSampleCountPercentile": "evaluate",
 "EvaluationPeriods": 1,
 "ExtendedStatistic": "p99.9",
 "InsufficientDataActions": [
  "arn:aws:automate:region:ec2:stop"
 ],
 "MetricName": "Sample Metric",
 "Namespace": "YourNamespace",
 "OkActions": [
  "arn:aws:swf:region:account-id:action/actions/AWS_EC2.InstanceId.Stop/1.0"
 ],
 "Period": 1,
 "Statistic": "SampleCount",
 "Threshold": 12.3,
 "ThresholdMetricId": "t1",
 "TreatMissingData": "notBreaching",
 "Unit": "Kilobytes/Second"
}
```

AwsCodeBuild resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsCodeBuild` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsCodeBuildProject

The `AwsCodeBuildProject` object provides information about an AWS CodeBuild project.

The following is an example `AwsCodeBuildProject` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsCodeBuildProject` attributes, see AwsCodeBuildProjectDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsCodeBuildProject": {
   "Artifacts": [
      {
          "ArtifactIdentifier": "string",
          "EncryptionDisabled": boolean,
          "Location": "string",
          "Name": "string",
          "NamespaceType": "string",
          "OverrideArtifactName": boolean,
          "Packaging": "string",
          "Path": "string",
          "Type": "string"
       }
   ],
   "SecondaryArtifacts": [
      {
          "ArtifactIdentifier": "string",
          "EncryptionDisabled": boolean,
          "Location": "string",
          "Name": "string",
          "NamespaceType": "string",
          "OverrideArtifactName": boolean,
          "Packaging": "string",
          "Path": "string",
          "Type": "string"
       }
   ],
   "EncryptionKey": "string",
   "Certificate": "string",
   "Environment": {
      "Certificate": "string",
      "EnvironmentVariables": [
           {
                "Name": "string",
                "Type": "string",
                "Value": "string"
           }
```

```
      ],
   "ImagePullCredentialsType": "string",
   "PrivilegedMode": boolean,
   "RegistryCredential": {
       "Credential": "string",
       "CredentialProvider": "string"
   },
   "Type": "string"
   },
   "LogsConfig": {
        "CloudWatchLogs": {
             "GroupName": "string",
             "Status": "string",
             "StreamName": "string"
        },
        "S3Logs": {
             "EncryptionDisabled": boolean,
             "Location": "string",
             "Status": "string"
        }
   },
   "Name": "string",
   "ServiceRole": "string",
   "Source": {
        "Type": "string",
        "Location": "string",
        "GitCloneDepth": integer
   },
   "VpcConfig": {
        "VpcId": "string",
        "Subnets": ["string"],
        "SecurityGroupIds": ["string"]
   }
}
```

AwsDms resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsDms` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see [AWS Security Finding Format (ASFF)].

AwsDmsEndpoint

The `AwsDmsEndpoint` object provides information about an AWS Database Migration Service (AWS DMS) endpoint. An endpoint provides connection, data store type, and location information about your data store.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsDmsEndpoint` object. To view descriptions of `AwsDmsEndpoint` attributes, see AwsDmsEndpointDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsDmsEndpoint": {
    "CertificateArn": "arn:aws:dms:us-
east-1:123456789012:cert:EXAMPLEIGDURVZGVJQZDPWJ5A7F2YDJVSMTBWFI",
    "DatabaseName": "Test",
    "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:EXAMPLEQB3CZY33F7XV253NAJVBNPK6MJQVFVQA",
    "EndpointIdentifier": "target-db",
    "EndpointType": "TARGET",
    "EngineName": "mariadb",
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "Port": 3306,
    "ServerName": "target-db.exampletafyu.us-east-1.rds.amazonaws.com",
    "SslMode": "verify-ca",
    "Username": "admin"
}
```

AwsDmsReplicationInstance

The `AwsDmsReplicationInstance` object provides information about an AWS Database Migration Service (AWS DMS) replication instance. DMS uses a replication instance to connect to your source data store, read the source data, and format the data for consumption by the target data store.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsDmsReplicationInstance` object. To view descriptions of `AwsDmsReplicationInstance` attributes, see AwsDmsReplicationInstanceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsDmsReplicationInstance": {
    "AllocatedStorage": 50,
    "AutoMinorVersionUpgrade": true,
    "AvailabilityZone": "us-east-1b",
    "EngineVersion": "3.5.1",
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "MultiAZ": false,
    "PreferredMaintenanceWindow": "wed:08:08-wed:08:38",
    "PubliclyAccessible": true,
    "ReplicationInstanceClass": "dms.c5.xlarge",
    "ReplicationInstanceIdentifier": "second-replication-instance",
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "default-vpc-2344f44f"
    },
    "VpcSecurityGroups": [
        {
            "VpcSecurityGroupId": "sg-003a34e205138138b"
        }
    ]
}
```

AwsDmsReplicationTask

The `AwsDmsReplicationTask` object provides information about an AWS Database Migration Service (AWS DMS) replication task. A replication task moves a set of data from the source endpoint to the target endpoint.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsDmsReplicationInstance` object. To view descriptions of `AwsDmsReplicationInstance` attributes, see AwsDmsReplicationInstance in the *AWS Security Hub API Reference*.

Example

```
"AwsDmsReplicationTask": {
    "CdcStartPosition": "2023-08-28T14:26:22",
    "Id": "arn:aws:dms:us-
east-1:123456789012:task:YDYUOHZIXWKQSUCBMUCQCNY44SJW74VJNB5DFWQ",
    "MigrationType": "cdc",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T7V6RFDP23PYQWUL26N3PF5REKML4YOUGIMYJUI",
    "ReplicationTaskIdentifier": "test-task",
```

```
    "ReplicationTaskSettings": "{\"Logging\":{\"EnableLogging\":false,
\"EnableLogContext\":false,\"LogComponents\":[{\"Severity\":\"LOGGER_SEVERITY_DEFAULT

AwsDynamoDB resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsDynamoDB` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsDynamoDbTable

The `AwsDynamoDbTable` object provides details about an Amazon DynamoDB table.

The following is an example `AwsDynamoDbTable` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsDynamoDbTable` attributes, see AwsDynamoDbTableDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsDynamoDbTable": {
    "AttributeDefinitions": [
        {
            "AttributeName": "attribute1",
            "AttributeType": "value 1"
        },
        {
```

```
            "AttributeName": "attribute2",
            "AttributeType": "value 2"
        },
        {
            "AttributeName": "attribute3",
            "AttributeType": "value 3"
        }
    ],
    "BillingModeSummary": {
        "BillingMode": "PAY_PER_REQUEST",
        "LastUpdateToPayPerRequestDateTime": "2019-12-03T15:23:10.323Z"
    },
    "CreationDateTime": "2019-12-03T15:23:10.248Z",
    "DeletionProtectionEnabled": true,
    "GlobalSecondaryIndexes": [
        {
            "Backfilling": false,
            "IndexArn": "arn:aws:dynamodb:us-west-2:111122223333:table/exampleTable/
index/exampleIndex",
            "IndexName": "standardsControlArnIndex",
            "IndexSizeBytes": 1862513,
            "IndexStatus": "ACTIVE",
            "ItemCount": 20,
            "KeySchema": [
                {
                    "AttributeName": "City",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "Date",
                    "KeyType": "RANGE"
                }
            ],
            "Projection": {
                "NonKeyAttributes": ["predictorName"],

AwsEc2 resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEc2` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see [AWS Security Finding Format (ASFF)].

AwsEc2ClientVpnEndpoint

The `AwsEc2ClientVpnEndpoint` object provides information about an AWS Client VPN endpoint. A Client VPN endpoint is the resource that you create and configure to enable and manage client VPN sessions. It's the termination point for all client VPN sessions.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2ClientVpnEndpoint` object. To view descriptions of `AwsEc2ClientVpnEndpoint` attributes, see AwsEc2ClientVpnEndpointDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2ClientVpnEndpoint": {
    "AuthenticationOptions": [
        {
            "MutualAuthentication": {
                "ClientRootCertificateChainArn": "arn:aws:acm:us-
east-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            },
            "Type": "certificate-authentication"
        }
    ],
    "ClientCidrBlock": "10.0.0.0/22",
    "ClientConnectOptions": {
        "Enabled": false
    },
    "ClientLoginBannerOptions": {
        "Enabled": false
    },
    "ClientVpnEndpointId": "cvpn-endpoint-00c5d11fc4729f2a5",
    "ConnectionLogOptions": {
        "Enabled": false
    },
    "Description": "test",
    "DnsServer": ["10.0.0.0"],
    "ServerCertificateArn": "arn:aws:acm:us-east-1:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SecurityGroupIdSet": [
        "sg-0f7a177b82b443691"
    ],
    "SelfServicePortalUrl": "https://self-service.clientvpn.amazonaws.com/endpoints/
cvpn-endpoint-00c5d11fc4729f2a5",
    "SessionTimeoutHours": 24,
```

```
    "SplitTunnel": false,
    "TransportProtocol": "udp",
    "VpcId": "vpc-1a2b3c4d5e6f1a2b3",
    "VpnPort": 443
}
```

AwsEc2Eip

The `AwsEc2Eip` object provides information about an Elastic IP address.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2Eip` object. To view descriptions of `AwsEc2Eip` attributes, see AwsEc2EipDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2Eip": {
    "InstanceId": "instance1",
    "PublicIp": "192.0.2.04",
    "AllocationId": "eipalloc-example-id-1",
    "AssociationId": "eipassoc-example-id-1",
    "Domain": "vpc",
    "PublicIpv4Pool": "anycompany",
    "NetworkBorderGroup": "eu-central-1",
    "NetworkInterfaceId": "eni-example-id-1",
    "NetworkInterfaceOwnerId": "777788889999",
    "PrivateIpAddress": "192.0.2.03"
}
```

AwsEc2Instance

The `AwsEc2Instance` object provides details about an Amazon EC2 instance.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2Instance` object. To view descriptions of `AwsEc2Instance` attributes, see AwsEc2InstanceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2Instance": {
    "IamInstanceProfileArn": "arn:aws:iam::123456789012:instance-profile/AdminRole",
    "ImageId": "ami-1234",
    "IpV4Addresses": [ "1.1.1.1" ],
```

```
    "IpV6Addresses": [ "2001:db8:1234:1a2b::123" ],
    "KeyName": "my_keypair",
    "LaunchedAt": "2018-05-08T16:46:19.000Z",
    "MetadataOptions": {
     "HttpEndpoint": "enabled",
     "HttpProtocolIpv6": "enabled",
     "HttpPutResponseHopLimit": 1,
     "HttpTokens": "optional",
     "InstanceMetadataTags": "disabled",
    },
    "Monitoring": {
     "State": "disabled"
    },
    "NetworkInterfaces": [
      {
         "NetworkInterfaceId": "eni-e5aa89a3"
      }
    ],
    "SubnetId": "subnet-123",
    "Type": "i3.xlarge",
    "VpcId": "vpc-123"
}
```

AwsEc2LaunchTemplate

The `AwsEc2LaunchTemplate` object contains details about an Amazon Elastic Compute Cloud launch template that specifies instance configuration information.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2LaunchTemplate` object. To view descriptions of `AwsEc2LaunchTemplate` attributes, see AwsEc2LaunchTemplateDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2LaunchTemplate": {
    "DefaultVersionNumber": "1",
    "ElasticGpuSpecifications": ["string"],
    "ElasticInferenceAccelerators": ["string"],
    "Id": "lt-0a16e9802800bdd85",
    "ImageId": "ami-0d5eff06f840b45e9",
    "LatestVersionNumber": "1",
    "LaunchTemplateData": {
     "BlockDeviceMappings": [{
```

```
      "DeviceName": "/dev/xvda",
      "Ebs": {
       "DeleteonTermination": true,
       "Encrypted": true,
       "SnapshotId": "snap-01047646ec075f543",
       "VolumeSize": 8,
       "VolumeType:" "gp2"
      }
     }],
     "MetadataOptions": {
      "HttpTokens": "enabled",
      "HttpPutResponseHopLimit" : 1
     },
     "Monitoring": {
      "Enabled": true,
     "NetworkInterfaces": [{
      "AssociatePublicIpAddress" : true,
     }],
    "LaunchTemplateName": "string",
    "LicenseSpecifications": ["string"],
    "SecurityGroupIds": ["sg-01fce87ad6e019725"],
    "SecurityGroups": ["string"],
    "TagSpecifications": ["string"]
}
```

AwsEc2NetworkAcl

The `AwsEc2NetworkAcl` object contains details about an Amazon EC2 network access control list (ACL).

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2NetworkAcl` object. To view descriptions of `AwsEc2NetworkAcl` attributes, see AwsEc2NetworkAclDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2NetworkAcl": {
    "IsDefault": false,
    "NetworkAclId": "acl-1234567890abcdef0",
    "OwnerId": "123456789012",
    "VpcId": "vpc-1234abcd",
    "Associations": [{
        "NetworkAclAssociationId": "aclassoc-abcd1234",
```

```
        "NetworkAclId": "acl-021345abcdef6789",
        "SubnetId": "subnet-abcd1234"
    }],
    "Entries": [{
        "CidrBlock": "10.24.34.0/23",
        "Egress": true,
        "IcmpTypeCode": {
            "Code": 10,
            "Type": 30
        },
        "Ipv6CidrBlock": "2001:DB8::/32",
        "PortRange": {
            "From": 20,
            "To": 40
        },
        "Protocol": "tcp",
        "RuleAction": "allow",
        "RuleNumber": 100
    }]
}
```

AwsEc2NetworkInterface

The `AwsEc2NetworkInterface` object provides information about an Amazon EC2 network interface.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2NetworkInterface` object. To view descriptions of `AwsEc2NetworkInterface` attributes, see AwsEc2NetworkInterfaceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2NetworkInterface": {
    "Attachment": {
        "AttachTime": "2019-01-01T03:03:21Z",
        "AttachmentId": "eni-attach-43348162",
        "DeleteOnTermination": true,
        "DeviceIndex": 123,
        "InstanceId": "i-1234567890abcdef0",
        "InstanceOwnerId": "123456789012",
        "Status": 'ATTACHED'
    },
    "SecurityGroups": [
```

```
        {
            "GroupName": "my-security-group",
            "GroupId": "sg-903004f8"
        },
    ],
    "NetworkInterfaceId": 'eni-686ea200',
    "SourceDestCheck": false
}
```

AwsEc2RouteTable

The `AwsEc2RouteTable` object provides information about an Amazon EC2 route table.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2RouteTable` object. To view descriptions of `AwsEc2RouteTable` attributes, see AwsEc2RouteTableDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2RouteTable": {
    "AssociationSet": [{
     "AssociationSet": {
      "State": "associated"
        },
     "Main": true,
     "RouteTableAssociationId": "rtbassoc-08e706c45de9f7512",
     "RouteTableId": "rtb-0a59bde9cf2548e34",
    }],
    "PropogatingVgwSet": [],
    "RouteTableId": "rtb-0a59bde9cf2548e34",
    "RouteSet": [
     {
      "DestinationCidrBlock": "10.24.34.0/23",
      "GatewayId": "local",
      "Origin": "CreateRouteTable",
      "State": "active"
     },
     {
      "DestinationCidrBlock": "10.24.34.0/24",
      "GatewayId": "igw-0242c2d7d513fc5d3",
      "Origin": "CreateRoute",
      "State": "active"
     }
```

```
    ],
    "VpcId": "vpc-0c250a5c33f51d456"
}
```

AwsEc2SecurityGroup

The `AwsEc2SecurityGroup` object describes an Amazon EC2 security group.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2SecurityGroup` object. To view descriptions of `AwsEc2SecurityGroup` attributes, see AwsEc2SecurityGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2SecurityGroup": {
    "GroupName": "MySecurityGroup",
    "GroupId": "sg-903004f8",
    "OwnerId": "123456789012",
    "VpcId": "vpc-1a2b3c4d",
    "IpPermissions": [
        {
            "IpProtocol": "-1",
            "IpRanges": [],
            "UserIdGroupPairs": [
                {
                    "UserId": "123456789012",
                    "GroupId": "sg-903004f8"
                }
            ],
            "PrefixListIds": [
                {"PrefixListId": "pl-63a5400a"}
            ]
        },
        {
            "PrefixListIds": [],
            "FromPort": 22,
            "IpRanges": [
                {
                    "CidrIp": "203.0.113.0/24"
                }
            ],
            "ToPort": 22,
            "IpProtocol": "tcp",
```

```
            "UserIdGroupPairs": []
        }
    ]
}
```

AwsEc2Subnet

The `AwsEc2Subnet` object provides information about a subnet in Amazon EC2.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2Subnet` object. To view descriptions of `AwsEc2Subnet` attributes, see AwsEc2SubnetDetails in the *AWS Security Hub API Reference*.

Example

```
AwsEc2Subnet: {
    "AssignIpv6AddressOnCreation": false,
    "AvailabilityZone": "us-west-2c",
    "AvailabilityZoneId": "usw2-az3",
    "AvailableIpAddressCount": 8185,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "OwnerId": "123456789012",
    "State": "available",
    "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-d5436c93",
    "SubnetId": "subnet-d5436c93",
    "VpcId": "vpc-153ade70",
    "Ipv6CidrBlockAssociationSet": [{
        "AssociationId": "subnet-cidr-assoc-EXAMPLE",
        "Ipv6CidrBlock": "2001:DB8::/32",
        "CidrBlockState": "associated"
   }]
}
```

AwsEc2TransitGateway

The `AwsEc2TransitGateway` object provides details about an Amazon EC2 transit gateway that interconnects your virtual private clouds (VPCs) and on-premises networks.

The following is an example `AwsEc2TransitGateway` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsEc2TransitGateway` attributes, see AwsEc2TransitGatewayDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2TransitGateway": {
 "AmazonSideAsn": 65000,
 "AssociationDefaultRouteTableId": "tgw-rtb-099ba47cbbea837cc",
 "AutoAcceptSharedAttachments": "disable",
 "DefaultRouteTableAssociation": "enable",
 "DefaultRouteTablePropagation": "enable",
 "Description": "sample transit gateway",
 "DnsSupport": "enable",
 "Id": "tgw-042ae6bf7a5c126c3",
 "MulticastSupport": "disable",
 "PropagationDefaultRouteTableId": "tgw-rtb-099ba47cbbea837cc",
 "TransitGatewayCidrBlocks": ["10.0.0.0/16"],
 "VpnEcmpSupport": "enable"
}
```

AwsEc2Volume

The `AwsEc2Volume` object provides details about an Amazon EC2 volume.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2Volume` object. To view descriptions of `AwsEc2Volume` attributes, see AwsEc2VolumeDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2Volume": {
    "Attachments": [
      {
        "AttachTime": "2017-10-17T14:47:11Z",
        "DeleteOnTermination": true,
        "InstanceId": "i-123abc456def789g",
        "Status": "attached"
      }
     ],
    "CreateTime": "2020-02-24T15:54:30Z",
    "Encrypted": true,
    "KmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/wJalrXUtnFEMI/K7MDENG/
bPxRfiCYEXAMPLEKEY",
    "Size": 80,
    "SnapshotId": "",
    "Status": "available"
```

```
}
```

AwsEc2Vpc

The `AwsEc2Vpc` object provides details about an Amazon EC2 VPC.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2Vpc` object. To view descriptions of `AwsEc2Vpc` attributes, see AwsEc2VpcDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2Vpc": {
    "CidrBlockAssociationSet": [
        {
            "AssociationId": "vpc-cidr-assoc-0dc4c852f52abda97",
            "CidrBlock": "192.0.2.0/24",
            "CidrBlockState": "associated"
        }
    ],
    "DhcpOptionsId": "dopt-4e42ce28",
    "Ipv6CidrBlockAssociationSet": [
        {
            "AssociationId": "vpc-cidr-assoc-0dc4c852f52abda97",
            "CidrBlockState": "associated",
            "Ipv6CidrBlock": "192.0.2.0/24"
       }

    ],
    "State": "available"
}
```

AwsEc2VpcEndpointService

The `AwsEc2VpcEndpointService` object contains details about the service configuration for a VPC endpoint service.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2VpcEndpointService` object. To view descriptions of `AwsEc2VpcEndpointService` attributes, see AwsEc2VpcEndpointServiceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2VpcEndpointService": {
    "ServiceType": [
      {
        "ServiceType": "Interface"
      }
    ],
    "ServiceId": "vpce-svc-example1",
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-example1",
    "ServiceState": "Available",
    "AvailabilityZones": [
      "us-east-1"
    ],
    "AcceptanceRequired": true,
    "ManagesVpcEndpoints": false,
    "NetworkLoadBalancerArns": [
      "arn:aws:elasticloadbalancing:us-east-1:444455556666:loadbalancer/net/my-network-
load-balancer/example1"
    ],
    "GatewayLoadBalancerArns": [],
    "BaseEndpointDnsNames": [
      "vpce-svc-04eec859668b51c34.us-east-1.vpce.amazonaws.com"
    ],
    "PrivateDnsName": "my-private-dns"
}
```

AwsEc2VpcPeeringConnection

The `AwsEc2VpcPeeringConnection` object provides details about the networking connection between two VPCs.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEc2VpcPeeringConnection` object. To view descriptions of `AwsEc2VpcPeeringConnection` attributes, see AwsEc2VpcPeeringConnectionDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEc2VpcPeeringConnection": {
 "AccepterVpcInfo": {
  "CidrBlock": "10.0.0.0/28",
  "CidrBlockSet": [{
   "CidrBlock": "10.0.0.0/28"
```

```
  }],
  "Ipv6CidrBlockSet": [{
   "Ipv6CidrBlock": "2002::1234:abcd:ffff:c0a8:101/64"
  }],
  "OwnerId": "012345678910",
  "PeeringOptions": {
   "AllowDnsResolutionFromRemoteVpc": true,
   "AllowEgressFromLocalClassicLinkToRemoteVpc": false,
   "AllowEgressFromLocalVpcToRemoteClassicLink": true
  },
  "Region": "us-west-2",
  "VpcId": "vpc-i123456"
 },
 "ExpirationTime": "2022-02-18T15:31:53.161Z",
 "RequesterVpcInfo": {
  "CidrBlock": "192.168.0.0/28",
  "CidrBlockSet": [{
   "CidrBlock": "192.168.0.0/28"
  }],
  "Ipv6CidrBlockSet": [{
   "Ipv6CidrBlock": "2002::1234:abcd:ffff:c0a8:101/64"
  }],
  "OwnerId": "012345678910",
  "PeeringOptions": {
   "AllowDnsResolutionFromRemoteVpc": true,
   "AllowEgressFromLocalClassicLinkToRemoteVpc": false,
   "AllowEgressFromLocalVpcToRemoteClassicLink": true
  },
  "Region": "us-west-2",
  "VpcId": "vpc-i123456"
 },
 "Status": {
  "Code": "initiating-request",
  "Message": "Active"
 },
 "VpcPeeringConnectionId": "pcx-1a2b3c4d"
}
```

AwsEcr resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEcr` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsEcrContainerImage

The `AwsEcrContainerImage` object provides information about an Amazon ECR image.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcrContainerImage` object. To view descriptions of `AwsEcrContainerImage` attributes, see AwsEcrContainerImageDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEcrContainerImage": {
    "RegistryId": "123456789012",
    "RepositoryName": "repository-name",
    "Architecture": "amd64"
    "ImageDigest":
 "sha256:a568e5c7a953fbeaa2904ac83401f93e4a076972dc1bae527832f5349cd2fb10",
    "ImageTags": ["00000000-0000-0000-0000-000000000000"],
    "ImagePublishedAt": "2019-10-01T20:06:12Z"
}
```

AwsEcrRepository

The `AwsEcrRepository` object provides information about an Amazon Elastic Container Registry repository.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcrRepository` object. To view descriptions of `AwsEcrRepository` attributes, see AwsEcrRepositoryDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEcrRepository": {
    "LifecyclePolicy": {
        "RegistryId": "123456789012",
    },
    "RepositoryName": "sample-repo",
    "Arn": "arn:aws:ecr:us-west-2:111122223333:repository/sample-repo",
    "ImageScanningConfiguration": {
        "ScanOnPush": true
    },
```

```
    "ImageTagMutability": "IMMUTABLE"
}
```

AwsEcs resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEcs` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsEcsCluster

The `AwsEcsCluster` object provides details about an Amazon Elastic Container Service cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcsCluster` object. To view descriptions of `AwsEcsCluster` attributes, see AwsEcsClusterDetails in the *AWS Security Hub API Reference*.

Example

```
    "AwsEcsCluster": {
        "CapacityProviders": [],
        "ClusterSettings": [
            {
                "Name": "containerInsights",
                "Value": "enabled"
            }
        ],
        "Configuration": {
            "ExecuteCommandConfiguration": {
                "KmsKeyId": "kmsKeyId",
                "LogConfiguration": {
                    "CloudWatchEncryptionEnabled": true,
                    "CloudWatchLogGroupName": "cloudWatchLogGroupName",
                    "S3BucketName": "s3BucketName",
                    "S3EncryptionEnabled": true,
                    "S3KeyPrefix": "s3KeyPrefix"
                },
                "Logging": "DEFAULT"
            }
        }
        "DefaultCapacityProviderStrategy": [
```

```
            {
                "Base": 0,
                "CapacityProvider": "capacityProvider",
                "Weight": 1
            }
        ]
    }
```

AwsEcsContainer

The `AwsEcsContainer` object contains details about an Amazon ECS container.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcsContainer` object. To view descriptions of `AwsEcsContainer` attributes, see AwsEcsContainerDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEcsContainer": {
    "Image": "1111111/
knotejs@sha256:356131c9fef111111111111115f4ed8de5f9dce4dc3bd34bg21846588a3",
    "MountPoints": [{
        "ContainerPath": "/mnt/etc",
        "SourceVolume": "vol-03909e9"
    }],
    "Name": "knote",
    "Privileged": true
}
```

AwsEcsService

The `AwsEcsService` object provides details about a service within an Amazon ECS cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcsService` object. To view descriptions of `AwsEcsService` attributes, see AwsEcsServiceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEcsService": {
    "CapacityProviderStrategy": [
        {
            "Base": 12,
```

```
            "CapacityProvider": "",
            "Weight": ""
        }
    ],
    "Cluster": "arn:aws:ecs:us-east-1:111122223333:cluster/example-ecs-cluster",
    "DeploymentConfiguration": {
        "DeploymentCircuitBreaker": {
            "Enable": false,
            "Rollback": false
        },
        "MaximumPercent": 200,
        "MinimumHealthyPercent": 100
    },
    "DeploymentController": "",
    "DesiredCount": 1,
    "EnableEcsManagedTags": false,
    "EnableExecuteCommand": false,
    "HealthCheckGracePeriodSeconds": 1,
    "LaunchType": "FARGATE",
    "LoadBalancers": [
        {
            "ContainerName": "",
            "ContainerPort": 23,
            "LoadBalancerName": "",
            "TargetGroupArn": ""
        }
    ],
    "Name": "sample-app-service",
    "NetworkConfiguration": {
        "AwsVpcConfiguration": {
            "Subnets": [
                "Subnet-example1",
                "Subnet-example2"
            ],
        "SecurityGroups": [
                "Sg-0ce48e9a6e5b457f5"
        ],
        "AssignPublicIp": "ENABLED"
        }
    },
    "PlacementConstraints": [
        {
            "Expression": "",
            "Type": ""
```

```
        }
    ],
    "PlacementStrategies": [
        {
            "Field": "",
            "Type": ""
        }
    ],
    "PlatformVersion": "LATEST",
    "PropagateTags": "",
    "Role": "arn:aws:iam::111122223333:role/aws-servicerole/ecs.amazonaws.com/
ServiceRoleForECS",
    "SchedulingStrategy": "REPLICA",
    "ServiceName": "sample-app-service",
    "ServiceArn": "arn:aws:ecs:us-east-1:111122223333:service/example-ecs-cluster/
sample-app-service",
    "ServiceRegistries": [
        {
            "ContainerName": "",
            "ContainerPort": 1212,
            "Port": 1221,
            "RegistryArn": ""
        }
    ],
    "TaskDefinition": "arn:aws:ecs:us-east-1:111122223333:task-definition/example-
taskdef:1"
}
```

AwsEcsTask

The `AwsEcsTask` object provides details about an Amazon ECS task.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcsTask` object. To view descriptions of `AwsEcsTask` attributes, see AwsEcsTask in the *AWS Security Hub API Reference*.

Example

```
"AwsEcsTask": {
 "ClusterArn": "arn:aws:ecs:us-west-2:123456789012:task/MyCluster/1234567890123456789",
 "CreatedAt": "1557134011644",
 "Group": "service:fargate-service",
 "StartedAt": "1557134011644",
```

```
 "StartedBy": "ecs-svc/1234567890123456789",
 "TaskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/sample-
fargate:2",
 "Version": 3,
 "Volumes": [{
  "Name": "string",
  "Host": {
   "SourcePath": "string"
  }
 }],
 "Containers": {
  "Image": "1111111/
knotejs@sha256:356131c9fef111111111111115f4ed8de5f9dce4dc3bd34bg21846588a3",
  "MountPoints": [{
   "ContainerPath": "/mnt/etc",
   "SourceVolume": "vol-03909e9"
  }],
  "Name": "knote",
  "Privileged": true
 }
}
```

AwsEcsTaskDefinition

The `AwsEcsTaskDefinition` object contains details about a task definition. A task definition describes the container and volume definitions of an Amazon Elastic Container Service task.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEcsTaskDefinition` object. To view descriptions of `AwsEcsTaskDefinition` attributes, see AwsEcsTaskDefinitionDetails in the *AWS Security Hub API Reference*.

Example

```
    "AwsEcsTaskDefinition": {
        "ContainerDefinitions": [
            {
                "Command": ['ruby', 'hi.rb'],
                "Cpu":128,
                "Essential": true,
                "HealthCheck": {
                    "Command": ["CMD-SHELL", "curl -f http://localhost/ || exit 1"],
                    "Interval": 10,
                    "Retries": 3,
```

```
                "StartPeriod": 5,
                "Timeout": 20
            },
            "Image": "tongueroo/sinatra:latest",
            "Interactive": true,
            "Links": [],
            "LogConfiguration": {
                "LogDriver": "awslogs",
                "Options": {
                    "awslogs-group": "/ecs/sinatra-hi",
                    "awslogs-region": "ap-southeast-1",
                    "awslogs-stream-prefix": "ecs"
                },
                "SecretOptions": []

            },
            "MemoryReservation": 128,
            "Name": "web",
            "PortMappings": [
                {
                    "ContainerPort": 4567,
                    "HostPort":4567,
                    "Protocol": "tcp"
                }
            ],
            "Privileged": true,
            "StartTimeout": 10,
            "StopTimeout": 100,
        }
    ],
    "Family": "sinatra-hi",
    "NetworkMode": "host",
    "RequiresCompatibilities": ["EC2"],
    "Status": "ACTIVE",
    "TaskRoleArn": "arn:aws:iam::111122223333:role/ecsTaskExecutionRole",
}
```

AwsEfs resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEfs` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsEfsAccessPoint

The `AwsEfsAccessPoint` object provides details about files stored in Amazon Elastic File System.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEfsAccessPoint` object. To view descriptions of `AwsEfsAccessPoint` attributes, see AwsEfsAccessPointDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEfsAccessPoint": {
 "AccessPointId": "fsap-05c4c0e79ba0b118a",
 "Arn": "arn:aws:elasticfilesystem:us-east-1:863155670886:access-point/
fsap-05c4c0e79ba0b118a",
 "ClientToken": "AccessPointCompliant-ASk06ZZSXsEp",
 "FileSystemId": "fs-0f8137f731cb32146",
 "PosixUser": {
  "Gid": "1000",
  "SecondaryGids": ["0", "4294967295"],
  "Uid": "1234"
 },
 "RootDirectory": {
  "CreationInfo": {
   "OwnerGid": "1000",
   "OwnerUid": "1234",
   "Permissions": "777"
  },
  "Path": "/tmp/example"
 }
}
```

AwsEks resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEks` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsEksCluster

The `AwsEksCluster` object provides details about an Amazon EKS cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEksCluster` object. To view descriptions of `AwsEksCluster` attributes, see AwsEksClusterDetails in the *AWS Security Hub API Reference*.

Example

```
{
  "AwsEksCluster": {
    "Name": "example",
    "Arn": "arn:aws:eks:us-west-2:222222222222:cluster/example",
    "CreatedAt": 1565804921.901,
    "Version": "1.12",
    "RoleArn": "arn:aws:iam::222222222222:role/example-cluster-
ServiceRole-1XWBQWYSFRE2Q",
    "ResourcesVpcConfig": {
      "EndpointPublicAccess": false,
      "SubnetIds": [
        "subnet-021345abcdef6789",
        "subnet-abcdef01234567890",
        "subnet-1234567890abcdef0"
      ],
      "SecurityGroupIds": [
        "sg-abcdef01234567890"
      ]
    },
    "Logging": {
      "ClusterLogging": [
        {
          "Types": [
            "api",
            "audit",
            "authenticator",
            "controllerManager",
            "scheduler"
          ],
          "Enabled": true
        }
      ]
    },
    "Status": "CREATING",
```

```
    "CertificateAuthorityData": {},
  }
}
```

AwsElasticBeanstalk resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsElasticBeanstalk` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsElasticBeanstalkEnvironment

The `AwsElasticBeanstalkEnvironment` object contains details about an AWS Elastic Beanstalk environment.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsElasticBeanstalkEnvironment` object. To view descriptions of `AwsElasticBeanstalkEnvironment` attributes, see AwsElasticBeanstalkEnvironmentDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsElasticBeanstalkEnvironment": {
    "ApplicationName": "MyApplication",
    "Cname": "myexampleapp-env.devo-2.elasticbeanstalk-internal.com",
    "DateCreated": "2021-04-30T01:38:01.090Z",
    "DateUpdated": "2021-04-30T01:38:01.090Z",
    "Description": "Example description of my awesome application",
    "EndpointUrl": "eb-dv-e-p-AWSEBLoa-abcdef01234567890-021345abcdef6789.us-
east-1.elb.amazonaws.com",
    "EnvironmentArn": "arn:aws:elasticbeanstalk:us-east-1:123456789012:environment/
MyApplication/myapplication-env",
    "EnvironmentId": "e-abcd1234",
    "EnvironmentLinks": [
        {
            "EnvironmentName": "myexampleapp-env",
            "LinkName": "myapplicationLink"
        }
    ],
    "EnvironmentName": "myapplication-env",
```

```
    "OptionSettings": [
        {
            "Namespace": "aws:elasticbeanstalk:command",
            "OptionName": "BatchSize",
            "Value": "100"
        },
        {
            "Namespace": "aws:elasticbeanstalk:command",
            "OptionName": "Timeout",
            "Value": "600"
        },
        {
            "Namespace": "aws:elasticbeanstalk:command",
            "OptionName": "BatchSizeType",
            "Value": "Percentage"
        },
        {
            "Namespace": "aws:elasticbeanstalk:command",
            "OptionName": "IgnoreHealthCheck",
            "Value": "false"
        },
        {
            "Namespace": "aws:elasticbeanstalk:application",
            "OptionName": "Application Healthcheck URL",
            "Value": "TCP:80"
        }
    ],
    "PlatformArn": "arn:aws:elasticbeanstalk:us-east-1::platform/Tomcat 8 with Java 8
 running on 64bit Amazon Linux/2.7.7",
    "SolutionStackName": "64bit Amazon Linux 2017.09 v2.7.7 running Tomcat 8 Java 8",
    "Status": "Ready",
    "Tier": {
        "Name": "WebServer"
       "Type": "Standard"
       "Version": "1.0"
    },
    "VersionLabel": "Sample Application"
}
```

AwsElasticSearch resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsElasticSearch` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsElasticSearchDomain

The `AwsElasticSearchDomain` object provides details about an Amazon OpenSearch Service domain.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsElasticSearchDomain` object. To view descriptions of `AwsElasticSearchDomain` attributes, see AwsElasticSearchDomainDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsElasticSearchDomain": {
    "AccessPolicies": "string",
    "DomainStatus": {
           "DomainId": "string",
           "DomainName": "string",
           "Endpoint": "string",
           "Endpoints": {
                  "string": "string"
           }
    },
    "DomainEndpointOptions": {
           "EnforceHTTPS": boolean,
           "TLSSecurityPolicy": "string"
    },
    "ElasticsearchClusterConfig": {
           "DedicatedMasterCount": number,
           "DedicatedMasterEnabled": boolean,
           "DedicatedMasterType": "string",
           "InstanceCount": number,
           "InstanceType": "string",
           "ZoneAwarenessConfig": {
                  "AvailabilityZoneCount": number
           },
           "ZoneAwarenessEnabled": boolean
    },
    "ElasticsearchVersion": "string",
    "EncryptionAtRestOptions": {
           "Enabled": boolean,
           "KmsKeyId": "string"
```

```
    },
    "LogPublishingOptions": {
           "AuditLogs": {
                  "CloudWatchLogsLogGroupArn": "string",
                  "Enabled": boolean
           },
           "IndexSlowLogs": {
                  "CloudWatchLogsLogGroupArn": "string",
                  "Enabled": boolean
           },
           "SearchSlowLogs": {
                  "CloudWatchLogsLogGroupArn": "string",
                  "Enabled": boolean
           }
    },
    "NodeToNodeEncryptionOptions": {
           "Enabled": boolean
    },
    "ServiceSoftwareOptions": {
           "AutomatedUpdateDate": "string",
           "Cancellable": boolean,
           "CurrentVersion": "string",
           "Description": "string",
           "NewVersion": "string",
           "UpdateAvailable": boolean,
           "UpdateStatus": "string"
    },
    "VPCOptions": {
           "AvailabilityZones": [
                 "string"
           ],
           "SecurityGroupIds": [
                 "string"
           ],
           "SubnetIds": [
                 "string"
           ],
          "VPCId": "string"
    }
}
```

AwsElb resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsElb` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsElbLoadBalancer

The `AwsElbLoadBalancer` object contains details about a Classic Load Balancer.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsElbLoadBalancer` object. To view descriptions of `AwsElbLoadBalancer` attributes, see AwsElbLoadBalancerDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsElbLoadBalancer": {
    "AvailabilityZones": ["us-west-2a"],
    "BackendServerDescriptions": [
         {
            "InstancePort": 80,
            "PolicyNames": ["doc-example-policy"]
        }
    ],
    "CanonicalHostedZoneName": "Z3DZXE0EXAMPLE",
    "CanonicalHostedZoneNameID": "my-load-balancer-444455556666.us-
west-2.elb.amazonaws.com",
    "CreatedTime": "2020-08-03T19:22:44.637Z",
    "DnsName": "my-load-balancer-444455556666.us-west-2.elb.amazonaws.com",
    "HealthCheck": {
        "HealthyThreshold": 2,
        "Interval": 30,
        "Target": "HTTP:80/png",
        "Timeout": 3,
        "UnhealthyThreshold": 2
    },
    "Instances": [
        {
            "InstanceId": "i-example"
        }
    ],
    "ListenerDescriptions": [
```

```
        {
            "Listener": {
                "InstancePort": 443,
                "InstanceProtocol": "HTTPS",
                "LoadBalancerPort": 443,
                "Protocol": "HTTPS",
                "SslCertificateId": "arn:aws:iam::444455556666:server-certificate/my-
server-cert"
            },
            "PolicyNames": ["ELBSecurityPolicy-TLS-1-2-2017-01"]
        }
    ],
    "LoadBalancerAttributes": {
        "AccessLog": {
            "EmitInterval": 60,
            "Enabled": true,
            "S3BucketName": "amzn-s3-demo-bucket",
            "S3BucketPrefix": "doc-example-prefix"
        },
        "ConnectionDraining": {
            "Enabled": false,
            "Timeout": 300
        },
        "ConnectionSettings": {
            "IdleTimeout": 30
        },
        "CrossZoneLoadBalancing": {
            "Enabled": true
        },
        "AdditionalAttributes": [{
            "Key": "elb.http.desyncmitigationmode",
            "Value": "strictest"
        }]

    },
    "LoadBalancerName": "example-load-balancer",
    "Policies": {
        "AppCookieStickinessPolicies": [
            {
                "CookieName": "",
                "PolicyName": ""
            }
        ],
        "LbCookieStickinessPolicies": [
```

```
            {
                "CookieExpirationPeriod": 60,
                "PolicyName": "my-example-cookie-policy"
            }
        ],
        "OtherPolicies": [
            "my-PublicKey-policy",
            "my-authentication-policy",
            "my-SSLNegotiation-policy",
            "my-ProxyProtocol-policy",
            "ELBSecurityPolicy-2015-03"
        ]
    },
    "Scheme": "internet-facing",
    "SecurityGroups": ["sg-example"],
    "SourceSecurityGroup": {
        "GroupName": "my-elb-example-group",
        "OwnerAlias": "444455556666"
    },
    "Subnets": ["subnet-example"],
    "VpcId": "vpc-a01106c2"
}
```

AwsElbv2LoadBalancer

The `AwsElbv2LoadBalancer` object provides information about a load balancer.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsElbv2LoadBalancer` object. To view descriptions of `AwsElbv2LoadBalancer` attributes, see AwsElbv2LoadBalancerDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsElbv2LoadBalancer": {
                        "AvailabilityZones": {
                            "SubnetId": "string",
                            "ZoneName": "string"
                        },
                        "CanonicalHostedZoneId": "string",
                        "CreatedTime": "string",
                        "DNSName": "string",
                        "IpAddressType": "string",
                        "LoadBalancerAttributes": [
```

```
                        {
                            "Key": "string",
                            "Value": "string"
                        }
                    ],
                    "Scheme": "string",
                    "SecurityGroups": [ "string" ],
                    "State": {
                        "Code": "string",
                        "Reason": "string"
                    },
                    "Type": "string",
                    "VpcId": "string"
                }
```

AwsEventBridge resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsEventBridge` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsEventSchemasRegistry

The `AwsEventSchemasRegistry` object provides information about an Amazon EventBridge schema registry. A schema defines the structure of events that are sent to EventBridge. Schema registries are containers that collect and logically group your schemas.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEventSchemasRegistry` object. To view descriptions of `AwsEventSchemasRegistry` attributes, see AwsEventSchemasRegistry in the *AWS Security Hub API Reference*.

Example

```
"AwsEventSchemasRegistry": {
    "Description": "This is an example event schema registry.",
    "RegistryArn": "arn:aws:schemas:us-east-1:123456789012:registry/schema-registry",
    "RegistryName": "schema-registry"
}
```

AwsEventsEndpoint

The `AwsEventsEndpoint` object provides information about an Amazon EventBridge global endpoint. The endpoint can improve your application's availability by making it Regional-fault tolerant.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEventsEndpoint` object. To view descriptions of `AwsEventsEndpoint` attributes, see AwsEventsEndpointDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEventsEndpoint": {
    "Arn": "arn:aws:events:us-east-1:123456789012:endpoint/my-endpoint",
    "Description": "This is a sample endpoint.",
    "EndpointId": "04k1exajoy.veo",
    "EndpointUrl": "https://04k1exajoy.veo.endpoint.events.amazonaws.com",
    "EventBuses": [
        {
            "EventBusArn": "arn:aws:events:us-east-1:123456789012:event-bus/default"
        },
        {
            "EventBusArn": "arn:aws:events:us-east-2:123456789012:event-bus/default"
        }
    ],
    "Name": "my-endpoint",
    "ReplicationConfig": {
        "State": "ENABLED"
    },
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/
Amazon_EventBridge_Invoke_Event_Bus_1258925394",
    "RoutingConfig": {
        "FailoverConfig": {
            "Primary": {
                "HealthCheck": "arn:aws:route53:::healthcheck/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
            },
            "Secondary": {
                "Route": "us-east-2"
            }
        }
    },
    "State": "ACTIVE"
```

```
}
```

AwsEventsEventbus

The `AwsEventsEventbus` object provides information about an Amazon EventBridge global endpoint. The endpoint can improve your application's availability by making it Regional-fault tolerant.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsEventsEventbus` object. To view descriptions of `AwsEventsEventbus` attributes, see AwsEventsEventbusDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsEventsEventbus":
    "Arn": "arn:aws:events:us-east-1:123456789012:event-bus/my-event-bus",
    "Name": "my-event-bus",
    "Policy": "{\"Version\":\"2012-10-17\",       \"Statement\":[{\"Sid
\":\"AllowAllAccountsFromOrganizationToPutEvents\",\"Effect\":\"Allow
\",\"Principal\":\"*\",\"Action\":\"events:PutEvents\",\"Resource\":
\"arn:aws:events:us-east-1:123456789012:event-bus/my-event-bus\",\"Condition
\":{\"StringEquals\":{\"aws:PrincipalOrgID\":\"o-ki7yjtkjv5\"}}},{\"Sid\":
\"AllowAccountToManageRulesTheyCreated\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::123456789012:root\"},\"Action\":[\"events:PutRule\",\"events:PutTargets
\",\"events:DeleteRule\",\"events:RemoveTargets\",\"events:DisableRule\",
\"events:EnableRule\",\"events:TagResource\",\"events:UntagResource\",
\"events:DescribeRule\",\"events:ListTargetsByRule\",\"events:ListTagsForResource\"],
\"Resource\":\"arn:aws:events:us-east-1:123456789012:rule/my-event-bus\",\"Condition\":
{\"StringEqualsIfExists\":{\"events:creatorAccount\":\"123456789012\"}}}]}"
```

AwsGuardDuty resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsGuardDuty` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsGuardDutyDetector

The `AwsGuardDutyDetector` object provides information about an Amazon GuardDuty detector. A detector is an object that represents the GuardDuty service. A detector is required for GuardDuty to become operational.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsGuardDutyDetector` object. To view descriptions of `AwsGuardDutyDetector` attributes, see AwsGuardDutyDetector in the *AWS Security Hub API Reference*.

Example

```
"AwsGuardDutyDetector": {
    "FindingPublishingFrequency": "SIX_HOURS",
    "ServiceRole": "arn:aws:iam::123456789012:role/aws-service-role/
guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
    "Status": "ENABLED",
    "DataSources": {
        "CloudTrail": {
            "Status": "ENABLED"
        },
        "DnsLogs": {
            "Status": "ENABLED"
        },
        "FlowLogs": {
            "Status": "ENABLED"
        },
        "S3Logs": {
             "Status": "ENABLED"
         },
         "Kubernetes": {
             "AuditLogs": {
                "Status": "ENABLED"
             }
         },
         "MalwareProtection": {
             "ScanEc2InstanceWithFindings": {
                "EbsVolumes": {
                    "Status": "ENABLED"
                 }
             },
            "ServiceRole": "arn:aws:iam::123456789012:role/aws-service-role/malware-
protection.guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDutyMalwareProtection"
```

```
        }
    }
}
```

AwsIam resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsIam` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsIamAccessKey

The `AwsIamAccessKey` object contains details about an IAM access key that is related to a finding.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsIamAccessKey` object. To view descriptions of `AwsIamAccessKey` attributes, see AwsIamAccessKeyDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsIamAccessKey": {
                        "AccessKeyId": "string",
                        "AccountId": "string",
                        "CreatedAt": "string",
                        "PrincipalId": "string",
                        "PrincipalName": "string",
                        "PrincipalType": "string",
                        "SessionContext": {
                            "Attributes": {
                                "CreationDate": "string",
                                "MfaAuthenticated": boolean
                            },
                            "SessionIssuer": {
                                "AccountId": "string",
                                "Arn": "string",
                                "PrincipalId": "string",
                                "Type": "string",
                                "UserName": "string"
                            }
                        },
                        "Status": "string"
```

```
                    }
```

AwsIamGroup

The `AwsIamGroup` object contains details about an IAM group.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsIamGroup` object. To view descriptions of `AwsIamGroup` attributes, see AwsIamGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsIamGroup": {
    "AttachedManagedPolicies": [
        {
            "PolicyArn": "arn:aws:iam::aws:policy/ExampleManagedAccess",
            "PolicyName": "ExampleManagedAccess",
        }
    ],
    "CreateDate": "2020-04-28T14:08:37.000Z",
    "GroupId": "AGPA4TPS3VLP7QEXAMPLE",
    "GroupName": "Example_User_Group",
    "GroupPolicyList": [
        {
            "PolicyName": "ExampleGroupPolicy"
        }
    ],
    "Path": "/"
}
```

AwsIamPolicy

The `AwsIamPolicy` object represents an IAM permissions policy.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsIamPolicy` object. To view descriptions of `AwsIamPolicy` attributes, see AwsIamPolicyDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsIamPolicy": {
    "AttachmentCount": 1,
    "CreateDate": "2017-09-14T08:17:29.000Z",
```

```
    "DefaultVersionId": "v1",
    "Description": "Example IAM policy",
    "IsAttachable": true,
    "Path": "/",
    "PermissionsBoundaryUsageCount": 5,
    "PolicyId": "ANPAJ2UCCR6DPCEXAMPLE",
    "PolicyName": "EXAMPLE-MANAGED-POLICY",
    "PolicyVersionList": [
        {
            "VersionId": "v1",
            "IsDefaultVersion": true,
            "CreateDate": "2017-09-14T08:17:29.000Z"
        }
    ],
    "UpdateDate": "2017-09-14T08:17:29.000Z"
}
```

AwsIamRole

The `AwsIamRole` object contains information about an IAM role, including all of the role's policies.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsIamRole` object. To view descriptions of `AwsIamRole` attributes, see AwsIamRoleDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsIamRole": {
    "AssumeRolePolicyDocument": "{'Version': '2012-10-17',       'Statement':
 [{'Effect': 'Allow','Action': 'sts:AssumeRole'}]}",
    "AttachedManagedPolicies": [
        {
            "PolicyArn": "arn:aws:iam::aws:policy/ExamplePolicy1",
            "PolicyName": "Example policy 1"
        },
        {
            "PolicyArn": "arn:aws:iam::444455556666:policy/ExamplePolicy2",
            "PolicyName": "Example policy 2"
        }
        ],
        "CreateDate": "2020-03-14T07:19:14.000Z",
        "InstanceProfileList": [
            {
```

```
                "Arn": "arn:aws:iam::333333333333:ExampleProfile",
                "CreateDate": "2020-03-11T00:02:27Z",
                "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
                "InstanceProfileName": "ExampleInstanceProfile",
                "Path": "/",
                "Roles": [
                    {
                       "Arn": "arn:aws:iam::444455556666:role/example-role",
                        "AssumeRolePolicyDocument": "",
                        "CreateDate": "2020-03-11T00:02:27Z",
                        "Path": "/",
                        "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                        "RoleName": "example-role",
                    }
                ]
            }
        ],
        "MaxSessionDuration": 3600,
        "Path": "/",
        "PermissionsBoundary": {
            "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AdministratorAccess",
            "PermissionsBoundaryType": "PermissionsBoundaryPolicy"
        },
        "RoleId": "AROA4TPS3VLEXAMPLE",
        "RoleName": "BONESBootstrapHydra-OverbridgeOpsFunctionsLambda",
        "RolePolicyList": [
            {
                "PolicyName": "Example role policy"
            }
        ]
    }
```

AwsIamUser

The `AwsIamUser` object provides information about a user.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsIamUser` object. To view descriptions of `AwsIamUser` attributes, see AwsIamUserDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsIamUser": {
```

```
    "AttachedManagedPolicies": [
        {
            "PolicyName": "ExamplePolicy",
            "PolicyArn": "arn:aws:iam::aws:policy/ExampleAccess"
        }
    ],
    "CreateDate": "2018-01-26T23:50:05.000Z",
    "GroupList": [],
    "Path": "/",
    "PermissionsBoundary" : {
        "PermissionsBoundaryArn" : "arn:aws:iam::aws:policy/AdministratorAccess",
        "PermissionsBoundaryType" : "PermissionsBoundaryPolicy"
    },
    "UserId": "AIDACKCEVSQ6C2EXAMPLE",
    "UserName": "ExampleUser",
    "UserPolicyList": [
        {
            "PolicyName": "InstancePolicy"
        }
    ]
}
```

AwsKinesis resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsKinesis` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsKinesisStream

The `AwsKinesisStream` object provides details about Amazon Kinesis Data Streams.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsKinesisStream` object. To view descriptions of `AwsKinesisStream` attributes, see AwsKinesisStreamDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsKinesisStream": {
 "Name": "test-vir-kinesis-stream",
 "Arn": "arn:aws:kinesis:us-east-1:293279581038:stream/test-vir-kinesis-stream",
```

```
 "RetentionPeriodHours": 24,
 "ShardCount": 2,
 "StreamEncryption": {
  "EncryptionType": "KMS",
  "KeyId": "arn:aws:kms:us-east-1:293279581038:key/849cf029-4143-4c59-91f8-
ea76007247eb"
 }
}
```

AwsKms resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsKms` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsKmsKey

The `AwsKmsKey` object provides details about an AWS KMS key.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsKmsKey` object. To view descriptions of `AwsKmsKey` attributes, see AwsKmsKeyDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsKmsKey": {
                      "AWSAccountId": "string",
                      "CreationDate": "string",
                      "Description": "string",
                      "KeyId": "string",
                      "KeyManager": "string",
                      "KeyRotationStatus": boolean,
                      "KeyState": "string",
                      "Origin": "string"
                  }
```

AwsLambda

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsLambda` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsLambdaFunction

The `AwsLambdaFunction` object provides details about a Lambda function's configuration.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsLambdaFunction` object. To view descriptions of `AwsLambdaFunction` attributes, see AwsLambdaFunctionDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsLambdaFunction": {
    "Architectures": [
        "x86_64"
    ],
    "Code": {
        "S3Bucket": "amzn-s3-demo-bucket",
        "S3Key": "samplekey",
        "S3ObjectVersion": "2",
        "ZipFile": "myzip.zip"
    },
    "CodeSha256": "1111111111111abcdef",
    "DeadLetterConfig": {
        "TargetArn": "arn:aws:lambda:us-east-2:123456789012:queue:myqueue:2"
    },
    "Environment": {
        "Variables": {
            "Stage": "foobar"
         },
        "Error": {
            "ErrorCode": "Sample-error-code",
            "Message": "Caller principal is a manager."
         }
     },
    "FunctionName": "CheckOut",
    "Handler": "main.py:lambda_handler",
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/mykey",
    "LastModified": "2001-09-11T09:00:00Z",
    "Layers": {
        "Arn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer:3",
        "CodeSize": 169
```

```
    },
    "PackageType": "Zip",
    "RevisionId": "23",
    "Role": "arn:aws:iam::123456789012:role/Accounting-Role",
    "Runtime": "go1.7",
    "Timeout": 15,
    "TracingConfig": {
        "Mode": "Active"
    },
    "Version": "$LATEST$",
    "VpcConfig": {
        "SecurityGroupIds": ["sg-085912345678492fb", "sg-08591234567bdgdc"],
         "SubnetIds": ["subnet-071f712345678e7c8", "subnet-07fd123456788a036"]
    },
    "MasterArn": "arn:aws:lambda:us-east-2:123456789012:\$LATEST",
    "MemorySize": 2048
}
```

AwsLambdaLayerVersion

The `AwsLambdaLayerVersion` object provides details about a Lambda layer version.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsLambdaLayerVersion` object. To view descriptions of `AwsLambdaLayerVersion` attributes, see AwsLambdaLayerVersionDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsLambdaLayerVersion": {
    "Version": 2,
    "CompatibleRuntimes": [
        "java8"
    ],
    "CreatedDate": "2019-10-09T22:02:00.274+0000"
}
```

AwsMsk resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsMsk` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsMskCluster

The `AwsMskCluster` object provides information about an Amazon Managed Streaming for Apache Kafka (Amazon MSK) cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsMskCluster` object. To view descriptions of `AwsMskCluster` attributes, see AwsMskClusterDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsMskCluster": {
        "ClusterInfo": {
            "ClientAuthentication": {
                "Sasl": {
                    "Scram": {
                        "Enabled": true
                    },
                    "Iam": {
                        "Enabled": true
                    }
                },
                "Tls": {
                    "CertificateAuthorityArnList": [],
                    "Enabled": false
                },
                "Unauthenticated": {
                    "Enabled": false
                }
            },
            "ClusterName": "my-cluster",
            "CurrentVersion": "K2PWKAKR8XB7XF",
            "EncryptionInfo": {
                "EncryptionAtRest": {
                    "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                "EncryptionInTransit": {
                    "ClientBroker": "TLS",
                    "InCluster": true
                }
            },
            "EnhancedMonitoring": "PER_TOPIC_PER_BROKER",
```

```
            "NumberOfBrokerNodes": 3
        }
}
```

AwsNetworkFirewall resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsNetworkFirewall` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsNetworkFirewallFirewall

The `AwsNetworkFirewallFirewall` object contains details about an AWS Network Firewall firewall.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsNetworkFirewallFirewall` object. To view descriptions of `AwsNetworkFirewallFirewall` attributes, see AwsNetworkFirewallFirewallDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsNetworkFirewallFirewall": {
    "DeleteProtection": false,
    "FirewallArn": "arn:aws:network-firewall:us-east-1:024665936331:firewall/
testfirewall",
    "FirewallPolicyArn": "arn:aws:network-firewall:us-east-1:444455556666:firewall-
policy/InitialFirewall",
    "FirewallId": "dea7d8e9-ae38-4a8a-b022-672a830a99fa",
    "FirewallName": "testfirewall",
    "FirewallPolicyChangeProtection": false,
    "SubnetChangeProtection": false,
    "SubnetMappings": [
        {
            "SubnetId": "subnet-0183481095e588cdc"
        },
        {
            "SubnetId": "subnet-01f518fad1b1c90b0"
        }
    ],
```

```
    "VpcId": "vpc-40e83c38"
}
```

AwsNetworkFirewallFirewallPolicy

The `AwsNetworkFirewallFirewallPolicy` object provides details about a firewall policy. A firewall policy defines the behavior of a network firewall.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsNetworkFirewallFirewallPolicy` object. To view descriptions of `AwsNetworkFirewallFirewallPolicy` attributes, see AwsNetworkFirewallFirewallPolicyDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsNetworkFirewallFirewallPolicy": {
   "FirewallPolicy": {
    "StatefulRuleGroupReferences": [
        {
            "ResourceArn": "arn:aws:network-firewall:us-east-1:444455556666:stateful-
rulegroup/PatchesOnly"
        }
    ],
    "StatelessDefaultActions": [ "aws:forward_to_sfe" ],
    "StatelessFragmentDefaultActions": [ "aws:forward_to_sfe" ],
    "StatelessRuleGroupReferences": [
       {
          "Priority": 1,
          "ResourceArn": "arn:aws:network-firewall:us-east-1:444455556666:stateless-
rulegroup/Stateless-1"
       }
     ]
   },
   "FirewallPolicyArn": "arn:aws:network-firewall:us-east-1:444455556666:firewall-
policy/InitialFirewall",
   "FirewallPolicyId": "9ceeda22-6050-4048-a0ca-50ce47f0cc65",
   "FirewallPolicyName": "InitialFirewall",
   "Description": "Initial firewall"
}
```

AwsNetworkFirewallRuleGroup

The `AwsNetworkFirewallRuleGroup` object provides details about an AWS Network Firewall rule group. Rule groups are used to inspect and control network traffic. Stateless rule groups apply to individual packets. Stateful rule groups apply to packets in the context of their traffic flow.

Rule groups are referenced in firewall policies.

The following examples show the AWS Security Finding Format (ASFF) for the `AwsNetworkFirewallRuleGroup` object. To view descriptions of `AwsNetworkFirewallRuleGroup` attributes, see AwsNetworkFirewallRuleGroupDetails in the *AWS Security Hub API Reference*.

Example – stateless rule group

```
"AwsNetworkFirewallRuleGroup": {
    "Capacity": 600,
    "RuleGroupArn": "arn:aws:network-firewall:us-east-1:444455556666:stateless-
rulegroup/Stateless-1",
    "RuleGroupId": "fb13c4df-b6da-4c1e-91ec-84b7a5487493",
    "RuleGroupName": "Stateless-1"
    "Description": "Example of a stateless rule group",
    "Type": "STATELESS",
    "RuleGroup": {
        "RulesSource": {
            "StatelessRulesAndCustomActions": {
                "CustomActions": [],
                "StatelessRules": [
                    {
                        "Priority": 1,
                        "RuleDefinition": {
                            "Actions": [
                                "aws:pass"
                            ],
                            "MatchAttributes": {
                                "DestinationPorts": [
                                    {
                                        "FromPort": 443,
                                        "ToPort": 443
                                    }
                                ],
                                "Destinations": [
                                    {
```

```
                                    "AddressDefinition": "192.0.2.0/24"
                                }
                            ],
                            "Protocols": [
                                        6
                            ],
                            "SourcePorts": [
                                {
                                    "FromPort": 0,
                                    "ToPort": 65535
                                }
                            ],
                            "Sources": [
                                {
                                     "AddressDefinition": "198.51.100.0/24"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
}
```

Example – stateful rule group

```
"AwsNetworkFirewallRuleGroup": {
    "Capacity": 100,
    "RuleGroupArn": "arn:aws:network-firewall:us-east-1:444455556666:stateful-
rulegroup/tupletest",
    "RuleGroupId": "38b71c12-da80-4643-a6c5-03337f8933e0",
    "RuleGroupName": "ExampleRuleGroup",
    "Description": "Example of a stateful rule group",
    "Type": "STATEFUL",
    "RuleGroup": {
        "RuleSource": {
            "StatefulRules": [
                {
                    "Action": "PASS",
                    "Header": {
                        "Destination": "Any",
```

```
                        "DestinationPort": "443",
                        "Direction": "ANY",
                        "Protocol": "TCP",
                        "Source": "Any",
                        "SourcePort": "Any"
                    },
                    "RuleOptions": [
                        {
                           "Keyword": "sid:1"
                        }
                    ]
                }
            ]
        }
    }
}
```

The following is a list of valid value examples for `AwsNetworkFirewallRuleGroup` attributes:

- `Action`

  Valid values: `PASS` | `DROP` | `ALERT`

- `Protocol`

  Valid values: `IP` | `TCP` | `UDP` | `ICMP` | `HTTP` | `FTP` | `TLS` | `SMB` | `DNS` | `DCERPC` | `SSH` | `SMTP` | `IMAP` | `MSN` | `KRB5` | `IKEV2` | `TFTP` | `NTP` | `DHCP`

- `Flags`

  Valid values: `FIN` | `SYN` | `RST` | `PSH` | `ACK` | `URG` | `ECE` | `CWR`

- `Masks`

  Valid values: `FIN` | `SYN` | `RST` | `PSH` | `ACK` | `URG` | `ECE` | `CWR`

AwsOpenSearchService resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsOpenSearchService` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsOpenSearchServiceDomain

The `AwsOpenSearchServiceDomain` object contains information about an Amazon OpenSearch Service domain.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsOpenSearchServiceDomain` object. To view descriptions of `AwsOpenSearchServiceDomain` attributes, see AwsOpenSearchServiceDomainDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsOpenSearchServiceDomain": {
    "AccessPolicies": "IAM_Id",
    "AdvancedSecurityOptions": {
        "Enabled": true,
        "InternalUserDatabaseEnabled": true,
        "MasterUserOptions": {
            "MasterUserArn": "arn:aws:iam::123456789012:user/third-master-use",
            "MasterUserName": "third-master-use",
            "MasterUserPassword": "some-password"
        }
    },
    "Arn": "arn:aws:Opensearch:us-east-1:111122223333:somedomain",
    "ClusterConfig": {
        "InstanceType": "c5.large.search",
        "InstanceCount": 1,
        "DedicatedMasterEnabled": true,
        "ZoneAwarenessEnabled": false,
        "ZoneAwarenessConfig": {
            "AvailabilityZoneCount": 2
        },
        "DedicatedMasterType": "c5.large.search",
        "DedicatedMasterCount": 3,
        "WarmEnabled": true,
        "WarmCount": 3,
        "WarmType": "ultrawarm1.large.search"
    },
    "DomainEndpoint": "https://es-2021-06-23t17-04-qowmgghud5vofgb5e4wmi.eu-
central-1.es.amazonaws.com",
    "DomainEndpointOptions": {
        "EnforceHTTPS": false,
        "TLSSecurityPolicy": "Policy-Min-TLS-1-0-2019-07",
```

```
        "CustomEndpointCertificateArn": "arn:aws:acm:us-
east-1:111122223333:certificate/bda1bff1-79c0-49d0-abe6-50a15a7477d4",
        "CustomEndpointEnabled": true,
        "CustomEndpoint": "example.com"
    },
    "DomainEndpoints": {
        "vpc": "vpc-endpoint-h2dsd34efgyghrtguk5gt6j2foh4.us-east-1.es.amazonaws.com"
    },
    "DomainName": "my-domain",
    "EncryptionAtRestOptions": {
        "Enabled": false,
        "KmsKeyId": "1a2a3a4-1a2a-3a4a-5a6a-1a2a3a4a5a6a"
    },
    "EngineVersion": "7.1",
    "Id": "123456789012",
    "LogPublishingOptions": {
        "IndexSlowLogs": {
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:111122223333:log-
group:/aws/aes/domains/es-index-slow-logs",
            "Enabled": true
        },
        "SearchSlowLogs": {
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:111122223333:log-

            "subnet-1a2a3a4a"
        ],
    }
}
```

AwsRds resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsRds` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsRdsDbCluster

The `AwsRdsDbCluster` object provides details about an Amazon RDS database cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsDbCluster` object. To view descriptions of `AwsRdsDbCluster` attributes, see AwsRdsDbClusterDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsDbCluster": {
    "ActivityStreamStatus": "stopped",
    "AllocatedStorage": 1,
    "AssociatedRoles": [
        {
        "RoleArn": "arn:aws:iam::777788889999:role/aws-service-role/rds.amazonaws.com/
AWSServiceRoleForRDS",
        "Status": "PENDING"
        }
    ],
    "AutoMinorVersionUpgrade": true,
    "AvailabilityZones": [
        "us-east-1a",
        "us-east-1c",
```

```
        "us-east-1e"
    ],
    "BackupRetentionPeriod": 1,
    "ClusterCreateTime": "2020-06-22T17:40:12.322Z",
    "CopyTagsToSnapshot": true,
    "CrossAccountClone": false,
    "CustomEndpoints": [],
    "DatabaseName": "Sample name",
    "DbClusterIdentifier": "database-3",
    "DbClusterMembers": [
        {
        "DbClusterParameterGroupStatus": "in-sync",
        "DbInstanceIdentifier": "database-3-instance-1",
        "IsClusterWriter": true,
        "PromotionTier": 1,
        }
    ],
    "DbClusterOptionGroupMemberships": [],
    "DbClusterParameterGroup": "cluster-parameter-group",
    "DbClusterResourceId": "cluster-example",
    "DbSubnetGroup": "subnet-group",
    "DeletionProtection": false,
    "DomainMemberships": [],
    "Status": "modifying",
    "EnabledCloudwatchLogsExports": [
        "audit",
        "error",
        "general",
        "slowquery"
    ],
    "Endpoint": "database-3.cluster-example.us-east-1.rds.amazonaws.com",
    "Engine": "aurora-mysql",
    "EngineMode": "provisioned",
    "EngineVersion": "5.7.mysql_aurora.2.03.4",
    "HostedZoneId": "ZONE1",
    "HttpEndpointEnabled": false,
    "IamDatabaseAuthenticationEnabled": false,
    "KmsKeyId": "arn:aws:kms:us-east-1:777788889999:key/key1",
    "MasterUsername": "admin",
    "MultiAz": false,
    "Port": 3306,
    "PreferredBackupWindow": "04:52-05:22",
    "PreferredMaintenanceWindow": "sun:09:32-sun:10:02",
    "ReaderEndpoint": "database-3.cluster-ro-example.us-east-1.rds.amazonaws.com",
```

```
    "ReadReplicaIdentifiers": [],
    "Status": "Modifying",
    "StorageEncrypted": true,
    "VpcSecurityGroups": [
        {
            "Status": "active",
            "VpcSecurityGroupId": "sg-example-1"
        }
    ],
}
```

AwsRdsDbClusterSnapshot

The `AwsRdsDbClusterSnapshot` object contains information about an Amazon RDS DB cluster snapshot.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsDbClusterSnapshot` object. To view descriptions of `AwsRdsDbClusterSnapshot` attributes, see AwsRdsDbClusterSnapshotDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsDbClusterSnapshot": {
    "AllocatedStorage": 0,
    "AvailabilityZones": [
        "us-east-1a",
        "us-east-1d",
        "us-east-1e"
    ],
    "ClusterCreateTime": "2020-06-12T13:23:15.577Z",
    "DbClusterIdentifier": "database-2",
    "DbClusterSnapshotAttributes": [{
        "AttributeName": "restore",
        "AttributeValues": ["123456789012"]
    }],
    "DbClusterSnapshotIdentifier": "rds:database-2-2020-06-23-03-52",
    "Engine": "aurora",
    "EngineVersion": "5.6.10a",
    "IamDatabaseAuthenticationEnabled": false,
    "KmsKeyId": "arn:aws:kms:us-east-1:777788889999:key/key1",
    "LicenseModel": "aurora",
    "MasterUsername": "admin",
    "PercentProgress": 100,
```

```
    "Port": 0,
    "SnapshotCreateTime": "2020-06-22T17:40:12.322Z",
    "SnapshotType": "automated",
    "Status": "available",
    "StorageEncrypted": true,
    "VpcId": "vpc-faf7e380"
}
```

AwsRdsDbInstance

The `AwsRdsDbInstance` object provides details about an Amazon RDS DB instance.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsDbInstance` object. To view descriptions of `AwsRdsDbInstance` attributes, see AwsRdsDbInstanceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsDbInstance": {
    "AllocatedStorage": 20,
    "AssociatedRoles": [],
    "AutoMinorVersionUpgrade": true,
    "AvailabilityZone": "us-east-1d",
    "BackupRetentionPeriod": 7,
    "CaCertificateIdentifier": "certificate1",
    "CharacterSetName": "",
    "CopyTagsToSnapshot": true,
    "DbClusterIdentifier": "",
    "DbInstanceArn": "arn:aws:rds:us-east-1:111122223333:db:database-1",
    "DbInstanceClass": "db.t2.micro",
    "DbInstanceIdentifier": "database-1",
    "DbInstancePort": 0,
    "DbInstanceStatus": "available",
    "DbiResourceId": "db-EXAMPLE123",
    "DbName": "",
    "DbParameterGroups": [
        {
            "DbParameterGroupName": "default.mysql5.7",
            "ParameterApplyStatus": "in-sync"
        }
    ],
```

```
    "DbSecurityGroups": [],

    "DbSubnetGroup": {
        "DbSubnetGroupName": "my-group-123abc",
        "DbSubnetGroupDescription": "My subnet group",
        "VpcId": "vpc-example1",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-123abc",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-456def",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1c"
                },
                "SubnetStatus": "Active"
            }
      ],
        "DbSubnetGroupArn": ""
    },
    "DeletionProtection": false,
    "DomainMemberships": [],
    "EnabledCloudWatchLogsExports": [],
    "Endpoint": {
        "address": "database-1.example.us-east-1.rds.amazonaws.com",
        "port": 3306,
        "hostedZoneId": "ZONEID1"
    },
    "Engine": "mysql",
    "EngineVersion": "5.7.22",
    "EnhancedMonitoringResourceArn": "arn:aws:logs:us-east-1:111122223333:log-
group:Example:log-stream:db-EXAMPLE1",

        {
            "OptionGroupName": "default:mysql-5-7",
            "Status": "in-sync"
        }
    ],
    "PreferredBackupWindow": "03:57-04:27",
    "PreferredMaintenanceWindow": "thu:10:13-thu:10:43",
    "PendingModifiedValues": {
        "DbInstanceClass": "",
        "AllocatedStorage": "",
        "MasterUserPassword": "",
        "Port": "",
        "BackupRetentionPeriod": "",
        "MultiAZ": "",
        "EngineVersion": "",
        "LicenseModel": "",
        "Iops": "",
        "DbInstanceIdentifier": "",
        "StorageType": "",
        "CaCertificateIdentifier": "",
        "DbSubnetGroupName": "",
        "PendingCloudWatchLogsExports": "",
        "ProcessorFeatures": []
    },
    "PerformanceInsightsEnabled": false,
    "PerformanceInsightsKmsKeyId": "",
    "PerformanceInsightsRetentionPeriod": "",
    "ProcessorFeatures": [],
    "PromotionTier": "",
    "PubliclyAccessible": false,
    "ReadReplicaDBClusterIdentifiers": [],
    "ReadReplicaDBInstanceIdentifiers": [],
    "ReadReplicaSourceDBInstanceIdentifier": "",
    "SecondaryAvailabilityZone": "",
    "StatusInfos": [],
    "StorageEncrypted": false,
    "StorageType": "gp2",
```

```
    "TdeCredentialArn": "",
    "Timezone": "",
    "VpcSecurityGroups": [
        {
            "VpcSecurityGroupId": "sg-example1",
            "Status": "active"
        }
    ]
}
```

AwsRdsDbSecurityGroup

The `AwsRdsDbSecurityGroup` object contains information about an Amazon Relational Database Service

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsDbSecurityGroup` object. To view descriptions of `AwsRdsDbSecurityGroup` attributes, see AwsRdsDbSecurityGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsDbSecurityGroup": {
    "DbSecurityGroupArn": "arn:aws:rds:us-west-1:111122223333:secgrp:default",
    "DbSecurityGroupDescription": "default",
    "DbSecurityGroupName": "mysecgroup",
    "Ec2SecurityGroups": [
        {
          "Ec2SecurityGroupuId": "myec2group",
          "Ec2SecurityGroupName": "default",
          "Ec2SecurityGroupOwnerId": "987654321021",
          "Status": "authorizing"
        }
    ],
    "IpRanges": [
        {
          "Cidrip": "0.0.0.0/0",
          "Status": "authorizing"
        }
    ],
    "OwnerId": "123456789012",
    "VpcId": "vpc-1234567f"
}
```

AwsRdsDbSnapshot

The `AwsRdsDbSnapshot` object contains details about an Amazon RDS DB cluster snapshot.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsDbSnapshot` object. To view descriptions of `AwsRdsDbSnapshot` attributes, see AwsRdsDbSnapshotDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsDbSnapshot": {
    "DbSnapshotIdentifier": "rds:database-1-2020-06-22-17-41",
    "DbInstanceIdentifier": "database-1",
    "SnapshotCreateTime": "2020-06-22T17:41:29.967Z",
    "Engine": "mysql",
    "AllocatedStorage": 20,
    "Status": "available",
    "Port": 3306,
    "AvailabilityZone": "us-east-1d",
    "VpcId": "vpc-example1",
    "InstanceCreateTime": "2020-06-22T17:40:12.322Z",
    "MasterUsername": "admin",
    "EngineVersion": "5.7.22",
    "LicenseModel": "general-public-license",
    "SnapshotType": "automated",
    "Iops": null,
    "OptionGroupName": "default:mysql-5-7",
    "PercentProgress": 100,
    "SourceRegion": null,
    "SourceDbSnapshotIdentifier": "",
    "StorageType": "gp2",
    "TdeCredentialArn": "",
    "Encrypted": false,
    "KmsKeyId": "",
    "Timezone": "",
    "IamDatabaseAuthenticationEnabled": false,
    "ProcessorFeatures": [],
    "DbiResourceId": "db-resourceexample1"
}
```

AwsRdsEventSubscription

The `AwsRdsEventSubscription` contains details about an RDS event notification subscription. The subscription allows RDS to post events to an SNS topic.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRdsEventSubscription` object. To view descriptions of `AwsRdsEventSubscription` attributes, see AwsRdsEventSubscriptionDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRdsEventSubscription": {
    "CustSubscriptionId": "myawsuser-secgrp",
    "CustomerAwsId": "111111111111",
    "Enabled": true,
    "EventCategoriesList": [
        "configuration change",
        "failure"
    ],
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:111111111111:es:my-instance-events",
    "SnsTopicArn": "arn:aws:sns:us-east-1:111111111111:myawsuser-RDS",
    "SourceIdsList": [
        "si-sample",
        "mysqldb-rr"
    ],
    "SourceType": "db-security-group",
    "Status": "creating",
    "SubscriptionCreationTime": "2021-06-27T01:38:01.090Z"
}
```

AwsRedshift resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsRedshift` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsRedshiftCluster

The `AwsRedshiftCluster` object contains details about an Amazon Redshift cluster.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRedshiftCluster` object. To view descriptions of `AwsRedshiftCluster` attributes, see AwsRedshiftClusterDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRedshiftCluster": {
    "AllowVersionUpgrade": true,
    "AutomatedSnapshotRetentionPeriod": 1,
    "AvailabilityZone": "us-west-2d",
    "ClusterAvailabilityStatus": "Unavailable",
    "ClusterCreateTime": "2020-08-03T19:22:44.637Z",
    "ClusterIdentifier": "redshift-cluster-1",
    "ClusterNodes": [
        {
            "NodeRole": "LEADER",
            "PrivateIPAddress": "192.0.2.108",
            "PublicIPAddress": "198.51.100.29"
        },
        {
            "NodeRole": "COMPUTE-0",
            "PrivateIPAddress": "192.0.2.22",
            "PublicIPAddress": "198.51.100.63"
        },
        {
             "NodeRole": "COMPUTE-1",
             "PrivateIPAddress": "192.0.2.224",
             "PublicIPAddress": "198.51.100.226"
        }
        ],
    "ClusterParameterGroups": [
        {
            "ClusterParameterStatusList": [
                {
                    "ParameterName": "max_concurrency_scaling_clusters",
                    "ParameterApplyStatus": "in-sync",
                    "ParameterApplyErrorDescription": "parameterApplyErrorDescription"
                },
                {
                    "ParameterName": "enable_user_activity_logging",
                    "ParameterApplyStatus": "in-sync",
                    "ParameterApplyErrorDescription": "parameterApplyErrorDescription"
                },
```

```
                {
                    "ParameterName": "auto_analyze",
                    "ParameterApplyStatus": "in-sync",
                    "ParameterApplyErrorDescription": "parameterApplyErrorDescription"
                },
                {
                    "ParameterName": "query_group",

AwsRoute53 resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsRoute53` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsRoute53HostedZone

The `AwsRoute53HostedZone` object provides information about an Amazon Route 53 hosted zone, including the four name servers assigned to the hosted zone. A hosted zone represents a collection of records that can be managed together, belonging to a single parent domain name.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsRoute53HostedZone` object. To view descriptions of `AwsRoute53HostedZone` attributes, see AwsRoute53HostedZoneDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsRoute53HostedZone": {
```

```
    "HostedZone": {
        "Id": "Z06419652JEMGO9TA2XKL",
        "Name": "asff.testing",
        "Config": {
            "Comment": "This is an example comment."
        }
    },
    "NameServers": [
        "ns-470.awsdns-32.net",
        "ns-1220.awsdns-12.org",
        "ns-205.awsdns-13.com",
        "ns-1960.awsdns-51.co.uk"
    ],
    "QueryLoggingConfig": {
        "CloudWatchLogsLogGroupArn": {
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:123456789012:log-
group:asfftesting:*",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "HostedZoneId": "Z00932193AF5H180PPNZD"
        }
    },
    "Vpcs": [
        {
            "Id": "vpc-05d7c6e36bc03ea76",
            "Region": "us-east-1"
        }
    ]
}
```

AwsS3 resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for AwsS3 resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsS3AccessPoint

AwsS3AccessPoint provides information about an Amazon S3 access point. S3 access points are named network endpoints that are attached to S3 buckets that you can use to perform S3 object operations.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsS3AccessPoint` object. To view descriptions of `AwsS3AccessPoint` attributes, see AwsS3AccessPointDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsS3AccessPoint": {
        "AccessPointArn": "arn:aws:s3:us-east-1:123456789012:accesspoint/asff-access-
point",
        "Alias": "asff-access-point-hrzrlukc5m36ft7okagglf3gmwluquse1b-s3alias",
        "Bucket": "amzn-s3-demo-bucket",
        "BucketAccountId": "123456789012",
        "Name": "asff-access-point",
        "NetworkOrigin": "VPC",
        "PublicAccessBlockConfiguration": {
            "BlockPublicAcls": true,
            "BlockPublicPolicy": true,
            "IgnorePublicAcls": true,
            "RestrictPublicBuckets": true
        },
        "VpcConfiguration": {
            "VpcId": "vpc-1a2b3c4d5e6f1a2b3"
        }
}
```

AwsS3AccountPublicAccessBlock

`AwsS3AccountPublicAccessBlock` provides information about the Amazon S3 Public Access Block configuration for accounts.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsS3AccountPublicAccessBlock` object. To view descriptions of `AwsS3AccountPublicAccessBlock` attributes, see AwsS3AccountPublicAccessBlockDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsS3AccountPublicAccessBlock": {
    "BlockPublicAcls": true,
    "BlockPublicPolicy": true,
    "IgnorePublicAcls": false,
    "RestrictPublicBuckets": true
```

```
}
```

AwsS3Bucket

The `AwsS3Bucket` object provides details about an Amazon S3 bucket.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsS3Bucket` object. To view descriptions of `AwsS3Bucket` attributes, see AwsS3BucketDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsS3Bucket": {
    "AccessControlList": "{\"grantSet\":null,\"grantList\":[{\"grantee\":{\"id\":
\"4df55416215956920d9d056aa8b99803a294ea221222bb668b55a8c6bca81094\",\"displayName

     }
}
```

AwsS3Object

The `AwsS3Object` object provides information about an Amazon S3 object.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsS3Object` object. To view descriptions of `AwsS3Object` attributes, see AwsS3ObjectDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsS3Object": {
    "ContentType": "text/html",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "LastModified": "2012-04-23T18:25:43.511Z",
    "ServerSideEncryption": "aws:kms",
    "SSEKMSKeyId": "arn:aws:kms:us-west-2:123456789012:key/4dff8393-e225-4793-
a9a0-608ec069e5a7",
    "VersionId": "ws31OurgOOjH_HHllIxPE35P.MELYaYh"
}
```

AwsSageMaker resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsSageMaker` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsSageMakerNotebookInstance

The `AwsSageMakerNotebookInstance` object provides information about a Amazon SageMaker AI notebook instance, which is a machine learning compute instance running the Jupyter Notebook App.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsSageMakerNotebookInstance` object. To view descriptions of `AwsSageMakerNotebookInstance` attributes, see AwsSageMakerNotebookInstanceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsSageMakerNotebookInstance": {
    "DirectInternetAccess": "Disabled",
    "InstanceMetadataServiceConfiguration": {
     "MinimumInstanceMetadataServiceVersion": "1",
    },
    "InstanceType": "ml.t2.medium",
    "LastModifiedTime": "2022-09-09 22:48:32.012000+00:00",
    "NetworkInterfaceId": "eni-06c09ac2541a1bed3",
    "NotebookInstanceArn": "arn:aws:sagemaker:us-east-1:001098605940:notebook-instance/
sagemakernotebookinstancerootaccessdisabledcomplia-8myjcyofzixm",
    "NotebookInstanceName":

    "SecurityGroups": [
     "sg-06b347359ab068745"
    ],
    "SubnetId": "subnet-02c0deea5fa64578e",
    "Url":
 "sagemakernotebookinstancerootaccessdisabledcomplia-8myjcyofzixm.notebook.us-
east-1.sagemaker.aws",
    "VolumeSizeInGB": 5
}
```

AwsSecretsManager resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsSecretsManager` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsSecretsManagerSecret

The `AwsSecretsManagerSecret` object provides details about a Secrets Manager secret.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsSecretsManagerSecret` object. To view descriptions of `AwsSecretsManagerSecret` attributes, see AwsSecretsManagerSecretDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsSecretsManagerSecret": {
    "RotationRules": {
        "AutomaticallyAfterDays": 30
    },
    "RotationOccurredWithinFrequency": true,
    "KmsKeyId": "kmsKeyId",
    "RotationEnabled": true,
    "RotationLambdaArn": "arn:aws:lambda:us-
west-2:777788889999:function:MyTestRotationLambda",
    "Deleted": false,
    "Name": "MyTestDatabaseSecret",
    "Description": "My test database secret"
}
```

AwsSns resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsSns` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsSnsTopic

The `AwsSnsTopic` object contains details about an Amazon Simple Notification Service topic.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsSnsTopic` object. To view descriptions of `AwsSnsTopic` attributes, see AwsSnsTopicDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsSnsTopic": {
    "ApplicationSuccessFeedbackRoleArn": "arn:aws:iam::123456789012:role/
ApplicationSuccessFeedbackRoleArn",
    "FirehoseFailureFeedbackRoleArn": "arn:aws:iam::123456789012:role/
FirehoseFailureFeedbackRoleArn",
    "FirehoseSuccessFeedbackRoleArn": "arn:aws:iam::123456789012:role/
FirehoseSuccessFeedbackRoleArn",
    "HttpFailureFeedbackRoleArn": "arn:aws:iam::123456789012:role/
HttpFailureFeedbackRoleArn",
    "HttpSuccessFeedbackRoleArn": "arn:aws:iam::123456789012:role/
HttpSuccessFeedbackRoleArn",
    "KmsMasterKeyId": "alias/ExampleAlias",
    "Owner": "123456789012",
    "SqsFailureFeedbackRoleArn": "arn:aws:iam::123456789012:role/
SqsFailureFeedbackRoleArn",
    "SqsSuccessFeedbackRoleArn": "arn:aws:iam::123456789012:role/
SqsSuccessFeedbackRoleArn",
    "Subscription": {
         "Endpoint": "http://sampleendpoint.com",
         "Protocol": "http"
    },
    "TopicName": "SampleTopic"
}
```

AwsSqs resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsSqs` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsSqsQueue

The `AwsSqsQueue` object contains information about an Amazon Simple Queue Service queue.

The following example shows the AWS Security Finding Format (ASFF) for the AwsSqsQueue object. To view descriptions of AwsSqsQueue attributes, see AwsSqsQueueDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsSqsQueue": {
    "DeadLetterTargetArn": "arn:aws:sqs:us-west-2:123456789012:queue/target",
    "KmsDataKeyReusePeriodSeconds": 60,,
    "KmsMasterKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "QueueName": "sample-queue"
}
```

AwsSsm resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for AwsSsm resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsSsmPatchCompliance

The AwsSsmPatchCompliance object provides information about the state of a patch on an instance based on the patch baseline that was used to patch the instance.

The following example shows the AWS Security Finding Format (ASFF) for the AwsSsmPatchCompliance object. To view descriptions of AwsSsmPatchCompliance attributes, see AwsSsmPatchComplianceDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsSsmPatchCompliance": {
    "Patch": {
        "ComplianceSummary": {
            "ComplianceType": "Patch",
            "CompliantCriticalCount": 0,
            "CompliantHighCount": 0,
            "CompliantInformationalCount": 0,
            "CompliantLowCount": 0,
            "CompliantMediumCount": 0,
            "CompliantUnspecifiedCount": 461,
            "ExecutionType": "Command",
```

```
            "NonCompliantCriticalCount": 0,
            "NonCompliantHighCount": 0,
            "NonCompliantInformationalCount": 0,
            "NonCompliantLowCount": 0,
            "NonCompliantMediumCount": 0,
            "NonCompliantUnspecifiedCount": 0,
            "OverallSeverity": "UNSPECIFIED",
            "PatchBaselineId": "pb-0c5b2769ef7cbe587",
            "PatchGroup": "ExamplePatchGroup",
            "Status": "COMPLIANT"
        }
    }
}
```

AwsStepFunctions resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsStepFunctions` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsStepFunctionStateMachine

The `AwsStepFunctionStateMachine` object provides information about an AWS Step Functions state machine, which is a workflow consisting of a series of event-driven steps.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsStepFunctionStateMachine` object. To view descriptions of `AwsStepFunctionStateMachine` attributes, see AwsStepFunctionStateMachine in the *AWS Security Hub API Reference*.

Example

```
"AwsStepFunctionStateMachine": {
    "StateMachineArn": "arn:aws:states:us-
east-1:123456789012:stateMachine:StepFunctionsLogDisableNonCompliantResource-
fQLujTeXvwsb",
    "Name": "StepFunctionsLogDisableNonCompliantResource-fQLujTeXvwsb",
    "Status": "ACTIVE",
    "RoleArn": "arn:aws:iam::123456789012:role/teststepfunc-
StatesExecutionRole-1PNM71RVO1UKT",
    "Type": "STANDARD",
```

```
    "LoggingConfiguration": {
        "Level": "OFF",
        "IncludeExecutionData": false
    },
    "TracingConfiguration": {
        "Enabled": false
    }
}
```

AwsWaf resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsWaf` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsWafRateBasedRule

The `AwsWafRateBasedRule` object contains details about an AWS WAF rate-based rule for global resources. An AWS WAF rate-based rule provides settings to indicate when to allow, block, or count a request. Rate-based rules include the number of requests that arrive over a specified period of time.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafRateBasedRule` object. To view descriptions of `AwsWafRateBasedRule` attributes, see AwsWafRateBasedRuleDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRateBasedRule":{
    "MatchPredicates" : [{
        "DataId" : "391b7a7e-5f00-40d2-b114-3f27ceacbbb0",
        "Negated" : "True",
        "Type" : "IPMatch" ,
    }],
    "MetricName" : "MetricName",
    "Name" : "Test",
    "RateKey" : "IP",
    "RateLimit" : 235000,
    "RuleId" : "5dfb4085-f103-4ec6-b39a-d4a0dae5f47f"
}
```

AwsWafRegionalRateBasedRule

The `AwsWafRegionalRateBasedRule` object contains details about a rate-based rule for Regional resources. A rate-based rule provides settings to indicate when to allow, block, or count a request. Rate-based rules include the number of requests that arrive over a specified period of time.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafRegionalRateBasedRule` object. To view descriptions of `AwsWafRegionalRateBasedRule` attributes, see AwsWafRegionalRateBasedRuleDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRegionalRateBasedRule":{
    "MatchPredicates" : [{
        "DataId" : "391b7a7e-5f00-40d2-b114-3f27ceacbbb0",
        "Negated" : "True",
        "Type" : "IPMatch" ,
    }],
    "MetricName" : "MetricName",
    "Name" : "Test",
    "RateKey" : "IP",
    "RateLimit" : 235000,
    "RuleId" : "5dfb4085-f103-4ec6-b39a-d4a0dae5f47f"
}
```

AwsWafRegionalRule

The `AwsWafRegionalRule` object provides details about an AWS WAF Regional rule . This rule identifies the web requests that you want to allow, block, or count.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafRegionalRule` object. To view descriptions of `AwsWafRegionalRule` attributes, see AwsWafRegionalRuleDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRegionalRule": {
    "MetricName": "SampleWAF_Rule__Metric_1",
    "Name": "bb-waf-regional-rule-not-empty-conditions-compliant",
    "RuleId": "8f651760-24fa-40a6-a9ed-4b60f1de95fe",
```

```
    "PredicateList": [{
        "DataId": "127d9346-e607-4e93-9286-c1296fb5445a",
        "Negated": false,
        "Type": "GeoMatch"
    }]
}
```

AwsWafRegionalRuleGroup

The `AwsWafRegionalRuleGroup` object provides details about an AWS WAF Regional rule group. A rule group is a collection of predefined rules that you add to a web access control list (web ACL).

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafRegionalRuleGroup` object. To view descriptions of `AwsWafRegionalRuleGroup` attributes, see AwsWafRegionalRuleGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRegionalRuleGroup": {
    "MetricName": "SampleWAF_Metric_1",
    "Name": "bb-WAFClassicRuleGroupWithRuleCompliant",
    "RuleGroupId": "2012ca6d-e66d-4d9b-b766-bfb03ad77cfb",
    "Rules": [{
        "Action": {
            "Type": "ALLOW"
        }
    }],
        "Priority": 1,
        "RuleId": "cdd225da-32cf-4773-8dc5-3bca3ed9c19c",
        "Type": "REGULAR"
}
```

AwsWafRegionalWebAcl

`AwsWafRegionalWebAcl` provides details about an AWS WAF Regional web access control list (web ACL). A web ACL contains the rules that identify the requests that you want to allow, block, or count.

The following is an example `AwsWafRegionalWebAcl` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayV2Stage` attributes, see AwsWafRegionalWebAclDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRegionalWebAcl": {
    "DefaultAction": "ALLOW",
    "MetricName" : "web-regional-webacl-metric-1",
    "Name": "WebACL_123",
    "RulesList": [
        {
            "Action": {
                "Type": "Block"
            },
            "Priority": 3,
            "RuleId": "24445857-852b-4d47-bd9c-61f05e4d223c",
            "Type": "REGULAR",
            "ExcludedRules": [
                {
                    "ExclusionType": "Exclusion",
                    "RuleId": "Rule_id_1"
                }
            ],
            "OverrideAction": {
                "Type": "OVERRIDE"
            }
        }
    ],
    "WebAclId": "443c76f4-2e72-4c89-a2ee-389d501c1f67"
}
```

AwsWafRule

`AwsWafRule` provides information about an AWS WAF rule. An AWS WAF rule identifies the web requests that you want to allow, block, or count.

The following is an example `AwsWafRule` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayV2Stage` attributes, see AwsWafRuleDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRule": {
    "MetricName": "AwsWafRule_Metric_1",
    "Name": "AwsWafRule_Name_1",
```

```
    "PredicateList": [{
        "DataId": "cdd225da-32cf-4773-1dc2-3bca3ed9c19c",
        "Negated": false,
        "Type": "GeoMatch"
    }],
    "RuleId": "8f651760-24fa-40a6-a9ed-4b60f1de953e"
}
```

AwsWafRuleGroup

`AwsWafRuleGroup` provides information about an AWS WAF rule group. An AWS WAF rule group is a collection of predefined rules that you add to a web access control list (web ACL).

The following is an example `AwsWafRuleGroup` finding in the AWS Security Finding Format (ASFF). To view descriptions of `AwsApiGatewayV2Stage` attributes, see AwsWafRuleGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafRuleGroup": {
    "MetricName": "SampleWAF_Metric_1",
    "Name": "bb-WAFRuleGroupWithRuleCompliant",
    "RuleGroupId": "2012ca6d-e66d-4d9b-b766-bfb03ad77cfb",
    "Rules": [{
        "Action": {
            "Type": "ALLOW",
        },
        "Priority": 1,
        "RuleId": "cdd225da-32cf-4773-8dc5-3bca3ed9c19c",
        "Type": "REGULAR"
    }]
}
```

AwsWafv2RuleGroup

The `AwsWafv2RuleGroup` object provides details about an AWS WAFV2 rule group.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafv2RuleGroup` object. To view descriptions of `AwsWafv2RuleGroup` attributes, see AwsWafv2RuleGroupDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafv2RuleGroup": {
    "Arn": "arn:aws:wafv2:us-east-1:123456789012:global/rulegroup/wafv2rulegroupasff/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Capacity": 1000,
    "Description": "Resource for ASFF",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "wafv2rulegroupasff",
    "Rules": [{
     "Action": {
     "Allow": {
      "CustomRequestHandling": {
       "InsertHeaders": [
        {
        "Name": "AllowActionHeader1Name",
        "Value": "AllowActionHeader1Value"
        },
        {
        "Name": "AllowActionHeader2Name",
        "Value": "AllowActionHeader2Value"
        }
       ]
      }
     },
     "Name": "RuleOne",
     "Priority": 1,
     "VisibilityConfig": {
      "CloudWatchMetricsEnabled": true,
      "MetricName": "rulegroupasff",
      "SampledRequestsEnabled": false
     }
    }],
    "VisibilityConfig": {
     "CloudWatchMetricsEnabled": true,
     "MetricName": "rulegroupasff",
     "SampledRequestsEnabled": false
    }
}
```

AwsWafWebAcl

The `AwsWafWebAcl` object provides details about an AWS WAF web ACL.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafWebAcl` object. To view descriptions of `AwsWafWebAcl` attributes, see AwsWafWebAclDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafWebAcl": {
    "DefaultAction": "ALLOW",
    "Name": "MyWafAcl",
    "Rules": [
        {
            "Action": {
                "Type": "ALLOW"
            },
            "ExcludedRules": [
                {
                    "RuleId": "5432a230-0113-5b83-bbb2-89375c5bfa98"
                }
            ],
            "OverrideAction": {
                "Type": "NONE"
            },
            "Priority": 1,
            "RuleId": "5432a230-0113-5b83-bbb2-89375c5bfa98",
            "Type": "REGULAR"
        }
    ],
    "WebAclId": "waf-1234567890"
}
```

AwsWafv2WebAcl

The `AwsWafv2WebAcl` object provides details about an AWS WAFV2 web ACL.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsWafv2WebAcl` object. To view descriptions of `AwsWafv2WebAcl` attributes, see AwsWafv2WebAclDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsWafv2WebAcl": {
    "Arn": "arn:aws:wafv2:us-east-1:123456789012:regional/webacl/WebACL-RoaD4QexqSxG/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "Capacity": 1326,
    "CaptchaConfig": {
     "ImmunityTimeProperty": {
      "ImmunityTime": 500
     }
    },
    "DefaultAction": {
     "Block": {}
    },
    "Description": "Web ACL for JsonBody testing",
    "ManagedbyFirewallManager": false,
    "Name": "WebACL-RoaD4QexqSxG",
    "Rules": [{
     "Action": {
      "RuleAction": {
       "Block": {}
      }
     },
     "Name": "TestJsonBodyRule",
     "Priority": 1,
     "VisibilityConfig": {
      "SampledRequestsEnabled": true,
      "CloudWatchMetricsEnabled": true,
      "MetricName": "JsonBodyMatchMetric"
     }
    }],
    "VisibilityConfig": {
     "SampledRequestsEnabled": true,
     "CloudWatchMetricsEnabled": true,
     "MetricName": "TestingJsonBodyMetric"
    }
}
```

AwsXray resources in ASFF

The following are examples of the AWS Security Finding Format (ASFF) syntax for `AwsXray` resources.

AWS Security Hub CSPM normalizes findings from various sources into ASFF. For background information about ASFF, see AWS Security Finding Format (ASFF).

AwsXrayEncryptionConfig

The `AwsXrayEncryptionConfig` object contains information about the encryption configuration for AWS X-Ray.

The following example shows the AWS Security Finding Format (ASFF) for the `AwsXrayEncryptionConfig` object. To view descriptions of `AwsXrayEncryptionConfig` attributes, see AwsXrayEncryptionConfigDetails in the *AWS Security Hub API Reference*.

Example

```
"AwsXRayEncryptionConfig":{
    "KeyId": "arn:aws:kms:us-east-2:222222222222:key/example-key",
    "Status": "UPDATING",
    "Type":"KMS"
}
```

CodeRepository object in ASFF

The `CodeRepository` object provides information about an external code repository that you connected to AWS resources and configured Amazon Inspector to scan for vulnerabilities.

The following example shows the AWS Security Finding Format (ASFF) syntax for the `CodeRepository` object. To view descriptions of `CodeRepository` attributes, see CodeRepositoryDetails in the *AWS Security Hub API Reference*. For background information about ASFF, see AWS Security Finding Format (ASFF).

Example

```
"CodeRepository": {
    "ProviderType": "GITLAB_SELF_MANAGED",
    "ProjectName": "projectName",
    "CodeSecurityIntegrationArn": "arn:aws:inspector2:us-
east-1:123456789012:codesecurity-integration/00000000-0000-0000-0000-000000000000"
}
```

Container object in ASFF

The following example shows the AWS Security Finding Format (ASFF) syntax for the `Container` object. To view descriptions of `Container` attributes, see ContainerDetails in the *AWS Security Hub API Reference*. For background information about ASFF, see AWS Security Finding Format (ASFF).

Example

```
"Container": {
    "ContainerRuntime": "docker",
    "ImageId": "image12",
    "ImageName": "1111111/
knotejs@sha256:372131c9fef111111111111115f4ed3ea5f9dce4dc3bd34ce21846588a3",
    "LaunchedAt": "2018-09-29T01:25:54Z",
    "Name": "knote",
    "Privileged": true,
    "VolumeMounts": [{
        "Name": "vol-03909e9",
        "MountPath": "/mnt/etc"
    }]
}
```

Other object in ASFF

In the AWS Security Finding Format (ASFF), the `Other` object specifies custom fields and values. For more information about ASFF, see AWS Security Finding Format (ASFF).

By using the `Other` object, you can specify custom fields and values for a resource. You can use the `Other` object for the following cases:

- The resource type does not have a corresponding `Details` object. To specify details for a resource, use the `Other` object.
- The `Details` object for the resource type does not include all the attributes that you want to specify. In this case, use the `Details` object for the resource type to specify available attributes. Use the `Other` object to specify attributes that are not in the type-specific `Details` object.
- The resource type is not one of the provided types. In this case, set `Resource.Type` to `Other` and use the `Other` object to specify the details.

Type: Map of up to 50 key-value pairs

Each key-value pair must meet the following requirements.

- The key must contain fewer than 128 characters.
- The value must contain fewer than 1,024 characters.

Viewing insights in Security Hub CSPM

In AWS Security Hub CSPM, an *insight* is a collection of related findings. An insight can identify a specific security area that requires attention and intervention. For example, an insight might point out EC2 instances that are the subject of findings that detect poor security practices. An insight brings together findings from across finding providers.

Each insight is defined by a group by statement and optional filters. The group by statement indicates how to group the matching findings, and identifies the type of item that the insight applies to. For example, if an insight is grouped by resource identifier, then the insight produces a list of resource identifiers. The optional filters identify the matching findings for the insight. For example, you might want to only see findings from specific providers or findings that are associated with specific types of resources.

Security Hub CSPM offers several built-in managed insights. You can't modify or delete managed insights. To track security issues that are unique to your AWS environment and usage, you can create custom insights.

The **Insights** page on the AWS Security Hub CSPM console displays the list of available insights.

By default, the list displays both managed and custom insights. To filter the insight list based on insight type, choose the insight type from the dropdown menu that is next to the filter field.

- To display all of the available insights, choose **All insights**. This is the default option.
- To display only managed insights, choose **Security Hub CSPM managed insights**.
- To display only custom insights, choose **Custom insights**.

You also can filter the insight list based on the insight's name. To do so, in the filter field, type the text to use to filter the list. The filter is not case sensitive. The filter looks for insights that contain the text anywhere in the insight name.

An insight only returns results if you have enabled integrations or standards that produce matching findings. For example, the managed insight **29. Top resources by counts of failed CIS checks** only returns results if you enable a version of the Center for Internet Security (CIS) AWS Foundations Benchmark standard.

Reviewing and acting on insights in Security Hub CSPM

For each insight, AWS Security Hub CSPM first determines the findings that match the filter criteria, and then uses the grouping attribute to group the matching findings.

From the **Insights** page on the console, you can view and take action on the results and findings.

If you enable cross-Region aggregation, the results for managed insights (when you're signed in to the aggregation Region) include findings from the aggregation Region and linked Regions. The results for custom insights, if the insight doesn't filter by Region, also include findings from the aggregation Region and linked Regions (when you're signed in to the aggregation Region). In other Regions, the insight results are only for that Region.

For information about configuring cross-Region aggregation, see the section called “Aggregating data across Regions”.

Viewing and taking action on insight results

The insight results consist of a grouped list of the results for the insight. For example, if the insight is grouped by resource identifiers, then the insight results are the list of resource identifiers. Each item in the results list indicates the number of matching findings for that item.

If the findings are grouped by resource identifier or resource type, the results include all of the resources in the matching findings. This includes resources that have a different type from the resource type specified in the filter criteria. For example, an insight identifies findings that are associated with S3 buckets. If a matching finding contains both an S3 bucket resource and an IAM access key resource, the insight results include both resources.

On the Security Hub CSPM console, the results list is sorted from most to fewest matching findings. Security Hub CSPM can only display 100 results. If there are more than 100 grouping values, you only see the first 100.

In addition to the results list, the insight results display a set of charts summarizing the number of matching findings for the following attributes.

- **Severity label** – Number of findings for each severity label
- **AWS account ID** – Top five account IDs for the matching findings
- **Resource type** – Top five resource types for the matching findings

- **Resource ID** – Top five resource IDs for the matching findings
- **Product name** - Top five finding providers for the matching findings

If you have configured custom actions, then you can send selected results to a custom action. The action must be associated with an Amazon CloudWatch rule for the `Security Hub Insight Results` event type. For more information, see the section called "Automated response and remediation". If you have not configured custom actions, the **Actions** menu is disabled.

Security Hub CSPM console

To view and take action on insight results (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. To display the list of insight results, choose the insight name.
4. Select the check box for each result to send to the custom action.
5. From the **Actions** menu, choose the custom action.

Security Hub CSPM API, AWS CLI

To view and take action on insight results (API, AWS CLI)

To view insight results, use the >GetInsightResults operation of the Security Hub CSPM API. If you use the AWS CLI, run the get-insight-results command.

To identify the insight to return results for, you need the insight ARN. To obtain the insight ARNs for custom insights, use the `GetInsights` API operation or the get-insight-results command.

The following example retrieves the results for the specified insight. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub get-insight-results --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

For information about how to create custom actions programmatically, see Using custom actions to send findings and insight results to EventBridge.

Viewing and taking action on insight result findings (console)

From an insight results list on the Security Hub CSPM console, you can display the list of findings for each result.

To display and take action on insight findings (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. To display the list of insight results, choose the insight name.
4. To display the list of findings for an insight result, choose the item from the results list. The findings list shows the active findings for the selected insight result that have a workflow status of `NEW` or `NOTIFIED`.

From the findings list, you can perform the following actions:

- Filtering findings in Security Hub CSPM
- Reviewing finding details and history
- Setting the workflow status of findings in Security Hub CSPM
- Sending findings to a custom Security Hub CSPM action

Managed insights in Security Hub CSPM

AWS Security Hub CSPM provides several managed insights.

You can't edit or delete Security Hub CSPM managed insights. You can view and take action on the insight results and findings. You can also use a managed insight as the basis for a new custom insight.

As with all insights, a managed insight only returns results if you have enabled product integrations or security standards that can produce matching findings.

For insights that are grouped by resource identifier, the results include the identifiers of all of the resources in the matching findings. This includes resources that have a different type from the

resource type in the filter criteria. For example, insight 2 in the following list identifies findings that are associated with Amazon S3 buckets. If a matching finding contains both an S3 bucket resource and an IAM access key resource, the insight results include both resources.

Security Hub CSPM currently offers the following managed insights:

1. AWS resources with the most findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/1`

Grouped by: Resource identifier

Finding filters:

- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

2. S3 buckets with public write or read permissions

ARN: `arn:aws:securityhub:::insight/securityhub/default/10`

Grouped by: Resource identifier

Finding filters:

- Type starts with `Effects/Data Exposure`
- Resource type is `AwsS3Bucket`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

3. AMIs that are generating the most findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/3`

Grouped by: EC2 instance image ID

Finding filters:

- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

4. EC2 instances involved in known Tactics, Techniques, and Procedures (TTPs)

ARN: `arn:aws:securityhub:::insight/securityhub/default/14`

Grouped by: Resource ID

Finding filters:

- Type starts with `TTPs`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

5. AWS principals with suspicious access key activity

ARN: `arn:aws:securityhub:::insight/securityhub/default/9`

Grouped by: IAM access key principal name

Finding filters:

- Resource type is `AwsIamAccessKey`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

6. AWS resources instances that don't meet security standards / best practices

ARN: `arn:aws:securityhub:::insight/securityhub/default/6`

Grouped by: Resource ID

Finding filters:

- Type is `Software and Configuration Checks/Industry and Regulatory Standards/AWS Security Best Practices`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

7. AWS resources associated with potential data exfiltration

ARN: `arn:aws:securityhub:::insight/securityhub/default/7`

Grouped by:: Resource ID

Finding filters:

- Type starts with Effects/Data Exfiltration/
- Record state is `ACTIVE`

- Workflow status is NEW or NOTIFIED

8. AWS resources associated with unauthorized resource consumption

ARN: arn:aws:securityhub:::insight/securityhub/default/8

Grouped by: Resource ID

Finding filters:

- Type starts with Effects/Resource Consumption
- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

9. S3 buckets that don't meet security standards / best practice

ARN: arn:aws:securityhub:::insight/securityhub/default/11

Grouped by: Resource ID

Finding filters:

- Resource type is AwsS3Bucket
- Type is Software and Configuration Checks/Industry and Regulatory Standards/AWS Security Best Practices
- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

10. S3 buckets with sensitive data

ARN: arn:aws:securityhub:::insight/securityhub/default/12

Grouped by: Resource ID

Finding filters:

- Resource type is AwsS3Bucket
- Type starts with Sensitive Data Identifications/
- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

11. Credentials that may have leaked

ARN: arn:aws:securityhub:::insight/securityhub/default/13

Grouped by: Resource ID

Finding filters:

- Type starts with `Sensitive Data Identifications/Passwords/`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

12. EC2 instances that have missing security patches for important vulnerabilities

ARN: `arn:aws:securityhub:::insight/securityhub/default/16`

Grouped by: Resource ID

Finding filters:

- Type starts with `Software and Configuration Checks/Vulnerabilities/CVE`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

13. EC2 instances with general unusual behavior

ARN: `arn:aws:securityhub:::insight/securityhub/default/17`

Grouped by: Resource ID

Finding filters:

- Type starts with `Unusual Behaviors`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

14. EC2 instances that have ports accessible from the Internet

ARN: `arn:aws:securityhub:::insight/securityhub/default/18`

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:

  - `Software and Configuration Checks/AWS Security Best Practices/Network Reachability`
  - `Software and Configuration Checks/Network Reachability -`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

15. EC2 instances that don't meet security standards / best practices

ARN: `arn:aws:securityhub:::insight/securityhub/default/19`

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:
  - `Software and Configuration Checks/Industry and Regulatory Standards/`
  - `Software and Configuration Checks/AWS Security Best Practices`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

16. EC2 instances that are open to the Internet

Security Hub CSPM plans to deprecate this managed insight. To continue to get insights about EC2 instances, use insight 14, which provides the same filters.

ARN: `arn:aws:securityhub:::insight/securityhub/default/21`

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:
  - `Software and Configuration Checks/AWS Security Best Practices/Network Reachability`
  - `Software and Configuration Checks/Network Reachability -`
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`

- Workflow status is `NEW` or `NOTIFIED`

17. EC2 instances associated with adversary reconnaissance

ARN: `arn:aws:securityhub:::insight/securityhub/default/22`

Grouped by: Resource ID

Finding filters:

- Type starts with TTPs/Discovery/Recon
- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

18. AWS resources that are associated with malware

ARN: `arn:aws:securityhub:::insight/securityhub/default/23`

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:
  - `Effects/Data Exfiltration/Trojan`
  - `TTPs/Initial Access/Trojan`
  - `TTPs/Command and Control/Backdoor`
  - `TTPs/Command and Control/Trojan`
  - `Software and Configuration Checks/Backdoor`
  - `Unusual Behaviors/VM/Backdoor`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

19. AWS resources associated with cryptocurrency issues

ARN: `arn:aws:securityhub:::insight/securityhub/default/24`

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:
  - `Effects/Resource Consumption/Cryptocurrency`

    - TTPs/Command and Control/CryptoCurrency
- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

20. AWS resources with unauthorized access attempts

ARN: arn:aws:securityhub:::insight/securityhub/default/25

Grouped by: Resource ID

Finding filters:

- Type starts with one of the following:
    - TTPs/Command and Control/UnauthorizedAccess
    - TTPs/Initial Access/UnauthorizedAccess
    - Effects/Data Exfiltration/UnauthorizedAccess
    - Unusual Behaviors/User/UnauthorizedAccess
    - Effects/Resource Consumption/UnauthorizedAccess
- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

21. Threat Intel indicators with the most hits in the last week

ARN: arn:aws:securityhub:::insight/securityhub/default/26

Finding filters:

- Created within the last 7 days

22. Top accounts by counts of findings

ARN: arn:aws:securityhub:::insight/securityhub/default/27

Grouped by: AWS account ID

Finding filters:

- Record state is ACTIVE
- Workflow status is NEW or NOTIFIED

23. Top products by counts of findings

ARN: arn:aws:securityhub:::insight/securityhub/default/28

Grouped by: Product name

Finding filters:

- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

24. Severity by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/29`

Grouped by: Severity label

Finding filters:

- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

25. Top S3 buckets by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/30`

Grouped by: Resource ID

Finding filters:

- Resource type is `AwsS3Bucket`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

26. Top EC2 instances by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/31`

Grouped by: Resource ID

Finding filters:

- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

27. Top AMIs by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/32`

Grouped by: EC2 instance image ID

Finding filters:

- Resource type is `AwsEc2Instance`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

28. Top IAM users by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/33`

Grouped by: IAM access key ID

Finding filters:

- Resource type is `AwsIamAccessKey`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

29. Top resources by counts of failed CIS checks

ARN: `arn:aws:securityhub:::insight/securityhub/default/34`

Grouped by: Resource ID

Finding filters:

- Generator ID starts with `arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/v/1.2.0/rule`
- Updated in the last day
- Compliance status is `FAILED`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

30. Top integrations by counts of findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/35`

Grouped by: Product ARN

Finding filters:

- Record state is `ACTIVE`

- Workflow status is `NEW` or `NOTIFIED`

31. Resources with the most failed security checks

ARN: `arn:aws:securityhub:::insight/securityhub/default/36`

Grouped by: Resource ID

Finding filters:

- Updated in the last day
- Compliance status is `FAILED`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

32. IAM users with suspicious activity

ARN: `arn:aws:securityhub:::insight/securityhub/default/37`

Grouped by: IAM user

Finding filters:

- Resource type is `AwsIamUser`
- Record state is `ACTIVE`
- Workflow status is `NEW` or `NOTIFIED`

33. Resources with the most AWS Health findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/38`

Grouped by: Resource ID

Finding filters:

- `ProductName` equals `Health`

34. Resources with the most AWS Config findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/39`

Grouped by: Resource ID

Finding filters:

- `ProductName` equals `Config`

35. Applications with the most findings

ARN: `arn:aws:securityhub:::insight/securityhub/default/40`

Grouped by: ResourceApplicationArn

Finding filters:

- `RecordState` equals `ACTIVE`
- `Workflow.Status` equals `NEW` or `NOTIFIED`

Understanding custom insights in Security Hub CSPM

In addition to AWS Security Hub CSPM managed insights, you can create custom insights in Security Hub CSPM to track issues that are specific to your environment. Custom insights help you track a curated subset of issues.

Here are some examples of custom insights that may be useful to set up:

- If you own an administrator account, you can set up a custom insight to track critical and high severity findings that are affecting member accounts.
- If you rely on a specific integrated AWS service, you can set up a custom insight to track critical and high severity findings from that service.
- If you rely on a third party integration, you can set up a custom insight to track critical and high severity findings from that integrated product.

You can create completely new custom insights, or start from an existing custom or managed insight.

Each insight can be configured with the following options:

- **Grouping attribute** – The grouping attribute determines which items are displayed in the insight results list. For example, if the grouping attribute is **Product name**, the insight results display the number of findings that are associated with each finding provider.
- **Optional filters** – The filters narrow down the matching findings for the insight.

  A finding is included in the insight results only if it matches all of the provided filters. For example, if the filters are "Product name is GuardDuty" and "Resource type is `AwsS3Bucket`", matching findings must match both of these criteria.

However, Security Hub CSPM applies boolean OR logic to filters that use the same attribute but different values. For example, if the filters are "Product name is GuardDuty" and "Product name is Amazon Inspector", a finding matches if it was generated by either Amazon GuardDuty or Amazon Inspector.

If you use the resource identifier or resource type as the grouping attribute, the insight results include all of the resources that are in the matching findings. The list is not limited to resources that match a resource type filter. For example, an insight identifies findings that are associated with S3 buckets, and groups those findings by resource identifier. A matching finding contains both an S3 bucket resource and an IAM access key resource. The insight results include both resources.

If you enable cross-region aggregation and then create a custom insight, the insight applies to matching findings in the aggregation Region and linked Regions. The exception is if your insight includes a Region filter.

Creating a custom insight

In AWS Security Hub CSPM, custom insights can be used to collect a specific set of findings and track issues that are unique to your environment. For background information about custom insights, see Understanding custom insights in Security Hub CSPM.

Choose your preferred method, and follow the steps to create a custom insight in Security Hub CSPM

Security Hub CSPM console

To create a custom insight (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. Choose **Create insight**.
4. To select the grouping attribute for the insight:
    a. Choose the search box to display the filter options.
    b. Choose **Group by**.
    c. Select the attribute to use to group the findings that are associated with this insight.

d. Choose **Apply**.

5. Optionally, choose any additional filters to use for this insight. For each filter, define the filter criteria, and then choose **Apply**.
6. Choose **Create insight**.
7. Enter an **Insight name**, and then choose **Create insight**.

Security Hub CSPM API

To create a custom insight (API)

1. To create a custom insight, use the CreateInsight operation of the Security Hub CSPM API. If you use the AWS CLI, run the create-insight command.
2. Populate the `Name` parameter with a name for your custom insight.
3. Populate the `Filters` parameter to specify which findings to include in the insight.
4. Populate the `GroupByAttribute` parameter to specify which attribute is used to group the findings that are included in the insight.
5. Optionally, populate the `SortCriteria` parameter to sort the findings by a specific field.

The following example creates a custom insight that includes critical findings with the `AwsIamRole` resource type. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub create-insight --name "Critical role findings" --filters
 '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' --group-by-
attribute "ResourceId"
```

PowerShell

To create a custom insight (PowerShell)

1. Use the `New-SHUBInsight` cmdlet.
2. Populate the `Name` parameter with a name for your custom insight.
3. Populate the `Filter` parameter to specify which findings to include in the insight.
4. Populate the `GroupByAttribute` parameter to specify which attribute is used to group the findings that are included in the insight.

If you've enabled cross-region aggregation and use this cmdlet from the aggregation Region, the insight applies to matching findings from the aggregation and linked Regions.

Example

```
$Filter = @{
    AwsAccountId = [Amazon.SecurityHub.Model.StringFilter]@{
        Comparison = "EQUALS"
        Value = "XXX"
    }
    ComplianceStatus = [Amazon.SecurityHub.Model.StringFilter]@{
        Comparison = "EQUALS"
        Value = 'FAILED'
    }
}
New-SHUBInsight -Filter $Filter -Name TestInsight -GroupByAttribute ResourceId
```

Creating a custom insight from a managed insight (console only)

You can't save changes to or delete a managed insight. However, you can use a managed insight as the basis for a custom insight. This is an option on the Security Hub CSPM console only.

To create a custom insight from a managed insight (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. Choose the managed insight to work from.
4. Edit the insight configuration as needed.
   - To change the attribute used to group findings in the insight:
     a. To remove the existing grouping, choose the **X** next to the **Group by** setting.
     b. Choose the search box.
     c. Select the attribute to use for grouping.
     d. Choose **Apply**.
   - To remove a filter from the insight, choose the circled **X** next to the filter.
   - To add a filter to the insight:
     a. Choose the search box.

b. Select the attribute and value to use as a filter.

c. Choose **Apply**.

5. When your updates are complete, choose **Create insight**.
6. When prompted, enter an **Insight name**, and then choose **Create insight**.

Editing a custom insight

You can edit an existing custom insight to change the grouping value and filters. After you make the changes, you can save the updates to the original insight, or save the updated version as a new insight.

In AWS Security Hub CSPM, custom insights can be used to collect a specific set of findings and track issues that are unique to your environment. For background information about custom insights, see Understanding custom insights in Security Hub CSPM.

To edit a custom insight, choose your preferred method, and follow the instructions.

Security Hub CSPM console

To edit a custom insight (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. Choose the custom insight to modify.
4. Edit the insight configuration as needed.
   - To change the attribute used to group findings in the insight:
     a. To remove the existing grouping, choose the **X** next to the **Group by** setting.
     b. Choose the search box.
     c. Select the attribute to use for grouping.
     d. Choose **Apply**.
   - To remove a filter from the insight, choose the circled **X** next to the filter.
   - To add a filter to the insight:
     a. Choose the search box.

   b. Select the attribute and value to use as a filter.
   c. Choose **Apply**.
5. When you complete the updates, choose **Save insight**.
6. When prompted, do one of the following:
   - To update the existing insight to reflect your changes, choose **Update *<Insight_Name>*** and then choose **Save insight**.
   - To create a new insight with the updates, choose **Save new insight**. Enter an **Insight name**, and then choose **Save insight**.

Security Hub CSPM API

To edit a custom insight (API)

1. Use the `UpdateInsight` operation of the Security Hub CSPM API. If you use the AWS CLI run the update-insight command.
2. To identify the custom insight that you want to update, provide the insight's Amazon Resource Name (ARN). To get the ARN of a custom insight, use the `GetInsights` operation or the get-insights command.
3. Update the `Name`, `Filters`, and `GroupByAttribute` parameters as needed.

The following example updates the specified insight. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub update-insight --insight-arn "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111" --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value":
 "AwsIamRole"}], "SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' --
name "High severity role findings"
```

PowerShell

To edit a custom insight (PowerShell)

1. Use the `Update-SHUBInsight` cmdlet.
2. To identify the custom insight, provide the insight's Amazon Resource Name (ARN). To get the ARN of a custom insight, use the `Get-SHUBInsight` cmdlet.

3. Update the `Name`, `Filter`, and `GroupByAttribute` parameters as needed.

Example

```
$Filter = @{
    ResourceType = [Amazon.SecurityHub.Model.StringFilter]@{
        Comparison = "EQUALS"
        Value = "AwsIamRole"
    }
    SeverityLabel = [Amazon.SecurityHub.Model.StringFilter]@{
        Comparison = "EQUALS"
        Value = "HIGH"
    }
}

Update-SHUBInsight -InsightArn "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111" -Filter $Filter -Name "High severity role findings"
```

Deleting a custom insight

In AWS Security Hub CSPM, custom insights can be used to collect a specific set of findings and track issues that are unique to your environment. For background information about custom insights, see Understanding custom insights in Security Hub CSPM.

To delete a custom insight, choose your preferred method, and follow the instructions. You can't delete a managed insight.

Security Hub CSPM console

To delete a custom insight (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. Locate the custom insight to delete.
4. For that insight, choose the more options icon (the three dots in the top-right corner of the card).
5. Choose **Delete**.

Security Hub CSPM API

To delete a custom insight (API)

1. Use the `DeleteInsight` operation of the Security Hub CSPM API. If you use the AWS CLI run the delete-insight command.
2. To identify the custom insight to delete, provide the insight's ARN. To get the ARN of a custom insight, use the `GetInsights` operation or get-insights command.

The following example deletes the specified insight. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub delete-insight --insight-arn "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
```

PowerShell

To delete a custom insight (PowerShell)

1. Use the `Remove-SHUBInsight` cmdlet.
2. To identify the custom insight, provide the insight's ARN. To get the ARN of a custom insight, use the `Get-SHUBInsight` cmdlet.

Example

```
-InsightArn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Automatically modifying and acting on findings in Security Hub CSPM

AWS Security Hub CSPM has features that automatically modify and take action on findings based on your specifications.

Security Hub CSPM currently supports two types of automations:

- **Automation rules** – Automatically update and suppress findings in near real time based on criteria that you define.
- **Automated response and remediation** – Create custom Amazon EventBridge rules that define automatic actions to take against specific findings and insights.

Automation rules are helpful when you want to automatically update finding fields in the AWS Security Finding Format (ASFF). For example, you can use an automation rule to update the severity level or workflow status of findings from a specific third-party integrations. Using the automation rule eliminates the need to manually update the severity level or workflow status of each finding from this third-party product.

EventBridge rules are helpful when you want to take actions outside of Security Hub CSPM with regards to specific findings or send specific findings to third-party tools for remediation or additional investigation. The rules can be used to trigger supported actions, such as invoking an AWS Lambda function or notifying an Amazon Simple Notification Service (Amazon SNS) topic about a specific finding.

Automation rules take effect before EventBridge rules are applied. That is, automation rules are triggered and update a finding before EventBridge receives the finding. EventBridge rules then apply to the updated finding.

When setting up automations for security controls, we recommend filtering based on control ID rather than title or description. Whereas Security Hub CSPM occasionally updates control titles and descriptions, control IDs stay the same.

Topics

- Understanding automation rules in Security Hub CSPM
- Using EventBridge for automated response and remediation

Understanding automation rules in Security Hub CSPM

You can use automation rules to automatically update findings in AWS Security Hub CSPM. As it ingests findings, Security Hub CSPM can apply a variety of rule actions, such as suppressing findings, changing their severity, and adding notes. Such rule actions modify findings that match your specified criteria.

Examples of use cases for automation rules include the following:

- Elevating a finding's severity to `CRITICAL` if the finding's resource ID refers to a business-critical resource.
- Elevating a finding's severity from `HIGH` to `CRITICAL` if the finding affects resources in specific production accounts.
- Assigning specific findings that have a severity of `INFORMATIONAL` a `SUPPRESSED` workflow status.

You can create and manage automation rules from a Security Hub CSPM administrator account only.

Rules apply to both new findings and updated findings. You can create a custom rule from scratch, or use a rule template provided by Security Hub CSPM. You can also start with a template and modify it as needed.

Defining rule criteria and rule actions

From a Security Hub CSPM administrator account, you can create an automation rule by defining one or more rule *criteria* and one or more rule *actions*. When a finding matches the defined criteria, Security Hub CSPM applies the rule actions to it. For more information about available criteria and actions, see Available rule criteria and rule actions.

Security Hub CSPM currently supports a maximum of 100 automation rules for each administrator account.

The Security Hub CSPM administrator account can also edit, view, and delete automation rules. A rule applies to matching findings in the administrator account and all of its member accounts. By providing member account IDs as rule criteria, Security Hub CSPM administrators can also use automation rules to update or suppress findings in specific member accounts.

An automation rule applies only in the AWS Region in which it's created. To apply a rule in multiple Regions, the administrator must create the rule in each Region. This can be done through the Security Hub CSPM console, Security Hub CSPM API, or AWS CloudFormation.You can also use a multi-Region deployment script.

Available rule criteria and rule actions

The following AWS Security Finding Format (ASFF) fields are currently supported as criteria for automation rules:

Rule criterion	Filter operators	Field type
AwsAccountId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
AwsAccountName	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
CompanyName	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ComplianceAssociatedStandardsId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ComplianceSecurityControlId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ComplianceStatus	Is, Is Not	Select: [FAILED, NOT_AVAILABLE , PASSED, WARNING]
Confidence	Eq (equal-to), Gte (greater-than-equal), Lte (less-than-equal)	Number
CreatedAt	Start, End, DateRange	Date (formatted as 2022-12-01T21:47:39.269Z)

Rule criterion	Filter operators	Field type
Criticality	Eq (equal-to), Gte (greater-than-equal), Lte (less-than-equal)	Number
Description	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
FirstObservedAt	Start, End, DateRange	Date (formatted as 2022-12-01T21:47:39.269Z)
GeneratorId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
Id	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
LastObservedAt	Start, End, DateRange	Date (formatted as 2022-12-01T21:47:39.269Z)
NoteText	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
NoteUpdatedAt	Start, End, DateRange	Date (formatted as 2022-12-01T21:47:39.269Z)

Rule criterion	Filter operators	Field type
NoteUpdatedBy	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ProductArn	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ProductName	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
RecordState	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
RelatedFindingsId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
RelatedFindingsProductArn	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ResourceApplicationArn	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String

Rule criterion	Filter operators	Field type
ResourceApplicationName	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ResourceDetailsOther	CONTAINS, EQUALS, NOT_CONTAINS, NOT_EQUALS	Map
ResourceId	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ResourcePartition	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ResourceRegion	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
ResourceTags	CONTAINS, EQUALS, NOT_CONTAINS, NOT_EQUALS	Map
ResourceType	Is, Is Not	Select (see Resources supported by ASFF)
SeverityLabel	Is, Is Not	Select: [CRITICAL, HIGH, MEDIUM, LOW, INFORMATIONAL]

Rule criterion	Filter operators	Field type
SourceUrl	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
Title	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
Type	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
UpdatedAt	Start, End, DateRange	Date (formatted as 2022-12-01T21:47:39.269Z)
UserDefinedFields	CONTAINS, EQUALS, NOT_CONTAINS, NOT_EQUALS	Map
VerificationState	CONTAINS, EQUALS, PREFIX, NOT_CONTAINS, NOT_EQUALS, PREFIX_NOT_EQUALS	String
WorkflowStatus	Is, Is Not	Select: [NEW, NOTIFIED, RESOLVED, SUPPRESSED]

For criteria that are labeled as string fields, using different filter operators on the same field affects the evaluation logic. For more information, see StringFilter in the *AWS Security Hub CSPM API Reference*.

Each criterion supports a maximum number of values that can be used to filter matching findings. For the limits on each criterion, see AutomationRulesFindingFilters in the *AWS Security Hub CSPM API Reference*.

The following ASFF fields are currently supported as actions for automation rules:

- `Confidence`
- `Criticality`
- `Note`
- `RelatedFindings`
- `Severity`
- `Types`
- `UserDefinedFields`
- `VerificationState`
- `Workflow`

For more information about specific ASFF fields, see AWS Security Finding Format (ASFF) syntax.

> **Tip**
>
> If you want Security Hub CSPM to stop generating findings for a specific control, we recommend disabling the control instead of using an automation rule. When you disable a control, Security Hub CSPM stops running security checks on it and stops generating findings for it, so you won't incur charges for that control. We recommend using automation rules to change the values of specific ASFF fields for findings that match defined criteria. For more information about disabling controls, see Disabling controls in Security Hub CSPM.

Findings that automation rules evaluate

An automation rule evaluates new and updated findings that Security Hub CSPM generates or ingests through the BatchImportFindings operation *after* you create the rule. Security Hub CSPM updates control findings every 12-24 hours or when the associated resource changes state. For more information, see Schedule for running security checks.

Automation rules evaluate original, provider-supplied findings. Providers can supply new findings and update existing findings by using the `BatchImportFindings` operation of the Security Hub CSPM API. If the following fields don't exist in the original finding, Security Hub CSPM automatically populates the fields and then uses the populated values in the evaluation by the automation rule:

- `AwsAccountName`
- `CompanyName`
- `ProductName`
- `Resource.Tags`
- `Workflow.Status`

After you create one or more automation rules, the rules aren't triggered if you update finding fields by using the BatchUpdateFindings operation. If you create an automation rule and make a `BatchUpdateFindings` update that both affect the same finding field, the last update sets the value for that field. Take the following example:

1. You use the `BatchUpdateFindings` operation to change the value for the `Workflow.Status` field of a finding from `NEW` to `NOTIFIED`.
2. If you call `GetFindings`, the `Workflow.Status` field now has a value of `NOTIFIED`.
3. You create an automation rule that changes the `Workflow.Status` field of the finding from `NEW` to `SUPPRESSED`. (Recall that rules ignore updates made using the `BatchUpdateFindings` operation.)
4. The finding provider uses the `BatchImportFindings` operation to update the finding and changes the value for the `Workflow.Status` field of the finding to `NEW`.
5. If you call `GetFindings`, the `Workflow.Status` field now has a value of `SUPPRESSED`. This is the case because the automation rule was applied, and the rule was the last action taken on the finding.

When you create or edit a rule on the Security Hub CSPM console, the console displays a preview of findings that match the rule criteria. Whereas automation rules evaluate original findings sent by the finding provider, the console preview reflects findings in their final state as they would be shown in a response to the GetFindings operation (that is, after rule actions or other updates are applied to the finding).

How rule order works

When creating automation rules, you assign each rule an order. This determines the order in which Security Hub CSPM applies your automation rules, and becomes important when multiple rules relate to the same finding or finding field.

When multiple rule actions relate to the same finding or finding field, the rule with the highest numerical value for rule order applies last and has the ultimate effect.

When you create a rule in the Security Hub CSPM console, Security Hub CSPM automatically assigns rule order based on the order of rule creation. The most recently created rule has the lowest numerical value for rule order and therefore applies first. Security Hub CSPM applies subsequent rules in ascending order.

When you create a rule through the Security Hub CSPM API or AWS CLI, Security Hub CSPM applies the rule with the lowest numerical value for `RuleOrder` first. It then applies subsequent rules in ascending order. If multiple findings have the same `RuleOrder`, Security Hub CSPM applies a rule with an earlier value for the `UpdatedAt` field first (that is, the rule which was most recently edited applies last).

You can modify rule order at any time.

Example of rule order:

Rule A (rule order is 1):

- Rule A criteria
  - `ProductName` = `Security Hub CSPM`
  - `Resources.Type` is `S3 Bucket`
  - `Compliance.Status` = `FAILED`
  - `RecordState` is `NEW`
  - `Workflow.Status` = `ACTIVE`
- Rule A actions
  - Update `Confidence` to 95
  - Update `Severity` to `CRITICAL`

Rule B (rule order is 2):

- Rule B criteria
  - `AwsAccountId` = `123456789012`
- Rule B actions
  - Update `Severity` to `INFORMATIONAL`

Rule A actions apply first to Security Hub CSPM findings that match Rule A criteria. Next, Rule B actions apply to Security Hub CSPM findings with the specified account ID. In this example, since Rule B applies last, the end value of `Severity` in findings from the specified account ID is `INFORMATIONAL`. Based on the Rule A action, the end value of `Confidence` in matched findings is 95.

Creating automation rules

An automation rule can be used to automatically update findings in AWS Security Hub CSPM. You can create a custom automation rule from scratch or, on the Security Hub CSPM console, use a pre-populated rule template. For background information about how automation rules work, see Understanding automation rules in Security Hub CSPM.

You can only create one automation rule at a time. To create multiple automation rules, follow the console procedures multiple times, or call the API or command multiple times with your desired parameters.

You must create an automation rule in each Region and account in which you want the rule to apply to findings.

When you create an automation rule in the Security Hub CSPM console, Security Hub CSPM shows you a preview of the findings to which your rule applies. The preview is currently not supported if your rule criteria include a CONTAINS or NOT_CONTAINS filter. You can choose these filters for map and string field types.

> **Important**
>
> AWS recommends that you don't include personally identifying, confidential, or sensitive information in your rule name, description, or other fields.

Creating a custom automation rule

Choose your preferred method, and complete the following steps to create a custom automation rule.

Console

To create a custom automation rule (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Choose **Create rule**. For **Rule Type**, choose **Create custom rule**.
4. In the **Rule** section, provide a unique rule name and a description for your rule.
5. For **Criteria**, use the **Key**, **Operator**, and **Value** drop down menus to specify your rule criteria. You must specify at least one rule criterion.

   If supported for your selected criteria, the console shows you a preview of findings that match your criteria.
6. For **Automated action**, use the drop down menus to specify which finding fields to update when findings match your rule criteria. You must specify at least one rule action.
7. For **Rule status**, choose whether you want the rule to be **Enabled** or **Disabled** after it's created.
8. (Optional) Expand the **Additional settings** section. Select **Ignore subsequent rules for findings that match these criteria** if you want this rule to be the last rule applied to findings that match the rule criteria.
9. (Optional) For **Tags**, add tags as key-value pairs to help you easily identify the rule.
10. Choose **Create rule**.

API

To create a custom automation rule (API)

1. Run `CreateAutomationRule` from the Security Hub CSPM administrator account. This API creates a rule with a specific Amazon Resource Name (ARN).
2. Provide a name and description for the rule.

3. Set the `IsTerminal` parameter to `true` if you want this rule to be the last rule applied to findings that match the rule criteria.
4. For the `RuleOrder` parameter, provide the order of the rule. Security Hub CSPM applies rules with a lower numerical value for this parameter first.
5. For the `RuleStatus` parameter, specify if you want Security Hub CSPM to enable and start applying the rule to findings after creation. If no value is specified, the default value is `ENABLED`. A value of `DISABLED` means that the rule is paused after creation.
6. For the `Criteria` parameter, provide the criteria that you want Security Hub CSPM to use to filter your findings. The rule action will apply to findings that match the criteria. For a list of supported criteria, see Available rule criteria and rule actions.
7. For the `Actions` parameter, provide the actions that you want Security Hub CSPM to take when there's a match between a finding and your defined criteria. For a list of supported actions, see Available rule criteria and rule actions.

The following example AWS CLI command creates an automation rule the updates the workflow status and note of matching findings. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub create-automation-rule \
--actions '[{
 "Type": "FINDING_FIELDS_UPDATE",
 "FindingFieldsUpdate": {
 "Severity": {
 "Label": "HIGH"
 },
 "Note": {
 "Text": "Known issue that is a risk. Updated by automation rules",
 "UpdatedBy": "sechub-automation"
 }
 }
 }]' \
--criteria '{
 "SeverityLabel": [{
 "Value": "INFORMATIONAL",
 "Comparison": "EQUALS"
 }]
 }' \
--description "A sample rule" \
--no-is-terminal \
```

```
--rule-name "sample rule" \
--rule-order 1 \
--rule-status "ENABLED" \
--region us-east-1
```

Creating an automation rule from a template (console only)

Rule templates reflect common use cases for automation rules. Currently, only the Security Hub CSPM console supports rule templates. Complete the following steps to create an automation rule from a template in the console.

To create an automation rule from a template (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Choose **Create rule**. For **Rule Type**, choose **Create a rule from template**.
4. Select a rule template from the drop down menu.
5. (Optional) If necessary for your use case, modify the **Rule**, **Criteria**, and **Automated action** sections. You must specify at least one rule criterion and one rule action.

   If supported for your selected criteria, the console shows you a preview of findings that match your criteria.
6. For **Rule status**, choose whether you want the rule to be **Enabled** or **Disabled** after it's created.
7. (Optional) Expand the **Additional settings** section. Select **Ignore subsequent rules for findings that match these criteria** if you want this rule to be the last rule applied to findings that match the rule criteria.
8. (Optional) For **Tags**, add tags as key-value pairs to help you easily identify the rule.
9. Choose **Create rule**.

Viewing automation rules

An automation rule can be used to automatically update findings in AWS Security Hub CSPM. For background information about how automation rules work, see Understanding automation rules in Security Hub CSPM.

Choose your preferred method, and follow the steps to view your existing automation rules and the details of each rule.

To view a history of how automation rules have changed your findings, see Reviewing finding details and history in Security Hub CSPM.

Console

To view automation rules (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Choose a rule name. Alternatively, select a rule.
4. Choose **Actions** and **View**.

API

To view automation rules (API)

1. To view the automation rules for your account, run `ListAutomationRules` from the Security Hub CSPM administrator account. This API returns the rule ARNs and other metadata for your rules. No input parameters are required for this API, but you can optionally provide `MaxResults` to limit the number of results and `NextToken` as a pagination parameter. The initial value of `NextToken` should be `NULL`.
2. For additional rule details, including the criteria and actions for a rule, run `BatchGetAutomationRules` from the Security Hub CSPM administrator account. Provide the ARNs of the automation rules that you want details for.

   The following example retrieves details for the specified automation rules. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub batch-get-automation-rules \
--automation-rules-arns '["arn:aws:securityhub:us-
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
 "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"]' \
```

```
--region us-east-1
```

Editing automation rules

An automation rule can be used to automatically update findings in AWS Security Hub CSPM. For background information about how automation rules work, see Understanding automation rules in Security Hub CSPM.

After creating an automation rule, the delegated Security Hub CSPM administrator can edit the rule. When you edit an automation rule, the changes apply to new and updated findings that Security Hub CSPM generates or ingests after the rule edit.

Choose your preferred method, and follow the steps to edit the contents of an automation rule. You can edit one or more rules with a single request. For instructions on editing rule order, see Editing automation rule order.

Console

To edit automation rules (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Select the rule that you want to edit. Choose **Action** and **Edit**.
4. Change the rule as desired, and choose **Save changes**.

API

To edit automation rules (API)

1. Run `BatchUpdateAutomationRules` from the Security Hub CSPM administrator account.
2. For the `RuleArn` parameter, provide the ARN of the rule(s) that you want to edit.
3. Provide the new values for the parameters that you want to edit. You can edit any parameter except `RuleArn`.

The following example updates the specified automation rule. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub batch-update-automation-rules \
--update-automation-rules-request-items '[
    {
      "Actions": [{
        "Type": "FINDING_FIELDS_UPDATE",
        "FindingFieldsUpdate": {
          "Note": {
            "Text": "Known issue that is a risk",
            "UpdatedBy": "sechub-automation"
          },
          "Workflow": {
            "Status": "NEW"
          }
        }
      }],
      "Criteria": {
        "SeverityLabel": [{
         "Value": "LOW",
         "Comparison": "EQUALS"
        }]
      },
      "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-
rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "RuleOrder": 14,
      "RuleStatus": "DISABLED",
    }
  ]' \
--region us-east-1
```

Editing automation rule order

An automation rule can be used to automatically update findings in AWS Security Hub CSPM. For background information about how automation rules work, see Understanding automation rules in Security Hub CSPM.

After creating an automation rule, the delegated Security Hub CSPM administrator can edit the rule.

If you want to keep the rule criteria and actions the same, but change the order in which Security Hub CSPM applies an automation rule, you can edit just the rule order. Choose your preferred method, and follow the steps to edit rule order.

For instructions on editing the criteria or actions of an automation rule, see Editing automation rules.

Console

To edit automation rule order (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Select the rule whose order you want to change. Choose **Edit priority**.
4. Choose **Move up** to increase the rule's priority by one unit. Choose **Move down** to decrease the rule priority's by one unit. Choose **Move to top** to assign the rule an order of **1** (this gives the rule precedence over other existing rules).

> **Note**
>
> When you create a rule in the Security Hub CSPM console, Security Hub CSPM automatically assigns rule order based on the order of rule creation. The most recently created rule has the lowest numerical value for rule order and therefore applies first.

API

To edit automation rule order (API)

1. Use the `BatchUpdateAutomationRules` operation from the Security Hub CSPM administrator account.
2. For the `RuleArn` parameter, provide the ARN of the rule(s) whose order you want to edit.
3. Modify the value of the `RuleOrder` field.

> **Note**
>
> If multiple rules have the same `RuleOrder`, Security Hub CSPM applies a rule with an earlier value for the `UpdatedAt` field first (that is, the rule which was most recently edited applies last).

Deleting or disabling automation rules

An automation rule can be used to automatically update findings in AWS Security Hub CSPM. For background information about how automation rules work, see Understanding automation rules in Security Hub CSPM.

When you delete an automation rule, Security Hub CSPM removes it from your account and no longer applies the rule to findings. As an alternative to deletion, you can *disable* a rule. This retains the rule for future use, but Security Hub CSPM won't apply the rule to any matching findings until you enable it.

Choose your preferred method, and follow the steps to delete an automation rule. You can delete one or more rules in a single request.

Console

To delete or disable automation rules (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Automations**.
3. Select the rule(s) that you want to delete. Choose **Action** and **Delete** (to retain a rule, but disable it temporarily, choose **Disable**).
4. Confirm your choice, and choose **Delete**.

API

To delete or disable automation rules (API)

1. Use the `BatchDeleteAutomationRules` operation from the Security Hub CSPM administrator account.

2. For the `AutomationRulesArns` parameter, provide the ARN of the rule(s) that you want to delete (to retain a rule, but disable it temporarily, provide `DISABLED` for the `RuleStatus` parameter).

The following example deletes the specified automation rule. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub batch-delete-automation-rules \
--automation-rules-arns '["arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]' \
--region us-east-1
```

Examples of automation rules

This section provides examples of automation rules for common Security Hub CSPM use cases. These examples correspond to rule templates that are available on the Security Hub CSPM console.

Elevate severity to Critical when specific resource such as an S3 bucket is at risk

In this example, the rule criteria are matched when the `ResourceId` in a finding is a specific Amazon Simple Storage Service (Amazon S3) bucket. The rule action is to change the severity of matched findings to `CRITICAL`. You can modify this template to apply to other resources.

Example API request:

```
{
    "IsTerminal": true,
    "RuleName": "Elevate severity of findings that relate to important resources",
    "RuleOrder": 1,
    "RuleStatus": "ENABLED",
    "Description": "Elevate finding severity to CRITICAL when specific resource such as
 an S3 bucket is at risk",
    "Criteria": {
        "ProductName": [{
            "Value": "Security Hub CSPM",
            "Comparison": "EQUALS"
        }],
        "ComplianceStatus": [{
            "Value": "FAILED",
```

```
            "Comparison": "EQUALS"
        }],
        "RecordState": [{
            "Value": "ACTIVE",
            "Comparison": "EQUALS"
        }],
        "WorkflowStatus": [{
            "Value": "NEW",
            "Comparison": "EQUALS"
        }],
        "ResourceId": [{
            "Value": "arn:aws:s3:::amzn-s3-demo-bucket/developers/design_info.doc",
            "Comparison": "EQUALS"
        }]
    },
    "Actions": [{
        "Type": "FINDING_FIELDS_UPDATE",
        "FindingFieldsUpdate": {
            "Severity": {
                "Label": "CRITICAL"
            },
            "Note": {
                "Text": "This is a critical resource. Please review ASAP.",
                "UpdatedBy": "sechub-automation"
            }
        }
    }]
}
```

Example CLI command:

```
$
aws securityhub create-automation-rule \
--is-terminal \
--rule-name "Elevate severity of findings that relate to important resources" \
--rule-order 1 \
--rule-status "ENABLED" \

--description "Elevate finding severity to CRITICAL when specific resource such as an
 S3 bucket is at risk" \
--criteria '{
"ProductName": [{
"Value": "Security Hub CSPM",
```

```
"Comparison": "EQUALS"
}],
"ComplianceStatus": [{
"Value": "FAILED",
"Comparison": "EQUALS"
}],
"RecordState": [{
"Value": "ACTIVE",
"Comparison": "EQUALS"
}],
"WorkflowStatus": [{
"Value": "NEW",
"Comparison": "EQUALS"
}],
"ResourceId": [{
"Value": "arn:aws:s3:::amzn-s3-demo-bucket/developers/design_info.doc",
"Comparison": "EQUALS"
}]
}' \
--actions '[{
"Type": "FINDING_FIELDS_UPDATE",
"FindingFieldsUpdate": {
"Severity": {
"Label": "CRITICAL"
},
"Note": {
"Text": "This is a critical resource. Please review ASAP.",
"UpdatedBy": "sechub-automation"
}
}
}]' \
--region us-east-1
```

Elevate severity of findings that relate to resources in production accounts

In this example, the rule criteria are matched when a `HIGH` severity finding is generated in specific production accounts. The rule action is to change the severity of matched findings to `CRITICAL`.

Example API request:

```
{
    "IsTerminal": false,
    "RuleName": "Elevate severity for production accounts",
```

```
    "RuleOrder": 1,
    "RuleStatus": "ENABLED",
    "Description": "Elevate finding severity from HIGH to CRITICAL for findings that
relate to resources in specific production accounts",
    "Criteria": {
        "ProductName": [{
            "Value": "Security Hub CSPM",
            "Comparison": "EQUALS"
        }],
        "ComplianceStatus": [{
            "Value": "FAILED",
            "Comparison": "EQUALS"
        }],
        "RecordState": [{
            "Value": "ACTIVE",
            "Comparison": "EQUALS"
        }],
        "WorkflowStatus": [{
            "Value": "NEW",
            "Comparison": "EQUALS"
        }],
        "SeverityLabel": [{
            "Value": "HIGH",
            "Comparison": "EQUALS"
        }],
        "AwsAccountId": [
        {
            "Value": "111122223333",
            "Comparison": "EQUALS"
        },
        {
            "Value": "123456789012",
            "Comparison": "EQUALS"
        }]
    },
    "Actions": [{
        "Type": "FINDING_FIELDS_UPDATE",
        "FindingFieldsUpdate": {
            "Severity": {
                "Label": "CRITICAL"
            },
            "Note": {
                "Text": "A resource in production accounts is at risk. Please review
ASAP.",
```

```
                "UpdatedBy": "sechub-automation"
            }
        }
    }]
}
```

Example CLI command:

```
aws securityhub create-automation-rule \
--no-is-terminal \
--rule-name "Elevate severity of findings that relate to resources in production
 accounts" \
--rule-order 1 \
--rule-status "ENABLED" \
--description "Elevate finding severity from HIGH to CRITICAL for findings that relate
 to resources in specific production accounts" \
--criteria '{
"ProductName": [{
"Value": "Security Hub CSPM",
"Comparison": "EQUALS"
}],
"ComplianceStatus": [{
"Value": "FAILED",
"Comparison": "EQUALS"
}],
"RecordState": [{
"Value": "ACTIVE",
"Comparison": "EQUALS"
}],
"SeverityLabel": [{
"Value": "HIGH",
"Comparison": "EQUALS"
}],
"AwsAccountId": [
{
"Value": "111122223333",
"Comparison": "EQUALS"
},
{
"Value": "123456789012",
"Comparison": "EQUALS"
}]
```

```
}' \
--actions '[{
"Type": "FINDING_FIELDS_UPDATE",
"FindingFieldsUpdate": {
"Severity": {
"Label": "CRITICAL"
},
"Note": {
"Text": "A resource in production accounts is at risk. Please review ASAP.",
"UpdatedBy": "sechub-automation"
}
}
}]' \
--region us-east-1
```

Suppress informational findings

In this example, the rule criteria are matched for `INFORMATIONAL` severity findings sent to Security Hub CSPM from Amazon GuardDuty. The rule action is to change the workflow status of matched findings to SUPPRESSED.

Example API request:

```
{
    "IsTerminal": false,
    "RuleName": "Suppress informational findings",
    "RuleOrder": 1,
    "RuleStatus": "ENABLED",
    "Description": "Suppress GuardDuty findings with INFORMATIONAL severity",
    "Criteria": {
        "ProductName": [{
            "Value": "GuardDuty",
            "Comparison": "EQUALS"
        }],
        "RecordState": [{
            "Value": "ACTIVE",
            "Comparison": "EQUALS"
        }],
        "WorkflowStatus": [{
            "Value": "NEW",
            "Comparison": "EQUALS"
        }],
        "SeverityLabel": [{
```

```
            "Value": "INFORMATIONAL",
            "Comparison": "EQUALS"
        }]
    },
    "Actions": [{
        "Type": "FINDING_FIELDS_UPDATE",
        "FindingFieldsUpdate": {
            "Workflow": {
                "Status": "SUPPRESSED"
            },
            "Note": {
                "Text": "Automatically suppress GuardDuty findings with INFORMATIONAL
 severity",
                "UpdatedBy": "sechub-automation"
            }
        }
    }]
}
```

Example CLI command:

```
aws securityhub create-automation-rule \
--no-is-terminal \
--rule-name "Suppress informational findings" \
--rule-order 1 \
--rule-status "ENABLED" \
--description "Suppress GuardDuty findings with INFORMATIONAL severity" \
--criteria '{
"ProductName": [{
"Value": "GuardDuty",
"Comparison": "EQUALS"
}],
"ComplianceStatus": [{
"Value": "FAILED",
"Comparison": "EQUALS"
}],
"RecordState": [{
"Value": "ACTIVE",
"Comparison": "EQUALS"
}],
"WorkflowStatus": [{
"Value": "NEW",
```

```
"Comparison": "EQUALS"
}],
"SeverityLabel": [{
"Value": "INFORMATIONAL",
"Comparison": "EQUALS"
}]
}' \
--actions '[{
"Type": "FINDING_FIELDS_UPDATE",
"FindingFieldsUpdate": {
"Workflow": {
"Status": "SUPPRESSED"
},
"Note": {
"Text": "Automatically suppress GuardDuty findings with INFORMATIONAL severity",
"UpdatedBy": "sechub-automation"
}
}
}]' \
--region us-east-1
```

Using EventBridge for automated response and remediation

By creating rules in Amazon EventBridge, you can respond automatically to AWS Security Hub CSPM findings. Security Hub CSPM sends findings as *events* to EventBridge in near-real time. You can write simple rules to indicate which events you are interested in and what automated actions to take when an event matches a rule. The actions that can be automatically triggered include the following:

- Invoking an AWS Lambda function
- Invoking the Amazon EC2 run command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an AWS Step Functions state machine
- Notifying an Amazon SNS topic or an Amazon SQS queue
- Sending a finding to a third-party ticketing, chat, SIEM, or incident response and management tool

Security Hub CSPM automatically sends all new findings and all updates to existing findings to EventBridge as EventBridge events. You can also create custom actions that allow you to send selected findings and insight results to EventBridge.

You then configure EventBridge rules to respond to each type of event.

For more information about using EventBridge, see the *Amazon EventBridge User Guide*.

> **Note**
>
> As a best practice, make sure that the permissions granted to your users to access EventBridge use least-privilege AWS Identity and Access Management (IAM) policies that grant only the required permissions.
> For more information, see Identity and access management in Amazon EventBridge.

A set of templates for cross-account automated response and remediation is also available in AWS Solutions. The templates leverage EventBridge event rules and Lambda functions. You deploy the solution using CloudFormation and AWS Systems Manager. The solution can create fully automated response and remediation actions. It can also use Security Hub CSPM custom actions to create user-triggered response and remediation actions. For details on how to configure and use the solution, see the Automated Security Response on AWS solution page.

Topics

- Security Hub CSPM event types in EventBridge
- EventBridge event formats for Security Hub CSPM
- Configuring an EventBridge rule for Security Hub CSPM findings
- Using custom actions to send findings and insight results to EventBridge

Security Hub CSPM event types in EventBridge

Security Hub CSPM uses the following Amazon EventBridge event types to integrate with EventBridge.

On the EventBridge dashboard for Security Hub CSPM, **All Events** includes all of these event types.

All findings (Security Hub Findings - Imported)

Security Hub CSPM automatically sends all new findings and all updates to existing findings to EventBridge as **Security Hub Findings - Imported** events. Each **Security Hub Findings - Imported** event contains a single finding.

Every `BatchImportFindings` and `BatchUpdateFindings` request triggers a **Security Hub Findings - Imported** event.

For administrator accounts, the event feed in EventBridge includes events for findings from both their account and from their member accounts.

In an aggregation Region, the event feed includes events for findings from the aggregation Region and the linked Regions. Cross-Region findings are included in the event feed in near real time. For information on how to configure finding aggregation, see the section called "Aggregating data across Regions".

You can define rules in EventBridge that automatically route findings to a remediation workflow, third-party tool, or other supported EventBridge target. The rules can include filters that only apply the rule if the finding has specific attribute values.

You use this method to automatically send all findings, or all findings that have specific characteristics, to a response or remediation workflow.

See the section called "Configuring an EventBridge rule".

Findings for custom actions (Security Hub Findings - Custom Action)

Security Hub CSPM also sends findings that are associated with custom actions to EventBridge as **Security Hub Findings - Custom Action** events.

This is useful for analysts working with the Security Hub CSPM console who want to send a specific finding, or a small set of findings, to a response or remediation workflow. You can select a custom action for up to 20 findings at a time. Each finding is sent to EventBridge as a separate EventBridge event.

When you create a custom action, you assign it a custom action ID. You can use this ID to create an EventBridge rule that takes a specified action after receiving a finding that is associated with that custom action ID.

See the section called "Configuring and using custom actions".

For example, you can create a custom action in Security Hub CSPM called `send_to_ticketing`. Then in EventBridge, you create a rule that is triggered when EventBridge receives a finding that includes the `send_to_ticketing` custom action ID. The rule includes logic to send the finding to your ticketing system. You can then select findings within Security Hub CSPM and use the custom action in Security Hub CSPM to manually send findings to your ticketing system.

For examples of how to send Security Hub CSPM findings to EventBridge for further processing, see How to Integrate AWS Security Hub CSPM Custom Actions with PagerDuty and How to Enable Custom Actions in AWS Security Hub CSPM on the AWS Partner Network (APN) Blog.

Insight results for custom actions (Security Hub Insight Results)

You can also use custom actions to send sets of insight results to EventBridge as **Security Hub Insight Results** events. Insight results are the resources that match an insight. Note that when you send insight results to EventBridge, you are not sending the findings to EventBridge. You are only sending the resource identifiers that are associated with the insight results. You can send up to 100 resource identifiers at a time.

Similar to custom actions for findings, you first create the custom action in Security Hub CSPM, and then create a rule in EventBridge.

See the section called “Configuring and using custom actions”.

For example, suppose you see a particular insight result of interest that you want to share with a colleague. In that case, you can use a custom action to send that insight result to the colleague through a chat or ticketing system.

EventBridge event formats for Security Hub CSPM

The **Security Hub Findings - Imported**, **Security Findings - Custom Action**, and **Security Hub Insight Results** event types use the following event formats.

The event format is the format that is used when Security Hub CSPM sends an event to EventBridge.

Security Hub Findings - Imported

Security Hub Findings - Imported events that are sent from Security Hub CSPM to EventBridge use the following format.

```
{
   "version":"0",
   "id":"CWE-event-id",
   "detail-type":"Security Hub Findings - Imported",
   "source":"aws.securityhub",
   "account":"111122223333",
   "time":"2019-04-11T21:52:17Z",
   "region":"us-west-2",
   "resources":[
      "arn:aws:securityhub:us-west-2::product/aws/macie/arn:aws:macie:us-
west-2:111122223333:integtest/trigger/6294d71b927c41cbab915159a8f326a3/alert/
f2893b211841"
   ],
   "detail":{
      "findings": [{
         <finding content>
       }]
   }
}
```

<finding content> is the content, in JSON format, of the finding that is sent by the event. Each event sends a single finding.

For a complete list of finding attributes, see AWS Security Finding Format (ASFF).

For information about how to configure EventBridge rules that are triggered by these events, see the section called "Configuring an EventBridge rule".

Security Hub Findings - Custom Action

Security Hub Findings - Custom Action events that are sent from Security Hub CSPM to EventBridge use the following format. Each finding is sent in a separate event.

```
{
  "version": "0",
  "id": "1a1111a1-b22b-3c33-444d-5555e5ee5555",
  "detail-type": "Security Hub Findings - Custom Action",
  "source": "aws.securityhub",
  "account": "111122223333",
  "time": "2019-04-11T18:43:48Z",
  "region": "us-west-1",
  "resources": [
```

```
    "arn:aws:securityhub:us-west-1:111122223333:action/custom/custom-action-name"
  ],
  "detail": {
    "actionName":"custom-action-name",
    "actionDescription": "description of the action",
    "findings": [
      {
        <finding content>
      }
    ]
  }
}
```

<finding content> is the content, in JSON format, of the finding that is sent by the event. Each event sends a single finding.

For a complete list of finding attributes, see AWS Security Finding Format (ASFF).

For information about how to configure EventBridge rules that are triggered by these events, see the section called "Configuring and using custom actions".

Security Hub Insight Results

Security Hub Insight Results events that are sent from Security Hub CSPM to EventBridge use the following format.

```
{
  "version": "0",
  "id": "1a1111a1-b22b-3c33-444d-5555e5ee5555",
  "detail-type": "Security Hub Insight Results",
  "source": "aws.securityhub",
  "account": "111122223333",
  "time": "2017-12-22T18:43:48Z",
  "region": "us-west-1",
  "resources": [
      "arn:aws:securityhub:us-west-1:111122223333::product/aws/macie:us-
west-1:222233334444:test/trigger/1ec9cf700ef6be062b19584e0b7d84ec/alert/f2893b211841"
  ],
  "detail": {
    "actionName":"name of the action",
    "actionDescription":"description of the action",
    "insightArn":"ARN of the insight",
    "insightName":"Name of the insight",
```

```
    "resultType":"ResourceAwsIamAccessKeyUserName",
    "number of results":"number of results, max of 100",
    "insightResults": [
        {"result 1": 5},
        {"result 2": 6}
    ]
  }
}
```

For information about how to create an EventBridge rule that is triggered by these events, see the section called “Configuring and using custom actions”.

Configuring an EventBridge rule for Security Hub CSPM findings

You can create a rule in Amazon EventBridge that defines an action to take when a **Security Hub Findings - Imported** event is received. **Security Hub Findings - Imported** events are triggered by updates from both the `BatchImportFindings` and `BatchUpdateFindings` operations.

Each rule contains an event pattern, which identifies the events that trigger the rule. The event pattern always contains the event source (`aws.securityhub`) and the event type (**Security Hub Findings - Imported**). The event pattern can also specify filters to identify the findings that the rule applies to.

The event rule then identifies the rule targets. The targets are the actions to take when EventBridge receives a **Security Hub Findings - Imported** event and the finding matches the filters.

The instructions provided here use the EventBridge console. When you use the console, EventBridge automatically creates the required resource-based policy that enables EventBridge to write to Amazon CloudWatch Logs.

You can also use the `PutRule` operation of the EventBridge API. However, if you use the EventBridge API, then you must create the resource-based policy. For information about the required policy, see CloudWatch Logs permissions in the *Amazon EventBridge User Guide*.

Format of the event pattern

The format of the event pattern for **Security Hub Findings - Imported** events is as follows:

```
{
  "source": [
```

```
    "aws.securityhub"
  ],
  "detail-type": [
    "Security Hub Findings - Imported"
  ],
  "detail": {
    "findings": {
      <attribute filter values>
    }
  }
}
```

- `source` identifies Security Hub CSPM as the service that generates the event.
- `detail-type` identifies the type of event.
- `detail` is optional and provides the filter values for the event pattern. If the event pattern does not contain a `detail` field, then all findings trigger the rule.

You can filter the findings based on any finding attribute. For each attribute, you provide a comma-separated array of one or more values.

```
"<attribute name>": [ "<value1>", "<value2>"]
```

If you provide more than one value for an attribute, then those values are joined by `OR`. A finding matches the filter for an individual attribute if the finding has any of the listed values. For example, if you provide both `INFORMATIONAL` and `LOW` as values for `Severity.Label`, then the finding matches if it has a severity label of either `INFORMATIONAL` or `LOW`.

The attributes are joined by `AND`. A finding matches if it matches the filter criteria for all of the provided attributes.

When you provide an attribute value, it must reflect the location of that attribute within the AWS Security Finding Format (ASFF) structure.

Tip

When filtering control findings, we recommend using the `SecurityControlId` or `SecurityControlArn` ASFF fields as filters, rather than `Title` or `Description`. The latter fields can change occasionally, whereas the control ID and ARN are static identifiers.

In the following example, the event pattern provides filter values for `ProductArn` and `Severity.Label`, so a finding matches if it is generated by Amazon Inspector and it has a severity label of either `INFORMATIONAL` or `LOW`.

```
{
    "source": [
        "aws.securityhub"
     ],
    "detail-type": [
        "Security Hub Findings - Imported"
    ],
    "detail": {
        "findings": {
            "ProductArn": ["arn:aws:securityhub:us-east-1::product/aws/inspector"],
            "Severity": {
                "Label": ["INFORMATIONAL", "LOW"]
            }
        }
    }
}
```

Creating an event rule

You can use a predefined event pattern or a custom event pattern to create a rule in EventBridge. If you select a predefined pattern, EventBridge automatically fills in `source` and `detail-type`. EventBridge also provides fields to specify filter values for the following finding attributes:

- `AwsAccountId`
- `Compliance.Status`
- `Criticality`
- `ProductArn`
- `RecordState`
- `ResourceId`
- `ResourceType`
- `Severity.Label`
- `Types`
- `Workflow.Status`

To create an EventBridge rule (console)

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. Using the following values, create an EventBridge rule that monitors finding events:

   - For **Rule type**, choose **Rule with an event pattern**.
   - Choose how to build the event pattern.

To build the event pattern with...	Do this...	
A template	In the **Event pattern** section, choose the following options: • For **Event source**, choose **AWS services**. • For **AWS service**, choose **Security Hub**. • For **Event type**, choose **Security Hub Findings - Imported**. • (Optional) To make the rule more specific, add filter values. For example, to limit the rule to findings with active record states, for **Specific Record state(s)**, choose **Active**.	
A custom event pattern (Use a custom pattern if you want to filter findings based on attributes that do	• In the **Event pattern** section, choose **Custom patterns (JSON editor)**, and then paste the following event pattern into the text area:	

To build the event pattern with...	Do this...	

not appear in the EventBridge console.)	<pre>{
	  "source": [
	    "aws.securityhub"
	  ],
	  "detail-type": [
	    "Security Hub Findings - Imported"
	  ],
	  "detail": {
	    "findings": {
	      "<attribute name> ": ["<value1>", "<value2>"]
	    }
	  }
	}</pre> • Update the event pattern to include the attribute and attribute values that you want to use as a filter.
	
	For example, to apply the rule to findings that have a verification state of `TRUE_POSITIVE` , use the following pattern example:
	
	<pre>{
	  "source": [
	    "aws.securityhub"</pre>	

To build the event pattern with...	Do this...

	``
	  ],
	  "detail-type": [
	  "Security
	 Hub Findings -
	 Imported"
	  ],
	  "detail": {
	  "findings": {
	  "Verifica
	tionState":
	 ["TRUE_POSITIVE"]
	  }
	  }
	}
	``

- For **Target types**, choose **AWS service**, and for **Select a target**, choose a target such as an Amazon SNS topic or AWS Lambda function. The target is triggered when an event is received that matches the event pattern defined in the rule.

For details about creating rules, see Creating Amazon EventBridge rules that react to events in the *Amazon EventBridge User Guide*.

Using custom actions to send findings and insight results to EventBridge

To use AWS Security Hub CSPM custom actions to send findings or insight results to Amazon EventBridge, you first create the custom action in Security Hub CSPM. Then, you can define rules in EventBridge that apply to your custom actions.

You can create up to 50 custom actions.

If you enable cross-Region aggregation, and manage findings from the aggregation Region, then create custom actions in the aggregation Region.

The rule in EventBridge uses the Amazon Resource Name (ARN) from the custom action.

Creating a custom action

When you create a custom action in AWS Security Hub CSPM, you specify its name, description, and a unique identifier.

A custom action specifies which actions to take when an EventBridge event matches an EventBridge rule. Security Hub CSPM sends each finding to EventBridge as an event.

Choose your preferred method, and follow the steps to create a custom action.

Console

To create a custom action in Security Hub CSPM (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Settings** and then choose **Custom actions**.
3. Choose **Create custom action**.
4. Provide a **Name**, **Description**, and **Custom action ID** for the action.

   The **Name** must be fewer than 20 characters.

   The **Custom action ID** must be unique for each AWS account.
5. Choose **Create custom action**.
6. Make a note of the **Custom action ARN**. You need to use the ARN when you create a rule to associate with this action in EventBridge.

API

To create a custom action (API)

Use the CreateActionTarget operation. If you're using the AWS CLI, run the create-action-target command.

The following example creates a custom action to send findings to a remediation tool. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub create-action-target --name "Send to remediation" --description
 "Action to send the finding for remediation tracking" --id "Remediation"
```

Defining a rule in EventBridge

To trigger a custom action in Amazon EventBridge, you must create a corresponding rule in EventBridge. The rule definition includes the Amazon Resource Name (ARN) of the custom action.

The event pattern for a **Security Hub Findings - Custom Action** event has the following format:

```
{
  "source": [
    "aws.securityhub"
  ],
  "detail-type": [
    "Security Hub Findings - Custom Action"
  ],
  "resources": [ "<custom action ARN>" ]
}
```

The event pattern for a **Security Hub Insight Results** event has the following format:

```
{
  "source": [
    "aws.securityhub"
  ],
  "detail-type": [
    "Security Hub Insight Results"
  ],
  "resources": [ "<custom action ARN>" ]
}
```

In both patterns, *<custom action ARN>* is the ARN of a custom action. You can configure a rule that applies to more than one custom action.

The instructions provided here are for the EventBridge console. When you use the console, EventBridge automatically creates the required resource-based policy that enables EventBridge to write to CloudWatch Logs.

You can also use the `PutRule` API operation of the EventBridge API. However, if you use the EventBridge API, then you must create the resource-based policy. For details on the required policy, see CloudWatch Logs permissions in the *Amazon EventBridge User Guide*.

To define a rule in EventBridge (EventBridge console)

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. In the navigation pane, choose **Rules**.
3. Choose **Create rule**.
4. Enter a name and description for the rule.
5. For **Event bus**, choose the event bus that you want to associate with this rule. If you want this rule to match events that come from your account, select **default**. When an AWS service in your account emits an event, it always goes to your account's default event bus.
6. For **Rule type**, choose **Rule with an event pattern**.
7. Choose **Next**.
8. For **Event source**, choose **AWS events**.
9. For **Event pattern**, choose **Event pattern form**.
10. For **Event source**, choose **AWS services**.
11. For **AWS service**, choose **Security Hub**.
12. For **Event type**, do one of the following:

    - To create a rule to apply when you send findings to a custom action, choose **Security Hub Findings - Custom Action**.
    - To create a rule to apply when you send insight results to a custom action, choose **Security Hub Insight Results**.
13. Choose **Specific custom action ARNs**, add a custom action ARN.

    If the rule applies to multiple custom actions, choose **Add** to add more custom action ARNs.
14. Choose **Next**.
15. Under **Select targets**, choose and configure the target to invoke when this rule is matched.
16. Choose **Next**.
17. (Optional) Enter one or more tags for the rule. For more information, see Amazon EventBridge tags in the *Amazon EventBridge User Guide*.
18. Choose **Next**.
19. Review the details of the rule and choose **Create rule**.

    When you perform a custom action on findings or insight results in your account, events are generated in EventBridge.

Selecting a custom action for findings and insight results

After you create AWS Security Hub CSPM custom actions and Amazon EventBridge rules, you can send findings and insight results to EventBridge for automatic management and processing.

Events are sent to EventBridge only in the account in which they are viewed. If you view a finding using an administrator account, the event is sent to EventBridge in the administrator account.

For AWS API calls to be effective, the implementations of target code must switch roles into member accounts. This also means that the role you switch into must be deployed to each member where action is needed.

To send findings to EventBridge (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Display a list of findings:
   - From **Findings**, you can view findings from all of the enabled product integrations and controls.
   - From **Security standards**, you can navigate to a list of findings generated from a specific control. For more information, see Reviewing the details of controls in Security Hub CSPM.
   - From **Integrations**, you can navigate to a list of findings generated by an enabled integration. For more information, see Viewing findings from a Security Hub CSPM integration.
   - From **Insights**, you can navigate to a list of findings for an insight result. For more information, see Reviewing and acting on insights in Security Hub CSPM.
3. Select the findings to send to EventBridge. You can select up to 20 findings at a time.
4. From **Actions**, choose the custom action that aligns with the EventBridge rule to apply.

   Security Hub CSPM sends a separate **Security Hub Findings - Custom Action** event for each finding.

To send insight results to EventBridge (console)

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Insights**.
3. On the **Insights** page, choose the insight that includes the results to send to EventBridge.

4. Select the insight results to send to EventBridge. You can select up to 20 results at a time.
5. From **Actions**, choose the custom action that aligns with the EventBridge rule to apply.

Working with the dashboard in Security Hub CSPM

On the Security Hub CSPM console, the **Summary** dashboard shows a summary of your risks, attack sequences, and security coverage. This dashboard helps you identify risks and attack sequences based on severity and account coverage for different security capabilities. Each time you open the dashboard, it refreshes automatically. Note, however, that security scores and control statuses refresh every 24 hours.

You can customize the **Summary** dashboard by adding and removing different security widgets from it. You can also specify filter criteria to retrieve and display particular types of data. If you customize the dashboard, Security Hub saves your customization settings. If other users of your account customize the dashboard, their changes are saved independently from your customization settings.

If you configured cross-Region aggregation in Security Hub CSPM, the **Summary** dashboard shows your aggregated data. If your account is the delegated administrator account for an organization, the data includes findings for your account and your member accounts. If your account is a member account or a standalone account, the data includes findings only for your account.

Topics

- Available widgets for the Summary dashboard
- Filtering the Summary dashboard in Security Hub CSPM
- Customizing the Summary dashboard in Security Hub CSPM

Available widgets for the Summary dashboard

The **Summary** dashboard includes widgets that reflect the modern cloud security threat landscape, guided by the security operations and experiences of AWS customers. Some widgets are shown by default while others are not. You can customize your view of the dashboard by adding or removing widgets.

To add a widget, choose **Add widget** at the top of the dashboard. You can then browse the list of available widgets or enter the title of a widget in the search bar. When you find the widget to add,

drag it to the location where you want it to appear on the dashboard. For more information, see Customizing the dashboard.

Widgets shown by default

By default, the **Summary** dashboard includes the following widgets.

Top threat sequences

Displays the highest severity threat sequences. Threat sequence findings, known as *attack sequence findings* in Amazon GuardDuty, correlate multiple events to identify potential threats to your AWS environment. Threat sequences may include in-progress or recent attack behaviors (within a 24-hour time window) in your environment, which may in turn lead to further compromise. You must have GuardDuty and GuardDuty S3 Protection enabled to receive threat sequence findings in Security Hub CSPM.

Top risks

Displays a summary of the top risks in your environment. The top of the widget shows you the count of risks at each severity level. You can choose a severity level to go to the **Risks** page with risks filtered to the selected severity level. Risks that have the most occurrences in your environment appear first. This widget helps you prioritize which risks to mitigate.

Security coverage

Summarizes the extent of your security coverage, based on coverage control findings. Coverage controls check whether a specific AWS service and its capabilities are enabled (for example, [Macie.1] Amazon Macie should be enabled). This widget helps you ensure that you have PASSED findings for coverage controls. The Security Hub CSPM console provides links from this widget to help you enable missing security capabilities. We recommend using central configuration to enable missing security capabilities across multiple AWS accounts and AWS Regions. For more information, see Understanding central configuration in Security Hub CSPM.

Security standards

Displays your most recent summary security score and the security score for each Security Hub CSPM standard. Security scores, which range from 0–100 percent, represent the proportion of passed controls relative to all of your enabled controls. For more information about these scores, see Method of calculating security scores. This widget helps you understand your overall security posture.

Assets with the most findings

Provides an overview of the resources, accounts, and applications that have the most findings. The list is sorted in descending order by the number of findings. In the widget, each tab shows the top six items in that category, grouped by severity and resource type. If you choose a number in the **Total findings** column, Security Hub CSPM opens a page that shows the findings for the asset. This widget helps you quickly identify which of your core assets have potential security threats.

Findings by Region

Shows the total number of findings, grouped by severity, in each AWS Region in which Security Hub CSPM is enabled. This widget helps you identify security issues that potentially affect particular Regions. If you open the dashboard in your aggregation Region, this widget helps you monitor potential security issues in each linked Region.

Most common threat types

Provides a breakdown of the 10 most common types of threats in your AWS environment. This includes threats such as escalation of privileges, use of exposed credentials, or communication with malicious IP addresses.

To view this data, Amazon GuardDuty must be enabled. If it is, choose a threat type in this widget to open the GuardDuty console and review findings related to this threat. This widget helps you evaluate potential threats in the context of other security issues.

Software vulnerabilities with exploits

Provides a summary of software vulnerabilities that exist in your AWS environment and have known exploits. You can also review a breakdown of vulnerabilities that do and don't have fixes available.

To view this data, Amazon Inspector must be enabled. If it is, choose a statistic in this widget to open the Amazon Inspector console and review more details about the vulnerability. This widget helps you evaluate software vulnerabilities in the context of other security issues.

New findings over time

Shows trends in the number of new daily findings during the past 90 days. You can break down the data by severity or by provider for additional context. This widget helps you understand if finding volume spiked or dropped at specific times during the past 90 days.

Resources with the most findings

Provides a summary of the resources that have generated the most findings, broken down by the following resource types: Amazon Simple Storage Service (Amazon S3) buckets, Amazon Elastic Compute Cloud (Amazon EC2) instances, and AWS Lambda functions.

In the widget, each tab focuses on one of the preceding resource types, listing the 10 resource instances that generated the most findings. To review the findings for a specific resource, choose the resource instance. This widget helps you triage security findings that are associated with common AWS resources.

Widgets hidden by default

The following widgets are also available for the **Summary** dashboard, but they are hidden by default.

AMIs with the most findings

Provides a list of the 10 Amazon Machine Images (AMIs) that have generated the most findings. This data is available only if Amazon EC2 is enabled for your account. It helps you identify which AMIs pose potential security risks.

IAM principals with the most findings

Provides a list of the 10 AWS Identity and Access Management (IAM) users that have generated the most findings. This widget helps you perform administrative and billing tasks. It shows you which users contribute to Security Hub CSPM usage the most.

Accounts with the most findings (by severity)

Shows a graph of the 10 accounts that have generated the most findings, grouped by severity. This widget helps you determine which accounts to focus analysis and remediation efforts on.

Accounts with the most findings (by resource type)

Shows a graph of the 10 accounts that have generated the most findings, grouped by resource type. This widget helps you determine which accounts and resource types to prioritize for analysis and remediation.

Insights

Lists five Security Hub CSPM managed insights and the number of findings that they generated. Insights identify a specific security area that requires attention.

Latest findings from AWS integrations

Shows the number of findings that you received in Security Hub CSPM from integrated AWS services. It also shows when you most recently received findings from each integrated service. This widget provides consolidated findings data from multiple AWS services. To drill down, choose an integrated service. Security Hub CSPM then opens the console for that service.

Filtering the Summary dashboard in Security Hub CSPM

You can curate the **Summary** dashboard on the Security Hub CSPM console so that it includes only the security data that's most relevant to you. For example, if you're a member of an application team, you might create a dedicated view for a critical application in your production environment. If you're a member of a security team, you might create a dedicated view that helps you focus on high-severity findings.

To create these curated views, enter filter criteria in the filter box above the dashboard. If you apply filter criteria, the criteria apply to all the data and widgets on the dashboard, except the data in the **Insights** and **Security standards** widgets. For a list of available widgets on the dashboard, see Available widgets for the Summary dashboard.

You can filter the data by using the following fields:

- Account name
- Account ID
- Application ARN
- Application name
- Product name (for an AWS service or third-party product that sends findings to Security Hub CSPM)
- Record state
- Region
- Resource tag
- Severity
- Workflow status

By default, dashboard data is filtered using the following criteria: `Workflow.Status` is `NOTIFIED` or `NEW`, and `RecordState` is `ACTIVE`. These criteria appear above the dashboard, below the filter box. To remove these criteria, choose **X** in the filter token for the criteria that you want to remove.

If you apply filter criteria that you want to use again, you can save it as a *filter set*. A filter set is a set of filter criteria that you create and save to reapply when you review data on the **Summary** dashboard. You can create and save a filter set that uses any of the available fields except the following fields: Application ARN, application name, and resource tag.

Creating and saving filter sets

Follow these steps to create and save a filter set.

To create and save a filter set

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Summary**.
3. In the filter box above the **Summary** dashboard, enter the filter criteria for the filter set.
4. On the **Clear filters** menu, choose **Save new filter set**.
5. In the **Save filter set** dialog box, enter a name for the filter set.
6. (Optional) To use the filter set by default each time you open the **Summary** page, select the option to set it as the default view.
7. Choose **Save**.

To switch between filter sets that you've created and saved, use the **Choose a filter set** menu above the **Summary** dashboard. When you select a filter set, Security Hub CSPM applies the criteria of the filter set to the data on the dashboard.

Updating or deleting filter sets

Follow these steps to update or delete an existing filter set. If you delete a filter set that is currently set as your default view of the **Summary** dashboard, your default view is reset to the default Security Hub CSPM view.

To update or delete a filter set

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.

2. In the navigation pane, choose **Summary**.
3. In the **Choose a filter set** menu above the **Summary** page, choose the filter set.
4. On the **Clear filters** menu, do one of the following:

   - To update the filter set, choose **Update current filter set**. Then, enter your changes in the dialog box that appears.
   - To delete the filter set choose **Delete current filter set**. Then, choose **Delete** in the dialog box that appears.

Customizing the Summary dashboard in Security Hub CSPM

You can customize the **Summary** dashboard on the Security Hub CSPM console in several ways. For example, you can add and remove widgets from the dashboard. You can also rearrange and resize widgets on the dashboard. For a list of available widgets and a description of each one, see Available widgets for the Summary dashboard.

If you customize the dashboard, Security Hub CSPM applies your changes immediately and saves your new dashboard settings. Your changes apply to your view of the dashboard in all AWS Regions and browsers.

To customize the Summary dashboard

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, choose **Summary**.
3. Do any of the following:

   - To add a widget, choose **Add widgets** at the upper-right corner of the page. In the search bar, enter the title of the widget to add. Then, drag the widget to the location that you want.
   - To remove a widget, choose the three dots in the upper-right corner of the widget.
   - To move a widget, choose the handle at the upper-left corner of the widget, and then drag the widget to the location that you want.
   - To change the size of a widget, choose the resize handle at the lower-right corner of the widget. Drag the widget's edge until the widget is your preferred size.

To subsequently restore the original settings, choose **Reset to default layout** at the top of the page.

Regional limits for Security Hub CSPM

Some AWS Security Hub CSPM features are available in only certain AWS Regions. The following sections specify these Regional limits. For a complete list of all the Regions where Security Hub CSPM is currently available, see AWS Security Hub endpoints and quotas in the *AWS General Reference*.

Cross-Region aggregation restrictions

In AWS GovCloud (US) Regions, cross-Region aggregation is available for findings, finding updates, and insights across AWS GovCloud (US) Regions only. Specifically, you can aggregate findings, finding updates, and insights only between the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions.

In the China Regions, cross-Region aggregation is available for findings, finding updates, and insights across the China Regions only. Specifically, you can aggregate findings, finding updates, and insights only between the China (Beijing) and China (Ningxia) Regions.

You can't use a Region that's disabled by default as your aggregation Region. For a list of Regions that are disabled by default, see Enable or disable AWS Regions in your account in the *AWS Account Management Reference Guide*.

Availability of integrations by Region

Some integrations aren't available in all AWS Regions. On the Security Hub CSPM console, an integration doesn't appear on the **Integrations** page if it isn't available in the Region that you're currently signed in to.

Integrations supported in the China (Beijing) and China (Ningxia) Regions

In the China (Beijing) and China (Ningxia) Regions, Security Hub CSPM supports only the following integrations with AWS services:

- AWS Firewall Manager
- Amazon GuardDuty
- AWS Identity and Access Management Access Analyzer
- Amazon Inspector
- AWS IoT Device Defender

- AWS Systems Manager Explorer
- AWS Systems Manager OpsCenter
- AWS Systems Manager Patch Manager

In the China (Beijing) and China (Ningxia) Regions, Security Hub CSPM supports only the following third-party integrations:

- Cloud Custodian
- FireEye Helix
- Helecloud
- IBM QRadar
- PagerDuty
- Palo Alto Networks Cortex XSOAR
- Palo Alto Networks VM-Series
- Prowler
- RSA Archer
- Splunk Enterprise
- Splunk Phantom
- ThreatModeler

Integrations supported in the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions

In the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions, Security Hub CSPM supports only the following integrations with AWS services:

- AWS Config
- Amazon Detective
- AWS Firewall Manager
- Amazon GuardDuty
- AWS Health
- IAM Access Analyzer
- Amazon Inspector

- AWS IoT Device Defender

In the AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions, Security Hub CSPM supports only the following third-party integrations:

- Atlassian Jira Service Management
- Atlassian Jira Service Management Cloud
- Atlassian OpsGenie
- Caveonix Cloud
- Cloud Custodian
- Cloud Storage Security Antivirus for Amazon S3
- CrowdStrike Falcon
- FireEye Helix
- Forcepoint CASB
- Forcepoint DLP
- Forcepoint NGFW
- Fugue
- Kion
- MicroFocus ArcSight
- NETSCOUT Cyber Investigator
- PagerDuty
- Palo Alto Networks – Prisma Cloud Compute
- Palo Alto Networks – Prisma Cloud Enterprise
- Palo Alto Networks – VM-Series (available only in AWS GovCloud (US-West))
- Prowler
- Rackspace Technology – Cloud Native Security
- Rapid7 InsightConnect
- RSA Archer
- ServiceNow ITSM
- Slack
- ThreatModeler

- Vectra AI Cognito Detect

Availability of standards by Region

The AWS Control Tower service-managed standard is available only in AWS Regions that AWS Control Tower supports. For a list of Regions that AWS Control Tower currently supports, see How AWS Regions Work With AWS Control Tower in the *AWS Control Tower User Guide*.

The AWS Resource Tagging standard isn't available in the Asia Pacific (Taipei) Region.

Other security standards are available in all the Regions where Security Hub CSPM is currently available.

Availability of controls by Region

Some Security Hub CSPM controls aren't available in all AWS Regions. For a list of controls that aren't available in each Region, see Regional limits on Security Hub CSPM controls.

On the Security Hub CSPM console, a control doesn't appear in the list of controls if it isn't available in the Region that you're currently signed in to. The exception is an aggregation Region. If you set an aggregation Region and sign in to that Region, the console shows controls that are available in the aggregation Region or one or more linked Regions.

Regional limits on Security Hub CSPM controls

Some AWS Security Hub CSPM controls aren't available in all AWS Regions. This page specifies which controls aren't available in specific Regions.

On the Security Hub CSPM console, a control doesn't appear in the list of controls if it isn't available in the Region that you're currently signed in to. The exception is an aggregation Region. If you set an aggregation Region and sign in to that Region, the console shows controls that are available in the aggregation Region or one or more linked Regions.

AWS Regions

- US East (N. Virginia)
- US East (Ohio)
- US West (N. California)
- US West (Oregon)

- Africa (Cape Town)
- Asia Pacific (Hong Kong)
- Asia Pacific (Hyderabad)
- Asia Pacific (Jakarta)
- Asia Pacific (Malaysia)
- Asia Pacific (Melbourne)
- Asia Pacific (Mumbai)
- Asia Pacific (New Zealand)
- Asia Pacific (Osaka)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Taipei)
- Asia Pacific (Thailand)
- Asia Pacific (Tokyo)
- Canada (Central)
- Canada West (Calgary)
- China (Beijing)
- China (Ningxia)
- Europe (Frankfurt)
- Europe (Ireland)
- Europe (London)
- Europe (Milan)
- Europe (Paris)
- Europe (Spain)
- Europe (Stockholm)
- Europe (Zurich)
- Israel (Tel Aviv)
- Mexico (Central)
- Middle East (Bahrain)

- Middle East (UAE)
- South America (São Paulo)
- AWS GovCloud (US-East)
- AWS GovCloud (US-West)

US East (N. Virginia)

The following controls are not supported in the US East (N. Virginia) Region.

- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled

US East (Ohio)

The following controls are not supported in the US East (Ohio) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control

- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition

- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

US West (N. California)

The following controls are not supported in the US West (N. California) Region.

- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests

- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged

- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest

- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

US West (Oregon)

The following controls are not supported in the US West (Oregon) Region.

- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries

- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Africa (Cape Town)

The following controls are not supported in the Africa (Cape Town) Region.

- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured

- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period

- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [ECR.4] ECR public repositories should be tagged
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ES.3] Elasticsearch domains should encrypt data sent between nodes
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged

- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [RDS.1] RDS snapshot should be private
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled

- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (Hong Kong)

The following controls are not supported in the Asia Pacific (Hong Kong) Region.

- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode

- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged

- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged

- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Hyderabad)

The following controls are not supported in the Asia Pacific (Hyderabad) Region.

- [Account.2] AWS accounts should be part of an AWS Organizations organization

- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured

- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled

- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS

- [EFS.2] Amazon EFS volumes should be in backup plans
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support

- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged

- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes

- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances

- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.3] SES configuration sets should have TLS enabled for sending emails

- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Jakarta)

The following controls are not supported in the Asia Pacific (Jakarta) Region.

- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests

- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted

- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [ECR.4] ECR public repositories should be tagged
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled

- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged

- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled

- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Malaysia)

The following controls are not supported in the Asia Pacific (Malaysia) Region.

- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [Backup.1] AWS Backup recovery points should be encrypted at rest

- [Backup.2] AWS Backup recovery points should be tagged
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins

- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged

- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.4] ECR public repositories should be tagged
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.17] ECS task definitions should not use host network mode
- [EKS.2] EKS clusters should run on a supported Kubernetes version

- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [ES.9] Elasticsearch domains should be tagged
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment

- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.1] AWS Glue jobs should be tagged
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled

- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.4] Amazon MQ brokers should be tagged
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled

- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.31] RDS DB security groups should be tagged
- [RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit
- [RDS.39] RDS for MySQL DB instances should be encrypted in transit
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL

- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.7] S3 general purpose buckets should use cross-Region replication
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys

- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SQS.2] SQS queues should be tagged
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (Melbourne)

The following controls are not supported in the Asia Pacific (Melbourne) Region.

- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Batch.1] Batch job queues should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration

- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged

- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager

- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged

- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached

- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys

- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [RDS.1] RDS snapshot should be private
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs

- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers

- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.4] SSM documents should not be public
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest

- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Mumbai)

The following controls are not supported in the Asia Pacific (Mumbai) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged

- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (New Zealand)

The following controls are not supported in the Asia Pacific (New Zealand) Region.

- [ACM.1] Imported and ACM-issued certificates should be renewed after a specified time period
- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.1] API Gateway REST and WebSocket API execution logging should be enabled
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication
- [APIGateway.3] API Gateway REST API stages should have AWS X-Ray tracing enabled

- [APIGateway.4] API Gateway should be associated with a WAF Web ACL
- [APIGateway.5] API Gateway REST API cache data should be encrypted at rest
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.4] AWS AppSync GraphQL APIs should be tagged
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Athena.4] Athena workgroups should have logging enabled
- [AutoScaling.2] Amazon EC2 Auto Scaling group should cover multiple Availability Zones
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.6] Auto Scaling groups should use multiple instance types in multiple Availability Zones
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.2] AWS Backup recovery points should be tagged
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged

- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged

- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.1] DataSync tasks should have logging enabled

- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.6] DynamoDB tables should have deletion protection enabled
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used

- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.172] EC2 VPC Block Public Access settings should block internet gateway traffic
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [EC2.182] Block public access settings should be enabled for Amazon EBS snapshots
- [EC2.183] EC2 VPN connections should use IKEv2 protocol

- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [ECS.16] ECS task sets should not automatically assign public IP addresses
- [ECS.17] ECS task definitions should not use host network mode
- [ECS.18] ECS Task Definitions should use in-transit encryption for EFS volumes
- [ECS.19] ECS capacity providers should have managed termination protection enabled
- [ECS.20] ECS Task Definitions should configure non-root users in Linux container definitions
- [ECS.21] ECS Task Definitions should configure non-administrator users in Windows container definitions
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch
- [EFS.7] EFS file systems should have automatic backups enabled
- [EFS.8] EFS file systems should be encrypted at rest
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled

- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols
- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest

- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.3] Elasticsearch domains should encrypt data sent between nodes
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [ES.9] Elasticsearch domains should be tagged
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.1] AWS Glue jobs should be tagged
- [Glue.3] AWS Glue machine learning transforms should be encrypted at rest
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.1] GuardDuty should be enabled
- [GuardDuty.2] GuardDuty filters should be tagged
- [GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled
- [GuardDuty.6] GuardDuty Lambda Protection should be enabled
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.10] GuardDuty S3 Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled

- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled

- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [KMS.5] KMS keys should not be publicly accessible
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled

- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled

- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit
- [RDS.39] RDS for MySQL DB instances should be encrypted in transit
- [RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit

- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.1] Amazon Redshift clusters should prohibit public access
- [Redshift.3] Amazon Redshift clusters should have automatic snapshots enabled
- [Redshift.4] Amazon Redshift clusters should have audit logging enabled
- [Redshift.6] Amazon Redshift should have automatic upgrades to major versions enabled
- [Redshift.7] Redshift clusters should use enhanced VPC routing
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.11] Redshift clusters should be tagged
- [Redshift.13] Redshift cluster snapshots should be tagged
- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs

- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.7] S3 general purpose buckets should use cross-Region replication
- [S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.12] ACLs should not be used to manage user access to S3 general purpose buckets
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.19] S3 access points should have block public access settings enabled
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.22] S3 general purpose buckets should log object-level write events
- [S3.23] S3 general purpose buckets should log object-level read events
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled

- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SNS.4] SNS topic access policies should not allow public access
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT
- [SSM.4] SSM documents should not be public
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled

- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Osaka)

The following controls are not supported in the Asia Pacific (Osaka) Region.

- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests

- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled

- [Detective.1] Detective behavior graphs should be tagged
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager

- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged

- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [RDS.31] RDS DB security groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SSM.2] Amazon EC2 instances managed by Systems Manager should have a patch compliance status of COMPLIANT after a patch installation
- [SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Seoul)

The following controls are not supported in the Asia Pacific (Seoul) Region.

- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged

- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [ECR.4] ECR public repositories should be tagged
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [RDS.31] RDS DB security groups should be tagged
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SSM.6] SSM Automation should have CloudWatch logging enabled

- [SSM.7] SSM documents should have the block public sharing setting enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (Singapore)

The following controls are not supported in the Asia Pacific (Singapore) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged

- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (Sydney)

The following controls are not supported in the Asia Pacific (Sydney) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control

- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Asia Pacific (Taipei)

The following controls are not supported in the Asia Pacific (Taipei) Region.

- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [ACM.3] ACM certificates should be tagged
- [APIGateway.1] API Gateway REST and WebSocket API execution logging should be enabled
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication

- [APIGateway.3] API Gateway REST API stages should have AWS X-Ray tracing enabled
- [APIGateway.4] API Gateway should be associated with a WAF Web ACL
- [APIGateway.5] API Gateway REST API cache data should be encrypted at rest
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.4] AWS AppSync GraphQL APIs should be tagged
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Athena.2] Athena data catalogs should be tagged
- [Athena.3] Athena workgroups should be tagged
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [AutoScaling.10] EC2 Auto Scaling groups should be tagged
- [Autoscaling.5] Amazon EC2 instances launched using Auto Scaling group launch configurations should not have Public IP addresses
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.2] AWS Backup recovery points should be tagged
- [Backup.3] AWS Backup vaults should be tagged
- [Backup.4] AWS Backup report plans should be tagged

- [Backup.5] AWS Backup backup plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.2] CloudFormation stacks should be tagged
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins

- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.9] CloudTrail trails should be tagged
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.1] Database Migration Service replication instances should not be public
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged

- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.5] DynamoDB tables should be tagged
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.33] EC2 transit gateway attachments should be tagged
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.35] EC2 network interfaces should be tagged
- [EC2.36] EC2 customer gateways should be tagged
- [EC2.37] EC2 Elastic IP addresses should be tagged
- [EC2.38] EC2 instances should be tagged
- [EC2.39] EC2 internet gateways should be tagged
- [EC2.40] EC2 NAT gateways should be tagged

- [EC2.41] EC2 network ACLs should be tagged
- [EC2.42] EC2 route tables should be tagged
- [EC2.43] EC2 security groups should be tagged
- [EC2.44] EC2 subnets should be tagged
- [EC2.45] EC2 volumes should be tagged
- [EC2.46] Amazon VPCs should be tagged
- [EC2.47] Amazon VPC endpoint services should be tagged
- [EC2.48] Amazon VPC flow logs should be tagged
- [EC2.49] Amazon VPC peering connections should be tagged
- [EC2.50] EC2 VPN gateways should be tagged
- [EC2.52] EC2 transit gateways should be tagged
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.172] EC2 VPC Block Public Access settings should block internet gateway traffic
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.182] Block public access settings should be enabled for Amazon EBS snapshots
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.4] ECR public repositories should be tagged
- [ECS.2] ECS services should not have public IP addresses assigned to them automatically
- [ECS.13] ECS services should be tagged
- [ECS.14] ECS clusters should be tagged
- [ECS.15] ECS task definitions should be tagged
- [ECS.16] ECS task sets should not automatically assign public IP addresses
- [EFS.5] EFS access points should be tagged

- [EKS.1] EKS cluster endpoints should not be publicly accessible
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.6] EKS clusters should be tagged
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.3] Classic Load Balancer listeners should be configured with HTTPS or TLS termination
- [ELB.7] Classic Load Balancers should have connection draining enabled
- [ELB.8] Classic Load Balancers with SSL listeners should use a predefined security policy that has strong AWS Configuration
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols
- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.1] Elasticsearch domains should have encryption at-rest enabled

- [ES.2] Elasticsearch domains should not be publicly accessible
- [ES.3] Elasticsearch domains should encrypt data sent between nodes
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [ES.5] Elasticsearch domains should have audit logging enabled
- [ES.6] Elasticsearch domains should have at least three data nodes
- [ES.7] Elasticsearch domains should be configured with at least three dedicated master nodes
- [ES.8] Connections to Elasticsearch domains should be encrypted using the latest TLS security policy
- [ES.9] Elasticsearch domains should be tagged
- [EventBridge.2] EventBridge event buses should be tagged
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.1] AWS Glue jobs should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.1] GuardDuty should be enabled
- [GuardDuty.2] GuardDuty filters should be tagged
- [GuardDuty.3] GuardDuty IPSets should be tagged
- [GuardDuty.4] GuardDuty detectors should be tagged
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached

- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.23] IAM Access Analyzer analyzers should be tagged
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged

- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.2] Kinesis streams should be tagged
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [KMS.3] AWS KMS keys should not be deleted unintentionally
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.6] Lambda functions should be tagged
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.4] Amazon MQ brokers should be tagged
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled

- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.7] Network Firewall firewalls should be tagged
- [NetworkFirewall.8] Network Firewall firewall policies should be tagged
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.16] Aurora DB clusters should be configured to copy tags to DB snapshots
- [RDS.17] RDS DB instances should be configured to copy tags to snapshots
- [RDS.19] Existing RDS event notification subscriptions should be configured for critical cluster events
- [RDS.20] Existing RDS event notification subscriptions should be configured for critical database instance events
- [RDS.21] An RDS event notifications subscription should be configured for critical database parameter group events
- [RDS.22] An RDS event notifications subscription should be configured for critical database security group events

- [RDS.23] RDS instances should not use a database engine default port
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.28] RDS DB clusters should be tagged
- [RDS.29] RDS DB cluster snapshots should be tagged
- [RDS.30] RDS DB instances should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [RDS.32] RDS DB snapshots should be tagged
- [RDS.33] RDS DB subnet groups should be tagged
- [RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.1] Amazon Redshift clusters should prohibit public access
- [Redshift.2] Connections to Amazon Redshift clusters should be encrypted in transit
- [Redshift.3] Amazon Redshift clusters should have automatic snapshots enabled
- [Redshift.4] Amazon Redshift clusters should have audit logging enabled
- [Redshift.6] Amazon Redshift should have automatic upgrades to major versions enabled
- [Redshift.7] Redshift clusters should use enhanced VPC routing
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username

- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.11] Redshift clusters should be tagged
- [Redshift.12] Redshift event notification subscriptions should be tagged
- [Redshift.13] Redshift cluster snapshots should be tagged
- [Redshift.14] Redshift cluster subnet groups should be tagged
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.17] S3 general purpose buckets should be encrypted at rest with AWS KMS keys
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms

- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SecretsManager.5] Secrets Manager secrets should be tagged

- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SNS.3] SNS topics should be tagged
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [StepFunctions.2] Step Functions activities should be tagged
- [Transfer.1] AWS Transfer Family workflows should be tagged
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Thailand)

The following controls are not supported in the Asia Pacific (Thailand) Region.

- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits

- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.2] AWS Backup recovery points should be tagged
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys

- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged

- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest

- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.6] DynamoDB tables should have deletion protection enabled
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.172] EC2 VPC Block Public Access settings should block internet gateway traffic
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged

- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.182] Block public access settings should be enabled for Amazon EBS snapshots
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.4] ECR public repositories should be tagged
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [ECS.16] ECS task sets should not automatically assign public IP addresses
- [ECS.17] ECS task definitions should not use host network mode
- [ECS.18] ECS Task Definitions should use in-transit encryption for EFS volumes
- [ECS.19] ECS capacity providers should have managed termination protection enabled
- [ECS.20] ECS Task Definitions should configure non-root users in Linux container definitions
- [ECS.21] ECS Task Definitions should configure non-administrator users in Windows container definitions
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones

- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [ES.9] Elasticsearch domains should be tagged
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes

- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.1] AWS Glue jobs should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.1] GuardDuty should be enabled
- [GuardDuty.2] GuardDuty filters should be tagged
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services

- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged

- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.4] Amazon MQ brokers should be tagged
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes

- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit
- [RDS.39] RDS for MySQL DB instances should be encrypted in transit
- [RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest

- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.7] S3 general purpose buckets should use cross-Region replication
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.22] S3 general purpose buckets should log object-level write events
- [S3.23] S3 general purpose buckets should log object-level read events
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged

- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged

- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Asia Pacific (Tokyo)

The following controls are not supported in the Asia Pacific (Tokyo) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled

- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Canada (Central)

The following controls are not supported in the Canada (Central) Region.

- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged

- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations

- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Canada West (Calgary)

The following controls are not supported in the Canada West (Calgary) Region.

- [ACM.1] Imported and ACM-issued certificates should be renewed after a specified time period
- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Athena.4] Athena workgroups should have logging enabled
- [AutoScaling.2] Amazon EC2 Auto Scaling group should cover multiple Availability Zones
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.6] Auto Scaling groups should use multiple instance types in multiple Availability Zones

- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins

- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.1] DataSync tasks should have logging enabled

- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.6] DynamoDB tables should have deletion protection enabled
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces

- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys
- [ECS.3] ECS task definitions should not share the host's process namespace

- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [ECS.17] ECS task definitions should not use host network mode
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch
- [EFS.7] EFS file systems should have automatic backups enabled
- [EFS.8] EFS file systems should be encrypted at rest
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit

- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EMR.2] Amazon EMR block public access setting should be enabled
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.3] AWS Glue machine learning transforms should be encrypted at rest
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged

- [GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled
- [GuardDuty.6] GuardDuty Lambda Protection should be enabled
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.10] GuardDuty S3 Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services

- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged

- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [KMS.5] KMS keys should not be publicly accessible
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots

- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.31] RDS DB security groups should be tagged

- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit
- [RDS.39] RDS for MySQL DB instances should be encrypted in transit
- [RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs

- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.7] S3 general purpose buckets should use cross-Region replication
- [S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.12] ACLs should not be used to manage user access to S3 general purpose buckets
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.19] S3 access points should have block public access settings enabled
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.22] S3 general purpose buckets should log object-level write events
- [S3.23] S3 general purpose buckets should log object-level read events
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled

- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SNS.4] SNS topic access policies should not allow public access
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.4] SSM documents should not be public
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged

- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

China (Beijing)

The following controls are not supported in the China (Beijing) Region.

- [ACM.1] Imported and ACM-issued certificates should be renewed after a specified time period
- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged

- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins

- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period

- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.20] Both VPN tunnels for an AWS Site-to-Site VPN connection should be up
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.36] EC2 customer gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled

- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.4] ECR public repositories should be tagged
- [EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols
- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [GuardDuty.3] GuardDuty IPSets should be tagged
- [GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled
- [GuardDuty.6] GuardDuty Lambda Protection should be enabled
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled

- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.10] GuardDuty S3 Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.9] MFA should be enabled for the root user
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.23] IAM Access Analyzer analyzers should be tagged
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged

- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled

- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.7] RDS clusters should have deletion protection enabled
- [RDS.12] IAM authentication should be configured for RDS clusters
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.15] RDS DB clusters should be configured for multiple Availability Zones
- [RDS.16] Aurora DB clusters should be configured to copy tags to DB snapshots
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.28] RDS DB clusters should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots

- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.22] S3 general purpose buckets should log object-level write events
- [S3.23] S3 general purpose buckets should log object-level read events
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled

- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

China (Ningxia)

The following controls are not supported in the China (Ningxia) Region.

- [ACM.1] Imported and ACM-issued certificates should be renewed after a specified time period
- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys

- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication

- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.20] Both VPN tunnels for an AWS Site-to-Site VPN connection should be up
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.36] EC2 customer gateways should be tagged
- [EC2.50] EC2 VPN gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager

- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.4] ECR public repositories should be tagged
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols
- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged

- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.3] AWS Glue machine learning transforms should be encrypted at rest
- [GuardDuty.3] GuardDuty IPSets should be tagged
- [GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled
- [GuardDuty.6] GuardDuty Lambda Protection should be enabled
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.10] GuardDuty S3 Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.9] MFA should be enabled for the root user
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.23] IAM Access Analyzer analyzers should be tagged
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled

- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Lambda.1] Lambda function policies should prohibit public access
- [Lambda.2] Lambda functions should use supported runtimes
- [Lambda.3] Lambda functions should be in a VPC
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones

- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit

- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers

- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SSM.5] SSM documents should be tagged
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.2] Step Functions activities should be tagged
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Europe (Frankfurt)

The following controls are not supported in the Europe (Frankfurt) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured

- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled

- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Europe (Ireland)

The following controls are not supported in the Europe (Ireland) Region.

- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [ECR.4] ECR public repositories should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Route53.1] Route 53 health checks should be tagged

- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Europe (London)

The following controls are not supported in the Europe (London) Region.

- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies

- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations

- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

Europe (Milan)

The following controls are not supported in the Europe (Milan) Region.

- [APIGateway.11] API Gateway domain names should use recommended security policies
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests

- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [ECR.4] ECR public repositories should be tagged
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager

- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled

- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [RDS.1] RDS snapshot should be private
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled

- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SSM.2] Amazon EC2 instances managed by Systems Manager should have a patch compliance status of COMPLIANT after a patch installation
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Europe (Paris)

The following controls are not supported in the Europe (Paris) Region.

- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins

- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged

- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Europe (Spain)

The following controls are not supported in the Europe (Spain) Region.

- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [Amplify.1] Amplify apps should be tagged

- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins

- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones

- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.1] Amazon EBS snapshots should not be configured to be publicly restorable
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged

- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less

- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged

- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.1] Lambda function policies should prohibit public access
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled

- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [RDS.1] RDS snapshot should be private
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled

- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule

- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Europe (Stockholm)

The following controls are not supported in the Europe (Stockholm) Region.

- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies

- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged

- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Europe (Zurich)

The following controls are not supported in the Europe (Zurich) Region.

- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged

- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged

- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period

- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit

- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged

- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled

- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes

- [RDS.1] RDS snapshot should be private
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled

- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Israel (Tel Aviv)

The following controls are not supported in the Israel (Tel Aviv) Region.

- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages

- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit

- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled

- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager

- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EFS.8] EFS file systems should be encrypted at rest
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [ELB.2] Classic Load Balancers with SSL/HTTPS listeners should use a certificate provided by AWS Certificate Manager
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled

- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter

- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged

- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled

- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [RDS.1] RDS snapshot should be private
- [RDS.4] RDS cluster snapshots and database snapshots should be encrypted at rest
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.29] RDS DB cluster snapshots should be tagged
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances

- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.4] SSM documents should not be public
- [SSM.6] SSM Automation should have CloudWatch logging enabled

- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Mexico (Central)

The following controls are not supported in the Mexico (Central) Region.

- [ACM.1] Imported and ACM-issued certificates should be renewed after a specified time period
- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged

- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.4] AWS AppSync GraphQL APIs should be tagged
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [Athena.4] Athena workgroups should have logging enabled
- [AutoScaling.2] Amazon EC2 Auto Scaling group should cover multiple Availability Zones
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.6] Auto Scaling groups should use multiple instance types in multiple Availability Zones
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Backup.2] AWS Backup recovery points should be tagged
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled

- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CloudTrail.7] Ensure S3 bucket access logging is enabled on the CloudTrail S3 bucket
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.1] CodeBuild Bitbucket source repository URLs should not contain sensitive credentials
- [CodeBuild.2] CodeBuild project environment variables should not contain clear text credentials

- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeBuild.7] CodeBuild report group exports should be encrypted at rest
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataFirehose.1] Firehose delivery streams should be encrypted at rest
- [DataSync.1] DataSync tasks should have logging enabled
- [DataSync.2] DataSync tasks should be tagged
- [Detective.1] Detective behavior graphs should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.3] DMS event subscriptions should be tagged
- [DMS.4] DMS replication instances should be tagged
- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones

- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.4] DynamoDB tables should be present in a backup plan
- [DynamoDB.6] DynamoDB tables should have deletion protection enabled
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.34] EC2 transit gateway route tables should be tagged
- [EC2.40] EC2 NAT gateways should be tagged
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports
- [EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports
- [EC2.55] VPCs should be configured with an interface endpoint for ECR API
- [EC2.56] VPCs should be configured with an interface endpoint for Docker Registry
- [EC2.57] VPCs should be configured with an interface endpoint for Systems Manager
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts

- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.171] EC2 VPN connections should have logging enabled
- [EC2.172] EC2 VPC Block Public Access settings should block internet gateway traffic
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [EC2.182] Block public access settings should be enabled for Amazon EBS snapshots
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [ECS.17] ECS task definitions should not use host network mode

- [ECS.18] ECS Task Definitions should use in-transit encryption for EFS volumes
- [ECS.19] ECS capacity providers should have managed termination protection enabled
- [ECS.20] ECS Task Definitions should configure non-root users in Linux container definitions
- [ECS.21] ECS Task Definitions should configure non-administrator users in Windows container definitions
- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch
- [EFS.7] EFS file systems should have automatic backups enabled
- [EFS.8] EFS file systems should be encrypted at rest
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.7] EKS identity provider configurations should be tagged
- [EKS.8] EKS clusters should have audit logging enabled
- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled

- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.3] Elasticsearch domains should encrypt data sent between nodes
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [ES.9] Elasticsearch domains should be tagged
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.1] AWS Glue jobs should be tagged
- [Glue.3] AWS Glue machine learning transforms should be encrypted at rest

- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.1] GuardDuty should be enabled
- [GuardDuty.2] GuardDuty filters should be tagged
- [GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled
- [GuardDuty.6] GuardDuty Lambda Protection should be enabled
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.10] GuardDuty S3 Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.1] IAM policies should not allow full "*" administrative privileges
- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.7] Password policies for IAM users should have strong configurations
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.10] Password policies for IAM users should have strong configurations
- [IAM.11] Ensure IAM password policy requires at least one uppercase letter
- [IAM.12] Ensure IAM password policy requires at least one lowercase letter
- [IAM.13] Ensure IAM password policy requires at least one symbol
- [IAM.14] Ensure IAM password policy requires at least one number
- [IAM.15] Ensure IAM password policy requires minimum password length of 14 or greater
- [IAM.16] Ensure IAM password policy prevents password reuse
- [IAM.17] Ensure IAM password policy expires passwords within 90 days or less
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support

- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoT.4] AWS IoT Core authorizers should be tagged
- [IoT.5] AWS IoT Core role aliases should be tagged
- [IoT.6] AWS IoT Core policies should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged

- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [Kinesis.3] Kinesis streams should have an adequate data retention period
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [KMS.5] KMS keys should not be publicly accessible
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch
- [MQ.4] Amazon MQ brokers should be tagged
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled

- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.24] RDS Database clusters should use a custom administrator username

- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.26] RDS DB instances should be protected by a backup plan
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs
- [RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs
- [RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit
- [RDS.39] RDS for MySQL DB instances should be encrypted in transit
- [RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.1] Amazon Redshift clusters should prohibit public access
- [Redshift.2] Connections to Amazon Redshift clusters should be encrypted in transit
- [Redshift.3] Amazon Redshift clusters should have automatic snapshots enabled
- [Redshift.4] Amazon Redshift clusters should have audit logging enabled
- [Redshift.6] Amazon Redshift should have automatic upgrades to major versions enabled
- [Redshift.7] Redshift clusters should use enhanced VPC routing
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.11] Redshift clusters should be tagged

- [Redshift.13] Redshift cluster snapshots should be tagged
- [Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins
- [Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys
- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.7] S3 general purpose buckets should use cross-Region replication
- [S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.12] ACLs should not be used to manage user access to S3 general purpose buckets
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.19] S3 access points should have block public access settings enabled
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.22] S3 general purpose buckets should log object-level write events
- [S3.23] S3 general purpose buckets should log object-level read events
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC

- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys

- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [ServiceCatalog.1] Service Catalog portfolios should be shared within an AWS organization only
- [SNS.4] SNS topic access policies should not allow public access
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.3] Amazon EC2 instances managed by Systems Manager should have an association compliance status of COMPLIANT
- [SSM.4] SSM documents should not be public
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection
- [Transfer.3] Transfer Family connectors should have logging enabled
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Middle East (Bahrain)

The following controls are not supported in the Middle East (Bahrain) Region.

- [APIGateway.11] API Gateway domain names should use recommended security policies
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled

- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.10] CloudTrail Lake event data stores should be encrypted with customer managed AWS KMS keys
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DocumentDB.6] Amazon DocumentDB clusters should be encrypted in transit
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.20] Both VPN tunnels for an AWS Site-to-Site VPN connection should be up
- [EC2.24] Amazon EC2 paravirtual instance types should not be used

- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.4] ECR public repositories should be tagged
- [ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys
- [ECS.17] ECS task definitions should not use host network mode
- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment
- [FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment
- [FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged

- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.41] RDS for SQL Server DB instances should be encrypted in transit
- [RDS.42] RDS for MariaDB DB instances should publish logs to CloudWatch Logs
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.44] RDS for MariaDB DB instances should be encrypted in transit
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.4] Redshift Serverless namespaces should be encrypted with customer managed AWS KMS keys

- [RedshiftServerless.5] Redshift Serverless namespaces should not use the default admin username
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.8] SageMaker notebook instances should run on supported platforms
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SQS.3] SQS queue access policies should not allow public access
- [Transfer.3] Transfer Family connectors should have logging enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest

- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

Middle East (UAE)

The following controls are not supported in the Middle East (UAE) Region.

- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [Backup.1] AWS Backup recovery points should be encrypted at rest
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration

- [CloudFormation.3] CloudFormation stacks should have termination protection enabled
- [CloudFormation.4] CloudFormation stacks should have associated service roles
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudTrail.6] Ensure the S3 bucket used to store CloudTrail logs is not publicly accessible
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DMS.2] DMS certificates should be tagged
- [DMS.4] DMS replication instances should be tagged

- [DMS.5] DMS replication subnet groups should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled
- [DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled
- [DMS.12] DMS endpoints for Redis OSS should have TLS enabled
- [DMS.13] DMS replication instances should be configured to use multiple Availability Zones
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.4] Stopped EC2 instances should be removed after a specified time period
- [EC2.14] Security groups should not allow ingress from 0.0.0.0/0 or ::/0 to port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.51] EC2 Client VPN endpoints should have client connection logging enabled
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.175] EC2 launch templates should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [EC2.180] EC2 network interfaces should have source/destination checking enabled
- [EC2.181] EC2 launch templates should enable encryption for attached EBS volumes
- [EC2.183] EC2 VPN connections should use IKEv2 protocol
- [ECR.4] ECR public repositories should be tagged

- [EFS.1] Elastic File System should be configured to encrypt file data at-rest using AWS KMS
- [EFS.2] Amazon EFS volumes should be in backup plans
- [EKS.9] EKS node groups should run on a supported Kubernetes version
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.17] Application and Network Load Balancers with listeners should use recommended security policies
- [ELB.18] Application and Network Load Balancer listeners should use secure protocols to encrypt data in transit
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.1] Amazon EMR cluster primary nodes should not have public IP addresses
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue
- [GuardDuty.2] GuardDuty filters should be tagged
- [IAM.1] IAM policies should not allow full "*" administrative privileges

- [IAM.2] IAM users should not have IAM policies attached
- [IAM.3] IAM users' access keys should be rotated every 90 days or less
- [IAM.4] IAM root user access key should not exist
- [IAM.5] MFA should be enabled for all IAM users that have a console password
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.8] Unused IAM user credentials should be removed
- [IAM.9] MFA should be enabled for the root user
- [IAM.18] Ensure a support role has been created to manage incidents with AWS Support
- [IAM.19] MFA should be enabled for all IAM users
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.22] IAM user credentials unused for 45 days should be removed
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached
- [Inspector.1] Amazon Inspector EC2 scanning should be enabled
- [Inspector.2] Amazon Inspector ECR scanning should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [Inspector.4] Amazon Inspector Lambda standard scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged

- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [KMS.1] IAM customer managed policies should not allow decryption actions on all KMS keys
- [KMS.2] IAM principals should not have IAM inline policies that allow decryption actions on all KMS keys
- [Lambda.7] Lambda functions should have AWS X-Ray active tracing enabled
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.4] MSK clusters should have public access disabled
- [MSK.5] MSK connectors should have logging enabled
- [MSK.6] MSK clusters should disable unauthenticated access
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [Opensearch.9] OpenSearch domains should be tagged
- [Opensearch.10] OpenSearch domains should have the latest software update installed
- [Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.31] RDS DB security groups should be tagged
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version

- [Redshift.18] Redshift clusters should have Multi-AZ deployments enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys

- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SQS.1] Amazon SQS queues should be encrypted at rest
- [SQS.2] SQS queues should be tagged
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [SSM.7] SSM documents should have the block public sharing setting enabled
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

South America (São Paulo)

The following controls are not supported in the South America (São Paulo) Region.

- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode

- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged

- [Cognito.5] MFA should be enabled for Cognito user pools
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [ECR.4] ECR public repositories should be tagged
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoT.1] AWS IoT Device Defender security profiles should be tagged
- [IoT.2] AWS IoT Core mitigation actions should be tagged
- [IoT.3] AWS IoT Core dimensions should be tagged
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing

- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group

AWS GovCloud (US-East)

The following controls are not supported in the AWS GovCloud (US-East) Region.

- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged

- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled
- [AppSync.4] AWS AppSync GraphQL APIs should be tagged
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [AutoScaling.2] Amazon EC2 Auto Scaling group should cover multiple Availability Zones
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.6] Auto Scaling groups should use multiple instance types in multiple Availability Zones
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured

- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured
- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.2] Cognito identity pools should not allow unauthenticated identities
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled

- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [Connect.2] Connect Customer instances should have CloudWatch logging enabled
- [DataSync.2] DataSync tasks should be tagged
- [DMS.2] DMS certificates should be tagged
- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.47] Amazon VPC endpoint services should be tagged
- [EC2.52] EC2 transit gateways should be tagged
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes

- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged
- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.8] EKS clusters should have audit logging enabled
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols

- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled
- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [Glue.3] AWS Glue machine learning transforms should be encrypted at rest
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled

- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.9] MFA should be enabled for the root user
- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.26] Expired SSL/TLS certificates managed in IAM should be removed
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [KMS.5] KMS keys should not be publicly accessible

- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes
- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible

- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy
- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.15] RDS DB clusters should be configured for multiple Availability Zones
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.31] RDS DB security groups should be tagged
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access

- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.12] ACLs should not be used to manage user access to S3 general purpose buckets
- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.1] Amazon SageMaker notebook instances should not have direct internet access
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.16] SageMaker models should use private registry in VPC for primary containers
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys

- [SageMaker.19] SageMaker models should use private registry in VPC for multi-container inference pipelines
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.21] SageMaker notebook instances should be encrypted with customer managed AWS KMS keys
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled
- [SES.1] SES contact lists should be tagged
- [SES.2] SES configuration sets should be tagged
- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SNS.4] SNS topic access policies should not allow public access
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.4] SSM documents should not be public
- [SSM.5] SSM documents should be tagged
- [SSM.6] SSM Automation should have CloudWatch logging enabled
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [StepFunctions.2] Step Functions activities should be tagged
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group

- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled
- [WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest
- [WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest

AWS GovCloud (US-West)

The following controls are not supported in the AWS GovCloud (US-West) Region.

- [ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits
- [Account.1] Security contact information should be provided for an AWS account
- [Account.2] AWS accounts should be part of an AWS Organizations organization
- [APIGateway.2] API Gateway REST API stages should be configured to use SSL certificates for backend authentication
- [APIGateway.8] API Gateway routes should specify an authorization type
- [APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [APIGateway.10] API Gateway V2 integrations should use HTTPS for private connections
- [APIGateway.11] API Gateway domain names should use recommended security policies
- [Amplify.1] Amplify apps should be tagged
- [Amplify.2] Amplify branches should be tagged
- [AppConfig.1] AWS AppConfig applications should be tagged
- [AppConfig.2] AWS AppConfig configuration profiles should be tagged
- [AppConfig.3] AWS AppConfig environments should be tagged
- [AppConfig.4] AWS AppConfig extension associations should be tagged
- [AppFlow.1] Amazon AppFlow flows should be tagged
- [AppRunner.1] App Runner services should be tagged
- [AppRunner.2] App Runner VPC connectors should be tagged
- [AppSync.2] AWS AppSync should have field-level logging enabled

- [AppSync.4] AWS AppSync GraphQL APIs should be tagged
- [AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys
- [AutoScaling.2] Amazon EC2 Auto Scaling group should cover multiple Availability Zones
- [AutoScaling.3] Auto Scaling group launch configurations should configure EC2 instances to require Instance Metadata Service Version 2 (IMDSv2)
- [AutoScaling.6] Auto Scaling groups should use multiple instance types in multiple Availability Zones
- [AutoScaling.9] Amazon EC2 Auto Scaling groups should use Amazon EC2 launch templates
- [Backup.4] AWS Backup report plans should be tagged
- [Batch.1] Batch job queues should be tagged
- [Batch.2] Batch scheduling policies should be tagged
- [Batch.3] Batch compute environments should be tagged
- [Batch.4] Compute resources properties in managed Batch compute environments should be tagged
- [Bedrock.1] Amazon Bedrock data sources should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.1] Bedrock AgentCore runtimes should be configured with VPC network mode
- [BedrockAgentCore.2] Bedrock AgentCore Gateways should require authorization for inbound requests
- [BedrockAgentCore.3] Bedrock AgentCore Memory should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.4] Bedrock AgentCore Gateway should be encrypted with customer managed AWS KMS keys
- [BedrockAgentCore.5] Bedrock AgentCore custom browsers should not use public network mode
- [BedrockAgentCore.6] Bedrock AgentCore custom browsers should have session recording enabled
- [BedrockAgentCore.7] Bedrock AgentCore custom code interpreters should use a private network configuration
- [CloudFront.1] CloudFront distributions should have a default root object configured
- [CloudFront.3] CloudFront distributions should require encryption in transit
- [CloudFront.4] CloudFront distributions should have origin failover configured

- [CloudFront.5] CloudFront distributions should have logging enabled
- [CloudFront.6] CloudFront distributions should have WAF enabled
- [CloudFront.7] CloudFront distributions should use custom SSL/TLS certificates
- [CloudFront.8] CloudFront distributions should use SNI to serve HTTPS requests
- [CloudFront.9] CloudFront distributions should encrypt traffic to custom origins
- [CloudFront.10] CloudFront distributions should not use deprecated SSL protocols between edge locations and custom origins
- [CloudFront.12] CloudFront distributions should not point to non-existent S3 origins
- [CloudFront.13] CloudFront distributions should use origin access control
- [CloudFront.14] CloudFront distributions should be tagged
- [CloudFront.15] CloudFront distributions should use the recommended TLS security policy
- [CloudFront.16] CloudFront distributions should use origin access control for Lambda function URL origins
- [CloudFront.17] CloudFront distributions should use trusted key groups for signed URLs and cookies
- [CloudWatch.17] CloudWatch alarm actions should be activated
- [CodeArtifact.1]CodeArtifact repositories should be tagged
- [CodeBuild.3] CodeBuild S3 logs should be encrypted
- [CodeBuild.4] CodeBuild project environments should have a logging AWS Configuration
- [CodeGuruProfiler.1] CodeGuru Profiler profiling groups should be tagged
- [CodeGuruReviewer.1] CodeGuru Reviewer repository associations should be tagged
- [Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication
- [Cognito.3] Password policies for Cognito user pools should have strong configurations
- [Cognito.4] Cognito user pools should have threat protection activated with full function enforcement mode for custom authentication
- [Cognito.5] MFA should be enabled for Cognito user pools
- [Cognito.6] Cognito user pools should have deletion protection enabled
- [Connect.1] Amazon Connect Customer Profiles object types should be tagged
- [DataSync.2] DataSync tasks should be tagged
- [DMS.2] DMS certificates should be tagged

- [DMS.6] DMS replication instances should have automatic minor version upgrade enabled
- [DMS.7] DMS replication tasks for the target database should have logging enabled
- [DMS.8] DMS replication tasks for the source database should have logging enabled
- [DMS.9] DMS endpoints should use SSL
- [DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest
- [DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period
- [DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public
- [DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs
- [DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled
- [DynamoDB.3] DynamoDB Accelerator (DAX) clusters should be encrypted at rest
- [DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit
- [EC2.21] Network ACLs should not allow ingress from 0.0.0.0/0 to port 22 or port 3389
- [EC2.22] Unused Amazon EC2 security groups should be removed
- [EC2.23] Amazon EC2 Transit Gateways should not automatically accept VPC attachment requests
- [EC2.24] Amazon EC2 paravirtual instance types should not be used
- [EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces
- [EC2.28] EBS volumes should be covered by a backup plan
- [EC2.38] EC2 instances should be tagged
- [EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts
- [EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager
- [EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)
- [EC2.173] EC2 Spot Fleet requests with launch parameters should enable encryption for attached EBS volumes
- [EC2.174] EC2 DHCP option sets should be tagged
- [EC2.175] EC2 launch templates should be tagged
- [EC2.176] EC2 prefix lists should be tagged
- [EC2.177] EC2 traffic mirror sessions should be tagged

- [EC2.178] EC2 traffic mirror filters should be tagged
- [EC2.179] EC2 traffic mirror targets should be tagged
- [ECR.1] ECR private repositories should have image scanning configured
- [ECR.2] ECR private repositories should have tag immutability configured
- [ECR.3] ECR repositories should have at least one lifecycle policy configured
- [ECR.4] ECR public repositories should be tagged
- [ECS.3] ECS task definitions should not share the host's process namespace
- [ECS.4] ECS containers should run as non-privileged
- [ECS.5] ECS task definitions should configure containers to be limited to read-only access to root filesystems
- [ECS.8] Secrets should not be passed as container environment variables
- [ECS.9] ECS task definitions should have a logging configuration
- [ECS.10] ECS Fargate services should run on the latest Fargate platform version
- [ECS.12] ECS clusters should use Container Insights
- [EFS.3] EFS access points should enforce a root directory
- [EFS.4] EFS access points should enforce a user identity
- [EKS.2] EKS clusters should run on a supported Kubernetes version
- [EKS.8] EKS clusters should have audit logging enabled
- [ELB.10] Classic Load Balancer should span multiple Availability Zones
- [ELB.12] Application Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.13] Application, Network and Gateway Load Balancers should span multiple Availability Zones
- [ELB.14] Classic Load Balancer should be configured with defensive or strictest desync mitigation mode
- [ELB.21] Application and Network Load Balancer target groups should use encrypted health check protocols
- [ELB.22] ELB target groups should use encrypted transport protocols
- [ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled
- [ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled
- [ElastiCache.3] ElastiCache replication groups should have automatic failover enabled

- [ElastiCache.4] ElastiCache replication groups should be encrypted at rest
- [ElastiCache.5] ElastiCache replication groups should be encrypted in transit
- [ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled
- [ElastiCache.7] ElastiCache clusters should not use the default subnet group
- [ElasticBeanstalk.1] Elastic Beanstalk environments should have enhanced health reporting enabled
- [ElasticBeanstalk.2] Elastic Beanstalk managed platform updates should be enabled
- [ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch
- [EMR.2] Amazon EMR block public access setting should be enabled
- [EMR.3] Amazon EMR security configurations should be encrypted at rest
- [EMR.4] Amazon EMR security configurations should be encrypted in transit
- [ES.4] Elasticsearch domain error logging to CloudWatch Logs should be enabled
- [EventBridge.3] EventBridge custom event buses should have a resource-based policy attached
- [EventBridge.4] EventBridge global endpoints should have event replication enabled
- [FraudDetector.1] Amazon Fraud Detector entity types should be tagged
- [FraudDetector.2] Amazon Fraud Detector labels should be tagged
- [FraudDetector.3] Amazon Fraud Detector outcomes should be tagged
- [FraudDetector.4] Amazon Fraud Detector variables should be tagged
- [FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes
- [FSx.2] FSx for Lustre file systems should be configured to copy tags to backups
- [GlobalAccelerator.1] Global Accelerator accelerators should be tagged
- [GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled
- [GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled
- [GuardDuty.9] GuardDuty RDS Protection should be enabled
- [GuardDuty.11] GuardDuty Runtime Monitoring should be enabled
- [GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled
- [GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled
- [IAM.6] Hardware MFA should be enabled for the root user
- [IAM.9] MFA should be enabled for the root user

- [IAM.21] IAM customer managed policies that you create should not allow wildcard actions for services
- [IAM.24] IAM roles should be tagged
- [IAM.25] IAM users should be tagged
- [IAM.28] IAM Access Analyzer external access analyzer should be enabled
- [Inspector.3] Amazon Inspector Lambda code scanning should be enabled
- [IoTSiteWise.1] AWS IoT SiteWise asset models should be tagged
- [IoTSiteWise.2] AWS IoT SiteWise dashboards should be tagged
- [IoTSiteWise.3] AWS IoT SiteWise gateways should be tagged
- [IoTSiteWise.4] AWS IoT SiteWise portals should be tagged
- [IoTSiteWise.5] AWS IoT SiteWise projects should be tagged
- [IoTTwinMaker.1] AWS IoT TwinMaker sync jobs should be tagged
- [IoTTwinMaker.2] AWS IoT TwinMaker workspaces should be tagged
- [IoTTwinMaker.3] AWS IoT TwinMaker scenes should be tagged
- [IoTTwinMaker.4] AWS IoT TwinMaker entities should be tagged
- [IoTWireless.1] AWS IoT Wireless multicast groups should be tagged
- [IoTWireless.2] AWS IoT Wireless service profiles should be tagged
- [IoTWireless.3] AWS IoT FUOTA tasks should be tagged
- [IVS.1] IVS playback key pairs should be tagged
- [IVS.2] IVS recording configurations should be tagged
- [IVS.3] IVS channels should be tagged
- [Keyspaces.1] Amazon Keyspaces keyspaces should be tagged
- [Kinesis.1] Kinesis streams should be encrypted at rest
- [KMS.5] KMS keys should not be publicly accessible
- [Lambda.5] VPC Lambda functions should operate in multiple Availability Zones
- [Macie.1] Amazon Macie should be enabled
- [Macie.2] Macie automated sensitive data discovery should be enabled
- [MQ.5] ActiveMQ brokers should use active/standby deployment mode
- [MQ.6] RabbitMQ brokers should use cluster deployment mode
- [MSK.1] MSK clusters should be encrypted in transit among broker nodes

- [MSK.2] MSK clusters should have enhanced monitoring configured
- [MSK.3] MSK Connect connectors should be encrypted in transit
- [MSK.5] MSK connectors should have logging enabled
- [Neptune.1] Neptune DB clusters should be encrypted at rest
- [Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs
- [Neptune.3] Neptune DB cluster snapshots should not be public
- [Neptune.4] Neptune DB clusters should have deletion protection enabled
- [Neptune.5] Neptune DB clusters should have automated backups enabled
- [Neptune.6] Neptune DB cluster snapshots should be encrypted at rest
- [Neptune.7] Neptune DB clusters should have IAM database authentication enabled
- [Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots
- [Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones
- [NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones
- [NetworkFirewall.2] Network Firewall logging should be enabled
- [NetworkFirewall.3] Network Firewall policies should have at least one rule group associated
- [NetworkFirewall.4] The default stateless action for Network Firewall policies should be drop or forward for full packets
- [NetworkFirewall.5] The default stateless action for Network Firewall policies should be drop or forward for fragmented packets
- [NetworkFirewall.6] Stateless Network Firewall rule group should not be empty
- [NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled
- [Opensearch.1] OpenSearch domains should have encryption at rest enabled
- [Opensearch.2] OpenSearch domains should not be publicly accessible
- [Opensearch.3] OpenSearch domains should encrypt data sent between nodes
- [Opensearch.4] OpenSearch domain error logging to CloudWatch Logs should be enabled
- [Opensearch.5] OpenSearch domains should have audit logging enabled
- [Opensearch.6] OpenSearch domains should have at least three data nodes
- [Opensearch.7] OpenSearch domains should have fine-grained access control enabled
- [Opensearch.8] Connections to OpenSearch domains should be encrypted using the latest TLS security policy

- [PCA.1] AWS Private CA root certificate authority should be disabled
- [PCA.2] AWS Private CA certificate authorities should be tagged
- [RDS.14] Amazon Aurora clusters should have backtracking enabled
- [RDS.15] RDS DB clusters should be configured for multiple Availability Zones
- [RDS.24] RDS Database clusters should use a custom administrator username
- [RDS.25] RDS database instances should use a custom administrator username
- [RDS.27] RDS DB clusters should be encrypted at rest
- [RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs
- [RDS.35] RDS DB clusters should have automatic minor version upgrade enabled
- [RDS.43] RDS DB proxies should require TLS encryption for connections
- [RDS.45] Aurora MySQL DB clusters should have audit logging enabled
- [RDS.47] RDS for PostgreSQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.48] RDS for MySQL DB clusters should be configured to copy tags to DB snapshots
- [RDS.50] RDS DB clusters should have enough backup retention period set
- [RDS.51] RDS global clusters should run on a supported Aurora MySQL version
- [Redshift.7] Redshift clusters should use enhanced VPC routing
- [Redshift.8] Amazon Redshift clusters should not use the default Admin username
- [Redshift.10] Redshift clusters should be encrypted at rest
- [Redshift.11] Redshift clusters should be tagged
- [Redshift.13] Redshift cluster snapshots should be tagged
- [Redshift.17] Redshift cluster parameter groups should be tagged
- [RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing
- [RedshiftServerless.2] Connections to Redshift Serverless workgroups should be required to use SSL
- [RedshiftServerless.3] Redshift Serverless workgroups should prohibit public access
- [RedshiftServerless.6] Redshift Serverless namespaces should export logs to CloudWatch Logs
- [Route53.1] Route 53 health checks should be tagged
- [Route53.2] Route 53 public hosted zones should log DNS queries
- [S3.10] S3 general purpose buckets with versioning enabled should have Lifecycle configurations
- [S3.11] S3 general purpose buckets should have event notifications enabled
- [S3.12] ACLs should not be used to manage user access to S3 general purpose buckets

- [S3.13] S3 general purpose buckets should have Lifecycle configurations
- [S3.20] S3 general purpose buckets should have MFA delete enabled
- [S3.24] S3 Multi-Region Access Points should have block public access settings enabled
- [S3.25] S3 directory buckets should have lifecycle configurations
- [SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SageMaker.5] SageMaker models should have network isolation enabled
- [SageMaker.6] SageMaker app image configurations should be tagged
- [SageMaker.7] SageMaker images should be tagged
- [SageMaker.9] SageMaker data quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.10] SageMaker model explainability job definitions should have inter-container traffic encryption enabled
- [SageMaker.11] SageMaker data quality job definitions should have network isolation enabled
- [SageMaker.12] SageMaker model bias job definitions should have network isolation enabled
- [SageMaker.13] SageMaker model quality job definitions should have inter-container traffic encryption enabled
- [SageMaker.14] SageMaker monitoring schedules should have network isolation enabled
- [SageMaker.15] SageMaker model bias job definitions should have inter-container traffic encryption enabled
- [SageMaker.17] SageMaker feature group offline stores should be encrypted with AWS KMS keys
- [SageMaker.18] SageMaker feature group online stores with standard storage should be encrypted with AWS KMS keys
- [SageMaker.20] SageMaker model explainability job definitions should have network isolation enabled
- [SageMaker.22] SageMaker monitoring schedules should have inter-container traffic encryption enabled
- [SageMaker.23] SageMaker inference experiments should have instance storage volume encrypted with customer managed AWS KMS keys
- [SageMaker.24] SageMaker inference experiments should have data storage encrypted with customer managed AWS KMS keys
- [SageMaker.25] SageMaker model quality job definitions should have network isolation enabled

- [SES.3] SES configuration sets should have TLS enabled for sending emails
- [SNS.4] SNS topic access policies should not allow public access
- [SQS.3] SQS queue access policies should not allow public access
- [SSM.4] SSM documents should not be public
- [SSM.5] SSM documents should be tagged
- [StepFunctions.1] Step Functions state machines should have logging turned on
- [StepFunctions.2] Step Functions activities should be tagged
- [Transfer.4] Transfer Family agreements should be tagged
- [Transfer.5] Transfer Family certificates should be tagged
- [Transfer.6] Transfer Family connectors should be tagged
- [Transfer.7] Transfer Family profiles should be tagged
- [WAF.1] AWS WAF Classic Global Web ACL logging should be enabled
- [WAF.2] AWS WAF Classic Regional rules should have at least one condition
- [WAF.3] AWS WAF Classic Regional rule groups should have at least one rule
- [WAF.4] AWS WAF Classic Regional web ACLs should have at least one rule or rule group
- [WAF.6] AWS WAF Classic global rules should have at least one condition
- [WAF.7] AWS WAF Classic global rule groups should have at least one rule
- [WAF.8] AWS WAF Classic global web ACLs should have at least one rule or rule group
- [WAF.10] AWS WAF web ACLs should have at least one rule or rule group
- [WAF.12] AWS WAF rules should have CloudWatch metrics enabled

Creating Security Hub CSPM resources with CloudFormation

AWS Security Hub CSPM integrates with AWS CloudFormation, which is a service that helps you model and set up your AWS resources so that you can spend less time creating and managing your resources and infrastructure. You create a template that describes all the AWS resources that you want (such as automation rules), and CloudFormation provisions and configures those resources for you.

When you use CloudFormation, you can reuse your template to set up your Security Hub CSPM resources consistently and repeatedly. Describe your resources once, and then provision the same resources over and over in multiple AWS accounts and Regions.

Security Hub CSPM and CloudFormation templates

To provision and configure resources for Security Hub CSPM and related services, you must understand how CloudFormation templates work. Templates are text files in JSON or YAML format. These templates describe the resources that you want to provision in your CloudFormation stacks.

If you're unfamiliar with JSON or YAML, you can use CloudFormation Designer to help you get started with CloudFormation templates. For more information, see What is CloudFormation Designer? in the *AWS CloudFormation User Guide*.

You can create CloudFormation templates for the following types of Security Hub CSPM resources:

- Enabling Security Hub CSPM
- Designating the delegated Security Hub CSPM administrator for an organization
- Specify the way your organization is configured in Security Hub CSPM
- Enabling a security standard
- Enabling cross-Region aggregation
- Creating a central configuration policy and associating it with accounts, organizational unit (OUs), or the root
- Creating a custom insight
- Creating an automation rule
- Customizing control parameters
- Subscribing to a third-party product integration

For more information, including examples of JSON and YAML templates for resources, see the AWS Security Hub CSPM resource type reference in the *AWS CloudFormation User Guide*.

Learn more about CloudFormation

To learn more about CloudFormation, see the following resources:

- AWS CloudFormation
- AWS CloudFormation User Guide
- CloudFormation API Reference
- AWS CloudFormation Command Line Interface User Guide

Subscribing to Security Hub CSPM announcements with Amazon SNS

This section provides information about subscribing to AWS Security Hub CSPM announcements with Amazon Simple Notification Service (Amazon SNS) to receive notifications about Security Hub CSPM.

After subscribing, you will receive notifications about the following events (note the corresponding `AnnouncementType` for each event):

- `NEW_STANDARDS_CONTROLS` – New Security Hub CSPM controls or standards have been added.
- `RETIRED_STANDARDS_CONTROLS` – Existing Security Hub CSPM controls or standards have been retired.

Notifications are available in all formats that Amazon SNS supports. You can subscribe to Security Hub CSPM announcements in all AWS Regions that Security Hub CSPM is available in.

A user must have `Subscribe` permissions to subscribe to an Amazon SNS topic. You can achieve this with Amazon SNS policies, IAM policies, or both. For more information, see IAM and Amazon SNS policies together in the *Amazon Simple Notification Service Developer Guide*.

> **Note**
>
> Security Hub CSPM sends Amazon SNS announcements about updates to the Security Hub CSPM service to any subscribed AWS account. To receive notifications about Security Hub CSPM findings, see Reviewing finding details and history in Security Hub CSPM.

You can subscribe to an Amazon Simple Queue Service (Amazon SQS) queue for an Amazon SNS topic, but you must use an Amazon SNS topic Amazon Resource Name (ARN) that is in the same Region. For more information, see Subscribing a queue to an Amazon SNS topic in the *Amazon Simple Queue Service Developer Guide*.

You can also use an AWS Lambda function to invoke events when you receive notifications. For more information, including sample function code, see Tutorial: Using AWS Lambda with Amazon Simple Notification Service in the *AWS Lambda Developer Guide*.

The Amazon SNS topic ARNs for each Region are as follows.

AWS Region	Amazon SNS topic ARN
US East (Ohio)	arn:aws:sns:us-east-2:291342846459:SecurityHubAnnouncements
US East (N. Virginia)	arn:aws:sns:us-east-1:088139225913:SecurityHubAnnouncements
US West (N. California)	arn:aws:sns:us-west-1:137690824926:SecurityHubAnnouncements
US West (Oregon)	arn:aws:sns:us-west-2:393883065485:SecurityHubAnnouncements
Africa (Cape Town)	arn:aws:sns:af-south-1:463142546776:SecurityHubAnnouncements
Asia Pacific (Hong Kong)	arn:aws:sns:ap-east-1:464812404305:SecurityHubAnnouncements
Asia Pacific (Hyderabad)	arn:aws:sns:ap-south-2:849907286123:SecurityHubAnnouncements
Asia Pacific (Jakarta)	arn:aws:sns:ap-southeast-3:627843640627:SecurityHubAnnouncements
Asia Pacific (Mumbai)	arn:aws:sns:ap-south-1:707356269775:SecurityHubAnnouncements

AWS Region	Amazon SNS topic ARN
Asia Pacific (Osaka)	arn:aws:sns:ap-northeast-3:633550238216:SecurityHubAnnouncements
Asia Pacific (Seoul)	arn:aws:sns:ap-northeast-2:374299265323:SecurityHubAnnouncements
Asia Pacific (Singapore)	arn:aws:sns:ap-southeast-1:512267288502:SecurityHubAnnouncements
Asia Pacific (Sydney)	arn:aws:sns:ap-southeast-2:475730049140:SecurityHubAnnouncements
Asia Pacific (Tokyo)	arn:aws:sns:ap-northeast-1:592469075483:SecurityHubAnnouncements
Canada (Central)	arn:aws:sns:ca-central-1:137749997395:SecurityHubAnnouncements
China (Beijing)	arn:aws-cn:sns:cn-north-1:672341567257:SecurityHubAnnouncements

Europe (Zurich)	arn:aws:sns:eu-central-2:704347005078:SecurityHubAnnouncements
Israel (Tel Aviv)	arn:aws:sns:il-central-1:726652212146:SecurityHubAnnouncements
Middle East (Bahrain)	arn:aws:sns:me-south-1:585146626860:SecurityHubAnnouncements

AWS Region	Amazon SNS topic ARN
Middle East (UAE)	`arn:aws:sns:me-central-1:431548502100:SecurityHubAnnouncements`
South America (São Paulo)	`arn:aws:sns:sa-east-1:359811883282:SecurityHubAnnouncements`
AWS GovCloud (US-East)	`arn:aws-us-gov:sns:us-gov-east-1:239368469855:SecurityHubAnnouncements`
AWS GovCloud (US-West)	`arn:aws-us-gov:sns:us-gov-west-1:239334163374:SecurityHubAnnouncements`

Messages are typically the same across Regions within a partition, so you can subscribe to one Region in each partition to receive announcements that affect all Regions in that partition. Announcements associated with member accounts are not replicated in the administrator account. As a result, each account, including the administrator account, will only have one copy of each announcement. You can decide which account you want to use to subscribe to Security Hub CSPM announcements.

For information about the cost of subscribing to Security Hub CSPM announcements, see Amazon SNS pricing.

Subscribing to Security Hub CSPM announcements (console)

1. Open the Amazon SNS console at https://console.aws.amazon.com/sns/v3/home.
2. In the Region list, choose the Region in which you want to subscribe to Security Hub CSPM announcements. This example uses the `us-west-2` Region.
3. In the navigation pane, choose **Subscriptions**, and then choose **Create subscription**.
4. Enter the topic ARN into the **Topic ARN** box. For example, `arn:aws:sns:us-west-2:393883065485:SecurityHubAnnouncements`.

5. For **Protocol**, choose how you want to receive Security Hub CSPM announcements. If you choose **Email**, for **Endpoint**, enter the email address that you want to use to receive announcements.
6. Choose **Create subscription**.
7. Confirm the subscription. For example, if you chose email protocol, Amazon SNS will send a subscription confirmation message to the email you provided.

Subscribing to Security Hub CSPM announcements (AWS CLI)

1. Run the following command:

```
 aws  sns --region us-west-2 subscribe --topic-arn arn:aws:sns:us-
west-2:393883065485:SecurityHubAnnouncements --protocol email --notification-
endpoint your_email@your_domain.com
```

2. Confirm the subscription. For example, if you chose email protocol, Amazon SNS will send a subscription confirmation message to the email you provided.

Amazon SNS message format

The following examples show Security Hub CSPM announcements from Amazon SNS about the introduction of new security controls. Message content varies based on announcement type, but the format is the same for all announcement types. Optionally, a `Link` field that provides details about the announcement may be included.

Example: Security Hub CSPM announcement for new controls (email protocol)

```
{
"AnnouncementType":"NEW_STANDARDS_CONTROLS",
"Title":"[New Controls] 36 new Security Hub CSPM controls added to the AWS Foundational
 Security Best Practices standard",
"Description":"We have added 36 new controls to the AWS Foundational Security Best
 Practices standard. These include controls for Amazon Auto Scaling (AutoScaling.3,
 AutoScaling.4, AutoScaling.6), CloudFormation (CloudFormation.1), Amazon CloudFront
 (CloudFront.10), Amazon Elastic Compute Cloud (Amazon EC2) (EC2.23, EC2.24, EC2.27),
 Amazon Elastic Container Registry (Amazon ECR) (ECR.1, ECR.2), Amazon Elastic
 Container Service (Amazon ECS) (ECS.3, ECS.4, ECS.5, ECS.8, ECS.10, ECS.12), Amazon
 Elastic File System (Amazon EFS) (EFS.3, EFS.4), Amazon Elastic Kubernetes Service
 (Amazon EKS) (EKS.2), Elastic Load Balancing (ELB.12, ELB.13, ELB.14), Amazon
```

```
 Kinesis (Kinesis.1), AWS Network Firewall (NetworkFirewall.3, NetworkFirewall.4,
 NetworkFirewall.5), Amazon OpenSearch Service (OpenSearch.7), Amazon Redshift
 (Redshift.9),
Amazon Simple Storage Service (Amazon S3) (S3.13), Amazon Simple Notification Service
 (SNS.2), AWS WAF (WAF.2, WAF.3, WAF.4, WAF.6, WAF.7, WAF.8). If you enabled the AWS
 Foundational Security Best Practices standard in an account and configured Security
 Hub CSPM to automatically enable new controls, these controls are enabled by default.
 Availability of controls can vary by Region. "
}
```

Example: Security Hub CSPM announcement for new controls (email-JSON protocol)

```
{
  "Type" : "Notification",

Disabling Security Hub CSPM

You can disable AWS Security Hub CSPM by using the Security Hub CSPM console or the Security Hub API. If you disable Security Hub CSPM, you can enable it again later.

If your organization uses central configuration, the delegated Security Hub CSPM administrator can create configuration policies that disable Security Hub CSPM for specific accounts and organizational units (OUs) and keep Security Hub CSPM enabled for others. Configuration policies affect the home Region and all linked Regions. For more information, see Understanding central configuration in Security Hub CSPM.

If you disable Security Hub CSPM for an account, the following occurs:

- All Security Hub CSPM standards and controls are disabled for the account.
- Security Hub CSPM stops generating, updating, and ingesting findings for the account.
- After 30 days, Security Hub CSPM permanently deletes all existing archived findings for the account. The findings cannot be recovered by using Security Hub CSPM.
- After 90 days, Security Hub CSPM permanently deletes all existing active findings for the account. The findings cannot be recovered by using Security Hub CSPM.
- After 90 days, Security Hub CSPM permanently deletes all existing insights and Security Hub CSPM configuration settings for the account. The data and settings cannot be recovered.

To retain existing findings, you can export the findings to an S3 bucket before you disable Security Hub CSPM. You can do this by using a custom action with an Amazon EventBridge rule. For more information, see Using EventBridge for automated response and remediation.

If you re-enable Security Hub CSPM within 90 days of disabling it for an account, you regain access to existing active findings, as well as insights and Security Hub CSPM configuration settings for the account. If you re-enable Security Hub CSPM within 30 days, you also regain access to existing archived findings for the account. However, existing findings might be inaccurate because they

will reflect the state of your AWS environment when you disabled Security Hub CSPM. In addition, as you re-enable individual standards and controls, Security Hub CSPM might initially generate duplicate findings for specific AWS resources, depending on the standards and controls that you enable. For these reasons, we recommend that you do one of the following:

- Change the workflow status of all existing findings to `RESOLVED` before you disable Security Hub CSPM. For more information, see Setting the workflow status of findings.
- Disable all standards at least six days before you disable Security Hub CSPM. Security Hub CSPM then archives all existing findings on a best-effort basis, typically within three to five days. For more information, see Disabling a standard.

You can't disable Security Hub CSPM in the following cases:

- Your account is the delegated Security Hub CSPM administrator account for an organization. If you use central configuration, you can't associate a configuration policy that disables Security Hub CSPM for the delegated administrator account. The association can succeed for other accounts, but Security Hub CSPM doesn't apply the policy to the delegated administrator account.
- Your account is a Security Hub CSPM administrator account by invitation, and you have member accounts. Before you can disable Security Hub CSPM, you must disassociate all of your member accounts. To learn how, see the section called “Disassociating member accounts”.

Before the owner of a member account can disable Security Hub CSPM, the account must disassociate from its administrator account. For an organization account, only the administrator account can disassociate a member account. For more information, see the section called “Disassociating organization member accounts”. For a manually invited account, either the administrator account or the member account can disassociate the account. For more information, see the section called “Disassociating member accounts” or the section called “Disassociating from an administrator account”. Disassociation isn't required if you use central configuration because the Security Hub CSPM administrator can create a policy that disables Security Hub CSPM for specific member accounts.

When you disable Security Hub CSPM for an account, it's disabled only in the current AWS Region. However, if you use central configuration to disable Security Hub CSPM for specific accounts, it's disabled in the home Region and all linked Regions.

To disable Security Hub CSPM, choose your preferred method and follow the steps.

Security Hub CSPM console

Follow these steps to disable Security Hub CSPM by using the console.

To disable Security Hub CSPM

1. Open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. In the navigation pane, under **Settings**, choose **General**.
3. In the **Disable Security Hub CSPM** section, choose **Disable Security Hub CSPM**.
4. When prompted for confirmation, choose **Disable Security Hub CSPM**.

Security Hub API

To disable Security Hub CSPM programmatically, use the DisableSecurityHub operation of the AWS Security Hub API. Or, if you're using the AWS CLI, run the disable-security-hub command. For example, the following command disables Security Hub CSPM in the current AWS Region:

```
$ aws securityhub disable-security-hub
```

Security in AWS Security Hub CSPM

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS compliance programs. To learn about the compliance programs that apply to AWS Security Hub CSPM, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Security Hub CSPM. The following topics show you how to configure Security Hub CSPM to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Security Hub CSPM resources.

Topics

- Data protection in AWS Security Hub CSPM
- AWS Identity and Access Management for Security Hub CSPM
- Compliance validation for AWS Security Hub CSPM
- Resilience in AWS Security Hub
- Infrastructure security in AWS Security Hub CSPM
- AWS Security Hub CSPM and interface VPC endpoints (AWS PrivateLink)

Data protection in AWS Security Hub CSPM

The AWS shared responsibility model applies to data protection in AWS Security Hub CSPM. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see Data Privacy FAQ. For information about data protection in Europe, see the General Data Protection Regulation (GDPR) Center.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.

- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Security Hub CSPM or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Security Hub CSPM is a multi-tenant service offering. To ensure data protection, Security Hub CSPM encrypts data at rest and data in transit between component services.

AWS Identity and Access Management for Security Hub CSPM

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Security Hub resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- How Security Hub works with IAM
- Identity-based policy examples for AWS Security Hub CSPM
- Service-linked roles for AWS Security Hub CSPM
- AWS managed policies for Security Hub
- Troubleshooting AWS Security Hub CSPM identity and access

Audience

How you use AWS Identity and Access Management (IAM) differs based on your role:

- **Service user** - request permissions from your administrator if you cannot access features (see Troubleshooting AWS Security Hub CSPM identity and access)
- **Service administrator** - determine user access and submit permission requests (see How Security Hub works with IAM)
- **IAM administrator** - write policies to manage access (see Identity-based policy examples for AWS Security Hub CSPM)

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated as the AWS account root user, an IAM user, or by assuming an IAM role.

You can sign in as a federated identity using credentials from an identity source like AWS IAM Identity Center (IAM Identity Center), single sign-on authentication, or Google/Facebook credentials. For more information about signing in, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

For programmatic access, AWS provides an SDK and CLI to cryptographically sign requests. For more information, see AWS Signature Version 4 for API requests in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity called the AWS account *root user* that has complete access to all AWS services and resources. We strongly recommend that you don't use the root user for everyday tasks. For tasks that require root user credentials, see Tasks that require root user credentials in the *IAM User Guide*.

Federated identity

As a best practice, require human users to use federation with an identity provider to access AWS services using temporary credentials.

A *federated identity* is a user from your enterprise directory, web identity provider, or Directory Service that accesses AWS services using credentials from an identity source. Federated identities assume roles that provide temporary credentials.

For centralized access management, we recommend AWS IAM Identity Center. For more information, see What is IAM Identity Center? in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An *IAM user* is an identity with specific permissions for a single person or application. We recommend using temporary credentials instead of IAM users with long-term credentials. For more information, see Require human users to use federation with an identity provider to access AWS using temporary credentials in the *IAM User Guide*.

An *IAM group* specifies a collection of IAM users and makes permissions easier to manage for large sets of users. For more information, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity with specific permissions that provides temporary credentials. You can assume a role by switching from a user to an IAM role (console) or by calling an AWS CLI or AWS API operation. For more information, see Methods to assume a role in the *IAM User Guide*.

IAM roles are useful for federated user access, temporary IAM user permissions, cross-account access, cross-service access, and applications running on Amazon EC2. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy defines permissions when associated with an identity or resource. AWS evaluates these policies when a principal makes a request. Most policies are stored in AWS as JSON documents. For more information about JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Using policies, administrators specify who has access to what by defining which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. An IAM administrator creates IAM policies and adds them to roles, which users can then assume. IAM policies define permissions regardless of the method used to perform the operation.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you attach to an identity (user, group, or role). These policies control what actions identities can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be *inline policies* (embedded directly into a single identity) or *managed policies* (standalone policies attached to multiple identities). To learn how to choose between managed and inline policies, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples include IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. You must specify a principal in a resource-based policy.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Other policy types

AWS supports additional policy types that can set the maximum permissions granted by more common policy types:

- **Permissions boundaries** – Set the maximum permissions that an identity-based policy can grant to an IAM entity. For more information, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – Specify the maximum permissions for an organization or organizational unit in AWS Organizations. For more information, see Service control policies in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – Set the maximum available permissions for resources in your accounts. For more information, see Resource control policies (RCPs) in the *AWS Organizations User Guide*.
- **Session policies** – Advanced policies passed as a parameter when creating a temporary session for a role or federated user. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

How Security Hub works with IAM

Before you use AWS Identity and Access Management (IAM) to manage access to AWS Security Hub CSPM, learn which IAM features are available to use with Security Hub CSPM.

IAM features you can use with AWS Security Hub CSPM

IAM feature	Security Hub CSPM support
Identity-based policies	Yes
Resource-based policies	No
Policy actions	Yes
Policy resources	No
Policy condition keys	Yes
Access control lists (ACLs)	No
Attribute-based access control (ABAC) – tags in policies	Yes
Temporary credentials	Yes
Forward access sessions (FAS)	Yes
Service roles	No
Service-linked roles	Yes

For a high-level view of how Security Hub CSPM and other AWS services work with most IAM features, see AWS services that work with IAM in the *IAM User Guide*.

Identity-based policies for Security Hub CSPM

Supports identity-based policies: Yes

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can

perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. To learn about all of the elements that you can use in a JSON policy, see IAM JSON policy elements reference in the *IAM User Guide*.

Security Hub CSPM supports identity-based policies. For more information, see Identity-based policy examples for AWS Security Hub CSPM.

Resource-based policies for Security Hub CSPM

Supports resource-based policies: No

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Security Hub CSPM does not support resource-based policies. You can't attach an IAM policy directly to a Security Hub CSPM resource.

Policy actions for Security Hub CSPM

Supports policy actions: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Action` element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in Security Hub CSPM use the following prefix before the action:

```
securityhub:
```

For example, to grant a user permission to enable Security Hub CSPM, which is an action that corresponds to the `EnableSecurityHub` operation of the Security Hub CSPM API, include the `securityhub:EnableSecurityHub` action in their policy. Policy statements must include either an `Action` or `NotAction` element. Security Hub CSPM defines its own set of actions that describe tasks that you can perform with this service.

```
"Action": "securityhub:EnableSecurityHub"
```

To specify multiple actions in a single statement, separate them with commas. For example:

```
"Action": [
      "securityhub:EnableSecurityHub",
      "securityhub:BatchEnableStandards"
```

You can also specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word `Get`, include the following action:

```
"Action": "securityhub:Get*"
```

However, as a best practice, you should create policies that follow the principle of least privilege. In other words, you should create policies that include only the permissions that are required to perform a specific task.

The user must have access to the `DescribeStandardsControl` operation in order to have access to `BatchGetSecurityControls`, `BatchGetStandardsControlAssociations`, and `ListStandardsControlAssociations`.

The user must have access to the `UpdateStandardsControls` operation in order to have access to `BatchUpdateStandardsControlAssociations`, and `UpdateSecurityControl`.

For a list of Security Hub CSPM actions, see Actions defined by AWS Security Hub CSPM in the *Service Authorization Reference*. For examples of policies that specify Security Hub CSPM actions, see Identity-based policy examples for AWS Security Hub CSPM.

Policy resources for Security Hub CSPM

Supports policy resources: No

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Resource` JSON policy element specifies the object or objects to which the action applies. As a best practice, specify a resource using its Amazon Resource Name (ARN). For actions that don't support resource-level permissions, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

Security Hub CSPM defines the following resource types:

- Hub
- Product
- Finding aggregator, also referred to as a *cross-Region aggregator*
- Automation rule
- Configuration policy

You can specify these types of resources in policies by using ARNs.

For a list of Security Hub CSPM resource types and the ARN syntax for each one, see Resource types defined by AWS Security Hub CSPM in the *Service Authorization Reference*. To learn which actions you can specify for each type of resource, see Actions defined by AWS Security Hub CSPM in the *Service Authorization Reference*. For examples of policies that specify resources, see Identity-based policy examples for AWS Security Hub CSPM.

Policy condition keys for Security Hub CSPM

Supports service-specific policy condition keys: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Condition` element specifies when statements execute based on defined criteria. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request. To see all AWS global condition keys, see AWS global condition context keys in the *IAM User Guide*.

For a list of Security Hub CSPM condition keys, see Condition keys for AWS Security Hub CSPM in the *Service Authorization Reference*. To learn which actions and resources you can use a condition key with, see Actions defined by AWS Security Hub CSPM. For examples of policies that use condition keys, see Identity-based policy examples for AWS Security Hub CSPM.

Access control lists (ACLs) in Security Hub CSPM

Supports ACLs: No

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Security Hub CSPM doesn't support ACLs, which means you can't attach an ACL to a Security Hub CSPM resource.

Attribute-based access control (ABAC) with Security Hub CSPM

Supports ABAC (tags in policies): Yes

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes called tags. You can attach tags to IAM entities and AWS resources, then design ABAC policies to allow operations when the principal's tag matches the tag on the resource.

To control access based on tags, you provide tag information in the condition element of a policy using the `aws:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys.

If a service supports all three condition keys for every resource type, then the value is **Yes** for the service. If a service supports all three condition keys for only some resource types, then the value is **Partial**.

For more information about ABAC, see Define permissions with ABAC authorization in the *IAM User Guide*. To view a tutorial with steps for setting up ABAC, see Use attribute-based access control (ABAC) in the *IAM User Guide*.

You can attach tags to Security Hub CSPM resources. You can also control access to resources by providing tag information in the `Condition` element of a policy.

For information about tagging Security Hub CSPM resources, see Tagging Security Hub resources. For an example of an identity-based policy that controls access to a resource based on tags, see Identity-based policy examples for AWS Security Hub CSPM.

Using temporary credentials with Security Hub CSPM

Supports temporary credentials: Yes

Temporary credentials provide short-term access to AWS resources and are automatically created when you use federation or switch roles. AWS recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see Temporary security credentials in IAM and AWS services that work with IAM in the *IAM User Guide*.

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as AssumeRole or GetFederationToken.

Security Hub CSPM supports the use of temporary credentials.

Forward access sessions for Security Hub CSPM

Supports forward access sessions (FAS): Yes

Forward access sessions (FAS) use the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. For policy details when making FAS requests, see Forward access sessions.

For example, Security Hub CSPM makes FAS requests to downstream AWS services when you integrate Security Hub CSPM with AWS Organizations and when you designate the delegated Security Hub CSPM administrator account for an organization in Organizations.

For other tasks, Security Hub CSPM uses a service-linked role to perform actions on your behalf. For details about this role, see Service-linked roles for AWS Security Hub CSPM.

Service roles for Security Hub CSPM

Security Hub CSPM doesn't assume or use service roles. To perform actions on your behalf, Security Hub CSPM uses a service-linked role. For details about this role, see Service-linked roles for AWS Security Hub CSPM.

> **Warning**
>
> Changing the permissions for a service role may create operational issues with your use of Security Hub CSPM. Edit service roles only when Security Hub CSPM provides guidance to do so.

Service-linked roles for Security Hub CSPM

Supports service-linked roles: Yes

A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

Security Hub CSPM uses a service-linked role to perform actions on your behalf. For details about this role, see Service-linked roles for AWS Security Hub CSPM.

Identity-based policy examples for AWS Security Hub CSPM

By default, users and roles don't have permission to create or modify Security Hub CSPM resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the users or groups that require those permissions.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating Policies on the JSON Tab in the *IAM User Guide*.

Topics

- Example: Allow users to view findings
- Example: Allow users to create and manage automation rules

Policy best practices

Identity-based policies determine whether someone can create, access, or delete Security Hub resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the *AWS managed policies*

that grant permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the *IAM User Guide*.

- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as *least-privilege permissions*. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the *IAM User Guide*.
- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as CloudFormation. For more information, see IAM JSON policy elements: Condition in the *IAM User Guide*.
- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see Validate policies with IAM Access Analyzer in the *IAM User Guide*.
- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or a root user in your AWS account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Secure API access with MFA in the *IAM User Guide*.

For more information about best practices in IAM, see Security best practices in IAM in the *IAM User Guide*.

Using the Security Hub CSPM console

To access the AWS Security Hub CSPM console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the Security Hub CSPM resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (users or roles) with that policy.

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that they're trying to perform.

To ensure that those users and roles can use the Security Hub CSPM console, also attach the following AWS managed policy to the entity. For more information, see Adding permissions to a user in the *IAM User Guide*:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "securityhub:*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:CreateServiceLinkedRole",
            "Resource": "*",
            "Condition": {
                "StringLike": {
                    "iam:AWSServiceName": "securityhub.amazonaws.com"
                }
            }
        }
    ]
}
```

Example: Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",
            "Action": [
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:ListAttachedUserPolicies",
                "iam:ListUserPolicies",
                "iam:GetUser"
            ],
            "Resource": ["arn:aws:iam::*:user/${aws:username}"]
        },
        {
            "Sid": "NavigateInConsole",
            "Effect": "Allow",
            "Action": [
                "iam:GetGroupPolicy",
                "iam:GetPolicyVersion",
                "iam:GetPolicy",
                "iam:ListAttachedGroupPolicies",
                "iam:ListGroupPolicies",
                "iam:ListPolicyVersions",
                "iam:ListPolicies",
                "iam:ListUsers"
            ],
            "Resource": "*"
        }
    ]
}
```

Example: Allow users to create and manage a configuration policy

This example shows how you might create an IAM policy that allows a user to create, view, update, and delete configuration policies. This example policy also allows the user to start, stop, and view policy associations. For this IAM policy to work, the user must be the delegated Security Hub CSPM administrator for an organization.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "CreateAndUpdateConfigurationPolicy",
            "Effect": "Allow",
            "Action": [
                "securityhub:CreateConfigurationPolicy",
                "securityhub:UpdateConfigurationPolicy"
            ],
            "Resource": "*"
        },
        {
            "Sid": "ViewConfigurationPolicy",
            "Effect": "Allow",
            "Action": [
                "securityhub:GetConfigurationPolicy",
                "securityhub:ListConfigurationPolicies"
            ],
            "Resource": "*"
        },
        {
            "Sid": "DeleteConfigurationPolicy",
            "Effect": "Allow",
            "Action": [
                "securityhub:DeleteConfigurationPolicy"
            ],
            "Resource": "*"
        },
        {
            "Sid": "ViewConfigurationPolicyAssociation",
            "Effect": "Allow",
            "Action": [
                "securityhub:BatchGetConfigurationPolicyAssociations",
                "securityhub:GetConfigurationPolicyAssociation",
                "securityhub:ListConfigurationPolicyAssociations"
            ],
            "Resource": "*"
        },
        {
            "Sid": "UpdateConfigurationPolicyAssociation",
            "Effect": "Allow",
            "Action": [
                "securityhub:StartConfigurationPolicyAssociation",
                "securityhub:StartConfigurationPolicyDisassociation"
            ],
            "Resource": "*"
```

```
        }
    ]
}
```

Example: Allow users to view findings

This example shows how you might create an IAM policy that allows a user to view Security Hub CSPM findings.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ReviewFindings",
            "Effect": "Allow",
            "Action": [
                "securityhub:GetFindings"
            ],
            "Resource": "*"
        }
    ]
}
```

Example: Allow users to create and manage automation rules

This example shows how you might create an IAM policy that allows a user to create, view, update, and delete Security Hub CSPM automation rules. For this IAM policy to work, the user must be a Security Hub CSPM administrator. To limit permissions— for example, to allow a user to only view automation rules—you can remove the create, update, and delete permissions.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "CreateAndUpdateAutomationRules",
```

```
            "Effect": "Allow",
            "Action": [
                "securityhub:CreateAutomationRule",
                "securityhub:BatchUpdateAutomationRules"
            ],
            "Resource": "*"
        },
        {
            "Sid": "ViewAutomationRules",
            "Effect": "Allow",
            "Action": [
                "securityhub:BatchGetAutomationRules",
                "securityhub:ListAutomationRules"
            ],
            "Resource": "*"
        },
        {
            "Sid": "DeleteAutomationRules",
            "Effect": "Allow",
            "Action": [
                "securityhub:BatchDeleteAutomationRules"
            ],
            "Resource": "*"
        }
    ]
}
```

Service-linked roles for AWS Security Hub CSPM

AWS Security Hub CSPM uses an AWS Identity and Access Management (IAM) service-linked role named `AWSServiceRoleForSecurityHub`. This service-linked role is an IAM role that's linked directly to Security Hub CSPM. It's predefined by Security Hub CSPM, and it includes all the permissions that Security Hub CSPM requires to call other AWS services and monitor AWS resources on your behalf. Security Hub CSPM uses this service-linked role in all the AWS Regions where Security Hub CSPM is available.

A service-linked role makes setting up Security Hub CSPM easier because you don't have to manually add the necessary permissions. Security Hub CSPM defines the permissions of its service-linked role, and unless defined otherwise, only Security Hub CSPM can assume the role. The defined permissions include the trust policy and the permissions policy, and you can't attach that permissions policy to any other IAM entity.

To review the details of the service-linked role, you can use the Security Hub CSPM console. In the navigation pane, choose **General** under **Settings**. Then, in the **Service permissions** section, choose **View service permissions**.

You can delete the Security Hub CSPM service-linked role only after you disable Security Hub CSPM in all the Regions where it's enabled. This protects your Security Hub CSPM resources because you can't inadvertently remove permissions to access them.

For information about other services that support service-linked roles, see AWS services that work with IAM in the *IAM User Guide* and locate the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to review the service-linked role documentation for that service.

Topics

- Service-linked role permissions for Security Hub CSPM
- Creating a service-linked role for Security Hub CSPM
- Editing a service-linked role for Security Hub CSPM
- Deleting a service-linked role for Security Hub CSPM

Service-linked role permissions for Security Hub CSPM

Security Hub CSPM uses the service-linked role named `AWSServiceRoleForSecurityHub`. It's a service-linked role required for AWS Security Hub CSPM to access your resources. This service-linked role allows Security Hub CSPM to perform tasks such as receive findings from other AWS services and configure the requisite AWS Config infrastructure to run security checks for controls. The `AWSServiceRoleForSecurityHub` service-linked role trusts the `securityhub.amazonaws.com` service to assume the role.

The `AWSServiceRoleForSecurityHub` service-linked role uses the managed policy `AWSSecurityHubServiceRolePolicy`.

You must grant permissions to allow an IAM identity (such as a role, group, or user) to create, edit, or delete a service-linked role. For the `AWSServiceRoleForSecurityHub` service-linked role to be successfully created, the IAM identity that you use to access Security Hub CSPM must have the required permissions. To grant the required permissions, attach the following policy to the IAM identity.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "securityhub:*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:CreateServiceLinkedRole",
            "Resource": "*",
            "Condition": {
                "StringLike": {
                    "iam:AWSServiceName": "securityhub.amazonaws.com"
                }
            }
        }
    ]
}
```

Creating a service-linked role for Security Hub CSPM

The `AWSServiceRoleForSecurityHub` service-linked role is created automatically when you enable Security Hub CSPM for the first time or you enable Security Hub CSPM in a Region where you didn't previously enable it. You can also create the `AWSServiceRoleForSecurityHub` service-linked role manually by using the IAM console, the IAM CLI, or the IAM API. For more information about creating the role manually, see Creating a service-linked role in the *IAM User Guide*.

> **Important**
>
> The service-linked role that's created for a Security Hub CSPM administrator account doesn't apply to associated Security Hub CSPM member accounts.

Editing a service-linked role for Security Hub CSPM

Security Hub CSPM doesn't allow you to edit the `AWSServiceRoleForSecurityHub` service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role by using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting a service-linked role for Security Hub CSPM

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete the role. That way, you don't have an unused entity that isn't actively monitored or maintained.

When you disable Security Hub CSPM, Security Hub CSPM doesn't automatically delete the `AWSServiceRoleForSecurityHub` service-linked role for you. If you enable Security Hub CSPM again, the service can then start using the existing service-linked role again. If you no longer need to use Security Hub CSPM, you can manually delete the service-linked role.

> **Important**
>
> Before you delete the `AWSServiceRoleForSecurityHub` service-linked role, you must first disable Security Hub CSPM in all the Regions where it's enabled. For more information, see Disabling Security Hub CSPM. If Security Hub CSPM isn't disabled when you try to delete the service-linked role, the deletion fails.

To delete the `AWSServiceRoleForSecurityHub` service-linked role, you can use the IAM console, the IAM CLI, or the IAM API. For more information, see Deleting a service-linked role in the *IAM User Guide*.

AWS managed policies for Security Hub

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that AWS managed policies might not grant least-privilege permissions for your specific use cases because they're available for all AWS customers to use. We recommend that you reduce permissions further by defining customer managed policies that are specific to your use cases.

You cannot change the permissions defined in AWS managed policies. If AWS updates the permissions defined in an AWS managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. AWS is most likely to update an AWS managed policy when a new AWS service is launched or new API operations become available for existing services.

For more information, see AWS managed policies in the *IAM User Guide*.

AWS managed policy: AWSSecurityHubFullAccess

You can attach the `AWSSecurityHubFullAccess` policy to your IAM identities.

This policy grants administrative permissions that allow a principal full access to all Security Hub CSPM actions. This policy must be attached to a principal before they enable Security Hub CSPM manually for their account. For example, principals with these permissions can both view and update the status of findings. They can also configure custom insights, enable integrations, and enable and disable standards and controls. Principals for an administrator account can also manage member accounts.

Permissions details

This policy includes the following permissions:

- `securityhub` – Allows principals full access to all Security Hub CSPM actions.
- `guardduty` – Allows principals perform full lifecycle management of a detector, organization admin management, member account mnagement, and organiation-wide configuration in Amazon GuardDuty. This includes API actions: GetDetector, ListDetector, CreateDetector, UpdateDetector, DeleteDetector, EnableOrganizationAdminAccount, ListOrganizationAdminAccounts, CreateMembers, UpdateOrganizationConfiguration, DescribeOrganizationConfiguration.
- `iam` – Allows principals to create a service-linked role for Security Hub CSPM and Security Hub and to get roles, policies, and policy versions.
- `inspector` – Allows principals to get information about account status, enable or disable, delegate admin management, and perform organization configuration management in Amazon Inspector. This includes API actions: BatchGetAccountStatus, Enable, Disable, EnableDelegatedAdminAccount, DisableDelegatedAdminAccount, ListDelegatedAdminAccounts, UpdateOrganizationConfiguration, DescribeOrganizationConfiguration.
- `pricing` – Allows principals to get a price list of AWS services and products.

- `account` – Allows principals to get information about account Regions to support Region management in Security Hub.

To review the permissions for this policy, see AWSSecurityHubFullAccess in the *AWS Managed Policy Reference Guide*.

AWS managed policy: AWSSecurityHubReadOnlyAccess

You can attach the `AWSSecurityHubReadOnlyAccess` policy to your IAM identities.

This policy grants read-only permissions that allow users to view information in Security Hub CSPM. Principals with this policy attached cannot make any updates in Security Hub CSPM. For example, principals with these permissions can view the list of findings associated with their account, but cannot change the status of a finding. They can view the results of insights, but cannot create or configure custom insights. They cannot configure controls or product integrations.

Permissions details

This policy includes the following permissions:

- `securityhub` – Allows users to perform actions that return a list of items or details about an item. This includes API operations that start with `Get`, `List`, or `Describe`.

To review the permissions for this policy, see AWSSecurityHubReadOnlyAccess in the *AWS Managed Policy Reference Guide*.

AWS managed policy: AWSSecurityHubOrganizationsAccess

You can attach the `AWSSecurityHubOrganizationsAccess` policy to your IAM identities.

This policy grants administrative permissions to enable and manage Security Hub, Security Hub CSPM, Amazon GuardDuty and Amazon Inspector for an organization in AWS Organizations. The permissions for this policy allow the organization management account to designate the delegated administrator account for Security Hub, Security Hub CSPM, Amazon GuardDuty and Amazon Inspector. They also allow the delegated administrator account to enable organization accounts as member accounts.

This policy only provides permissions for AWS Organizations. The organization management account and delegated administrator account also require permissions for associated actions. These permissions can be granted using the `AWSSecurityHubFullAccess` managed policy.

Creating or updating a delegated administrator policy in a management account requires additional permissions that are not provided in this policy. To perform these actions is is recommended to add permissions for `organizations:PutResourcePolicy` or attach the AWSOrganizationsFullAccess policy.

Permissions details

This policy includes the following permissions:

- `organizations:ListAccounts` – Allows principals to retrieve the list of accounts that are part of an organization.
- `organizations:DescribeOrganization` – Allows principals to retrieve information about the organization.
- `organizations:ListRoots` – Allows principals to list the root of an organization.
- `organizations:ListDelegatedAdministrators` – Allows principals to list the delegated administrator of an organization.
- `organizations:ListAWSServiceAccessForOrganization` – Allows principals to list the AWS services that an organization uses.
- `organizations:ListOrganizationalUnitsForParent` – Allows principals to list the child organizational units (OU) of a parent OU.
- `organizations:ListAccountsForParent` – Allows principals to list the child accounts of a parent OU.
- `organizations:ListParents` – Lists the root or organizational units (OUs) that serve as the immediate parent of the specified child OU or account.
- `organizations:DescribeAccount` – Allows principals to retrieve information about an account in the organization.
- `organizations:DescribeOrganizationalUnit` – Allows principals to retrieve information about an OU in the organization.
- `organizations:ListPolicies` – Retrieves the list of all policies in an organization of a specified type.
- `organizations:ListPoliciesForTarget` – Lists the policies that are directly attached to the specified target root, organizational unit (OU), or account.
- `organizations:ListTargetsForPolicy` – Lists all the roots, organizational units (OUs), and accounts that the specified policy is attached to.

- `organizations:EnableAWSServiceAccess` – Allows principals to enable the integration with Organizations.
- `organizations:RegisterDelegatedAdministrator` – Allows principals to designate the delegated administrator account.
- `organizations:DeregisterDelegatedAdministrator` – Allows principals to remove the delegated administrator account.
- `organizations:DescribePolicy` – Retrieves information about a policy.
- `organizations:DescribeEffectivePolicy` – Returns the contents of the effective policy for specified policy type and account.
- `organizations:CreatePolicy` – Creates a policy of a specified type that you can attach to a root, an organizational unit (OU), or an individual AWS account.
- `organizations:UpdatePolicy` – Updates an existing policy with a new name, description, or content.
- `organizations:DeletePolicy` – Deletes the specified policy from your organization.
- `organizations:AttachPolicy` – Attaches a policy to a root, an organizational unit (OU), or an individual account.
- `organizations:DetachPolicy` – Detaches a policy from a target root, organizational unit (OU), or account.
- `organizations:EnablePolicyType` – Enables a policy type in a root.
- `organizations:DisablePolicyType` – Disables an organizational policy type in a root.
- `organizations:TagResource` – Adds one or more tags to a specified resource.
- `organizations:UntagResource` – Removes any tags with the specified keys from a specified resource.
- `organizations:ListTagsForResource` – Lists tags that are attached to a specified resource.
- `organizations:DescribeResourcePolicy` – Retrieves information about a resource policy.

To review the permissions for this policy, see AWSSecurityHubOrganizationsAccess in the *AWS Managed Policy Reference Guide*.

AWS managed policy: AWSSecurityHubServiceRolePolicy

You can't attach `AWSSecurityHubServiceRolePolicy` to your IAM entities. This policy is attached to a service-linked role that allows Security Hub CSPM to perform actions on your behalf. For more information, see the section called “Service-linked roles”.

This policy grants administrative permissions that allow the service-linked role to perform tasks such as run security checks for Security Hub CSPM controls.

Permissions details

This policy includes the following permissions:

- `cloudtrail` – Retrieve information about CloudTrail trails.
- `cloudwatch` – Retrieve current CloudWatch alarms and Connector health metrics.
- `logs` – Retrieve metric filters for CloudWatch logs.
- `sns` – Retrieve the list of subscriptions to an SNS topic.
- `config` – Retrieve information about configuration recorders, resources, and AWS Config rules. Manage the Security Hub CSPM service-linked configuration recorders and third-party service-linked configuration recorders. Create and delete AWS Config rules, and run evaluations against the rules. List configuration recorders and get connector information to support third-party cloud integrations.
- `iam` – Retrieve and generate credential reports for accounts, and create the service-linked role for AWS Config.
- `organizations` – Retrieve account and organizational unit (OU) information for an organization.
- `securityhub` – Retrieve information about how the Security Hub CSPM service, standards, and controls are configured.
- `tag` – Retrieve information about resource tags.

To review the permissions for this policy, see AWSSecurityHubServiceRolePolicy in the *AWS Managed Policy Reference Guide*.

Security Hub updates to AWS managed policies

The following table provides details about updates to AWS managed policies for AWS Security Hub and Security Hub CSPM since this service began tracking these changes. For automatic alerts about updates to the policies, subscribe to the RSS feed on the Security Hub document history page.

Change	Description	Date
AWSSecurityHubServiceRolePolicy – Updated policy	Security Hub CSPM updated the policy to support third-party integration. The update adds the following permissions: manage third-party configuration recorders, list configuration recorders, get connector information, and retrieve Connector health metrics.	June 30, 2026
AWSSecurityHubServiceRolePolicy – Updated policy	Security Hub CSPM updated the policy to add permissions to manage Security Hub CSPM service-linked configuration recorders and create the AWS Config service-linked role.	April 29, 2026
AWSSecurityHubOrganizationsAccess – Updated policy	Security Hub updated the policy to add permissions to describe resource policies to support Security Hub features. Security Hub is in preview release and subject to change.	November 12, 2025
AWSSecurityHubFullAccess – Updated policy	Security Hub updated the policy to add capabilities around managing GuardDuty, Amazon Inspector, and account management to support Security Hub features. Security Hub is in	November 17, 2025

Change	Description	Date
	preview release and subject to change.	
AWSSecurityHubOrganizationsAccess – Update to an existing policy	Security Hub added new permissions to the policy. The permissions allow the organization management to enable and manage Security Hub and Security Hub CSPM for an organization.	June 17, 2025
AWSSecurityHubFullAccess – Update to an existing policy	Security Hub CSPM added new permissions that allow principals to create a service-linked role for Security Hub.	June 17, 2025
AWSSecurityHubFullAccess – Update to an existing policy	Security Hub CSPM updated the policy to get pricing details for AWS services and products.	April 24, 2024
AWSSecurityHubReadOnlyAccess – Update to an existing policy	Security Hub CSPM updated this managed policy by adding a `Sid` field.	February 22, 2024
AWSSecurityHubFullAccess – Update to an existing policy	Security Hub CSPM updated the policy so it can determine if Amazon GuardDuty and Amazon Inspector are enabled in an account. This helps customers bring together security-related information from multiple AWS services.	November 16, 2023

Change	Description	Date
AWSSecurityHubOrganizationsAccess – Update to an existing policy	Security Hub CSPM updated the policy to grant additional permissions to allow read-only access to AWS Organizations delegated administrator functionality. This includes details like the root, organizational units (OUs), accounts, organizational structure, and service access.	November 16, 2023
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM added the `BatchGetSecurityControls` , `DisassociateFromAdministratorAccount` , and `UpdateSecurityControl` permissions to read and update customizable security control properties.	November 26, 2023
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM added the `tag:GetResources` permission to read resource tags related to findings.	November 7, 2023
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM added the `BatchGetStandardsControlAssociations` permission to get information about the enablement status of a control in a standard.	September 27, 2023

Change	Description	Date
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM added new permissions to get AWS Organizations data and read and update Security Hub CSPM configurations, including standards and controls.	September 20, 2023
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM moved the existing `config:DescribeConfigRuleEvaluationStatus` permission to a different statement within the policy. The `config:DescribeConfigRuleEvaluationStatus` permission is now applied to all resources.	March 17, 2023
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM moved the existing `config:PutEvaluations` permission to a different statement within the policy. The `config:PutEvaluations` permission is now applied to all resources.	July 14, 2021
AWSSecurityHubServiceRolePolicy – Update to an existing policy	Security Hub CSPM added a new permission to allow the service-linked role to deliver evaluation results to AWS Config.	June 29, 2021

Change	Description	Date
AWSSecurityHubServiceRolePolicy – Added to the list of managed policies	Added information about the managed policy AWSSecurityHubServiceRolePolicy, which is used by the Security Hub CSPM service-linked role.	June 11, 2021
AWSSecurityHubOrganizationsAccess – New policy	Security Hub CSPM added a new policy that grants permissions that are needed for the Security Hub CSPM integration with Organizations.	March 15, 2021
Security Hub CSPM started tracking changes	Security Hub CSPM started tracking changes for its AWS managed policies.	March 15, 2021

Troubleshooting AWS Security Hub CSPM identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS Security Hub CSPM and IAM.

Topics

- I am not authorized to perform an action in Security Hub CSPM
- I am not authorized to perform iam:PassRole
- I want programmatic access to Security Hub CSPM
- I'm an administrator and want to allow others to access Security Hub CSPM
- I want to allow people outside my AWS account to access my Security Hub CSPM resources

I am not authorized to perform an action in Security Hub CSPM

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your sign-in credentials.

The following example error occurs when the user `mateojackson` tries to use the console to view details about a *`widget`* but does not have `securityhub:`*`GetWidget`* permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
 securityhub:GetWidget on resource: my-example-widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the *`my-example-widget`* resource using the `securityhub:`*`GetWidget`* action.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to Security Hub.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Security Hub. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want programmatic access to Security Hub CSPM

Users need programmatic access if they want to interact with AWS outside of the AWS Management Console. The way to grant programmatic access depends on the type of user that's accessing AWS.

To grant users programmatic access, choose one of the following options.

Which user needs programmatic access?	To	By
IAM	(Recommended) Use console credentials as temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Login for AWS local development in the *AWS Command Line Interface User Guide*. • For AWS SDKs, see Login for AWS local development in the *AWS SDKs and Tools Reference Guide*.
Workforce identity (Users managed in IAM Identity Center)	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Configuring the AWS CLI to use AWS IAM Identity Center in the *AWS Command Line Interface User Guide*. • For AWS SDKs, tools, and AWS APIs, see IAM Identity Center authentication in the *AWS SDKs and Tools Reference Guide*.
IAM	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions in Using temporary credentials with AWS resources in the *IAM User Guide*.

Which user needs programmatic access?	To	By
IAM	(Not recommended) Use long-term credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Authenticating using IAM user credentials in the *AWS Command Line Interface User Guide*. • For AWS SDKs and tools, see Authenticate using long-term credentials in the *AWS SDKs and Tools Reference Guide*. • For AWS APIs, see Managing access keys for IAM users in the *IAM User Guide*.

I'm an administrator and want to allow others to access Security Hub CSPM

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.

- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

I want to allow people outside my AWS account to access my Security Hub CSPM resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Security Hub supports these features, see How Security Hub works with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Compliance validation for AWS Security Hub CSPM

Our new AWS sign-up experience is not designed for regulated workloads. If you're using our new AWS sign-up experience, but you want to use AWS for regulated workloads, you can sign up for AWS (advanced) or activate advanced features for your AWS environment.

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more

information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Resilience in AWS Security Hub

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Infrastructure security in AWS Security Hub CSPM

As a managed service, AWS Security Hub CSPM is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access Security Hub CSPM through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

AWS Security Hub CSPM and interface VPC endpoints (AWS PrivateLink)

You can establish a private connection between your VPC and AWS Security Hub CSPM by creating an *interface VPC endpoint*. Interface endpoints are powered by AWS PrivateLink, a technology that enables you to privately access Security Hub CSPM APIs without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to communicate with Security Hub CSPM APIs. Traffic between your VPC and Security Hub CSPM does not leave the Amazon network.

Each interface endpoint is represented by one or more Elastic Network Interfaces in your subnets. For more information, see Access an AWS service using an interface VPC endpoint in the *Amazon Virtual Private Cloud Guide*.

Considerations for Security Hub CSPM VPC endpoints

Before you set up an interface VPC endpoint for Security Hub CSPM, ensure that you review the prerequisites and other information in the Amazon Virtual Private Cloud Guide.

Security Hub CSPM supports making calls to all of its API actions from your VPC.

Creating an interface VPC endpoint for Security Hub CSPM

You can create a VPC endpoint for the Security Hub CSPM service using either the Amazon VPC console or the AWS Command Line Interface (AWS CLI). For more information, see Create a VPC endpoint in the *Amazon Virtual Private Cloud Guide*.

Create a VPC endpoint for Security Hub CSPM using the following service name:

`com.amazonaws.`*`region`*`.securityhub`

Where *`region`* is the Region code for the applicable AWS Region.

If you enable private DNS for the endpoint, you can make API requests to Security Hub CSPM using its default DNS name for the Region, for example, `securityhub.us-east-1.amazonaws.com` for the US East (N. Virginia) Region.

Creating a VPC endpoint policy for Security Hub CSPM

You can attach an endpoint policy to your VPC endpoint that controls access to Security Hub CSPM. The policy specifies the following information:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Control access to VPC endpoints using endpoint policies in the *Amazon Virtual Private Cloud Guide*.

Example: VPC endpoint policy for Security Hub CSPM actions

The following is an example of an endpoint policy for Security Hub CSPM. When attached to an endpoint, this policy grants access to the listed Security Hub CSPM actions for all principals on all resources.

```
{
   "Statement":[
      {
         "Principal":"*",
         "Effect":"Allow",
         "Action":[
            "securityhub:getFindings",
            "securityhub:getEnabledStandards",
            "securityhub:getInsights"
         ],
         "Resource":"*"
      }
   ]
}
```

Shared subnets

You can't create, describe, modify, or delete VPC endpoints in subnets that are shared with you. However, you can use the VPC endpoints in subnets that are shared with you. For information about VPC sharing, see Share your VPC subnets with other accounts in the *Amazon Virtual Private Cloud Guide*.

Logging Security Hub API calls with CloudTrail

AWS Security Hub CSPM is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Security Hub CSPM. CloudTrail captures API calls for Security Hub CSPM as events. The captured calls include calls from the Security Hub CSPM console and code calls to the Security Hub CSPM API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Security Hub CSPM. If you don't configure a trail, you can still view the most recent events on the CloudTrail console in **Event history**. Using the information that CloudTrail collects, you can determine the request that was made to Security Hub CSPM, the IP address that the request was made from, who made the request, when it was made, and additional details.

To learn more about CloudTrail, including how to configure and enable it, see the AWS CloudTrail User Guide.

Security Hub CSPM information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When supported event activity occurs in Security Hub CSPM, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your account. For more information, see Viewing events with CloudTrail event history.

For an ongoing record of events in your account, including events for Security Hub CSPM, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail on the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for creating a trail
- CloudTrail supported services and integrations
- Configuring Amazon SNS notifications for CloudTrail
- Receiving CloudTrail log files from multiple regions and Receiving CloudTrail log files from multiple accounts

Security Hub CSPM supports logging all of the Security Hub CSPM API actions as events in CloudTrail logs. To view a list of Security Hub CSPM operations, see the Security Hub CSPM API Reference.

When activity for the following actions is logged to CloudTrail, the value for `responseElements` is set to `null`. This ensures that sensitive information isn't included in CloudTrail logs.

- `BatchImportFindings`
- `GetFindings`
- `GetInsights`
- `GetMembers`
- `UpdateFindings`

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials
- Whether the request was made with temporary security credentials for a role or federated user
- Whether the request was made by another AWS service

For more information, see the CloudTrail userIdentity element.

Example: Security Hub CSPM log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry that demonstrates the `CreateInsight` action. In this example, an insight called `Test Insight` is created. The `ResourceId` attribute is specified as the **Group by** aggregator, and no optional filters for this insight are specified. For more information about insights, see Viewing insights in Security Hub CSPM.

```

Tagging Security Hub resources

A *tag* is an optional label that you can define and assign to AWS resources, including certain types of AWS Security Hub CSPM resources. Tags can help you identify, categorize, and manage resources in different ways, such as by purpose, owner, environment, or other criteria. For example, you can use tags to distinguish between resources, identify resources that support certain compliance requirements or workflows, or allocate costs.

You can add tags to the following types of Security Hub CSPM resources:

- Automation rules
- Configuration policies
- Hub resource

Tagging fundamentals

A resource can have as many as 50 tags. Each tag consists of a required *tag key* and an optional *tag value*, both of which you define. A *tag key* is a general label that acts as a category for a more specific tag value. A *tag value* acts as a descriptor for a tag key.

For example, if you create different automation rules for different environments (one set of automation rules for test accounts and another for production accounts), you might assign an `Environment` tag key to those rules. The associated tag value might be `Test` for the rules that are associated with test accounts, and `Prod` for the rules that are associated with production accounts and OUs.

As you define and assign tags to AWS Security Hub CSPM resources, keep the following in mind:

- Each resource can have a maximum of 50 tags.
- For each resource, each tag key must be unique and it can have only one tag value.
- Tag keys and values are case sensitive. As a best practice, we recommend that you define a strategy for capitalizing tags and implement that strategy consistently across your resources.
- A tag key can have a maximum of 128 UTF-8 characters. A tag value can have a maximum of 256 UTF-8 characters. The characters can be letters, numbers, spaces, or the following symbols: _ . : / = + - @

- The `aws:` prefix is reserved for use by AWS. You can't use it in any tag keys or values that you define. In addition, you can't change or remove tag keys or values that use this prefix. Tags that use this prefix don't count against the quota of 50 tags per resource.
- Any tags that you assign are available only for your AWS account and only in the AWS Region in which you assign them.
- If you assign tags to a resource by using Security Hub CSPM, the tags are applied only to the resource that's stored directly in Security Hub CSPM in the applicable AWS Region. They aren't applied to any associated, supporting resources that Security Hub CSPM creates, uses, or maintains for you in other AWS services. For example, if you assign tags to an automation rule that updates findings related to Amazon Simple Storage Service (Amazon S3), the tags are applied only to your automation rule in Security Hub CSPM for the specified Region. They aren't applied to your S3 buckets. To also assign tags to an associated resource, you can use AWS Resource Groups or the AWS service that stores the resource—for example, Amazon S3 for an S3 bucket. Assigning tags to associated resources can help you identify supporting resources for your Security Hub CSPM resources.
- If you delete a resource, any tags that are assigned to the resource are also deleted.

Important

Do not store confidential or other types of sensitive data in tags. Tags are accessible from many AWS services, including AWS Billing and Cost Management. They aren't intended to be used for sensitive data.

To add and manage tags for Security Hub CSPM resources, you can use the Security Hub CSPM console, the Security Hub CSPM API, or the AWS Resource Groups Tagging API. With Security Hub CSPM, you can add tags to a resource when you create the resource. You can also add and manage tags for individual existing resources. With Resource Groups, you can add and manage tags in bulk for multiple existing resources spanning multiple AWS services, including Security Hub CSPM.

For additional tagging tips and best practices, see Tagging your AWS resources in the *Tagging AWS Resources User Guide*.

Using tags in IAM policies

After you start tagging resources, you can define tag-based, resource-level permissions in AWS Identity and Access Management (IAM) policies. By using tags in this way, you can implement granular control of which users and roles in your AWS account have permission to create and tag resources, and which users and roles have permission to add, edit, and remove tags more generally. To control access based on tags, you can use tag-related condition keys in the Condition element of IAM policies.

For example, you can create an IAM policy that allows a user to have full access to all AWS Security Hub CSPM resources, if the `Owner` tag for the resource specifies their username:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ModifyResourceIfOwner",
            "Effect": "Allow",
            "Action": "securityhub:*",
            "Resource": "*",
            "Condition": {
                "StringEqualsIgnoreCase": {"aws:ResourceTag/Owner":
 "${aws:username}"}
            }
        }
    ]
}
```

If you define tag-based, resource-level permissions, the permissions take effect immediately. This means that your resources are more secure as soon as they're created, and you can quickly start enforcing the use of tags for new resources. You can also use resource-level permissions to control which tag keys and values can be associated with new and existing resources. For more information, see Controlling access to AWS resources using tags in the *IAM User Guide*.

Adding tags to Security Hub CSPM resources

A *tag* is a label that you can define and assign to AWS resources, including certain types of AWS Security Hub CSPM resources. By using tags, you can identify, categorize, and manage resources in different ways, such as by purpose, owner, environment, or other criteria. For example, you can use tags to: apply policies, allocate costs, distinguish between versions of resources, or identify resources that support certain compliance requirements or workflows.

You can add tags to the following types of Security Hub CSPM resources:

- Automation rules
- Configuration policies
- Hub resource

A resource can have as many as 50 tags. Each tag consists of a required *tag key* and an optional *tag value*. A *tag key* is a general label that acts as a category for a more specific tag value. A *tag value* acts as a descriptor for a tag key. For more information about tagging options and requirements, see Tagging fundamentals.

To add tags to a Security Hub CSPM resource, you can use the Security Hub CSPM console or the Security Hub CSPM API. However, the console doesn't support adding tags to the Hub resource.

After adding tags, you can edit the tag and change the tag key or tag value.

To add or edit tags for multiple Security Hub CSPM resources at the same time, use the tagging operations of the AWS Resource Groups Tagging API.

> **Important**
>
> Adding tags to a resource can affect access to the resource. Before you add a tag to a resource, review any AWS Identity and Access Management (IAM) policies that might use tags to control access to resources.

Console

To add tags to a Security Hub CSPM resource (console)

When you create an automation rule or a configuration policy, the Security Hub CSPM console provides options for adding tags to it. You can provide the tag key and tag value in the **Tags** section.

Security Hub CSPM API

To add tags to a Security Hub CSPM resource (API)

To create a resource and add one or more tags to it programmatically, use the appropriate operation for the type of resource that you want to create:

- To create a configuration policy and add one or more tags to it, invoke the CreateConfigurationPolicy API or, if you're using the AWS CLI, run the create-configuration-policy command.
- To create an automation rule and add one or more tags to it, invoke the CreateAutomationRule API or, if you're using the AWS CLI, run the create-automation-rule command.
- To enable Security Hub CSPM and add one or more tags to your Hub resource, invoke the EnableSecurityHub API or, if you're using the AWS Command Line Interface (AWS CLI), run the enable-security-hub command.

In your request, use the `tags` parameter to specify the tag key and optional tag value for each tag to add to the resource. The `tags` parameter specifies an array of objects. Each object specifies a tag key and its associated tag value.

To add one or more tags to an existing resource, use the TagResource operation of the Security Hub CSPM API or, if you're using the AWS CLI, run the tag-resource command. In your request, specify the Amazon Resource Name (ARN) of the resource that you want to add a tag to. Use the `tags` parameter to specify the tag key (`key`) and optional tag value (`value`) for each tag to add. The `tags` parameter specifies an array of objects, one object for each tag key and its associated tag value.

For example, the following AWS CLI command adds an `Environment` tag key with a `Prod` tag value to the specified configuration policy. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

Example CLI command:

```
$ aws securityhub tag-resource \
```

```
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tags '{"Environment":"Prod"}'
```

Where:

- `resource-arn` specifies the ARN of the configuration policy to add a tag to.
- *`Environment`* is the tag key of the tag to add to the rule.
- *`Prod`* is the tag value for the specified tag key (*`Environment`*).

In the following example, the command adds several tags to the configuration policy.

```
$ aws securityhub tag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tags '{"Environment":"Prod", "CostCenter":"12345", "Owner":"jane-doe"}'
```

For each object in a `tags` array, both the `key` and `value` arguments are required. However, the value for the `value` argument can be an empty string. If you don't want to associate a tag value with a tag key, don't specify a value for the `value` argument. For example, the following command adds an `Owner` tag key with no associated tag value:

```
$ aws securityhub tag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tags '{"Owner":""}'
```

If a tagging operation succeeds, Security Hub CSPM returns an empty HTTP 200 response. Otherwise, Security Hub CSPM returns an HTTP 4*xx* or 500 response that indicates why the operation failed.

Editing tags for Security Hub CSPM resources

As your environment or requirements change over time, you can evaluate existing tags for your AWS Security Hub CSPM resources and change the tags as necessary. A *tag* is a label that you define and assign to one or more AWS resources, including certain types of Macie resources. Each tag consists of a required *tag key* and an optional *tag value*. A *tag key* is a general label that acts as a category for a more specific tag value. A *tag value* acts as a descriptor for a tag key.

Tags can help you identify, categorize, and manage resources in different ways, such as by purpose, owner, environment, or other criteria. For example, you can use tags to: apply policies, allocate costs, distinguish between versions of resources, or identify resources that support certain compliance requirements or workflows.

You can add tags to the following types of Security Hub CSPM resources:

- Automation rules
- Configuration policies
- Hub resource

To edit tag keys or tag values for a Security Hub CSPM resource, you can use the Security Hub CSPM API. The Security Hub CSPM console currently doesn't support tag editing.

> **Important**
>
> Editing tags for a resource can affect access to the resource. Before you edit a tag for a resource, review any AWS Identity and Access Management (IAM) policies that might use tags to control access to resources.

Security Hub CSPM API

To edit tags for a Security Hub CSPM resource (API)

When you edit a tag for a resource programmatically, you overwrite the existing tag with new values. Therefore, the best way to edit a tag depends on whether you want to edit a tag key, a tag value, or both. To edit a tag key, remove the current tag and add a new tag.

To edit or remove only the tag value that's associated with a tag key, overwrite the existing value by using the TagResource operation of the Security Hub CSPM API. If you're using the AWS CLI, run the tag-resource command. In your request, specify the Amazon Resource Name (ARN) of the resource whose tag value you want to edit or remove.

To edit a tag value, use the `tags` parameter to specify the tag key whose tag value you want to change. You should also specify the new tag value for the key. For example, the following AWS CLI command changes the tag value from `Prod` to `Test` for the `Environment` tag key that's assigned to the specified automation rule. This example is formatted for Linux, macOS, or Unix, and it uses the backslash (\) line-continuation character to improve readability.

```
$ aws securityhub tag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tags '{"Environment":"Test"}'
```

Where:

- `resource-arn` specifies the ARN of the configuration policy.
- *`Environment`* is the tag key that's associated with the tag value to change.
- *`Test`* is the new tag value for the specified tag key (*`Environment`*).

To remove a tag value from a tag key, don't specify a value for the `value` argument of the key in the `tags` parameter. For example:

```
$ aws securityhub tag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tags '{"Owner":""}'
```

If the operation succeeds, Security Hub CSPM returns an empty HTTP 200 response. Otherwise, Security Hub CSPM returns an HTTP 4*xx* or 500 response that indicates why the operation failed.

Reviewing tags for Security Hub CSPM resources

After you add or edit tags for AWS Security Hub CSPM resources, you can view what tag keys and tag values a resource currently has. A *tag* is a label that you define and assign to one or more AWS resources, including certain types of Macie resources. Each tag consists of a required *tag key* and an optional *tag value*. A *tag key* is a general label that acts as a category for a more specific tag value. A *tag value* acts as a descriptor for a tag key.

Tags can help you identify, categorize, and manage resources in different ways, such as by purpose, owner, environment, or other criteria. For example, you can use tags to: apply policies, allocate costs, distinguish between versions of resources, or identify resources that support certain compliance requirements or workflows.

You can add tags to the following types of Security Hub CSPM resources:

- Automation rules
- Configuration policies
- Hub resource

You can review the tags for a Security Hub CSPM automation rule or configuration policy by using the Security Hub CSPM console or the Security Hub CSPM API. The console doesn't support reviewing tags for the Hub resource. Programmatically, you can review tags for any resource.

To review tags for multiple Security Hub CSPM resources at the same time, use the tagging operations of the AWS Resource Groups Tagging API.

Console

To review tags for a Security Hub CSPM resource (console)

1. Using the credentials of the Security Hub CSPM administrator, open the AWS Security Hub CSPM console at https://console.aws.amazon.com/securityhub/.
2. Depending on the type of resource that you want to add a tag to, do one of the following:
   - To review the tags for an automation rule, choose **Automations** in the navigation pane. Then, choose an automation rule.
   - To review the tags for a configuration policy, choose **Configuration** in the navigation pane. Then, on the **Policies** tab, select the option next to a configuration policy. A side panel opens that shows you the number of tags assigned to the policy. You can expand the **Tags** header to see the tag keys and tag values.

   The **Tags** section lists all the tags that are currently assigned to the resource.

Security Hub CSPM API

To review tags for a Security Hub CSPM resource (API)

To retrieve and review the tags for an existing resource, invoke the ListTagsForResource API. In your request, use the `resourceArn` parameter to specify the Amazon Resource Name (ARN) of the resource.

If you're using the AWS CLI, run the list-tags-for-resource command and use the `resource-arn` parameter to specify the ARN of the resource. For example:

```
$ aws securityhub list-tags-for-resource --resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

If the operation succeeds, Security Hub CSPM returns a `tags` array. Each object in the array specifies a tag (both the tag key and tag value) that's currently assigned to the resource. For example:

```
{
    "tags": [
        {
            "key": "Environment",
            "value": "Prod"
        },
        {
            "key": "CostCenter",
            "value": "12345"
        },
        {
            "key": "Owner",
            "value": ""
        }
    ]
}
```

Where `Environment`, `CostCenter`, and `Owner` are the tag keys that are assigned to the resource. `Prod` is the tag value that's associated with the `Environment` tag key. `12345` is the tag value that's associated with the `CostCenter` tag key. The `Owner` tag key doesn't have an associated tag value.

To retrieve a list of all the Security Hub CSPM resources that have tags and all the tags that are assigned to each of those resources, use the GetResources operation of the AWS Resource Groups Tagging API. In your request, set the value for the `ResourceTypeFilters` parameter to `securityhub`. To do this using the AWS CLI, run the get-resources command and set the value for the `resource-type-filters` parameter to `securityhub`. For example:

```
$ aws resourcegroupstaggingapi get-resources -\-resource-type-filters "securityhub"
```

If the operation succeeds, Resource Groups returns a `ResourceTagMappingList` array. The array contains one object for each Security Hub CSPM resource that has tags. Each object

specifies the ARN of a Security Hub CSPM resource, and the tag keys and values that are assigned to the resource.

Removing tags from Security Hub CSPM resources

If you add tags to an AWS Security Hub CSPM resource, you can subsequently remove one or more of them. A *tag* is a label that you define and assign to AWS resources, including certain types of Security Hub CSPM resources. You can add, edit, and remove tags from the following types of Security Hub CSPM resources: automation rules, configuration policies, and the Hub resource.

To remove tags from an individual AWS Security Hub CSPM resource, you can use the Security Hub CSPM API. The Security Hub CSPM console currently doesn't support tag removal.

To remove tags from multiple Security Hub CSPM resources at the same time, use the tagging operations of the AWS Resource Groups Tagging API.

> **Important**
>
> Removing tags from a resource can affect access to the resource. Before you remove a tag, review any AWS Identity and Access Management (IAM) policies that might use the tag to control access to resources.

Security Hub CSPM API

To remove tags from a Security Hub CSPM resource (API)

To remove one or more tags from a resource programmatically, use the UntagResource operation of the Security Hub CSPM API. In your request, use the `resourceArn` parameter to specify the Amazon Resource Name (ARN) of the resource to remove a tag from. Use the `tagKeys` parameter to specify the tag key of the tag to remove. To remove multiple tags, append the `tagKeys` parameter and argument for each tag to remove, separated by an ampersand (&)—for example, `tagKeys=key1&tagKeys=key2`. To remove only a specific tag value (not a tag key) from a resource, edit the tag instead of removing the tag.

If you're using the AWS CLI, run the untag-resource command to remove one or more tags from a resource. For the `resource-arn` parameter, specify the ARN of the resource to remove a tag from. Use the `tag-keys` parameter to specify the tag key of the tag to remove. For example,

the following command removes the `Environment` tag (both the tag key and tag value) from the specified configuration policy:

```
$ aws securityhub untag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tag-keys Environment
```

Where `resource-arn` specifies the ARN of the configuration policy to remove a tag from, and *`Environment`* is the tag key of the tag to remove.

To remove multiple tags from a resource, add each additional tag key as an argument for the `tag-keys` parameter. For example:

```
$ aws securityhub untag-resource \
--resource-arn arn:aws:securityhub:us-east-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--tag-keys Environment Owner
```

If the operation succeeds, Security Hub CSPM returns an empty HTTP 200 response. Otherwise, Security Hub CSPM returns an HTTP 4*xx* or 500 response that indicates why the operation failed.

Quotas for Security Hub

Your AWS account has certain default quotas, formerly referred to as *limits*, for each AWS service. These quotas are the maximum number of service resources or operations for your account. This topic links to the quotas that apply to AWS Security Hub resources and operations for your account. Unless otherwise noted, each quota applies to your account in each AWS Region.

Some quotas can be increased, while others cannot. To request an increase to a quota, use the Service Quotas console. To learn how to request an increase, see Requesting a quota increase in the *Service Quotas User Guide*. If a quota isn't available on the Service Quotas console, use the service limit increase form on the AWS Support Center Console to request an increase to the quota.

Maximum quotas

For a list of quotas that apply to AWS Security Hub resources, see AWS Security Hub endpoints and quotas in the *AWS General Reference*.

Rate quotas

For a list of quotas that apply to AWS Security Hub API operations, see the AWS Security Hub API Reference.

If you set up cross-Region aggregation in Security Hub CSPM, one call to `BatchImportFindings` and `BatchUpdateFindings` impacts linked Regions and the aggregation Region. The `GetFindings` operation retrieves findings from linked Regions and the aggregation Region. However, the `BatchEnableStandards` and `UpdateStandardsControl` operations are Region-specific.

Document history for the AWS Security Hub User Guide

The following table describes the important changes to the documentation since the last release of AWS Security Hub and Security Hub CSPM. For releases of new Security Hub CSPM controls, the date specifies when the controls begin to be available in supported AWS Regions. It can take 1-2 weeks for controls to be available in all supported Regions. For details about material changes to existing controls, see Change log for Security Hub CSPM controls.

To receive notifications about updates to the *AWS Security Hub User Guide*, you can subscribe to an RSS feed.

Change	Description	Date
SBOM inventory	Security Hub now provides a software bill of materials (SBOM) inventory of the software packages installed on the compute resources that Amazon Inspector scans, such as Amazon EC2 instances, Amazon ECR container images, and Lambda functions. Use it to find every resource that contains a package and to view the software installed on a resource.	November 3, 2026
Updates to security controls	Security Hub CSPM added 8 controls to standards. Security Hub CSPM added Bedrock.1, SageMaker .21, SageMaker.23, and SageMaker.24 to the NIST SP 800-53 Rev. 5 standard. Security Hub CSPM added SageMaker.20, SageMaker.22,	October 20, 2026

	SageMaker.25, and BedrockAgentCore.7 to the AWS Foundational Security Best Practices (FSBP) standard.	
New security standard	Security Hub CSPM released the CRI Profile v2.2 standard. This standard aligns with the CRI Profile, a cybersecurity framework developed by the Cyber Risk Institute (CRI) that harmonizes cybersecurity and regulatory expectations for the financial services sector.	October 14, 2026
Automation rules can update resource criticality	Security Hub automation rules can now update the criticality of resources (resource rules), in addition to updating finding details and creating tickets. Setting resource criticality helps you prioritize remediation based on how important the affected resources are to your business.	October 1, 2026
Remediation plans	Added remediation plans, which group related exposure findings by root cause so that one fix can resolve or reduce the severity of several exposures. For more information, see Remediation plans in AWS Security Hub.	September 30, 2026

Updated Network Scanning informational findings details	Added information about informational findings that Network Scanning generates.	September 3, 2026
Updated Network Scanning ports list	Added list of ports that are currently supported by Network Scanning.	August 18, 2026
Updated security controls	Security Hub CSPM removed the EFS.6 control from the AWS Foundational Security Best Practices (FSBP) standard. This control remains available in the NIST SP 800-53 Rev. 5, NIST SP 800-171 Revision 2, and PCI DSS v4.0.1 standards.	August 3, 2026
Enhanced enabling Security Hub documentation	Improved the guidance in the Managing configuration of member accounts in an AWS Organization page.	July 7, 2026
Added Network Scanning feature documentation	Added documentation for the Network scanning feature of Security Hub	July 7, 2026
AI inventory	Added the AI inventory, which provides a unified view of managed and self-hosted artificial intelligence (AI) and machine learning (ML) resources across your AWS environment. For more information, see AI inventory in AWS Security Hub.	July 7, 2026

Updates to a managed policy – AWSSecurityHubV2ServiceRolePolicy	Security Hub updated the AWS managed policy named AWSSecurityHubV2ServiceRolePolicy . The updates added permissions to support third-party integrations, including managing third-party configuration recorders, creating and managing connectors, and obtaining web identity tokens for federation.	June 30, 2026
Updates to a managed policy – AWSSecurityHubServiceRolePolicy	Security Hub CSPM updated the AWS managed policy named AWSSecurityHubServiceRolePolicy . The updates added permissions to support third-party integrations. These include managing third-party configuration recorders and retrieving Connector health metrics.	June 30, 2026
New security standard	Security Hub CSPM released the AI Security Best Practices standard. This standard provides a curated set of controls that detect when deployed AI resources do not align with security best practices.	June 30, 2026

New security controls	Security Hub CSPM released eight new controls for the AI Security Best Practices standard. The new controls are: Bedrock.1, BedrockAgentCore.7, SageMaker.20, SageMaker.21, SageMaker.22, SageMaker.23, SageMaker.24, and SageMaker.25.	June 30, 2026
Impact trait type and severity updates for exposure findings	Added the Impact trait type to exposure findings. Impact describes the potential blast radius if a resource is compromised, based on the effective permissions of associated AWS Identity and Access Management principals. Updated the severity calculation to use a Likelihood and Impact risk matrix aligned with NIST guidance. Added per-resource remediation guidance for impact access path traits.	June 23, 2026
Updates to security standards and controls	We retired the ECS.1 and RDS.18 controls and removed them from all applicable standards. Since Amazon EC2-Classic networking was retired, Amazon Relational Database Service (Amazon RDS) instances can no longer be deployed outside a VPC.	June 5, 2026

Updates for CSPM service-linked recorder	Added information related to the new service-linked configuration recorder that enables Security Hub CSPM to perform security control checks based on resource configuration information.	May 27, 2026
Unused access findings	Security Hub added functionality to generate and display unused access findings from IAM Access Analyzer Understanding unused access findings in Security Hub	May 19, 2026
New security controls	Security Hub CSPM released five new controls. Some of the controls support the AWS Foundational Security Best Practices (FSBP) standard. Most of the controls support NIST SP 800-53 Rev. 5 requirements. • For the AWS FSBP standard, IDs for the applicable controls are: BedrockAgentCore.5 and BedrockAgentCore.6. • For NIST SP 800-53 Rev. 5, IDs for the applicable controls are: BedrockAgentCore.3, BedrockAgentCore.4, and SageMaker.18.	May 15, 2026

Updates to a managed policy – AWSSecurityHubServiceRolePolicy	Security Hub CSPM updated the AWS managed policy named AWSSecurityHubServiceRolePolicy . The updates added permissions to manage Security Hub CSPM service-linked configuration recorders and create the AWS Config service-linked role.	April 29, 2026
New security controls	Security Hub CSPM released four new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are: BedrockAgentCore.1, BedrockAgentCore.2, RDS.51, and SageMaker.19.	April 22, 2026
New security controls	Security Hub CSPM released five new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are: APIGateway.11, EC2.183, EKS.9, SageMaker.16, and SageMaker.17.	April 7, 2026
Updates to security standards and controls	We retired the AppSync.1 and AppSync.6 controls and removed them from the AWS Foundational Security Best Practices (FSBP) standard. AWS AppSync now provides default encryption on all current and future API caches.	March 9, 2026

Updates to security standards and controls	We retired the ECS.1 control and removed the control from the AWS Foundational Security Best Practices (FSBP) standard and the NIST SP 800-53 Rev. 5 standard.	March 4, 2026
New security controls	Security Hub CSPM released eleven new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are: APIGateway.10, ELB.21, ELB.22, RDS.50, SageMaker .9 SageMaker.10 SageMaker .11 SageMaker.12 SageMaker .13 SageMaker.14, and SageMaker.15.	February 16, 2026
Updates to security standards and controls	We retired the MQ.3 control and removed the control from all applicable standards. We retired the control due to Amazon MQ requirements for automatic minor version upgrades. Previously, this control applied to the AWS Foundational Security Best Practices (FSBP) standard, the NIST SP 800-53 Rev. 5 standard and the PCI DSS v4.0.1 standard.	January 12, 2026

Updates to cost estimator documentation	Added details to the Security Hub cost estimator documentation on how to grant cross account access for doing estimates in accounts besides the management account.	January 12, 2026
New security controls	Security Hub CSPM released five new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are:CloudFormation.4, CloudFront.17, ECS.19, ECS.20, and ECS.21.	January 6, 2026
Updates to security standards and controls	Due to Amazon MQ requirements for automatic minor version upgrades, we are planning to retire the MQ.3 and remove the control from all applicable standards on January 12, 2026. Currently, the control applies to the AWS Foundational Security Best Practices (FSBP) standard, the NIST SP 800-53 Rev. 5 standard and the PCI DSS v4.0.1 standard.	December 12, 2025

Updated content for Service-Managed Standard: AWS Control Tower	Updated content for Service-Managed Standard: AWS Control Tower to provide improved guidance for creating, viewing and disabling controls in the standard from AWS Control Tower.	December 8, 2025
New security controls	Security Hub CSPM released seven new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are: Cognito.4 , Cognito.5, Cognito.6, EC2.182, CloudFormation.3, ECS.18, and SES.3.	December 8, 2025
Updated content for Security Hub General Availability	Added content to support the General Availability release of AWS Security Hub	December 2, 2025
Updated content for Security Hub	Added content for Trends, and Region Aggregation. These changes support the Security Hub preview release.	November 21, 2025

Updates to a managed policy – AWSSecurityHubV2ServiceRolePolicy	Security Hub updated the AWS managed policy named AWSSecurityHubV2ServiceRolePolicy . The updates added metering capabilities for Amazon Elastic Container Registry, AWS Lambda, Amazon CloudWatch, and AWS Identity and Access Management to support Security Hub features. The updates also added support for global AWS Config recorders. These changes support the Security Hub preview release.	November 17, 2025
Updates to a managed policy – AWSSecurityHubOrganizationsAccess	Security Hub updated the AWS managed policy named AWSSecurityHubOrganizationsAccess . The updates added permissions to describe resource policies that support Security Hub features. These changes support the Security Hub preview release.	November 17, 2025

Updates to a managed policy – AWSSecurityHubFullAccess	Security Hub updated the AWS managed policy named AWSSecurityHubFullAccess . The updates added capabilities around managing GuardDuty, Amazon Inspector , and account managemen t to support Security Hub features. These changes support the Security Hub preview release.	November 17, 2025
Updates to security controls	We changed the severity of 10 Security Hub CSPM controls: CloudFron t.7, CloudTrail.5, ELB.7, GuardDuty.7, MQ.3, Opensearch.10, RDS.7, ServiceCatalog.1, SNS.4, and SQS.3. For a breakdown of the changes, see the Change log for Security Hub CSPM controls.	November 13, 2025
New security controls	Security Hub CSPM released six new controls for the AWS Foundational Security Best Practices (FSBP) standard. The new controls are: Cognito.3 , DMS.13, EC2.181, RDS.43, RDS.47, and RDS.48.	October 28, 2025

New security standard	Security Hub CSPM now provides a security standard that aligns with CIS AWS Foundations Benchmark v5.0.0. This new standard includes 40 existing security controls. The controls perform automated checks that evaluate certain resources for compliance with a subset of the requirements defined by the framework.	October 16, 2025
New third-party integration	Elastic is a new third-party integration that can receive findings from Security Hub CSPM.	October 3, 2025

Updates to security standards and controls	We retired the Redshift.9 and RedshiftServerless.7 controls and removed them from all applicable standards . We retired these controls due to inherent Amazon Redshift limitations that prevented effective remediation of FAILED findings for the controls. Previously, these controls applied to the AWS Foundational Security Best Practices (FSBP) standard and the NIST SP 800-53 Rev. 5 standard. The Redshift.9 control also applied to the AWS Control Tower service-managed standard.	September 24, 2025
Regional availability	Security Hub CSPM is now available in the Asia Pacific (New Zealand) Region. For a complete list of AWS Regions where Security Hub CSPM is currently available, see AWS Security Hub endpoints and quotas in the *AWS General Reference*.	September 19, 2025
New security controls	Security Hub CSPM released two new controls for the AWS Foundational Security Best Practices (FSBP) standard: CloudFront.16 and RDS.46.	September 3, 2025

Regional availability	The AWS Resource Tagging standard is now available in the Asia Pacific (Thailand) and Mexico (Central) Regions.	August 29, 2025
Updates to security standards and controls	Due to Amazon Redshift limitations, we are planning to retire the Redshift.9 and RedshiftServerless.7 controls and remove them from all applicable standards on September 15, 2025. Currently, these controls apply to the AWS Foundational Security Best Practices (FSBP) standard and the NIST SP 800-53 Rev. 5 standard. The Redshift.9 control also applies to the AWS Control Tower service-managed standard.	August 15, 2025
New resource details object in the ASFF	The AWS Security Finding Format (ASFF) now includes a `CodeRepository` resource object. This object provides details about an external code repository that you connected to AWS resources and configured Amazon Inspector to scan for vulnerabilities.	August 1, 2025

Regional availability	Security Hub CSPM is now available in the Asia Pacific (Taipei) Region. For a complete list of AWS Regions where Security Hub CSPM is currently available, see AWS Security Hub endpoints and quotas in the *AWS General Reference*.	July 23, 2025
New third-party integration	Dynatrace is a new third-party integration that can receive findings from Security Hub CSPM.	July 18, 2025
New security controls	Security Hub CSPM released 13 new controls. Most of the controls support the AWS Foundational Security Best Practices (FSBP) standard. Some of the controls support NIST SP 800-53 Rev. 5 requirements. • For the AWS FSBP standard, IDs for the applicable controls are: CloudFront.15, Cognito.2, EC2.180, ELB.18, MSK.4, MSK.5, MSK.6, RDS.45, Redshift.18, S3.25, SSM.6, and SSM.7. • For NIST SP 800-53 Rev. 5, IDs for the applicable controls are: Lambda.7 and RDS.45.	July 15, 2025

Updates to generation of control findings	To help you track compliance changes, Security Hub CSPM now updates existing control findings, instead of generating new findings, when there are changes to the compliance status of individual resources. This means that you can use the data provided by individual findings to track compliance changes for particular resources against particular controls.	July 3, 2025
Updates to security standards and controls	We removed the IAM.13 control from the PCI DSS v4.0.1 standard. We also removed the IAM.17 control from the NIST SP 800-171 Revision 2 standard. The standards don't explicitly require the checks that these controls provide. We also updated related requirement details for these standards for certain controls that check IAM password policies: IAM.7, and IAM.10 through IAM.17.	June 30, 2025

Updates to finding retention	Security Hub CSPM now stores archived findings for 30 days instead of 90 days, which can reduce finding noise. For longer-term retention, you can export findings to an S3 bucket by using a custom action with an Amazon EventBridge rule.	June 20, 2025
Updates to existing managed policies	Security Hub CSPM added new permission to the AWS managed policy named `AWSSecurityHubOrganizationsAccess` . The permission allows the organization management to enable and manage Security Hub and Security Hub CSPM within an organization. Security Hub CSPM also added new permission to the AWS managed policy named `AWSSecurityHubFullAccess` . The permission allows principals to create a service-linked role for Security Hub.	June 18, 2025

Public preview release and a new managed policy for Security Hub	Public preview release of AWS Security Hub and the *AWS Security Hub User Guide*. This release includes a new AWS managed policy, `AWSSecurityHubV2ServiceRolePolicy` . The policy allows Security Hub to manage AWS Config rules and Security Hub resources in a customer's organization and on the customer's behalf. Security Hub is in preview release and subject to change.	June 17, 2025
Updates to security standards and controls	We removed the IAM.10 control from the PCI DSS v4.0.1 standard. This control checks whether account password policies for IAM users meet minimum requirements, including a minimum password length of 7 characters. PCI DSS v4.0.1 now requires passwords to have a minimum of 8 characters. The IAM.10 control continues to apply to the PCI DSS v3.2.1 standard, which has different password requirements.	May 30, 2025

New security standard	Security Hub CSPM now provides a security standard that aligns with the NIST SP 800-171 Revision 2 cybersecurity and compliance framework. This new standard includes more than 60 existing security controls. The controls perform automated checks that evaluate certain AWS services and resources for compliance with a subset of the requirements defined by the framework.	May 29, 2025
Updates to security controls	Security Hub CSPM rolled back the release of the following control in all AWS Regions: *[RDS.46] RDS DB instances should not be deployed in public subnets with routes to internet gateways*. Previously, this control supported the AWS Foundational Security Best Practices (FSBP) standard.	May 8, 2025

New security controls	Security Hub CSPM released 9 new controls. Most of the controls support the AWS Foundational Security Best Practices (FSBP) standard. Some of the controls support NIST SP 800-53 Rev. 5 requirements. • For the AWS FSBP standard, IDs for the applicable controls are: DocumentDB.6, RDS.44, RedshiftServerless.2, RedshiftServerless.3, RedshiftServerless.5, RedshiftServerless.6, and RedshiftServerless.7 (later retired). • For NIST SP 800-53 Rev. 5, IDs for the applicable controls are: CloudTrail.10, RedshiftServerless.4, and RedshiftServerless.7 (later retired).	May 7, 2025

New security controls	Security Hub CSPM released 24 new controls. Most of the controls support the AWS Foundational Security Best Practices (FSBP) or AWS Resource Tagging standard. Some of the controls support NIST SP 800-53 Rev. 5 requirements. • For the AWS FSBP standard, IDs for the applicable controls are: EC2.173, RDS.41, RDS.42, and SageMaker.8. • For the AWS Resource Tagging standard, IDs for the applicable controls are: Amplify.1, Amplify.2 , Batch.4, DataSync.2, EC2.174, EC2.175, EC2.176, EC2.177, EC2.178, EC2.179, Redshift.17, SageMaker .6, SageMaker.7, SSM.5, Transfer.4, Transfer.5, Transfer.6, and Transfer.7. • For NIST SP 800-53 Rev. 5, IDs for the applicable controls are: ECS.17 and RDS.42.	April 16, 2025

New security controls	Security Hub CSPM released four new controls for the AWS Foundational Security Best Practices standard. The controls are: • the section called "[FSx.3] FSx for OpenZFS file systems should be configured for Multi-AZ deployment" • the section called "[FSx.4] FSx for NetApp ONTAP file systems should be configured for Multi-AZ deployment" • the section called "[FSx.5] FSx for Windows File Server file systems should be configured for Multi-AZ deployment" • the section called "[RedshiftServerless.1] Amazon Redshift Serverless workgroups should use enhanced VPC routing"	March 18, 2025

Updates to security standards and controls	We removed the RDS.18 security control (later retired) from the AWS Foundational Security Best Practices standard and automated checks for NIST SP 800-53 Rev. 5 requirements. Since Amazon EC2-Classic networking was retired, Amazon Relational Database Service (Amazon RDS) instances can no longer be deployed outside a VPC.	March 7, 2025
Updates to control findings	Security Hub CSPM now generates `WARNING` findings for an enabled control if resource recording isn't turned on in AWS Config for the type of resource that the control checks. This can help you identify and address potential configuration gaps in your security control checks.	February 25, 2025

New security controls	Security Hub CSPM released 11 new controls. The controls are: • the section called "[Connect .2] Connect Customer instances should have CloudWatch logging enabled" • the section called "[ECR.5] ECR repositories should be encrypted with customer managed AWS KMS keys" • the section called "[ELB.17] Application and Network Load Balancers with listeners should use recommended security policies" • the section called "[Glue.4] AWS Glue Spark jobs should run on supported versions of AWS Glue" • the section called "[GuardDuty.11] GuardDuty Runtime Monitoring should be enabled" • the section called "[GuardDuty.12] GuardDuty ECS Runtime Monitoring should be enabled" • the section called "[GuardDuty.13] GuardDuty EC2 Runtime Monitoring should be enabled"	February 24, 2025

- the section called "[NetworkFirewall.10] Network Firewall firewalls should have subnet change protection enabled"
- the section called "[RDS.40] RDS for SQL Server DB instances should publish logs to CloudWatch Logs"
- the section called "[SQS.3] SQS queue access policies should not allow public access"
- the section called "[Transfer.3] Transfer Family connectors should have logging enabled"

New security controls	Security Hub CSPM released 37 new controls for the AWS Resource Tagging Standard. Security Hub CSPM also released the following new controls: • the section called "[EMR.3] Amazon EMR security configurations should be encrypted at rest" • the section called "[EMR.4] Amazon EMR security configurations should be encrypted in transit" • the section called "[SageMaker.5] SageMaker models should have network isolation enabled"	January 22, 2025
New security control	Security Hub CSPM released EC2.172 EC2 VPC Block Public Access settings should block internet gateway traffic.	January 15, 2025

New security controls	The following new Security Hub CSPM controls are available. • the section called "[Cognito.1] Cognito user pools should have threat protection activated with full function enforcement mode for standard authentication" • the section called "[RDS.38] RDS for PostgreSQL DB instances should be encrypted in transit" • the section called "[RDS.39] RDS for MySQL DB instances should be encrypted in transit" • the section called "[Redshift.16] Redshift cluster subnet groups should have subnets from multiple Availability Zones"	December 17, 2024
Security Hub CSPM supports PCI DSS v4.0.1	Security Hub CSPM now supports v4.0.1 of the Payment Card Industry Data Security Standard (PCI DSS). For more information about the standard and the controls that apply to it, see PCI DSS in Security Hub CSPM.	December 11, 2024

Security Hub CSPM receives GuardDuty attack sequence findings	Security Hub CSPM now receives attack sequence findings from Amazon GuardDuty Extended Threat Detection. Attack sequence finding details are available in the Detection object of the AWS Security Finding Format (ASFF).	December 1, 2024
Security Hub CSPM supported in new AWS Region	Security Hub CSPM is now available in the Asia Pacific (Malaysia) Region. Some security controls have Regional limitations. For a list of controls that aren't available in this Region, see Regional limits on Security Hub CSPM controls.	November 22, 2024
Changes to Config.1	Security Hub CSPM increased the severity of the Config.1 control from `MEDIUM` to `CRITICAL`, and added new status codes and status reasons for failed Config.1 findings. For more informati on about the changes, see the entry for November 20, 2024 in the Change log for Security Hub CSPM controls.	November 20, 2024

New security controls	The following new Security Hub CSPM controls are available. These controls are part of AWS Foundatio nal Security Best Practices and NIST SP 800-53 Rev. 5, and they evaluate whether a virtual private cloud (VPC) that you manage has an interface VPC endpoint for an AWS service or AWS resource. • the section called "[EC2.55] VPCs should be configured with an interface endpoint for ECR API" • the section called "[EC2.56] VPCs should be configured with an interface endpoint for Docker Registry" • the section called "[EC2.57] VPCs should be configured with an interface endpoint for Systems Manager" • the section called "[EC2.58] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager Contacts" • the section called "[EC2.60] VPCs should be configured with an interface endpoint for Systems Manager Incident Manager"	November 15, 2024

New security controls	The following new Security Hub CSPM controls are available. • [AppSync.1] AWS AppSync API caches should be encrypted at rest • [AppSync.6] AWS AppSync API caches should be encrypted in transit • the section called "[EC2.170] EC2 launch templates should use Instance Metadata Service Version 2 (IMDSv2)" • the section called "[EC2.171] EC2 VPN connections should have logging enabled" • the section called "[EFS.8] EFS file systems should be encrypted at rest" • the section called "[KMS.5] KMS keys should not be publicly accessible" • the section called "[SNS.4] SNS topic access policies should not allow public access"	October 18, 2024

New security controls	The following new Security Hub CSPM controls are available. • the section called "[ECS.16] ECS task sets should not automatically assign public IP addresses" • the section called "[GuardDuty.7] GuardDuty EKS Runtime Monitoring should be enabled" • the section called "[Kinesis .3] Kinesis streams should have an adequate data retention period" • the section called "[MSK.3] MSK Connect connector s should be encrypted in transit" • the section called "[RDS.36] RDS for PostgreSQL DB instances should publish logs to CloudWatch Logs" • the section called "[RDS.37] Aurora PostgreSQL DB clusters should publish logs to CloudWatch Logs" • the section called "[S3.24] S3 Multi-Region Access Points should have block public access settings enabled"	October 3, 2024

New security controls	The following new Security Hub CSPM controls are available. • the section called "[Athena.4] Athena workgroups should have logging enabled" • the section called "[CodeBuild.7] CodeBuild report group exports should be encrypted at rest" • the section called "[DataSync.1] DataSync tasks should have logging enabled" • the section called "[EFS.7] EFS file systems should have automatic backups enabled" • Glue.2 (retired) • the section called "[Glue.3] AWS Glue machine learning transforms should be encrypted at rest" • the section called "[WorkSpaces.1] WorkSpaces user volumes should be encrypted at rest" • the section called "[WorkSpaces.2] WorkSpaces root volumes should be encrypted at rest"	August 30, 2024

New finding panel	The new finding panel on the Security Hub CSPM console helps you quickly take action on findings, review resource details and finding history, and find other pertinent information about a finding.	August 16, 2024
Update to Config.1 control	The Config.1 control checks whether AWS Config is enabled, uses the service-linked role, and records resources for enabled controls. Security Hub CSPM added a custom control parameter named `includeConfigServiceLinkedRoleCheck`. By setting this parameter to `false`, you can opt out of checking whether AWS Config uses the service-linked role.	August 15, 2024
Designate a home Region without linked Regions	You can now create a finding aggregator and establish a home Region without linking any AWS Regions to the home Region. This allows you to enable central configuration without specifying linked Regions.	July 25, 2024

Select controls available in more Regions	The following controls are now available in additional AWS Regions, including US East (N. Virginia) and US East (Ohio). • the section called "[DataFirehose.1] Firehose delivery streams should be encrypted at rest" • the section called "[DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled" • the section called "[DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled" • the section called "[DMS.12] DMS endpoints for Redis OSS should have TLS enabled" • the section called "[DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit" • the section called "[EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch"	July 15, 2024

- [EKS.3] EKS clusters should use encrypted Kubernetes secrets
- the section called "[FSx.2] FSx for Lustre file systems should be configured to copy tags to backups"
- the section called "[MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch"
- [MQ.3] Amazon MQ brokers should have automatic minor version upgrade enabled
- the section called "[Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes"
- the section called "[Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins"
- the section called "[SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1"
- the section called "[Service Catalog.1] Service Catalog portfolios should be shared

within an AWS organization only”

- the section called “[Transfer.2] Transfer Family servers should not use FTP protocol for endpoint connection”

New security controls	The following new Security Hub CSPM controls are available: • the section called "[GuardDuty.5] GuardDuty EKS Audit Log Monitoring should be enabled" • the section called "[GuardDuty.6] GuardDuty Lambda Protection should be enabled" • the section called "[GuardDuty.8] GuardDuty Malware Protection for EC2 should be enabled" • the section called "[GuardDuty.9] GuardDuty RDS Protection should be enabled" • the section called "[GuardDuty.10] GuardDuty S3 Protection should be enabled" • the section called "[Inspector.1] Amazon Inspector EC2 scanning should be enabled" • the section called "[Inspector.2] Amazon Inspector ECR scanning should be enabled" • the section called "[Inspector.3] Amazon Inspector	July 11, 2024

Lambda code scanning should be enabled”

- the section called “[Inspector.4] Amazon Inspector Lambda standard scanning should be enabled”

Release of CIS AWS Foundations Benchmark v3.0.0	Security Hub CSPM released Center for Internet Security (CIS) AWS Foundations Benchmark v3.0.0. The release includes the following new controls, as well as mappings to several existing controls. • the section called "[EC2.53] EC2 security groups should not allow ingress from 0.0.0.0/0 to remote server administration ports" • the section called "[EC2.54] EC2 security groups should not allow ingress from ::/0 to remote server administration ports" • the section called "[IAM.26] Expired SSL/TLS certificates managed in IAM should be removed" • the section called "[IAM.27] IAM identities should not have the AWSCloudShellFullAccess policy attached" • the section called "[IAM.28] IAM Access Analyzer external access analyzer should be enabled" • the section called "[S3.22] S3 general purpose buckets	May 13, 2024

should log object-level write events”

- the section called “[S3.23] S3 general purpose buckets should log object-level read events”

New security controls	The following new Security Hub CSPM controls are available: • the section called "[DataFirehose.1] Firehose delivery streams should be encrypted at rest" • the section called "[DMS.10] DMS endpoints for Neptune databases should have IAM authorization enabled" • the section called "[DMS.11] DMS endpoints for MongoDB should have an authentication mechanism enabled" • the section called "[DMS.12] DMS endpoints for Redis OSS should have TLS enabled" • the section called "[DynamoDB.7] DynamoDB Accelerator clusters should be encrypted in transit" • the section called "[EFS.6] EFS mount targets should not be associated with subnets that assign public IP addresses on launch" • [EKS.3] EKS clusters should use encrypted Kubernetes secrets	May 3, 2024

- the section called "[FSx.2] FSx for Lustre file systems should be configured to copy tags to backups"
- the section called "[MQ.2] ActiveMQ brokers should stream audit logs to CloudWatch"
- [MQ.3] Amazon MQ brokers should have automatic minor version upgrade enabled
- the section called "[Opensearch.11] OpenSearch domains should have at least three dedicated primary nodes"
- the section called "[Redshift.15] Redshift security groups should allow ingress on the cluster port only from restricted origins"
- the section called "[SageMaker.4] SageMaker endpoint production variants should have an initial instance count greater than 1"
- the section called "[Service Catalog.1] Service Catalog portfolios should be shared within an AWS organization only"
- the section called "[Transfer.2] Transfer Family servers

	should not use FTP protocol for endpoint connection”	
AWS Resource Tagging Standard	The AWS Resource Tagging Standard from Security Hub CSPM is now generally available, along with new controls that apply to the standard.	April 30, 2024
Update to existing managed policy	Security Hub CSPM updated the AWS managed policy named `AmazonSecurityHubFullAccess` to get pricing details for AWS services and products.	April 24, 2024
In-context configuration of control parameters	If you use central configuration, you can now configure control parameters in context, from the details page of a control on the Security Hub CSPM console.	March 29, 2024
Update to existing managed policy	Security Hub CSPM updated the AWS managed policy named `AWSSecurityHubReadOnlyAccess` by adding a `Sid` field.	February 22, 2024
New security control	The control [Macie.2] Macie automated sensitive data discovery should be enabled is now available. For Regional limits on this control, see Availability of controls by Region.	February 19, 2024

Security Hub CSPM available in Canada West (Calgary)	Security Hub CSPM is now available in Canada West (Calgary). All Security Hub CSPM features are now available in this Region, with the exception of certain security controls. For more information, see Availability of controls by Region.	December 20, 2023

New security controls	The following new Security Hub CSPM controls are available: • the section called "[Backup.1] AWS Backup recovery points should be encrypted at rest" • the section called "[DynamoDB.6] DynamoDB tables should have deletion protection enabled" • the section called "[EC2.51] EC2 Client VPN endpoints should have client connection logging enabled" • the section called "[EKS.8] EKS clusters should have audit logging enabled" • the section called "[EMR.2] Amazon EMR block public access setting should be enabled" • the section called "[FSx.1] FSx for OpenZFS file systems should be configured to copy tags to backups and volumes" • the section called "[Macie.1] Amazon Macie should be enabled" • the section called "[MSK.2] MSK clusters should have	December 14, 2023

enhanced monitoring configured”

- the section called “[Neptune.9] Neptune DB clusters should be deployed across multiple Availability Zones”
- the section called “[NetworkFirewall.1] Network Firewall firewalls should be deployed across multiple Availability Zones”
- the section called “[NetworkFirewall.2] Network Firewall logging should be enabled”
- the section called “[Opensearch.10] OpenSearch domains should have the latest software update installed”
- the section called “[PCA.1] AWS Private CA root certificate authority should be disabled”
- the section called “[S3.19] S3 access points should have block public access settings enabled”
- the section called “[S3.20] S3 general purpose buckets should have MFA delete enabled”

Finding enrichment	Security Hub CSPM added the new finding fields `AwsAccountName` , `ApplicationArn` , and `ApplicationName` to the AWS Security Finding Format (ASFF).	November 27, 2023
Enhancements to Summary dashboard	You can now access more dashboard widgets on the **Summary** page of the Security Hub CSPM console, save dashboard filter sets to quickly focus on specific security issues, and customize the dashboard layout.	November 27, 2023
Central configuration	Central configuration is now available. With central configuration, the Security Hub CSPM delegated administrator can configure Security Hub CSPM, standards , and controls across multiple organization accounts, organizational units (OUs), and Regions.	November 27, 2023
Updates to managed policy	Security Hub CSPM added new permissions to the `AWSSecurityHubServiceRolePolicy` managed policy that allow Security Hub CSPM to read and update customizable security control properties.	November 26, 2023

Custom control parameters	You can now customize parameter values for select Security Hub CSPM controls. This can make findings for a specific control more relevant to your business requirements and security expectations.	November 26, 2023
Updates to managed policies	Security Hub CSPM updated the `AWSSecurityHubFullAccess` and `AWSSecurityHubOrganizationsAccess` managed policies that permit you to use, respectively, Security Hub CSPM features and the integration with AWS Organizations.	November 16, 2023

Existing security controls added to Service-Managed Standard: AWS Control Tower	The following existing Security Hub CSPM controls have been added to Service-Managed Standard: AWS Control Tower. • **ACM.2** • **AppSync.5** • **CloudTrail.6** • **DMS.9** • **DocumentDB.3** • **DynamoDB.3** • **EC2.23** • **EKS.1** • **ElastiCache.3** • **ElastiCache.4** • **ElastiCache.5** • **ElastiCache.6** • **EventBridge.3** • **KMS.4** • **Lambda.3** • **MQ.5** • **MQ.6** • **MSK.1** • **RDS.12** • **RDS.15** • **S3.17**	November 14, 2023

Updates to managed policy	Security Hub CSPM added a new tagging permission to the `AWSSecurityHubServiceRolePolicy` managed policy that allows Security Hub CSPM to read resource tags related to findings.	November 7, 2023

New security controls	The following new Security Hub CSPM controls are available: • the section called "[AppSync.5] AWS AppSync GraphQL APIs should not be authenticated with API keys" • the section called "[DMS.6] DMS replication instances should have automatic minor version upgrade enabled" • the section called "[DMS.7] DMS replication tasks for the target database should have logging enabled" • the section called "[DMS.8] DMS replication tasks for the source database should have logging enabled" • the section called "[DMS.9] DMS endpoints should use SSL" • the section called "[DocumentDB.3] Amazon DocumentDB manual cluster snapshots should not be public" • the section called "[DocumentDB.4] Amazon DocumentDB clusters should publish audit logs to CloudWatch Logs"	October 10, 2023

- the section called "[DocumentDB.5] Amazon DocumentDB clusters should have deletion protection enabled"
- the section called "[ECS.9] ECS task definitions should have a logging configuration"
- the section called "[EventBridge.3] EventBridge custom event buses should have a resource-based policy attached"
- the section called "[EventBridge.4] EventBridge global endpoints should have event replication enabled"
- the section called "[MSK.1] MSK clusters should be encrypted in transit among broker nodes"
- the section called "[MQ.5] ActiveMQ brokers should use active/standby deployment mode"
- the section called "[MQ.6] RabbitMQ brokers should use cluster deployment mode"
- the section called "[NetworkFirewall.9] Network Firewall firewalls should have deletion protection enabled"

	• the section called "[RDS.34] Aurora MySQL DB clusters should publish audit logs to CloudWatch Logs" • the section called "[RDS.35] RDS DB clusters should have automatic minor version upgrade enabled" • the section called "[Route53.2] Route 53 public hosted zones should log DNS queries" • the section called "[WAF.12] AWS WAF rules should have CloudWatch metrics enabled"	
Updates to managed policy	Security Hub CSPM added new Organizations actions to the `AWSSecurityHubServiceRolePolicy` managed policy that allow Security Hub CSPM to retrieve account and organizational unit (OU) information. We also added new Security Hub CSPM actions that allow Security Hub CSPM to read and update service configurations, including standards and controls.	September 27, 2023

Existing security controls added to Service-Managed Standard: AWS Control Tower	The following existing Security Hub CSPM controls have been added to Service-Managed Standard: AWS Control Tower. • [Athena.1] Athena workgroups should be encrypted at rest • the section called "[DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest" • the section called "[DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period" • the section called "[Neptune.1] Neptune DB clusters should be encrypted at rest" • the section called "[Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs" • the section called "[Neptune.3] Neptune DB cluster snapshots should not be public" • the section called "[Neptune.4] Neptune DB clusters should have	September 26, 2023

deletion protection enabled”

- the section called “[Neptune.5] Neptune DB clusters should have automated backups enabled”
- the section called “[Neptune.6] Neptune DB cluster snapshots should be encrypted at rest”
- the section called “[Neptune.7] Neptune DB clusters should have IAM database authentication enabled”
- the section called “[Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots”
- the section called “[RDS.27] RDS DB clusters should be encrypted at rest”

Consolidated controls view and consolidated control findings available in AWS GovCloud (US)	Consolidated controls view and consolidated control findings are now available in the AWS GovCloud (US) Region. The **Controls** page of the Security Hub CSPM console shows all your controls across standards. Each control has the same control ID across standards. When you turn on consolida ted control findings, you receive a single finding per security check even when a control applies to multiple enabled standards.	September 6, 2023
Consolidated controls view and consolidated control findings available in China Regions	Consolidated controls view and consolidated control findings are now available in the China Regions. The **Controls** page of the Security Hub CSPM console shows all your controls across standards . Each control has the same control ID across standards. When you turn on consolida ted control findings, you receive a single finding per security check even when a control applies to multiple enabled standards.	August 28, 2023

Security Hub CSPM available in Israel (Tel Aviv) Region	Security Hub CSPM is now available in Israel (Tel Aviv). All Security Hub CSPM features are now available in this Region, with the exception of certain security controls. For more informati on, see Availability of controls by Region.	August 8, 2023

New security controls	The following new Security Hub CSPM controls are available: • [Athena.1] Athena workgroups should be encrypted at rest • the section called "[DocumentDB.1] Amazon DocumentDB clusters should be encrypted at rest" • the section called "[DocumentDB.2] Amazon DocumentDB clusters should have an adequate backup retention period" • the section called "[Neptune.1] Neptune DB clusters should be encrypted at rest" • the section called "[Neptune.2] Neptune DB clusters should publish audit logs to CloudWatch Logs" • the section called "[Neptune.3] Neptune DB cluster snapshots should not be public" • the section called "[Neptune.4] Neptune DB clusters should have deletion protection enabled"	July 28, 2023

	• the section called "[Neptune.5] Neptune DB clusters should have automated backups enabled" • the section called "[Neptune.6] Neptune DB cluster snapshots should be encrypted at rest" • the section called "[Neptune.7] Neptune DB clusters should have IAM database authentication enabled" • the section called "[Neptune.8] Neptune DB clusters should be configured to copy tags to snapshots" • the section called "[RDS.27] RDS DB clusters should be encrypted at rest"	
New operators for automation rule criteria	You can now use CONTAINS and NOT_CONTAINS comparison operators for automation rule map and string criteria.	July 25, 2023
Automation rules	Security Hub CSPM now offers automation rules that automatically update findings based on criteria that you specify.	June 13, 2023

New third party integration	Snyk is a new third-party integration that sends findings to Security Hub CSPM.	June 12, 2023

Existing security controls added to Service-Managed Standard: AWS Control Tower	The following existing Security Hub CSPM controls have been added to Service-Managed Standard: AWS Control Tower. • the section called "[Account.1] Security contact information should be provided for an AWS account" • the section called "[APIGateway.8] API Gateway routes should specify an authorization type" • the section called "[APIGateway.9] Access logging should be configured for API Gateway V2 Stages" • the section called "[CodeBuild.3] CodeBuild S3 logs should be encrypted" • the section called "[EC2.25] Amazon EC2 launch templates should not assign public IPs to network interfaces" • the section called "[ELB.1] Application Load Balancer should be configured to redirect all HTTP requests to HTTPS" • the section called "[Redshift.10] Redshift clusters	June 12, 2023

should be encrypted at rest”

- the section called “[SageMaker.2] SageMaker notebook instances should be launched in a custom VPC”
- the section called “[SageMaker.3] Users should not have root access to SageMaker notebook instances”
- the section called “[WAF.10] AWS WAF web ACLs should have at least one rule or rule group”

New security controls	The following new Security Hub CSPM controls are available: • the section called "[ACM.2] RSA certificates managed by ACM should use a key length of at least 2,048 bits" • the section called "[AppSync.2] AWS AppSync should have field-level logging enabled" • the section called "[CloudFront.13] CloudFront distributions should use origin access control" • the section called "[Elastic Beanstalk.3] Elastic Beanstalk should stream logs to CloudWatch" • the section called "[S3.17] S3 general purpose buckets should be encrypted at rest with AWS KMS keys" • the section called "[StepFunctions.1] Step Functions state machines should have logging turned on"	June 6, 2023

Security Hub CSPM available in Asia Pacific (Melbourne)	Security Hub CSPM is now available in Asia Pacific (Melbourne). All Security Hub CSPM features are now available in this Region, with the exception of certain security controls. For more information, see Availability of controls by Region.	May 25, 2023
Finding history	Security Hub CSPM can now track the history of a finding during the last 90 days.	May 4, 2023
New security controls	The following new Security Hub CSPM controls are available: • the section called "[EKS.1] EKS cluster endpoints should not be publicly accessible" • the section called "[ELB.16] Application Load Balancers should be associated with an AWS WAF web ACL" • the section called "[Redshift.10] Redshift clusters should be encrypted at rest" • the section called "[S3.15] S3 general purpose buckets should have Object Lock enabled"	March 29, 2023

Expanded support for consolidated control findings	The Automated Security Response on AWS v2.0.0 now supports consolidated control findings.	March 24, 2023
Security Hub CSPM available in new AWS Regions	Security Hub CSPM is now available in Asia Pacific (Hyderabad), Europe (Spain), and Europe (Zurich). Limits exist on which controls are available in these Regions.	March 21, 2023
Update to managed policy	Security Hub CSPM has updated an existing permission in the `AWSSecurityHubServiceRolePolicy` managed policy.	March 17, 2023

New security controls for NIST 800-53 standard	Security Hub CSPM has added the following security controls, which are applicable to the NIST 800-53 standard: • the section called "[Account.2] AWS accounts should be part of an AWS Organizations organization" • the section called "[CloudWatch.15] CloudWatch alarms should have specified actions configured" • the section called "[CloudWatch.16] CloudWatch log groups should be retained for a specified time period" • the section called "[CloudWatch.17] CloudWatch alarm actions should be activated" • the section called "[DynamoDB.4] DynamoDB tables should be present in a backup plan" • the section called "[EC2.28] EBS volumes should be covered by a backup plan" • **EC2.29 – EC2 instances should be launched in a VPC** (retired) • the section called "[RDS.26] RDS DB instances should	March 3, 2023

	be protected by a backup plan” • the section called “[S3.14] S3 general purpose buckets should have versioning enabled” • the section called “[WAF.11] AWS WAF web ACL logging should be enabled”	
National Institute of Standards and Technology (NIST) 800-53 Rev. 5	Security Hub CSPM now supports the NIST 800-53 Rev. 5 standard with more than 200 applicable security controls.	February 28, 2023
Consolidated controls view and control findings	With the release of consolidated controls view, the **Controls** page of the Security Hub CSPM console shows all your controls across standards. Each control has the same control ID across standards. When you turn on consolidated control findings, you receive a single finding per security check even when a control applies to multiple enabled standards.	February 23, 2023

New security controls	The following new Security Hub CSPM controls are available. Some controls have Regional limitations. • the section called "[ElastiCache.1] ElastiCache (Redis OSS) clusters should have automatic backups enabled" • the section called "[ElastiCache.2] ElastiCache clusters should have automatic minor version upgrades enabled" • the section called "[ElastiCache.3] ElastiCache replication groups should have automatic failover enabled" • the section called "[ElastiCache.4] ElastiCache replication groups should be encrypted at rest" • the section called "[ElastiCache.5] ElastiCache replication groups should be encrypted in transit" • the section called "[ElastiCache.6] ElastiCache (Redis OSS) replication groups of earlier versions should have Redis OSS AUTH enabled" • the section called "[ElastiCache.7] ElastiCache clusters	February 16, 2023

	should not use the default subnet group"	
New ASFF fields	Security Hub CSPM has added ProductFields.ArchivalReasons:0/Description and ProductFields.ArchivalReasons:0/ReasonCode to the AWS Security Finding Format (ASFF).	February 8, 2023
New ASFF fields	Security Hub CSPM has added Compliance.AssociatedStandards and Compliance.SecurityControlId to the AWS Security Finding Format (ASFF).	January 31, 2023
Vulnerability details now available	You can now see vulnerability details in the Security Hub CSPM console for findings that Amazon Inspector sends to Security Hub CSPM.	January 14, 2023
Security Hub CSPM is available in Middle East (UAE)	Security Hub CSPM is now available in Middle East (UAE). Some controls have Regional limits.	January 12, 2023
Added third-party integration with MetricStream	Security Hub CSPM now supports a third-party integration with MetricStream in all Regions except China and AWS GovCloud (US).	January 11, 2023

Increased organizational account limit	Security Hub CSPM now supports up to 11,000 member accounts for each Security Hub CSPM administrator account per Region.	December 27, 2022
ElasticBeanstalk.3 rolled back	Security Hub CSPM rolled back the control **[ElasticBeanstalk.3] Elastic Beanstalk should stream logs to CloudWatch** from the FSBP standard in all Regions.	December 21, 2022
Security Hub CSPM adds new security controls	New Security Hub CSPM controls are available to customers who have enabled the FSBP standard. Some controls have Regional limitations.	December 15, 2022
Guidance on upcoming features	Security Hub CSPM is planning to release two new features: consolidated controls view and consolidated control findings. These upcoming features may impact existing workflows that rely on control finding fields and values.	December 9, 2022
Amazon Security Lake integration now available	Security Lake now integrates with Security Hub CSPM by receiving Security Hub CSPM findings.	November 29, 2022

Support for Service-Managed Standard: AWS Control Tower	Security Hub CSPM supports a new security standard called Service-Managed Standard: AWS Control Tower. AWS Control Tower manages this standard.	November 28, 2022
CIS AWS Foundations Benchmark v1.4.0 now available in China Regions	Security Hub CSPM now supports CIS AWS Foundations Benchmark v1.4.0 in the China Regions.	November 18, 2022
Jira Service Management Cloud integration now available	Jira Service Management Cloud now receives Security Hub CSPM findings in all available Regions, except the China Regions.	November 17, 2022
AWS IoT Device Defender integration now available	AWS IoT Device Defender now sends findings to Security Hub CSPM in all available Regions.	November 17, 2022
Support for CIS AWS Foundations Benchmark v1.4.0	Security Hub CSPM now provides security controls that support CIS AWS Foundations Benchmark v1.4.0. This standard is available in all available Regions, except the China Regions.	November 9, 2022

Support for Security Hub CSPM announcements in AWS GovCloud (US)	You can now subscribe to Security Hub CSPM announcements with Amazon Simple Notification Service (Amazon SNS) in AWS GovCloud (US-East) and AWS GovCloud (US-West) to receive notifications about Security Hub CSPM.	October 3, 2022
AWS Security Hub CSPM adds a new security control	The new Security Hub CSPM control **AutoScaling.9** is available to customers who have enabled the FSBP standard. Controls may have Regional limitations.	September 1, 2022
Subscribe to Security Hub CSPM announcements	You can now subscribe to Security Hub CSPM announcements with Amazon Simple Notification Service (Amazon SNS) to receive notifications about Security Hub CSPM.	August 29, 2022
Region expansion for cross-Region aggregation	Cross-Region aggregation is now available for findings, finding updates, and insights across AWS GovCloud (US).	August 2, 2022
New third-party product integrations	Fortinet - FortiCNP is a third-party integration that receives Security Hub CSPM findings, and JFrog is a third-par ty integration that sends findings to Security Hub CSPM.	July 26, 2022

EC2.27 is retired	Security Hub CSPM has retired **EC2.27 - Running EC2 Instances should not use key pairs**, a former control in the AWS Foundational Security Best Practices (FSBP) standard.	July 20, 2022
Lambda.2 no longer supports python3.6	Security Hub CSPM no longer supports python3.6 as a parameter for **Lambda.2 - Lambda functions should use supported runtimes**, a control in the AWS Foundatio nal Security Best Practices (FSBP) standard.	July 19, 2022
AWS Security Hub CSPM adds new security controls	New Security Hub CSPM controls are available to customers who have enabled the FSBP standard. Some controls have Regional limitations.	June 22, 2022
AWS Security Hub CSPM supports a new Region	Security Hub CSPM is now available in Asia Pacific (Jakarta). Some controls are not available in this Region.	June 7, 2022
Improved integration between AWS Security Hub CSPM and AWS Config	Security Hub CSPM users can see the results of AWS Config rule evaluations as findings in Security Hub CSPM.	June 6, 2022

Added ability to opt out of auto-enabled standards	For users who have integrated with AWS Organizations, this feature allows you to log into the Security Hub CSPM administrator account and opt new member accounts out of auto-enabled standards.	April 25, 2022
Expanded cross-Region aggregation	Added cross-Region aggregation to control statuses and security scores.	April 20, 2022
CompanyName and ProductName are now top level attributes	Added new top level attributes for setting company and product names associated with custom integrations	April 1, 2022
Added new controls to the AWS Foundational Security Best Practices standard	Added 5 new controls to the AWS Foundational Security Best Practices standard.	March 31, 2022
Added new resource details objectes to ASFF	Added `AwsRdsDbSecurityGroup` resource type to ASFF.	March 25, 2022
Added additional resources details in ASFF	Added additional details to `AwsAutoScalingScalingGroup` , `AwsElbLoadBalancer` , `AwsRedshiftCluster` , and `AwsCodeBuildProject` .	March 25, 2022
Added new controls to the AWS Foundational Security Best Practices standard	Added 15 new controls to the AWS Foundational Security Best Practices standard.	March 16, 2022

Added new controls to the AWS Foundational Security Best Practices standard and Payment Card Industry Data Security Standard (PCI DSS)	Added new controls for Amazon OpenSearch Service, Amazon RDS, Amazon EC2, Elastic Load Balancing, and CloudFront to the AWS Foundational Security Best Practices standard. Also added two new controls for OpenSearch Service to the PCI DSS.	February 15, 2022
Added new field to ASFF	Added new field: Sample.	January 26, 2022
Added integration with AWS Health	AWS Health uses service-to-service event messaging to send findings to Security Hub CSPM.	January 19, 2022
Added integration with AWS Trusted Advisor	Trusted Advisor sends the results of its checks to Security Hub CSPM as Security Hub CSPM findings. Security Hub CSPM sends the results of its AWS Foundational Security Best Practices checks to Trusted Advisor.	January 18, 2022

Updated resource details objects in ASFF	Added `MixedInstancesPolicy` and `AvailabilityZones` to `AwsAutoScalingAutoScalingGroup`. Added `MetadataOptions` to `AwsAutoScalingLaunchConfiguration`. Added `BucketVersioningConfiguration` to `AwsS3Bucket`.	December 20, 2021
Updated output for ASFF documentation	The descriptions of ASFF attributes were previously in a single topic. Each top-level object and each resource details object is now in its own topic. The ASFF syntax topic contains links to those topics.	December 20, 2021
Added new resource details objects to ASFF for AWS Network Firewall	For AWS Network Firewall, added the following resource details objects: `AwsNetworkFirewallFirewall`, `AwsNetworkFireFirewallPolicy`, and `AwsNetworkFirewallRuleGroup`.	December 20, 2021
Added support for the new version of Amazon Inspector	Security Hub CSPM is integrated with the new version of Amazon Inspector as well as with Amazon Inspector Classic. Amazon Inspector sends findings to Security Hub CSPM.	November 29, 2021

Changed the severity of EC2.19	The severity of EC2.19 (Security groups should not allow unrestricted access to ports with high risk) is changed from High to Critical.	November 17, 2021
New integration with Sonrai Dig	Security Hub CSPM now offers an integration with Sonrai Dig. Sonrai Dig monitors cloud environments to identify security risks. Sonrai Dig sends findings to Security Hub CSPM.	November 12, 2021
Updated check for CIS 2.1 and CloudTrail.1 controls	In addition to checking that at least one multi-Region CloudTrail trail is in place, CIS 2.1 and CloudTrail.1 now also check that the `ExcludeManagementEventSources` parameter is empty in at least one of the multi-Region CloudTrail trails.	November 9, 2021
Added support for VPC endpoints	Security Hub CSPM is now integrated with AWS PrivateLink and supports VPC endpoints.	November 3, 2021
Added controls to the AWS Foundational Security Best Practices standard	Added new controls for Elastic Load Balancing (ELB.2 and ELB.8) and AWS Systems Manager (SSM.4).	November 2, 2021

Added ports to the check for the EC2.19 control	EC2.19 now also checks that security groups do not allow unrestricted ingress access to the following ports: 3000 (Go, Node.js, and Ruby web development frameworks), 5000 (Python web development frameworks), 8088 (legacy HTTP port), and 8888 (alternative HTTP port)	October 27, 2021
Added the integration with Logz.io Cloud SIEM	Logz.io is a provider of Cloud SIEM that provides advanced correlation of log and event data to help security teams to detect, analyze, and respond to security threats in real time. Logz.io receives findings from Security Hub CSPM.	October 25, 2021
Added support for cross-Region aggregation of findings	Cross-Region aggregation allows you to view all of your findings without having to change Regions. Administrator accounts choose an aggregation Region and linked Regions. Findings for the administrator account and its member accounts are aggregated from the linked Regions to the aggregation Region.	October 20, 2021

Updated resource details objects in ASFF	Added viewer certificate details to `AwsCloudFrontDistribution`. Added additional details to `AwsCodeBuildProject`. Added load balancer attributes to `AwsElbV2LoadBalancer`. Added the S3 bucket owner account identifier to `AwsS3Bucket`.	October 8, 2021
Added new resource details objects to ASFF	Added the following new resource details objects to ASFF: `AwsEc2VpcEndpointService`, `AwsEcrRepository`, `AwsEksCluster`, `AwsOpenSearchServiceDomain`, `AwsWafRateBasedRule`, `AwsWafRegionalRateBasedRule`, `AwsXrayEncryptionConfig`	October 8, 2021
Removed deprecated runtime from the Lambda.2 control	In the AWS Foundational Security Best Practices standard, removed the `dotnetcore2.1` runtime from **[Lambda.2] Lambda functions should use supported runtimes**.	October 6, 2021

New name for Check Point integration	The integration with Check Point Dome9 Arc is now Check Point CloudGuard Posture Management. The integration ARN did not change.	October 1, 2021
Removed the integration with Alcide	The integration with Alcide kAudit is discontinued.	September 30, 2021
Changed the severity of EC2.19	The severity of **[EC2.19] Security groups should not allow unrestricted access to ports with high risk** is changed from Medium to High.	September 30, 2021
Integration with AWS Organizations is now supported in the China Regions	The Security Hub CSPM integration with Organizations is now supported in China (Beijing) and China (Ningxia).	September 20, 2021
New AWS Config rule for the S3.1 and PCI.S3.6 controls	Both S3.1 and PCI.S3.6 verify that the Amazon S3 Block Public Access setting is enabled. The AWS Config rule for these controls is changed from `s3-account-level-public-access-blocks` to `s3-account-level-public-access-blocks-periodic`.	September 14, 2021

Removed deprecated runtimes from the Lambda.2 control	In the AWS Foundational Security Best Practices standard, removed the `nodejs10.x` and `ruby2.5` runtimes from **[Lambda.2] Lambda functions should use supported runtimes**.	September 13, 2021
Changed the severity of the CIS 2.2 control	In the CIS AWS Foundations Benchmark standard, the severity for **2.2. – Ensure CloudTrail log file validation is enabled** is changed from Low to Medium.	September 13, 2021
Updated ECS.1, Lambda.2, and SSM.1 in the AWS Foundational Security Best Practices standard	In the AWS Foundational Security Best Practices standard, ECS.1 now has a `SkipInactiveTaskDefinitions` parameter that is set to `true`. This ensures that the control only checks active task definitions. For Lambda.2, added Python 3.9 to the list of runtimes. SSM.1 now checks both stopped and running instances.	September 7, 2021
PCI.Lambda.2 control now excludes Lambda@Edge resources	In the Payment Card Industry Data Security Standard (PCI DSS) standard, the PCI.Lambda.2 control now excludes Lambda@Edge resources.	September 7, 2021

Added the integration with HackerOne Vulnerability Intelligence	Security Hub CSPM now offers an integration with HackerOne Vulnerability Intelligence. The integration sends findings to Security Hub CSPM.	September 7, 2021
Updated resource details objects in ASFF	For `AwsKmsKey` , added `KeyRotationStatus` . For `AwsS3Bucket` , added `AccessControlList` , `BucketLoggingConfiguration` , `BucketNotificationConfiguration` , and `BucketWebsiteConfiguration` .	September 2, 2021
Added new resource details objects to ASFF	Added the following new resource details objects to ASFF: `AwsAutoScalingLaunchConfiguration` , `AwsEc2VpnConnection` , and `AwsEcrContainerImage` .	September 2, 2021
Added details to the `Vulnerabilities` object in ASFF	In `Cvss` , added `Adjustments` and `Source`. In `VulnerablePackages` , added the file path and package manager.	September 2, 2021
Systems Manager Explorer and OpsCenter integration now supported in the China Regions	The Security Hub CSPM integration with SSM Explorer and OpsCenter is now supported in China (Beijing) and China (Ningxia).	August 31, 2021

Retiring the Lambda.4 control	Security Hub CSPM is retiring the control **[Lambda.4] Lambda functions should have a dead-letter queue configured**. When a control is retired, it no longer displays on the console, and Security Hub CSPM does not perform checks against it.	August 31, 2021
Retiring the PCI.EC2.3 control	Security Hub CSPM is retiring the control **[PCI.EC2.3] Unused EC2 security groups should be removed**. When a control is retired, it no longer displays on the console, and Security Hub CSPM does not perform checks against it.	August 27, 2021
Change to how Security Hub CSPM sends findings to custom actions	When you send findings to a custom action, Security Hub CSPM now sends each finding in a separate **Security Hub Findings - Custom Action** event.	August 20, 2021
Added a new compliance status reason code for custom Lambda runtimes	Added a new `LAMBDA_CUSTOM_RUNTIME_DETAILS_NOT_AVAILABLE` compliance status reason code. This reason code indicates that Security Hub CSPM could not perform a check against a custom Lambda runtime.	August 20, 2021

AWS Firewall Manager integration now supported in the China Regions	The Security Hub CSPM integration with Firewall Manager is now supported in China (Beijing) and China (Ningxia).	August 19, 2021
New integrations with Caveonix Cloud and Forcepoint Cloud Security Gateway	Security Hub CSPM now offers integrations with Caveonix Cloud and Forcepoint Cloud Security Gateway. Both integrations send findings to Security Hub CSPM.	August 10, 2021
Added new `CompanyName`, `ProductName`, and `Region` attributes to ASFF	Added `CompanyName`, `ProductName`, and `Region` fields to the top level of the ASFF. These fields are populated automatically and, except for custom product integrations, cannot be updated using `BatchImportFindings` or `BatchUpdateFindings`. On the console, finding filters use these new fields. In the API, the `CompanyName` and `ProductName` filters use the attributes that are under `ProductFields`.	July 23, 2021

Added and updated resource details objects in ASFF	Added a new `AwsRdsEventSubscription` resource type and resource details. Added resource details for the `AwsEcsService` resource type. Added attributes to the `AwsElasticsearchDomain` resource details object.	July 23, 2021
Added controls to the AWS Foundational Security Best Practices standard	Added new controls for Amazon API Gateway (APIGateway.5), Amazon EC2 (EC2.19), Amazon ECS (ECS.2), Elastic Load Balancing (ELB.7), Amazon OpenSearch Service (ES.5 through ES.8), Amazon RDS (RDS.16 through RDS.23), Amazon Redshift (Redshift.4), and Amazon SQS (SQS.1).	July 20, 2021
Moved a permission within the service-linked role managed policy	Moved the `config:PutEvaluations` permission within the managed policy `AWSSecurityHubServiceRolePolicy`, so that it is applied to all resources.	July 14, 2021

Added controls to the AWS Foundational Security Best Practices standard	Added new controls for Amazon API Gateway (APIGateway.4), Amazon CloudFront (CloudFront.5 and CloudFront.6), Amazon EC2 (EC2.17 and EC2.18), Amazon ECS (ECS.1), Amazon OpenSearch Service (ES.4), AWS Identity and Access Management (IAM.21), Amazon RDS (RDS.15), and Amazon S3 (S3.8).	July 8, 2021
Added new compliance status reason codes for control findings	`INTERNAL_SERVICE_ERROR` indicates that an unknown error occurred. `SNS_TOPIC_CROSS_ACCOUNT` indicates that the SNS topic is owned by a different account. `SNS_TOPIC_INVALID` indicates that the associated SNS topic is invalid.	July 6, 2021
Added the integration with Amazon Q Developer in chat applications	Added the integration with Amazon Q Developer in chat applications. Security Hub CSPM sends findings to Amazon Q Developer in chat applications.	June 30, 2021

Added a new permission to the service-linked role managed policy	Added a new permission to the managed policy `AWSSecurityHubServiceRolePolicy` to allow the service-linked role to deliver evaluation results to AWS Config.	June 29, 2021
New and updated resource details objects in the ASFF	Added new resource details objects for ECS clusters and ECS task definitions. Updated the EC2 instance object to list the associated network interfaces. Added the client certificate ID for the API Gateway V2 stages. Added the lifecycle configuration for S3 buckets.	June 24, 2021
Updated the calculation of aggregated control statuses and standard security scores	Security Hub CSPM now calculates the overall control status and standard security score every 24 hours. For administrator accounts, the score now reflects whether each control is enabled or disabled for each account.	June 23, 2021
Updated information about Security Hub CSPM handling of suspended accounts	Added information on how Security Hub CSPM handles accounts that are suspended in AWS.	June 23, 2021

Added tabs to display the enabled and disabled controls for the individual administrator account	For the administrator account, the main tabs on the standard details page contain aggregated information across accounts. The new **Enabled for this account** and **Disabled for this account** tabs list the accounts that are enabled or disabled for the individual administrator account.	June 23, 2021
Added `java8.al2` to the parameters for `Lambda.2`	In the AWS Foundational Security Best Practices standard, added `java8.al2` to the supported runtimes for the `Lambda.2` control.	June 8, 2021
New integrations with MicroFocus ArcSight and NETSCOUT Cyber Investigator	Added integrations with MicroFocus ArcSight and NETSCOUT Cyber Investigator. MicroFocus ArcSight receives findings from Security Hub CSPM. NETSCOUT Cyber Investigator sends findings to Security Hub CSPM.	June 7, 2021
Added details for `AWSSecurityHubServiceRolePolicy`	Updated the managed policies section to add details for the existing managed policy `AWSSecurityHubServiceRolePolicy`, which is used by the Security Hub CSPM service-linked role.	June 4, 2021

New integration with Jira Service Management	The AWS Service Management Connector for Jira sends findings to Jira and uses them to create Jira issues. When the Jira issues are updated, the corresponding findings in Security Hub CSPM also are updated.	May 26, 2021
Updated the supported controls list for the Asia Pacific (Osaka) Region	Updated the CIS AWS Foundations standard and the Payment Card Industry Data Security Standard (PCI DSS) to indicate the controls that are not supported in Asia Pacific (Osaka).	May 21, 2021
New integration with Sysdig Secure for cloud	Added an integration with Sysdig Secure for cloud. The integration sends findings to Security Hub CSPM.	May 14, 2021

Added controls to the AWS Foundational Security Best Practices standard	Added new controls for Amazon API Gateway (APIGateway.2 and APIGateway.3), AWS CloudTrail (CloudTrail.4 and CloudTrail.5), Amazon EC2 (EC2.15 and EC2.16), AWS Elastic Beanstalk (ElasticBeanstalk.1 and ElasticBeanstalk.2), AWS Lambda (Lambda.4), Amazon RDS (RDS.12 – RDS.14), Amazon Redshift (Redshift.7), AWS Secrets Manager (SecretsManager.3 and SecretsManager.4), and AWS WAF (WAF.1).	May 10, 2021
Updates to GuardDuty and Amazon RDS controls	Changed the severity of `GuardDuty.1` and `PCI.GuardDuty.1` from Medium to High. Added a `databaseEngines` parameter to `RDS.8`.	May 4, 2021
Added new resource details to the ASFF	In `Resources.Details`, added new resource details objects for Amazon EC2 network ACLs, Amazon EC2 subnets, and AWS Elastic Beanstalk environments.	May 3, 2021
Added console fields to provide filter values for Amazon EventBridge rules	The new predefined filter patterns for Security Hub CSPM EventBridge rules provide console fields that you can use to specify filter values.	April 30, 2021

Added the integration with AWS Systems Manager Explorer and OpsCenter	Security Hub CSPM now supports an integration with Systems Manager Explorer and OpsCenter. The integration receives findings from Security Hub CSPM and updates those findings in Security Hub CSPM.	April 26, 2021
New type for product integrations	A new integration type, `UPDATE_FINDINGS_IN_SECURITY_HUB`, indicates that a product integration updates findings that it receives from Security Hub CSPM.	April 22, 2021
Changed "master account" to "administrator account"	The term "master account" is changed to "administrator account." The term is also changed in the Security Hub CSPM console and API.	April 22, 2021
Updated APIGateway.1 to replace HTTP with Websocket	Updated the title, description, and remediation for APIGateway.1. The control now checks for Websocket API execution logging instead of for HTTP API execution logging.	April 9, 2021
Amazon GuardDuty integration now supported in Beijing and Ningxia	The Security Hub CSPM integration with GuardDuty is now supported in the China (Beijing) and China (Ningxia) Regions.	April 5, 2021

Added `nodejs14.x` to the supported runtimes for Lambda.2 control	The Lambda.2 control in the Foundational Security Best Practices standard now supports the `nodejs14.x` runtime.	March 30, 2021
Security Hub CSPM launched in Asia Pacific (Osaka)	Security Hub CSPM is now available in the Asia Pacific (Osaka) Region.	March 29, 2021
Added finding provider fields to finding details	On the finding details panel, the new **Finding Provider Fields** section contains the finding provider values for confidence, criticality, related findings, severity, and types.	March 24, 2021
Added option to receive sensitive findings from Amazon Macie	The integration with Macie can now be configured to send sensitive findings to Security Hub CSPM.	March 23, 2021
Transitioning to AWS Organizations for account management	For customers who have an existing administrator account with member accounts, added new information on how to change from managing accounts by invitation to managing accounts using Organizations.	March 22, 2021

New objects in ASFF for information about Amazon S3 Public Access Block configuration	In `Resources`, a new `AwsS3AccountPublicAccessBlock` resource type and details object provides information about the Amazon S3 Public Access Block configuration for accounts. In the `AwsS3Bucket` resource details object, the `PublicAccessBlockConfiguration` object provides the Public Access Block configuration for the S3 bucket.	March 18, 2021
New object in ASFF to allow finding providers to update specific fields	The new `FindingProviderFields` object in ASFF is used in `BatchImportFindings` to provide values for `Confidence`, `Criticality`, `RelatedFindings`, `Severity`, and `Types`. The original fields should only be updated using `BatchUpdateFindings`.	March 18, 2021
New `DataClassification` object for resources in ASFF	The new `Resources.DataClassification` object in ASFF is used to provide information about sensitive data that was detected on the resource.	March 18, 2021

Added CONFIG_RETURNS_NOT_APPLICABLE value to the available compliance status codes	For the NOT_AVAILABLE compliance status, removed the reason code RESOURCE_NO_LONGER_EXISTS and added the reason code CONFIG_RETURNS_NOT_APPLICABLE .	March 16, 2021
New managed policy for integration with AWS Organizations	A new managed policy, AWSSecurityHubOrganizationsAccess , provides the Organizations permissions that are needed by the organization management account and the delegated Security Hub CSPM administrator account.	March 15, 2021
Managed policy and service-linked role information moved to the Security chapter	The information on managed policies is revised and expanded. Both the managed policy information and the information on service-linked roles has moved to the Security chapter.	March 15, 2021
Revised severity for CIS 1.1 and CIS 3.1 – CIS 3.14 controls	The severity of the CIS 1.1 and CIS 3.1 – CIS 3.14 controls is changed to Low.	March 3, 2021
Removed the RDS.11 control	Removed the RDS.11 control from the Foundational Security Best Practices standard.	March 3, 2021

Updated integration for Turbot	The Turbot integration is updated to both send and receive findings.	February 26, 2021
Added controls to the Foundational Security Best Practices standard	Added new controls for Amazon API Gateway (APIGateway.1), Amazon EC2 (EC2.9 and EC2.10), Amazon Elastic File System (EFS.2), Amazon OpenSearch Service (ES.2 and ES.3), Elastic Load Balancing (ELB.6), and AWS Key Management Service (AWS KMS) (KMS.3).	February 11, 2021
Added optional `ProductArn` filter to the `DescribeProducts` API	The `DescribeProducts` API operation now includes an optional `ProductArn` parameter. The `ProductArn` parameter is used to identify the specific product integration to return details for.	February 3, 2021
New integration with Antivirus for Amazon S3 from Cloud Storage Security	The integration with Antivirus for Amazon S3 sends the virus scan results to Security Hub CSPM as findings.	January 27, 2021

Updated the security score calculation process for administrator accounts	For an administrator account, Security Hub CSPM uses a separate process to calculate the security score. The new process ensures that the score includes controls that are enabled for member accounts but disabled for the administrator account.	January 21, 2021
New fields and objects in the ASFF	Added a new `Action` object to track actions that occurred against a resource. Added fields to the `AwsEc2NetworkInterface` object to track DNS names and IP addresses. Added a new `AwsSsmPatchCompliance` object to the resource details.	January 21, 2021
Added controls to the Foundational Security Best Practices standard	Added new controls for Amazon CloudFront (CloudFront.1 through CloudFront.4), Amazon DynamoDB (DynamoDB.1 through DynamoDB.3), Elastic Load Balancing (ELB.3 through ELB.5), Amazon RDS (RDS.9 through RDS.11), Amazon Redshift (Redshift.1 through Redshift.3 and Redshift.6), and Amazon SNS (SNS.1).	January 15, 2021

Workflow status is reset based on the record state or compliance status	Security Hub CSPM automatically resets the workflow status from `NOTIFIED` or `RESOLVED` to `NEW` if an archived finding is made active, or if the compliance status of a finding changes from `PASSED` to either `FAILED`, `WARNING`, or `NOT_AVAILABLE` . These changes indicate that additional investigation is required.	January 7, 2021
Added `ProductFields` information for control-based findings	For findings that are generated from controls, added information about the content of the `ProductFields` object in the AWS Security Finding Format (ASFF).	December 29, 2020
Updates to managed insights	Changed the title of insight 5. Added a new insight, 32, that checks for IAM users with suspicious activity.	December 22, 2020
Updates to IAM.7 and Lambda.1 controls	In the AWS Foundational Security Best Practices standard, updated the parameters for IAM.7. Updated the title and description of Lambda.1.	December 22, 2020

Expanded integration with ServiceNow ITSM	The ServiceNow ITSM integration allows users to automatically create incidents or problems when a Security Hub CSPM finding is received. Updates to these incidents or problems result in updates to the findings in Security Hub CSPM.	December 11, 2020
New integration with AWS Audit Manager	Security Hub CSPM now offers an integration with AWS Audit Manager. The integration allows Audit Manager to receive control-based findings from Security Hub CSPM.	December 8, 2020
New integration with Aqua Security Kube-bench	Security Hub CSPM added an integration with Aqua Security Kube-bench. The integration sends findings to Security Hub CSPM.	November 24, 2020
Cloud Custodian is now available in the China Regions	The integration with Cloud Custodian is now available in the China (Beijing) and China (Ningxia) Regions.	November 24, 2020

BatchImportFindings can now be used to update additional fields	Previously, you could not use BatchImportFindings to update the Confidence , Criticality , RelatedFindings , Severity, and Types fields. Now, if these fields have not been updated by BatchUpdateFindings , they can be updated by BatchImportFindings . Once they are updated by BatchUpdateFindings , they cannot be updated by BatchImportFindings .	November 24, 2020
Security Hub CSPM is now integrated with AWS Organizations	Customers can now manage member accounts using their Organizations account configuration. The organization management account designates the Security Hub CSPM administrator account, who determines which organization accounts to enable in Security Hub CSPM. The manual invitation process can still be used for accounts that are not part of an organization.	November 23, 2020
Removed the separate finding list format for high-volume controls	The finding list for a control no longer uses the **Findings** page format when there is a very large number of findings.	November 19, 2020

New and updated third-party integrations	Security Hub CSPM now supports integrations with cloudtamer.io, 3CORESec, Prowler, and StackRox Kubernetes Security. IBM QRadar no longer sends findings. It only receives findings.	October 30, 2020
Added option to download the list of findings from the control details page.	On the control details page, a new **Download** option allows you to download the finding list to a .csv file. The downloaded list respects any filters that are on the list. If you selected specific findings, then the downloaded list only includes those findings.	October 26, 2020
Added option to download the list of controls from the standard details page.	On the standard details page, a new **Download** option allows you to download the control list to a .csv file. The downloaded list respects any filters that are on the list. If you selected a specific control, then the downloaded list only includes that control.	October 26, 2020

New and updated partner integrations	Security Hub CSPM is now integrated with ThreatModeler. Updated the following partner integrations to reflect their new product names. Twistlock Enterprise Edition is now Palo Alto Networks - Prisma Cloud Compute. Also from Palo Alto Networks, Demisto is now Cortex XSOAR and Redlock is now Prisma Cloud Enterprise.	October 23, 2020
Security Hub CSPM launched in China (Beijing) and China (Ningxia)	Security Hub CSPM is now available in the China (Beijing) and China (Ningxia) Regions.	October 21, 2020
Revised format for ASFF attributes and third-party integrations	The lists of ASFF attributes and partner integrations now use a list-based format instead of tables. The ASFF syntax, attributes, and types taxonomy are now in separate topics.	October 15, 2020
Redesigned standard details page	The standard details page for an enabled standard now displays a tabbed list of controls. The tabs filter the control list based on the control status.	October 7, 2020
Replaced CloudWatch Events with EventBridge	Replaced references to Amazon CloudWatch Events with Amazon EventBridge.	October 1, 2020

New integrations with Blue Hexagon for AWS, Alcide kAudit, and Palo Alto Networks VM-Series.	Security Hub CSPM is now integrated with Blue Hexagon for AWS, Alcide kAudit, and Palo Alto Networks VM-Series. Blue Hexagon for AWS and kAudit send findings to Security Hub CSPM. VM-Series receives findings from Security Hub CSPM.	September 30, 2020
New and updated resource details objects in ASFF	Added new `Resources.Details` objects for `AwsApiGatewayRestApi`, `AwsApiGatewayStage`, `AwsApiGatewayV2Api`, `AwsApiGatewayV2Stage`, `AwsCertificateManagerCertificate`, `AwsElbLoadBalancer`, `AwsIamGroup`, and `AwsRedshiftCluster`. Added details to the `AwsCloudFrontDistribution`, `AwsIamRole` and `AwsIamAccessKey` objects.	September 30, 2020
New `ResourceRole` attribute for resources in ASFF to track whether a resource is an actor or a target.	The `ResourceRole` attribute for resources indicates whether the resource is the target of the finding activity or the perpetrator of the finding activity. The valid values are `ACTOR` and `TARGET`.	September 30, 2020

Added AWS Systems Manager Patch Manager to available AWS service integrations	AWS Systems Manager Patch Manager is now integrated with Security Hub CSPM. Patch Manager sends findings to Security Hub CSPM when instances in a customer's fleet go out of compliance with their patch compliance standard.	September 22, 2020
Added new controls to the AWS Foundational Security Best Practices standard	Added new controls for the following services: Amazon EC2 (EC2.7 and EC2.8), Amazon EMR (EMR.1), IAM (IAM.8), Amazon RDS (RDS.4 through RDS.8), Amazon S3 (S3.6), and AWS Secrets Manager (SecretsManager.1 and SecretsManager.2).	September 15, 2020
New context keys for IAM policy to control access to `BatchUpdateFindings` fields	IAM policies can now be configured to restrict access to fields and field values when using `BatchUpdateFindings` .	September 10, 2020
Expanded access to `BatchUpdateFindings` for member accounts	By default, member accounts now have the same access to `BatchUpdateFindings` as administrator accounts.	September 10, 2020

New controls for AWS KMS in the Foundational Security Best Practices Standard	Added two new controls (KMS.1 and KMS.2) to the Foundational Security Best Practices Standard. The new controls check whether IAM policies restrict access to AWS KMS decryption actions.	September 9, 2020
Removed account-level findings for controls	Security Hub CSPM no longer generates account-level findings for a control. Only resource-level findings are generated.	September 1, 2020
New PatchSummary object in ASFF	Added the `PatchSummary` object to the ASFF. The `PatchSummary` object provides information about the patch compliance of a resource relative to a selected compliance standard.	September 1, 2020
Redesigned control details page	The details page for controls is redesigned. The control finding list provides tabs to allow you to quickly filter the list based on the compliance status. You can also quickly see suppressed findings. Each entry provides access to additional details about the finding resource, AWS Config rule, and finding notes.	August 28, 2020

New filter options for findings	For finding filters, you can use the **is not** filter to find findings for which a field value is not equal to the filter value. You can use the **does not start with** to find findings for which a field value does not start with the specified filter value.	August 28, 2020
New resource details objects in ASFF	Added new `Resources.Details` objects for the following resource types: `AwsDynamoDbTable`, `AwsEc2Eip`, `AwsIamPolicy`, `AwsIamUser`, `AwsRdsDbCluster`, `AwsRdsDbClusterSnapshot`, `AwsRdsDbSnapshot`, `AwsSecretsManagerSecret`	August 18, 2020
New integration with RSA Archer	Security Hub CSPM is now integrated with RSA Archer. RSA Archer receives findings from Security Hub CSPM.	August 18, 2020
New Description field for AwsKmsKey	Added a `Description` field to the `AwsKmsKey` object under `Resources.Details`.	August 18, 2020
Added fields to AwsRdsDbInstance	Added several attributes to the `AwsRdsDbInstance` object under `Resources.Details`.	August 18, 2020

Updated how Security Hub CSPM determines the overall status of a control	For controls that have no findings, the status is **No data** instead of **Unknown**. The control status includes both account-level and resource-level findings. The control status does not use the workflow status of findings, except to ignore suppressed findings.	August 13, 2020
Updated how Security Hub CSPM calculates the security score for a standard	When calculating the security score for a standard, Security Hub CSPM now ignores controls with a status of **No Data**. The security score is proportion of passed controls to enabled controls, excluding controls with no data.	August 13, 2020
New option to automatically enable new controls in enabled standards	Added a **Settings** option to automatically enable new controls in standards that are enabled. You can also use the `UpdateSecurityHubConfiguration` API operation to configure this option.	July 31, 2020

New controls for the Payment Card Industry Data Security Standard (PCI DSS) standard	Added new controls to the PCI DSS standard. The identifiers of the new controls are PCI.DMS.1, PCI.EC2.5 , PCI.EC2.6, PCI.ELBV2.1, PCI.GuardDuty.1, PCI.IAM.7, PCI.IAM.8, PCI.S3.5, PCI.S3.6, PCI.SageMaker.1, PCI.SSM.2, and PCI.SSM.3.	July 29, 2020
New and updated controls for the Foundational Security Best Practices standard	Added new controls to the Foundational Security Best Practices standard. The identifiers of the new controls are AutoScaling.1, DMS.1, EC2.4, EC2.6, S3.5, and SSM.3. Updated the title of ACM.1 and changed the value of the `daysToExpiration` parameter to 30.	July 29, 2020
New `Vulnerabilities` object in the ASFF	Added the `Vulnerabilities` object, which provides information about vulnerabilities that are associated with the finding.	July 1, 2020
New `Resource.Details` objects in the ASFF for Auto Scaling groups, EC2 volumes, and EC2 VPCs	Added the `AwsAutoScalingAutoScalingGroup` , `AWSEc2Volume` , and `AwsEc2Vpc` objects to `Resource.Details` .	July 1, 2020

New `NetworkPath` object in the ASFF	Added the `NetworkPath` object, which provides information about a network path that is related to the finding.	July 1, 2020
Automatically resolve findings when `Compliance.Status` is PASSED	For findings from controls, if `Compliance.Status` is PASSED, then Security Hub CSPM automatically sets `Workflow.Status` to `RESOLVED`.	June 24, 2020
AWS Command Line Interface examples	Added AWS CLI syntax and examples for several Security Hub CSPM tasks. Includes enabling Security Hub CSPM, managing insights, managing standards and controls, managing product integrations, and disabling Security Hub CSPM.	June 24, 2020
New `Severity.Original` attribute in the ASFF	Added the `Severity.Original` attribute, which is the original severity from the finding provider. This replaces the deprecated `Severity.Product` attribute.	May 20, 2020
New `Compliance.StatusReasons` object in the ASFF for details about a control's status	Added the `Compliance.StatusReasons` object, which provides additional context for the current status of a control.	May 20, 2020

New AWS Foundational Security Best Practices standard	Added the new AWS Foundational Security Best Practices standard, which is a set of controls that detect when your deployed accounts and resources deviate from security best practices.	April 22, 2020
New console option to update the workflow status for a finding	Added information for using the Security Hub console or API to set the workflow status for findings.	April 16, 2020
New `BatchUpdateFindings` API for customer updates to findings	Added information on using `BatchUpdateFindings` to update information related to the process of investigating a finding. `BatchUpdateFindings` replaces `UpdateFindings`, which is deprecated.	April 16, 2020
Updates to the AWS Security Finding Format (ASFF)	Added several new resource types. Added a new `Label` attribute to the `Severity` object. `Label` is intended to replace the `Normalized` field. Added a new `Workflow` object to track the process of an investigation into a finding. `Workflow` contains a `Status` attribute, which replaces the existing `Workflowstate` attribute.	March 12, 2020

Updates to the Integrations page	Updated to reflect the changes to the **Integrations** page. For each integration, the page now shows the integration category and whether each integration sends findings to or receives findings from Security Hub CSPM. It also provides the specific steps required to enable each integration.	February 26, 2020
New third-party product integrations	Added the following new product integrations: Cloud Custodian, FireEye Helix, Forcepoint CASB, Forcepoint DLP, Forcepoint NGFW, Rackspace Cloud Native Security, and Vectra.ai Cognito Detect.	February 21, 2020
New security standard for the Payment Card Industry Data Security Standard (PCI DSS)	Added the Security Hub CSPM security standard for the Payment Card Industry Data Security Standard (PCI DSS). When this standard is enabled, Security Hub CSPM performs automated checks against controls related to PCI DSS requirements.	February 13, 2020

Updates to the AWS Security Finding Format (ASFF)	Added a field for related requirements for standards controls. Added new resource types and new resource details. The ASFF also now allows you to provide up to 32 resources.	February 5, 2020
New option to disable individual security standard controls	Added information on how to control whether each individual security standard control is enabled.	January 15, 2020
Updates to Security Hub CSPM concepts	Updated some descriptions and added new terms to Security Hub CSPM concepts.	September 21, 2019
AWS Security Hub CSPM general availability release	Content updates to reflect improvements made to Security Hub CSPM during the beta period.	June 25, 2019
Added remediation steps for CIS AWS Foundations checks	Added remediation steps to Security Standards Supported in AWS Security Hub CSPM.	April 15, 2019
beta release of AWS Security Hub CSPM	Published the beta release version of the *AWS Security Hub CSPM User Guide*.	November 18, 2018
